The treaty of marriage between queen Mary and Philip, ſon of Charles V. king of Spain and emperor of Germany, was the next momentous buſineſs to which Gardiner's attention was directed. This projected marriage was extremely odious to the nation in general; and though the articles of it were drawn with much art and plauſibility, and ſeemingly much in favour of England, yet, when they were publiſhed, they gave no ſatisfaction to the people. At the meeting of the ſecond parliament of the queen's reign, however, in April, 1554, the treaty of marriage was made the ſubject of diſcuſſion; and as Gardiner had received large remittances from the emperor, by means of which he had ſecured the votes of many conſiderable members, the terms of it were ratified by both houſes without much oppoſition. In the month of July following the queen met the Spaniſh prince at Wincheſter, where they were married by Gardiner, in that venerable cathedral. This prelate now brought over cardinal Pole, the popiſh legate, and conſigned the people of England once more into the boſom of the catholic church; and a bill quickly followed, by which the old ſtatutes againſt heretics, made in the reigns of Richard II. Henry IV. and Henry V. were revived in their full force. For theſe ſervices biſhop Gardiner was promiſed a cardinal's hat, and, on the firſt vacancy, a promotion to the archbiſhopric of Canterbury. But in the month of October, 1555, he opened the ſeſſions of parliament, and within a few days afterwards was taken ill of the gout, according to ſome writers, but according to others of a ſuppreſſion of urine, which proved fatal to him on the 13th of November following, when he was about ſeventy-two years of age. He is ſaid to have ſuſtained excruciating agonies on his death-bed, and to have felt great remorſe for his paſt life, often repeating the words, *Erravi cum Petro, ſed non flevi cum Petro*; "I have erred with Peter, but I have not wept with Peter." He was the author of a treatiſe *De Vera Obedientia*, already mentioned. 2. *Palinodia dicti Libri*, or a retraction of the preceding works. 3. An Explication and Aſſertion of the true Catholic Faith, touching the moſt bleſſed Sacrament of the Altar, &c. written againſt Cranmer, and printed abroad in 1551. 4. *Confutatio Cavillationum, quibus, ſacroſanctum Euchariſtiæ Sacramentum, ab impiis Capernaitis impetiſolet*, written in the Tower, in reply to an anſwer of Cranmer to the laſt-mentioned piece; and different defences of himſelf againſt the attacks of Dr. Turner, Dr. Poynet, and other proteſtant exiles. Several of his letters to the duke of Somerſet, lord protector, and other perſons, are extant in the firſt edition of Fox's Acts and Monuments, and ſome to Smith and Cheke on the pronunciation of the Greek language in Bene't college library, at Cambridge.

GARDIN'GEN, a town of Denmark, in the duchy of Sleſwic: twenty-eight miles weſt-ſouth-weſt of Sleſwic. Lat. 54. 24. N. lon. 8. 52. E. Greenwich.

GARD'MANGER, *ſ.* [French] A ſtorehouſe, a place to put victuals in. *Scott.*

GARD'NER, a townſhip of the American States, in Worceſter county, Maſſachuſetts, incorporated in 1785. It contains about 14,000 acres, well watered, chiefly by Otter river. The road from Connecticut river through Peterſham, Gerry, and Templeton, and to Boſton, paſſes through it. It contains 531 inhabitants, and is twenty-ſix miles north by weſt of Worceſter, and ſixty north-weſt of Boſton.

GARDNER's ISLAND, or ISLE OF WIGHT, an iſland of the American States, ſituated at the eaſt end of Long-Iſland, in New-York ſtate, ſheltered within Oyſter Pond and Montauk points; ten miles north-weſt of the latter, and as far ſouth-weſt of Plumb iſland. It contains about three thouſand acres of fertile land, and yields excellent graſs, wheat and corn. Fine ſheep and cattle are raiſed on it. It is annexed to Eaſt Hampton, and lies forty miles ſouth-weſterly of Newport, Rhode-Iſland.

GARD'ON, a river of France, which riſes in the department of the Lozere, croſſes the department of the Gard, receiving another river in its courſe, called the *Gardon d'Alais*, and runs into the Rhone, four miles north of Taraſcon.

GARDOU'CH, a town of France, in the department of the Upper Garonne: five leagues ſouth-eaſt of Toulouſe.

GARD'ROBE, *ſ.* [French] A wardrobe, a place to keep clothes in. *Scott.*

GARD'SBY, a town of Sweden, in the province of Smaland: twenty-eight miles north of Wexio.

GARE, *ſ.* Wool growing on the legs of ſheep.

GA'REB, a hill of Paleſtine, (probably GOREB,) ſituated weſt of Jeruſalem near Mount-Calvary, mentioned Jer. xxxi. 29.

GA'RED, a town of Africa, in the kingdom of Suz, on the river Suz, celebrated for its morocco leather.

GARENCIE'RES, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Montfort: one league and a quarter north-weſt of Montfort.

GARENGE'OT (Rene Jacques Croiſſant de), an eminent French ſurgeon, born at Vitry, in 1688. He ſettled at Paris, and firſt raiſed himſelf to notice by publiſhing the diſcoveries and inventions of others as his own, which gave riſe to various litigations. At length he obtained reputation upon better grounds, and became one of the firſt Pariſian ſurgeons of his time. He was a fellow of the royal ſociety of London, and demonſtrator-royal in ſurgery at Paris He was a dextrous operator, as well as an uſeful writer. He died in 1759. The works of Garengeot are: *Traité des Operations de Chirurgie*, Par. 1720, two vols. 8vo. 1731, 1749, three vols. 12mo. This is a valuable performance, containing many practical improvements. *Nouveau Traité des Inſtrumens de Chirurgie*, Par. 1723, two vols. 12mo. *De l'Operation de la Taille par l'Appareil lateral*, Par. 1730, 12mo. *Splanchnologie, ou l'Anatomie des Viſcères*, Par. 1728, 1742, two vols. 12mo. *Myotomie humaine & canine*, Par. 1728, 1750, two vols. 12mo. He alſo wrote ſome papers in the *Mém. de l'Acad. de Chirurgie*, and the *Mém. de l'Acad. des Sciences.*

GAREN'NE (La), a town of France, in the department of Paris: two leagues eaſt-north-eaſt of Paris.

GAREOU'LT, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Brignoles: five miles ſouth of Brignoles.

GA'RET (John), a learned French benedictine monk, of the congregation of St. Maur, born at Havre de Grace

Grace in 1627. When he was twenty years of age he embraced the eccleſiaſtical life, which he adorned by his piety and virtues, at the ſame time that he acquired the reſpect of his fraternity by his literary proficiency. He died at the abbey of Jumieges, in 1694, when about ſixty-ſeven years of age. To his labours are we indebted for the moſt valuable edition of the works of "Caſſiodorus," in two volumes folio, publiſhed at Rouen in 1679, with learned and judicious notes. It was printed under the inſpection of Father le Nourri, to whom ſome authors have, improperly, attributed the preface, and the tables which accompany it. This edition of the works of Caſſiodorus is preceded by a curious diſſertation on the monaſtic life of that celebrated Roman ſenator.

GARFE'TE, a town of Portugal, in the province of Alentejo: four leagues weſt of Crato.

GARGA'NO, a town of Italy, in the kingdom of Naples, and province of Capitanata: ſeven miles north of Mount St. Angelo.

GARGANVILLA'RD, a town of France, in the department of the Landes, ſeven miles north-weſt of Riviere Verdun.

GARGA'NUS, in ancient geography, now *St. Angelo*, a lofty mountain of Apulia, which advances in the form of a promontory into the Adriatic Sea. *Lucan.*

GARGA'PHIA, a valley near Platæa, with a fountain of the ſame name, where Actæon was torn to pieces by his dogs. *Ovid.*

GAR'GARA, a town of Aſiatic Turkey, in the province of Natolia: twenty miles weſt of Adramiti.

GARGA'REON, [Greek; from עגר, *gargar*, Arab. or גרגרה, *gargarah*, Heb.] The uvula, or glandulous body which hangs down into the throat.

GAR'GARIS, a king of the Curetes, who firſt found the manner of collecting honey. He had a ſon by his daughter, whom he attempted in vain to deſtroy. He made him his ſucceſſor. *Juſtin.*

GAR'GARISM, *ſ.* [γαργαρισμος, Gr. *gargariſme*, Fr.] A liquid form of medicine to waſh the mouth with.—Apophlegmatiſms and *gargariſms* draw the rheum down by the palate. *Bacon.*

To GAR'GARIZE, *v. a.* [γαργαριζω, Gr. *gargariſer*, Fr.] To waſh the mouth with medicated liquors.—Vinegar, put to the noſtrils, or *gargariſed*, doth eaſe the hiccough; for that is aſtringent, and inhibiteth the motion of the ſpirit. *Bacon.*—This being relaxed, may make a ſhaking of the larynx; as when we *gargarize*. *Holder.*

GAR'GARUS, a town and mountain of Troas, near mount Ida, famous for its fertility. *Strabo.*

GAR'GET, *ſ.* A diſtemper in cattle.—The *garget* appears in the head, maw, or in the hinder parts. *Mortimer.*

GARGET'TUS, a town of Attica, the birth-place of Epicurus. *Cicero.*

GAR'GIL, *ſ.* a diſtemper in geeſe, which by ſtopping the head frequently proves mortal. Three or four cloves of garlic, beaten in a mortar with butter, and made into little balls, and given faſting, are the ordinary cure.

GARGILLES'SE, a town of France, in the department of the Indre, and chief place of a canton, in the diſtrict of Argenton: three leagues north-eaſt of St. Benoiſt du Sault, and one and three quarters ſouth-eaſt of Argenton.

To GAR'GLE, *v. a.* [*gargouiller*, Fr. *gargogliare*, Ital. *gurgel*, Germ. the throat.] To waſh the throat with ſome liquor not ſuffered immediately to deſcend.—The exciſion made, the bleeding will ſoon be ſtopt by *gargling* with oxycrate. *Wiſeman.*

They comb, and then they order ev'ry hair;
Next *gargle* well their throats. *Dryden.*

To warble; to play in the throat. An improper uſe:

Thoſe which only warble long,
And *gargle* in their throats a ſong. *Waller.*

So charm'd you were, you ceas'd a while to doat
On nonſenſe *gargled* in an eunuch's throat. *Fenton.*

GAR'GLE, *ſ.* A liquor with which the throat is waſhed.—His throat was waſhed with one of the *gargles* ſet down in the method of cure. *Wiſeman.*

GAR'GLION, *ſ.* An exſudation of nervous juice from a bruiſe, or the like, which indurates into a hard immoveable tumour. *Quincy.*

GARGNA'NO, a town of Italy, in the Breſſan; twenty-one miles north-eaſt of Breſcia. It contains 3400 inhabitants.

GAR'GOL, *ſ.* A diſtemper in hogs.—The ſigns of the *gargol* in hogs are, hanging down of the head, moiſt eyes, ſtaggering, and loſs of appetite. *Mortimer.*

GAR'HA, a river of Hindooſtan, which runs into the Chumbul, about three miles north-eaſt from Suiſſopour, in the country of Agimere.

GA'RIA, a bay on the ſouth coaſt of Newfoundland: twenty-two miles eaſt of Cape Ray.

GARIDEL'LA, *ſ.* [ſo named by Tournefort in honour of Pierre Garidel, M. D. phyſician at Aix in Provence.] In botany, a genus of the claſs decandria, order trigynia, natural order multiſiliquæ, (ranunculaceæ, *Juſſ.*) The generic characters are—Calyx: perianthium five-leaved, ſmall; leaflets ovate, acute, deciduous. Corolla: petals none, unleſs the calyx be taken for them; nectaries five, long, equal, two-lipped; outer lip bifid, flat; diviſions long, linear, blunt; inner lip ſhorter, ſimple. Stamina: filaments uſually ten, ſubulate, ſhorter than the corolla; antheræ upright, blunt. Piſtillum: germs three, ovate, upright, acuminate, connected; ſtyles ſcarcely any; ſtigmas ſimple. Pericarpium: capſules three, ſuperior, connected, oblong, acuminate, compreſſed, one-celled, two-valved; the inner future more convex. Seeds: ſeveral, ſhort, about twelve in each cell, ovate-acuminate, wrinkled, black or brown.—*Eſſential Character.* Calyx five-leaved, like petals; nectary five, two-lipped, bifid; capſule three, connected, containing many ſeeds.

Garidella nigellaſtrum, or fennel-leaved garidella, is the only ſpecies known: an annual plant, which riſes with an upright ſtalk a foot high, dividing into ſeveral ſlender branches, having very fine-cut leaves, like thoſe of fennel, at their joints; the ſtalks are terminated by one ſmall flower, of a pale herbaceous colour. Native of the ſouth of France, where it was firſt diſcovered by Monſ. Garidel in 1692. It is found alſo in Italy. It flowers in June and July, and the ſeeds ripen in September. This plant is propagated by ſeeds ſown in autumn on a border of light freſh earth: when the plants come up, weed and thin them to the diſtance of four or five inches; or if the ſeeds be permitted to ſcatter, the plants will come up without farther care. They do not well bear tranſplanting.

GARIEVIT'ZA, or MOUNT CLAUDIUS, a mountain of Sclavonia: ſixteen miles north of Kraliovavelika.

GARIGLIA'NO, a river of Italy, in the kingdom of Naples, which runs into the Mediterranean: eight miles eaſt of Gaeta.

GA'RISH. See GAIRISH.

GARISSO'LES (Anthony), an eminent French proteſtant miniſter, and profeſſor of divinity, born at Montauban in 1587. He poſſeſſed excellent natural abilities, and an early inclination for learning, which being duly foſtered, he made a rapid improvement in the ſtudy of the belles-lettres and philoſophy, and particularly of the Latin language, which he wrote and ſpoke with elegance, and with the ſame facility as he did his native tongue. Afterwards he applied himſelf to theological literature, with great reputation; and when he was twenty-four years of age was admitted into the miniſterial function, and appointed one of the paſtors of the church at Puylaurens. In 1627, the national ſynod held at Caſtres nominated him to the office of profeſſor of divinity

divinity at Montauban, the duties of which he diſcharged with great diligence and fidelity, and with diſtinguiſhed applauſe, until his death, which took place in 1650. He was moderator in the national ſynod held at Charenton in the year 1645. The writings which he publiſhed were partly theological and partly poetical. Of the former kind are a volume of ſermons, entitled, *La Voye de Salut*, or The Way to Salvation; ſeveral *Theſes* in the Latin language; a treatiſe *De Chriſto Mediatore*; *Decreti Synodici Carentonienſis, de Imputatione Peccati Adæ, Explicatio et Defenſio*, 1648, 8vo.; and *Explicatio Catecheſeos Religionis Chriſtianæ*, 8vo. The principal of his Latin poems was entitled, *Adolphidos, ſive de Bello Germanico*, an epic poem, in twelve books, highly commended for its ſkilful conſtruction and variety of images, intereſting epiſodes, noble ſentiments, and elegant latinity. Gariſſoles alſo wrote a Latin poem on the coronation of Chriſtina, and another in praiſe of the four proteſtant Swiſs cantons.

GARITE'NA, a town of European Turkey, in the Morea: thirty-two miles weſt of Argos.

GARIVAN', a town of European Turkey, in the province of Bulgaria, near the Danube: twenty-two miles ſouth-weſt of Driſtra.

GAR'IZIM. 2 *Macc.* v. 23. See GERIZIM.

GAR'LAND, *ſ.* [*garlande, guirlande*, Fr.] A wreath of branches or flowers:

A reeling world will never ſtand upright,
'Till Richard wear the *garland* of the realm.
—How! wear the *garland!* do'ſt thou mean the crown?
—Ay, my good lord. *Shakeſpeare.*

The top; the principal; the thing moſt prized:

With every minute you do change a mind,
And call him noble, that was now your hate,
Him vile, that was your *garland*. *Shakeſpeare.*

[In a ſhip.] A collar of rope wound about the head of a main-maſt to keep the ſhrouds from galling.

GAR'LIC, *ſ.* [ȝaꝛ, Sax. a lance; and *leek*, the leek that ſhoots up in blades. *Skinner.*] In botany; ſee ALLIUM, vol. i. p. 349.—*Garlic* has, of all our plants, the greateſt ſtrength, affords moſt nouriſhment, and ſupplies moſt ſpirits to thoſe who eat little fleſh. *Temple.*

'Tis mortal ſin an onion to devour;
Each clove of *garlic* is a ſacred pow'r:
Religious nations ſure, and bleſt abodes,
Where ev'ry orchard is o'er-run with gods. *Tate.*

GAR'LIC PEAR, *ſ.* in botany. See CRATEVA.

GAR'LIN, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the diſtrict of Pau: ſixteen miles north of Pau.

GAR'MENT, *ſ.* [*guarniment*, old Fr.] Any thing by which the body is covered; clothes; dreſs.—Our leaf, once fallen, ſpringeth no more; neither doth the ſun or ſummer adorn us again with the *garments* of new leaves and flowers. *Raleigh.*

Faireſt thing that ſhines below,
Why in this robe doſt thou appear?
Would'ſt thou a while more perfect ſhow,
Thou muſt at all no *garment* wear. *Cowley.*

GARN, a town of Sweden, in the province of Upland: twelve miles north-eaſt of Upſal.

GARNA'CHE (La), a town of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Challans: one league north-north-eaſt of Challans, and two ſouth of Machecoul.

GAR'NER, *ſ.* [*grenier*, Fr.] A place in which threſhed grain is ſtored up.—Barns and *garners* ſhould be never empty. *Shakeſpeare.*

For ſundry foes the rural realm ſurround;
The fieldmouſe builds her *garner* under ground:
For gather'd grain the blind laborious mole,
In winding mazes, works her hidden hole. *Dryden.*

To GAR'NER, *v. a.* To ſtore as in garners:

There, where I have *garner'd* up my heart,
Where either I muſt live, or bear no life. *Shakeſpeare.*

GAR'NER, a river of England, which joins the Garran, and runs with it into the Wye, four miles ſouth-weſt of Roſs, in Herefordſhire.

GARNERA'NS, a town of France, in the department of the Saône and Loire: two leagues ſouth of Maçon.

GAR'NET, *ſ.* [*garnato*, Ital. *granatus*, low Lat. from its reſemblance in colour to the grain of the pomegranate.] A ſtone, which, when tranſparent and of a fine colour, is reckoned among gems. Its colour is blueiſh or yellowiſh red; its tranſparency often obſcure, unleſs it be held to a ſtrong light. The natural form of its cryſtals is various, and ſeldom regular. Its texture is granular. The garnet is a very common ſtone, frequently embodied in the maſſes of compound rocks. The Syrian garnet, which is of a fine red, inclining to purple, and very clear, though leſs brilliant than the oriental amethyſt, is the moſt eſteemed. See the articles GEM, and MINERALOGY.

GAR'NET, *ſ.* [q. d. *cranet*, i. e. a little crane.] Tackle in a ſhip, wherewith goods are hoiſted in or out.

GARNI'ER (John), a learned French Jeſuit, born at Paris in 1612. He entered on his noviciate when he was ſixteen years old, and diſcovering a quick capacity, and an avidity for learning, he received thoſe advantages of inſtruction by which, through his ſedulous application, he roſe to conſiderable literary eminence among his contemporaries. After having for ſome time taught the claſſics and rhetoric with great ſucceſs and applauſe, he filled the chair of philoſophical profeſſor at Paris for ſeven years, and was then appointed to the profeſſorſhip of theology, the duties of which he ably diſcharged for twenty-ſix years. In 1681 he was deputed to attend at Rome, on ſome buſineſs of moment relating to his ſociety; but falling ſick on his journey, he died at Bologna, in the ſeventieth year of his age. He was the author, or editor, of various works, which afford ample evidence of his learning and abilities: ſuch as, 1. *Organi Philoſophiæ Rudimenta*, 1651, reprinted with enlargements in 1677. 2. *Theſes de Philoſophia Morali*, 1651. 3. *Regulæ Fidei Catholicæ de Gratia Dei per Jeſum Chriſtum*, 1655. 4. *Juliani Eclanenſis Epiſcopi Libellus miſſus ad Sedem Apoſtolicam, Notis illuſtratus*, 1668. 5. *Marii Mercatoris Opera, Gr. & Lat.* in two vols. folio, 1673, illuſtrated with learned notes, commentaries, diſſertations, &c. 6. *Liberati Diaconi Breviarium, cum Notis et Diſſertationibus*, 1675, 8vo. 7. *Liber Diurnus Romanorum Pontificum*, 1680, 4to. accompanied with hiſtorical notes and very curious diſſertations; and a ſupplement to the works of Theodoret, publiſhed after the author's death, in 1684, and entitled, 8. *Auctuarium Theodoreti Cyrenſis Epiſcopi, ſeu Operum Tomus Quintus*, in folio, with notes and critical diſſertations. He alſo publiſhed, in 1678, 9. *Syſtema Bibliothecæ Collegii Pariſienſis Societatis Jeſu*, in quarto, which is much commended for the excellence of its arrangement, by means of which it will be found uſeful to perſons engaged in placing large libraries in proper order.

GARNI'ER (Julian), a learned French benedictine monk, of the congregation of St. Maur, born at Connerai, in 1670. He took the vows when he was about twenty years of age, and acquired much applauſe by his proficiency in the different branches of academic learning. His ſuperiors called him to Paris in 1699, and two years afterwards confided to him the taſk of preparing for publication a new edition of the works of St. Baſil. To this undertaking he applied with becoming diligence, and in 1721 produced the firſt volume, in folio, with a new tranſlation, numerous learned notes, and a very excellent preface, abounding in judicious criticiſm and genuine information. The ſecond volume made its appearance in 1723, when Garnier's ſtate of health re-

ceived a ſevere ſhock from the attack of a dangerous illneſs. His anxiety, however, to complete the work, engaged him to devote his remaining ſtrength to that object; but he had ſcarcely entered upon the third volume, before his powers failed, and he was obliged to abandon his undertaking. He died in 1725, when about fifty-five years of age. The care of finiſhing the third volume was entruſted to father Maran, who was alſo the author of the Preface, the Life of St. Baſil, and the Notes. It was publiſhed in 1730. This edition of the works of St. Baſil is one of the beſt editions of the fathers which have proceeded from the labours of the congregation of St. Maur.

GARNI'ER (Robert), an early French poet, born in 1545, at La Ferté Bernard in Maine. He was brought up to the law, and was firſt a counſellor, and then lieutenant-criminal in the preſidency of Mans. In advanced years, Henry IV. created him a counſellor in his grand council. He died at Mans in 1601. He was attached to poetry in his youth, and while ſtudying at Toulouſe obtained a prize in the Floral games of that city. Afterwards, the peruſal of Seneca the tragedian gave him a taſte for dramatic compoſition, and at his ſecond attempt he became the rival in fame of Jodelle, who was the father of French tragedy. The pieces of Garnier, as well as thoſe of his precurſor, were rude and of little intrinſic merit; yet his nine tragedies for a conſiderable time were the delight of the ſtage, and he deſerves a place among the creators of the French theatre. He alſo wrote *L'Hymne de la Monarchie*, and other poems.

To GAR'NISH, *v. a.* [*garnir*, Fr.] To decorate with ornamental appendages.—Paradiſe was a terreſtrial garden, *garniſhed* with fruits, delighting both the eye and the taſte. *Raleigh.*

All within the flowers was *garniſhed*,
That, when mild Zephyrus amongſt them blew,
Did breathe out bounteous ſmells, and painted colours ſhew. *Spenſer.*

To embelliſh a diſh with ſomething laid round it:

With what expence and art, how richly dreſt!
Garniſh'd with 'ſparagus, himſelf a feaſt! *Dryden.*

No man lards fat pork with orange-peel,
Or *garniſhes* his lamb with ſpitchcock'd eel. *King.*

To fit with fetters; a cant term among gaolers and thief-takers.

GAR'NISH, *ſ.* Ornament; decoration; embelliſhment:

Matter and figure they produce;
For *garniſh* this, and that for uſe;
They ſeek to feed and pleaſe their gueſts. *Prior.*

Things ſtrewed round a diſh. [In gaols.] Fetters; *a cant term.* An acknowledgment in money when firſt a priſoner goes into a gaol.

GARNISHEE', *ſ.* is ſuch third perſon or party in whoſe hands money is attached within the liberties of the city of London, by proceſs out of the ſheriff's court; ſo called, becauſe he hath had *garniſhment* or warning, not to pay the money to the defendant, but to appear and anſwer to the plaintiff creditor's ſuit.

GAR'NISHER, *ſ.* One that garniſhes; one that ſets off any thing. *Scott.*

GAR'NISHMENT, *ſ.* Ornament; embelliſhment.—The church of Sancta Guiſtiniana in Padua is a ſound piece of good art, where the materials being ordinary ſtone, without any *garniſhment* of ſculpture, raviſh the beholders. *Wotton.*

GAR'NISHMENT, *ſ.* in law, means a warning given to one for his appearance; for the information of the court; and explaining a cauſe. For example; a perſon is ſued for the detinue of certain writings delivered; and the defendant alleging that they were delivered to him by the plaintiff, and another perſon, upon condition, prays that the other perſon may be warned to plead with the plaintiff, whether the condition be performed or not; in this petition he is ſaid to pray *garniſhment*, which may be interpreted either a warning of that other, or a furniſhing the court with all parties to the action, whereby it may thoroughly determine the cauſe; and until he appears and joins, the defendant is as it were out of the court. *Cromp. Juriſ.* 211. A writ of ſcire facias is to go forth againſt the other perſon to appear and plead with the plaintiff; and when he comes and thus pleads, it is called *enterpleader*. If the garniſhee be returned ſcire feci, and make default, judgment will be had to recover the writings, and for their delivery, againſt the defendant; and if the garniſhee appears and pleads, if the plaintiff recovers, he ſhall have damages. 1 *Brownl.* 147. Garniſhment is generally uſed for a warning; as *garniſher le court*, is to warn the court; and *reaſonable garniſhment*, is where a perſon hath reaſonable warning. *Kitch.* 6. In the ſtat. 27 Eliz. c. 3, we read, upon a *garniſhment* or two *nihils* returned, &c. And further, ſome contracts are naked, *ſans garnement*; and ſome furniſhed, &c.

GAR'NITURE, *ſ.* Furniture; ornament.—They conclude, if they fall ſhort in *garniture* of their knees, that they are inferior in furniture of their heads. *Government of the Tongue.*

Plain ſenſe, which pleas'd your ſires an age ago,
Is loſt, without the *garniture* of ſhow. *Granville.*

GA'RO DE MALA'CA, *ſ.* See AQUILARIA.

GAROFA'LO (Benvenuto), an eminent painter, born at Ferrara, in 1481. He ſtudied under various maſters, and at length fixed his taſte in the Roman ſchool, where he had the good fortune to obtain the friendſhip and inſtruction of Raphael. Returning to Ferrara, he was patroniſed by the duke, and was employed in ſeveral conſiderable works, in which he diſplayed much excellence both in deſign and colouring, and nearly approached to the manner of Raphael himſelf. Some of his fineſt pieces are the Reſurrection of Lazarus, and the Murder of the Innocents, in the church of St. Francis at Ferrara, and the Adoration of the Magi in the chapel of St. George, near that city. He alſo painted landſcape in a capital ſtyle. He copied ſome of the pictures of Raphael with great exactneſs. Garofalo had the misfortune to loſe his ſight in his ſixty-ninth year; and died at Ferrara in 1559.

GA'RON, or GARUM, *ſ.* A kind of pickle prepared of fiſh; at firſt it was made from a fiſh which the Greeks called *garos*; but the beſt was made from mackerel. Among the moderns, *garum* ſignifies the liquor in which fiſh is pickled. A compoſition of this and vinegar is called *oxygarum.*

GARON'NE, a river of France, which riſes in the Pyrenées, on the borders of Arragon, in Spain, and joining with the Dordogne, about twelve miles below Bourdeaux, changes its name to GIRONDE; which ſee.

GARON'NE (Upper), a department of France, bounded on the north by the department of the Lot, on the north-eaſt by the department of the Tarn, on the ſouth-eaſt by the departments of the Aude and the Arriege, on the ſouth by Spain, and on the weſt by the departments of the Upper Pyrenées and the Gers. It takes its name from the Garonne, which paſſes through it. Toulouſe is the capital.

GAROS'MUS, *ſ.* in botany. See CHENOPODIUM.

GAROUAI', or GAROVAY, a town of Africa, on the Grain Coaſt, on the river St. Clement.

GA'ROUS, *adj.* Reſembling pickle made of fiſh.—In a civet-cat an offenſive odour proceeds, partly from its food, that being eſpecially fiſh; whereof this humour may be a *garous* excretion, and olidous ſeparation. *Brown.*

GARRACHI'CHA, a ſeaport town of the iſland of Teneriffe, deſtroyed by an earthquake and eruption of the volcano on the Peak, in the year 1704; ſo that houſes are now built where the ſhips then lay at anchor.

GAR'RAF, a town of Spain, in the province of Catalonia,

talonia, near the ſea coaſt: ten miles ſouth-weſt of Barcelona.

GAR'RAN, *ſ.* [Erſe. It imports the ſame as gelding. The word is ſtill retained in Scotland.] A ſmall horſe; a hobby. A Highland horſe, which, when brought into the north of England, takes the name of *galloway*.—Every man would be forçed to provide winter-fodder for his team, whereas common *garrans* ſhift upon graſs the year round. *Temple.*

GAR'RAN, a river of England, which runs into the Wye, in the county of Hereford.

GARRES'SIO, a town of Italy, in the principality of Piedmont: nine miles ſouth-weſt of Ceva.

GAR'RET, *ſ.* [*garite*, the tower of a citadel, Fr.] A room on the higheſt floor of the houſe.—John Bull ſkipped from room to room; ran up ſtairs and down ſtairs, from the kitchen to the *garret*. *Arbuthnot.*

On earth the god of wealth was made
Sole patron of the building trade;
Leaving the arts the ſpacious air,
With licence to build caſtles there:
And 'tis conceiv'd their old pretence,
To lodge in *garrets*, comes from thence. *Swift.*

Rotten wood. Not in uſe.—The colour of the ſhining part of rotten wood, by daylight, is in ſome pieces white, and in ſome pieces inclining to red, which they call the white and red *garret*. *Bacon.*

GARRET DEN'NIS, an iſland in the Eaſtern Pacific Ocean, about fourteen leagues in circumference, inhabited by blacks, who are armed with lances, bows and arrows, ſituated to the north of New Ireland. Lat. 2. 30. S. lon. 151. 25. E. Greenwich.

GARRETEE'R, *ſ.* An inhabitant of a garret; a poor author.

GAR'RICK (David), the moſt diſtinguiſhed actor on the Britiſh ſtage, born at Hereford in 1716. His grandfather was a refugee from France, on account of the revocation of the edict of Nantes. His father was a captain in the army, and uſually reſided at Lichfield, where he had married the daughter of one of the vicars of the cathedral. David received the firſt rudiments of education at the grammar-ſchool of Lichfield. He was more diſtinguiſhed by his ſprightlineſs than by his application to literature; and he gave a very early proof of his paſſion for the drama, by engaging his young companions to act the Recruiting Officer, in which play he himſelf took the part of Serjeant Kite. At this time he was little more than eleven years of age, and the applauſe he obtained probably made a durable impreſſion upon his mind. As the circumſtances of his father were narrow, it was thought proper to ſend him to Liſbon upon the invitation of an uncle, who was a conſiderable wine-merchant in that capital. From ſome cauſe, however, his ſtay there was very ſhort; he returned to Lichfield, and again went to ſchool, but the volatility of his temper impeded his proficiency in literature. In order to accelerate his improvement, he was, in his nineteenth year, placed under the celebrated Samuel Johnſon, who had then undertaken to inſtruct a few youths in the belles-lettres at his native city of Lichfield; but love for the ſtage had taken ſuch firm poſſeſſion of the mind of young Garrick, that it left little room for claſſical ſtudies, and he was writing ſcenes in comedies of his own invention, when he ſhould have been compoſing exerciſes. He muſt have been able, however, by his manners and talents, to ingratiate himſelf with his grave tutor; for when Johnſon, tired of his ſituation, determined to try his fortune in London, he joined company with his pupil Garrick. This era in the lives of theſe two diſtinguiſhed perſons was the year 173$\frac{6}{7}$. Garrick, by the recommendation of his father's friend, Mr. Gilbert Walmeſley, was ſent to reſide with the Rev. Mr. Colſon, an eminent mathematician at Rocheſter, with the intention of furniſhing him with general knowledge previous to his entering at the Temple. Though he became no great mathematician, or philoſopher, under the tuition of this perſon, he improved in the uſe of his reaſoning powers, and fitted himſelf for the buſineſs of the world. His father died about this time, leaving a large family unprovided; and his mother ſoon followed. His Liſbon uncle, who died ſome time before, had bequeathed him a thouſand pounds, and with this ſum he entered into partnerſhip in the wine trade with his brother Peter. The very different diſpoſition of the two brothers ſoon cauſed a diſſolution of this connection, and David thenceforth reſolved to follow his favourite plan of becoming an actor by profeſſion. He courted the company of ſtage heroes, obtained introductions to the managers, and tried his powers in recitation. At length he began his campaign in the ſummer of 1741, at Ipſwich, with Giffard's company. Under the aſſumed name of Lyddal he played a variety of parts with uniform ſucceſs; and Ipſwich has the honour of firſt having witneſſed and recogniſed the powers of this greateſt of actors.

At this period the ſtages of the metropolis were but indifferently ſupplied with performers in the higher walks of the drama, and there was a manifeſt interruption in the ſucceſſion from the preceding generation. Though Garrick would have diſtinguiſhed himſelf at any time, the preſent interval was particularly favourable to a ſudden and decided eclat. Beſides the two principal theatres of Drury-lane and Covent-garden, there was then a houſe open in Goodman's-fields, of which Giffard was manager. At this the young Roſcius made his firſt entrance in the metropolis, October 19, 1741. He judiciouſly choſe the part of Richard III. as one which would not require a dignity of perſon that he did not poſſeſs; while it would give ſcope to all thoſe ſtrong markings of character and quick changes of paſſion in which his principal excellence ever conſiſted. Though his natural mode of recitation was a novelty in tragedy to a London audience, accuſtomed to the artificial tones of declamation, yet it was a novelty which, by favouring expreſſions, produced its intended effect, and never was an audience betrayed into more hearty and unfeigned applauſe. The part was repeated for ſeveral ſucceſſive nights, and was followed by others both in tragedy and comedy; and ſuch was the blaze of fame attending the new actor, that the eſtabliſhed theatres were deſerted, and ſtrings of carriages from the polite part of the town thronged the ſtreets of the city. Nor was this the mere rage of faſhion. The beſt judges joined their approbation to the public applauſe; and Pope, who was induced to ſee him, pronounced his eulogy by ſaying "that he was afraid the young man would be ſpoiled, for he would have no competitor." He was ſtill at Goodman's-fields, when he appeared as a dramatic writer in two pieces, The Lying Valet, and Lethe; the firſt broad farce, the ſecond a dramatic ſatire. Both were well received, and ſtill keep poſſeſſion of the ſtage. The proprietors of the old theatres, alarmed at his ſucceſs, threatened the manager of Goodman's-fields with a proſecution, and Fleetwood drew away Garrick to Drury-lane. After finiſhing the winter ſeaſon of 1742 there, he went over to Dublin in the ſummer, where he was received with an admiration bordering upon extravagance. He ſo crowded the theatre, in a hot ſeaſon, that an epidemic diſeaſe, which broke out in that capital, was called the *Garrick-fever*. After his return, he took up ſome parts of a kind entirely new to him, among the reſt, that of Abel Drugger, in which he excited great ſurpriſe by baniſhing from one of the moſt lively and expreſſive of countenances every veſtige of ſenſe, and putting on the ſtare of abſolute ſtupidity. It is aſſerted, that by this theatrical degradation he wrought an unlucky cure in a young lady of fortune, who had fallen in love with him under the perſons of Chamont and Lothario. No actor, indeed, ever more thoroughly adopted for the time the characters he undertook, and his

his attention to propriety was uniformly ſupported by every look and geſture while he continued in the ſight of the audience, whether ſpeaking or ſilent. The part of Hamlet, ſo full of ſoul and animation, was that by which he contraſted his Drugger.

Stage quarrels and revolutions, and a ſecond viſit to Dublin, occupied Garrick during the remainder of the period which he paſſed as a hired actor, but with continually increaſing reputation. He produced in that interval his farce of Miſs in her Teens, the hint of which was taken from Dancourt, but with ſuch accommodation to the Engliſh taſte as to make it a favourite. In the ſpring of 1747 he commenced his reſpectable and lucrative career as a theatrical manager. By acting at Covent-garden, he had reduced Drury-lane to ſuch a ſtate of inferiority, that Lacy, the patentee, was glad to admit him as an equal partner upon moderate terms. In this joint concern the two managers wiſely took diſtinct provinces: that of Lacy was the care of the ſcenes and the domeſtic economy, while Garrick ſuperintended the choice of plays, the diſtribution of parts, and the treaties with authors and actors. Under theſe auſpices, the theatre of Drury-lane opened in September, 1747, furniſhed with a prologue by Garrick's old and conſtant friend, Samuel Johnſon, which ranks among the three or four compoſitions of that kind, the merit of which is not temporary, but ſuch as will ever place them in the firſt ranks of Engliſh poetry. It was the prelude of a better era of dramatic exhibitions; in particular it uſhered in the revival of a number of Shakeſpeare's plays, moſtly freed from the taſteleſs and incongruous additions which had been made to them by the writers of the paſt century. Garrick was himſelf the living commentator of that great dramatiſt. By his admirable force of action, he called forth all the latent beauties of ſentiment and tranſient ſtrokes of feeling of the author, and gave to the hearer ideas which might ever have eſcaped the reader. It is certain that the almoſt idolatrous admiration of Shakeſpeare which diſtinguiſhed the eighteenth century, may be traced from the appearance of Garrick in his principal characters.

In 1749 he married mademoiſelle Violetti, who had been a ſtage dancer; ſhe maintained an irreproachable character, and the union was a ſource of mutual felicity till diſſolved by death. Though Garrick was juſtly a favourite with the public, ſome complaints were made of parſimony under his management, in providing thoſe ornamental decorations and ſplendid ſhows which are found neceſſary to keep the eye ſatisfied, as well as the judgment. To obviate this diſcontent, he prepared, in 1754, an exhibition which was to unite every charm of muſic, dancing, and ſcenery, with that of perfect novelty in deſign. No expence was ſpared on the occaſion; and a large body of foreign performers was hired, at the head of whom was Noverre, the celebrated ballet-maſter, whoſe inventive genius produced a ſpectacle which he entitled a Chineſe Feſtival. But before its exhibition, the national prejudices, enforced by a commencing war with France, took alarm at this importation of foreigners, all of whom were, as uſual, called *Frenchmen*, and a violent oppoſition was organiſed. The piece was brought out in November, 1755, and though firſt ſanctioned by the king's preſence, and warmly ſupported by many of the young nobility, its ſixth repreſentation was terminated by a violent riot, by which a damage was incurred to the theatre of ſome thouſand pounds. Garrick was blamed for his pertinacity in contending againſt the voice of the majority, which was attributed to his reluctance at loſing the fruits of great expence.

In his capacity of manager, he had the ſame difficulties to encounter in his tranſactions with the "irritable race" of authors that all his predeceſſors had, and various ſquabbles aroſe on this account, which we ſhall paſs over. It is admitted that his treatment of dramatic writers was more liberal and gentleman-like than that of ſeveral former managers; but his opinion and theirs could not always coincide, and he might occaſionally ſhow a ſenſe of his own conſequence and their inſignificance. Moreover, he, like many of his brethren of the ſtage, frequently paſſed a judgment upon works, which the event proved to be erroneous; nor was he diſpoſed to revoke a ſentence once given. On the whole, however, he kept on good terms with the moſt reſpectable writers, and received from many of them that praiſe which he dearly loved. This fondneſs for applauſe was naturally accompanied with an equal ſenſibility to ridicule or cenſure. The attacks of one of his critics, by their peculiar petulance, drew from him a retort, in a mock-heroic poem, entitled The Fribbleriad, which poſſeſſes conſiderable vivacity and pleaſantry. The perſon ridiculed took, however, a ſevere vengeance, by exciting a formidable riot on the ſubject of admiſſion at half-price, the conſequences of which were both detrimental and humiliating.

In 1763 Garrick reſolved to relax from his cares and fatigues in a tour to the continent. Accompanied by his wife, from whom he was inſeparable, he viſited ſeveral parts of Italy and France, and met with flattering notice from many perſons of diſtinction. At Paris he ſaw and admired the celebrated mademoiſelle Clairon, and theſe two excellent actors gratified a ſplendid circle with ſpecimens of their theatric powers with equal and mutual applauſe. He returned after an abſence of a year and a half, and was welcomed with rapture. The prologue ſpoken by him on his firſt re-appearance was one of his happieſt efforts of the kind, and he was obliged to repeat it ten ſucceſſive nights. He was thought, if poſſible, to be improved in his ſtyle of acting, as he certainly was in his general knowledge of the drama. In the ſeaſon of 1766 he brought out the excellent comedy of The Clandeſtine Marriage, the joint production of himſelf and Colman, whoſe ſeveral ſhares in it are indiſtinguiſhably and harmoniouſly blended.

One of the moſt remarkable events in Garrick's life, was the celebration of the Shakeſpeare jubilee. A mulberry tree, planted by that poet at his native town of Stratford upon-Avon, being cut down, the wood of it was converted into a number of toys and implements, which were eagerly purchaſed. The corporation of Stratford judiciouſly cauſed a box to be made from it, which, with the freedom of the place encloſed, they preſented to the great actor, who had done their poet ſo much honour. This incident probably ſuggeſted to him the celebration of a feſtival in commemoration of Shakeſpeare, upon the ſpot where he was born, and the idea was put in execution in September, 1769. Temporary buildings were raiſed for the occaſion, and various entertainments were planned, ſome ſufficiently appropriate, others too much partaking of the vulgar taſte of rural feſtivities. A ſplendid company aſſembled from the capital and different parts of the kingdom, ſome warmed by literary enthuſiaſm, more led by mere faſhion and the love of novelty. The jubilee laſted three days, in the midſt of moſt unfavourable weather, and, upon the whole, the pleaſure ſeems not to have been adequate to the effort. Garrick, who was the ſoul of the feſtival, exerted all his talents to gratify both the eye and the underſtanding. Beſides various ſongs for muſic, he compoſed an ode, of conſiderable length, to the honour of the great national bard, in which he ſtrained his poetic powers to the height, and with a ſucceſs deſerving at leaſt of temporary applauſe. As he had expended a large ſum in the Stratford pageant, he was careful, with his uſual attention to economy, to reimburſe himſelf. The Jubilee was made into a theatrical ſpectacle, which became ſo popular, that it was repreſented ninety-two nights to crowded audiences. He alſo recited his ode at the theatre, but the ears of the public were much ſooner ſatiated than their eyes.

After the death of Mr. Lacy, in 1773, the ſole management

nagement of the theatre devolved on Garrick. His health was at this time beginning to give way, and his period of life was ill adapted to additional labours. He continued, however, ſome time longer to fulfil the duties of his office; and he rendered an eſſential ſervice to the profeſſion which he had dignified, by perfecting the plan of an inſtitution for the relief of decayed actors, and bountifully contributing to its fund. At length he determined upon his final retreat, and in January, 1776, he parted with his moiety of the Drury-lane patent for the ſum of 35,000l. to ſuch a value had it riſen in his hands! In order to prove that his admirable powers were ſtill unimpaired, he performed, at ſhort intervals, many of his moſt trying and brilliant parts, juſt before he took leave of the ſtage. The laſt character in which he appeared was Don Felix in the Wonder, for the benefit of the theatrical fund. At the concluſion of the play he made a brief farewel addreſs to the audience, which the genuine feelings of regret on both ſides rendered truly pathetic; and few perſons ever quitted a public ſtation with more deſerved plaudits. He did not long enjoy his opulent and well-earned repoſe. In the Chriſtmas of 1778, being upon a viſit at the ſeat of lord Spencer, he was ſeized with ſome alarming ſymptoms, which haſtened him to London. A ſuppreſſion of urine ſucceeded, under the effects of which he ſunk into a ſtate of ſtupor, and died on January 20, 1779. His remains were interred with great pomp in Weſtminſter abbey, attended by many perſons of the firſt diſtinction in rank and talents. His large fortune, after an ample proviſion for his widow, was ſhared among his relations.

David Garrick was in character a man of the world, whoſe vivacity and apparent volatility did not interfere with the ſteady purſuit of fame and fortune. In this he was guided by great good ſenſe and diſcretion, and a ſpirit of order and economy. The latter quality ſubjected him to the imputation of avarice: but though he was fond of money, and did not laviſh it in the careleſs manner of ſome of his detractors, yet he was fully capable of uſing it with liberality. His mode of living was hoſpitable and generous, and his bounty often flowed in a large ſtream of munificence. Inſtead of quoting particular inſtances upon record, it will be ſufficient to repeat what Dr. Johnſon (who knew him well) ſaid of him, that "he believed David Garrick gave away more money than any man in London." His principal foible was vanity, which made him as inordinately fond of adulation, as he was impatient of cenſure or ridicule. This propenſity alſo rendered him culpably jealous of rivals, and he is charged with endeavouring to keep down thoſe riſing talents from which he feared competition. In his commerce with the great he was attentive and reſpectful, yet with freedom enough to make him a delightful companion; and he obſerved decorum ſo well, that perſons of the graveſt and moſt dignified characters courted his ſociety.

As an actor, it ſeems to be allowed that none ever ſurpaſſed him in the truth and nature with which he identified himſelf with the fictitious object of his repreſentation, ſo that he ſeemed, as it were, to have darted his ſoul ſucceſſively into all the forms which he aſſumed. This faculty he diſplayed equally in the moſt comic and the moſt tragic parts, nor was it ever agreed in which of the two his chief excellence lay. Reynolds happily expreſſed this doubt by his charming picture of Garrick, between the comic and tragic muſe, each of whom is contending to poſſeſs him. His voice and his eye were calculated for every poſſible expreſſion of mental feeling. Expreſſion, indeed, was his great ſtrength, and the parts in which he beſt ſucceeded were thoſe in which paſſion moſt predominated. In the enunciation of calm ſentiment, decorated by poetical language, he has had ſeveral ſuperiors.

His literary talents were reſpectable, but not of the higher kind. He compoſed ſome ſmart epigrams, many pleaſant and well-adapted prologues, entertaining, but rather farcical, dramatic pieces, and lively poems of the humorous and familiar claſs. To ſublimity he was inadequate, and his imagination was capable of no lofty flight. Beſides thoſe of his works which have been mentioned in his life, there are a few dramatic interludes, and many alterations of old plays, in which he generally diſplayed a good judgment, and thorough knowledge of ſtage effect.

GAR'RIEL (Peter), a French eccleſiaſtic in the ſeventeenth century, and author of ſeveral works, intended to illuſtrate the civil and eccleſiaſtical antiquities of his country, was a native of Montpellier; but we have no information reſpecting either the time of his birth, or of his death. He became a canon of the cathedral church in that city, and was admitted to the degrees of doctor in civil and canon law. He was the author of the Origin, Alterations, and preſent State, of the Cathedral Church of St. Peter, at Montpellier, 1631, 12mo. and 1634, 8vo. A Chronological View of the Governors of the Province of Languedoc, from the Time of the Romans to the preſent Day, 1645; and *Series Præſulum Megalonenſium & Montiſpelienſium ab Anno 451 ad Annum 1652*, folio; afterwards reprinted in 1665, with enlargements, and a continuation of the hiſtory to that date. By ſome writers, this work is ſaid to be more the production of father Bonnefoy, a Jeſuit, than of Garriel, and it is claimed for that father in the *Bibliothéque* of the writers of the Society of Jeſus. Garriel was alſo the author of a ſmall volume, in folio, entitled *Idée de la Ville de Montpellier, recherchée & preſentée aux honnêtes Gens*, 1665, which is rendered unpleaſant to the reader by the author's tumid ſtyle, and his frequent digreſſions. It is a work, however, in eſteem with antiquaries and collectors. Among the manuſcripts of Coiſlin, in the library of the abbey of St. Germain des Près, there was preſerved A Diſcourſe on the War againſt the Calviniſts of the Province of Languedoc, from the Year 1619 to the Peace of Montpellier, in 1622, of which father Aiſſet has made uſe in the fifth volume of his Hiſtory of Languedoc. As it is aſcribed to a Peter Gariel, or Garriel, who was alſo a canon of Montpellier, moſt probably it was the production of this author.

GAR'RINISH POINT, a cape on the weſt coaſt of the county of Cork, in Ireland, twenty-ſeven miles weſt of Bantry, and one and a quarter north of Codd's Head.

GAR'RIS, a town of France, in the department of the Lower Pyrenées, half a league ſouth of Palais, and ſix and a half ſouth-eaſt of Bayonne.

GAR'RISON, *ſ.* [*garniſon*, Fr.] Soldiers placed in a fortified town or caſtle to defend it:

How oft he ſaid to me,
Thou art no ſoldier fit for Cupid's *garriſon*. *Sidney.*

Fortified place ſtored with ſoldiers:

Whom the old Roman wall ſo ill confin'd,
With a new chain of *garriſons* you bind. *Waller.*

The ſtate of being placed in a fortification for its defence.—Some of them that are laid in *garriſon* will do no great hurt to the enemies. *Spenſer on Ireland.*

To GAR'RISON, *v. a.* To ſecure by fortreſſes:

Others thoſe forces join,
Which *garriſon* the conqueſts near the Rhine. *Dryden.*

GAR'ROWS, a hill-country of Aſia, ſituated to the eaſt of Bengal, weſt of Aſſam, and ſouth of Burhampooter river, and near the Ganges.—See the article HINDOOSTAN.

GARRU'LITY, *ſ.* [*garrulitas*, Lat.] Loquacity; incontinence of tongue; inability to keep a ſecret:

Let me here
Expatiate, if poſſible, my crime,
Shameful *garrulity*. *Milton's Agoniſtes.*

The quality of talking too much; talkativeneſs.—Some-

vices of ſpeech muſt carefully be avoided: firſt of all, loquacity or *garrulity*. *Ray*.

GAR'RULOUS, *adj.* [*garulus*, Lat.] Prattling; talkative:

Old age looks out,
And *garrulous* recounts the feats of youth. *Thomſon*.

GAR'RULOUSNESS, *ſ.* Talkativeneſs, aptneſs to prate. *Scott*.

GAR'SCH, a town of Germany, in the archduchy of Auſtria: four miles ſouth-ſouth-eaſt of Horn.

GAR'STANG, an ancient market-town in Lancaſhire, diſtant 222 miles from London, twelve from Kirkham, and ſix from Eccleſton. It was incorporated into a borough-town by Charles II. and is governed by a bailiff and ſeven capital burgeſſes, who have power to try miſdemeanors committed within the borough; but it ſends no member to parliament. The market is on Thurſdays. There are three annual fairs: the firſt on Holy Thurſday, for cattle and hardware; the ſecond fair begins the 9th of July, and continues the 10th and 11th, for cattle, wool, woollen-cloth, toys, and hardware; the third begins the 21ſt of November, and holds the 22d and 23d, for cattle, horſes, woollen-cloth, hardware, &c. There are ſeveral very extenſive cotton manufactories eſtabliſhed in the environs of the town. Garſtang ſtands on the great poſt road to Carliſle and Glaſgow, betwixt Preſton and Lancaſter, being eleven miles from each, and is a great thoroughfare. The river Wier bounds the eaſtern ſide of the town, which ſupplies the inhabitants with plenty of fine water; and the river abounds with trout, chub, ſmelts, and other fiſh. By its inland navigation, it has communication with the rivers Merſey, Dee, Ribble, Ouſe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. and extends above five hundred miles in the counties of Nottingham, York, Weſtmoreland, Cheſter, Stafford, Warwick, Leiceſter, Oxford, Worceſter, &c.

GAR'TACH, a town of Germany, in the circle of Swabia, and kingdom of Wirtemberg, on a ſmall river which runs into the Neckar: four miles and a half north-weſt of Heilbronn.

GAR'TAU, a town of Germany, in the circle of Lower Saxony, and principality of Luneburg Zell: twelve miles eaſt of Lucno, and forty-eight eaſt-ſouth-eaſt of Luneburg.

GARTEM'PE, a river of France, which runs into the Creuſe, near Roche-Poſay, in the department of the Indre and Loire.

GAR'TER, *ſ.* [*gardus*, Welch; *jartier*, Fr. from *gar*, Welch, the binding of the knee.] A ſtring or ribband by which the ſtocking is held upon the leg.—When we reſt in our cloaths, we looſen our *garters*, and other ligatures, to give the ſpirits free paſſage. *Ray*.

There lay three *garters*, half a pair of gloves,
And all the trophies of his former loves. *Pope*.

The mark of the order of the garter, the higheſt order of Engliſh knighthood:

Now by my george, my *garter*.
—The george, profan'd, hath loſt his holy honour:
The *garter*, blemiſh'd, pawn'd his knightly virtue.
Shakeſpeare.

Among heralds, the principal king at arms.

ORDER *of the* GARTER, a military order of knighthood, inſtituted by Edward III. for the origin and inſignalia of which, ſee the articles HERALDRY and KNIGHT.

To GAR'TER, *v. a.* To bind with a garter.—He, being in love, could not ſee to *garter* his hoſe. *Shakeſ.*

GAR'TERING, *ſ.* The garters, the ſtuff of which garters are made.

GARTH, *ſ.* [as if *girth*, from *gird*.] The bulk of the body meaſured by the girdle. A ſmall cloſe of land, or garden. A dam or weir to catch fiſh.

GARTH (ſir Samuel), a phyſician and poet, deſcended from a good family in Yorkſhire, and received his academical education at Peterhouſe, in Cambridge, where he reſided till he took his degree of doctor of phyſic, in 1691. He was admitted a fellow of the college of phyſicians, in 1692; and was ſo well able to make his way in the metropolis, as ſoon to ſtand in the firſt profeſſional rank. He was a zealous adherent of the whig party; and his talents for company, and proficience in elegant literature, acquired him patrons among the great, and probably cauſed him to be regarded as a valuable auxiliary. It has not often happened that poetical abilities have raiſed a man to medical eminence, except when accompanied with ſome public proofs of profeſſional knowledge. It was, however, fortunate for Dr. Garth, that the poem which firſt gave him celebrity, was upon a ſubject well calculated to make a phyſician popular. The college had adopted a plan of a diſpenſary for the benefit of the poor in London, which, with the gratuitous advice of the faculty, ſhould unite the diſtribution of medicines at a reduced price. Like many other charitable inſtitutions, this was better intended than it was judiciouſly planned; and its execution met with impediments not only from the company of apothecaries, whoſe intereſt was immediately concerned, but from ſome members of the college of phyſicians itſelf. A ſchiſm, in conſequence, aroſe in that body; and Dr. Garth, being of the number who ſupported the charity, thought the cauſe a proper one to employ his wit and poetry, as well as his profeſſional influence. His mock-heroic poem, entitled The Diſpenſary, was firſt publiſhed in 1699, and, both as a ſatire and a poem, was generally read and admired. It preſently went through three editions, was ſucceſſively improved and corrected by the author, and has ſince become part of the durable ſtock of Engliſh poetry. In 1697 he pronounced and printed the Harveian Oration, which has been much praiſed as a piece of Latin oratory. It ſeems, however, to ſtand little diſtinguiſhed among thoſe pieces of anniverſary rhetoric. Dr. Garth, in 1701, meritoriouſly diſplayed his liberality and reſpect for literary eminence, by taking an active part in the funeral of Dryden, over whoſe remains he ſpoke a Latin panegyrical oration. He was, indeed, though a party man, ready to do good offices to men of merit, of oppoſite principles. Hence he was an early encourager of Pope, who has recorded his kindneſs, with an epithet characteriſtic of him:

"*Well-natured Garth* would tell me I could write."

He had too much honour to deſert his patrons when out of power, and did himſelf credit by a copy of verſes addreſſed to lord Godolphin, on his diſmiſſion, in 1710. Theſe were criticiſed in the true party ſtyle, in a paper of the Examiner, and were defended by Addiſon. He alſo lamented the exile of the duke of Marlborough, in ſome complimentary lines. He diſplayed his attachment to the houſe of Hanover, by an elegant Latin dedication of an intended edition of Lucretius to the elector (afterwards George I.) in 1711. Upon the acceſſion of that prince, his zeal was rewarded by the honour of knighthood, which he had the ſatisfaction of receiving from the ſword of his hero, Marlborough. He was alſo appointed phyſician in ordinary to the king, and phyſician-general to the army. In the height of reputation both medical and literary he died, after a ſhort illneſs, in June, 1718-9, and was interred at Harrow in Middleſex. If his profeſſional celebrity may be eſtimated by ſome lines of lord Landſdown's on his ſickneſs, it muſt have been high indeed, for "his danger is ſaid to be the danger of mankind." Yet his name is unknown in medical hiſtory, as the author of one ſingle improvement or obſervation in his art! One of Garth's laſt literary taſks was an edition of Ovid's Metamorphoſes, tranſlated by ſeveral hands. To this he prefixed a preface, which is no favourable ſpecimen of his critical abilities.

GARTH'MAN, *ſ.* A perſon employed to catch fiſh by

by means of fiſh-garths, or weirs. By ſtatute it is ordained, that no fiſher, nor garthman, ſhall uſe any nets or engines to deſtroy the fry of fiſh, &c. 17 *Rich.* II. c. 9. The word is derived from the Scotch *gart*, which ſignifies *forced* or *compelled*; becauſe fiſh are forced by the weir to paſs in a loop, where they are taken.

GARTZ, a town of Pomerania, in the iſland of Rugen, built on the ſpot on which formerly ſtood a powerful city, called *Carenz*, which was deſtroyed by the dukes of Pomerania, in the 12th century.

GARTZ, a town of Pruſſian Pomerania, in the principality of Stettin, ſituated on the Oder. Lat. 53. 13. N. lon. 34. 45. E. Ferro.

GARVA'O, a town of Portugal, on the ſouth ſide of the Tagus, in the province of Alentejo; twelve miles eaſt of Abrantes.

GARVA'O, a town of Portugal, in the province of Alentejo: two leagues weſt of Ourique.

GAR'VELACH, a ſmall iſland near the weſt coaſt of Scotland, in the county of Argyle: eight miles ſouth-eaſt from Mull Iſland.

GAR'VILANS, a ſmall iſland on the north coaſt of Ireland, in the county of Donegal: about two miles eaſt-ſouth-eaſt from Malin Head.

GAR'VIS, a ſmall iſland of Scotland, in the Frith of Forth: five miles ſouth of Dumfermline.

GA'RUM, *ſ.* The brine or pickle in which fiſh are preſerved. See GARON.

GARUM'NA, in ancient geography, a river of Gaul, now called *Garonne*, riſing in the Pyrenean mountains, and ſeparating Gallia Celtica from Aquitania. It falls into the bay of Biſcay, and has, by the perſevering labours of Louis XIV. of France, a communication with the Mediterranean by the canal of Languedoc, carried upwards of one hundred miles through hills, and over vallies.

GARWO'LIN, a town of Poland, in the palatinate of Maſovia: twelve miles ſouth-eaſt of Czerſk.

GARZ, a town of Germany, in Anterior Pomerania, on the Oder: ſurrounded with walls in 1258: thirty-ſix miles north of Cuſtrin, fifty-three north-eaſt of Berlin, and fourteen ſouth of Old Stettin.

GAR'ZI (Lodovico), an eminent painter, born at Piſtoia (or at Rome) in 1640. He was ſent at the age of fifteen to the ſchool of Andrea Sacchi, and became the favourite pupil of that maſter. He acquired a proficiency in every part of his art, and his reputation extended throughout Italy. After having executed ſeveral public works at Rome, he was ſent for to Naples in order to paint the cupola of the church of St. Catharine, at Formello. His ſucceſs in this work cauſed him to be employed in the palace of the viceroy; and he received great offers to induce him to ſettle in Naples, but preferred returning to Rome. His chief works are in the churches of that city, and they are numerous. In point of invention and colouring, he had few ſuperiors. He drew correctly, and particularly excelled in groups of boys and angels. He has, however, leſs grace in the airs of his heads than Carlo Maratti, who was his fellow-pupil, and whom in general he much reſembled in ſtyle of painting. Garzi's induſtry was unremitted, and old age did not cauſe him to diſcontinue his labours. At the age of fourſcore he engaged to paint the cupola of the church Degli Stigmati, and ſucceeded ſo well in it, that it is reckoned his beſt performance. The effort, however, exhauſted him, and he died in 1721.

GAR'ZIS, a town of Africa, in the kingdom of Fez, ſurrounded with walls, the houſes built with black ſtone, ſituated in a fertile country: fifty-ſix miles ſouth of Melilla.

GAS or GAZ, [from *gaſcht*, Germ. an eruption of wind.] Any matter ſubtiliſed by heat into an elaſtic aëriform ſtate.—For the formation and properties of the different *gaſes*, ſee the article CHEMISTRY, vol. iv. p. 193, 202, 210, &c.

GAS'BORN, a town of Sweden, in the province of Warmeland: forty-three miles north-north-eaſt of Carlſtadt.

GASCOI'GNE (ſir William), chief juſtice of the court of king's bench under Henry IV. A moſt learned and upright judge: who being inſulted on the bench by the then prince of Wales, afterwards Henry V. with equal intrepidity and coolneſs committed the prince to priſon; and by this ſeaſonable fortitude laid the foundation of the future glory of that great monarch, who from this event dated his reformation from the licentiouſneſs of his youth. It is not well authenticated that the prince ſtruck ſir William, as recorded by Shakeſpeare; but all authors agree, that he endeavoured to interrupt the courſe of juſtice, in order to ſcreen a worthleſs dependant. Sir William died in 1413.

GASCOI'GNE (George), an Engliſh poet of ſome fame in the reign of queen Elizabeth, born at Walthamſtow in Eſſex, of an ancient family, and educated at Cambridge. From thence he removed to Gray's Inn, and commenced ſtudent in the law; but poſſeſſing a genius too volatile for that ſtudy, he travelled abroad, and for ſome time ſerved in the army in the Low Countries. He afterwards went to France; where he became enamoured of a Scottiſh lady, and married her. Being at length, ſays Wood, weary of thoſe vanities, he returned to England; and ſettled once more in Gray's Inn, where he wrote moſt of his dramatic and other poems. The latter part of his life he ſpent in his native village of Walthamſtow, where he died, in 1578. He had the character of a polite gentleman, an eloquent and witty companion, *et vir inter poetas ſui ſeculi præſtantiſſimus*. His plays, firſt printed ſeparately, were afterwards, with ſeveral other poems, &c. re-printed in two volumes, 4to. the firſt volume in 1577, the ſecond in 1587.

GAS'COIN, *ſ.* The hinder thigh of a horſe, which begins at the ſtifle, and reaches to the bending of the ham.

GASCONA'DE, *ſ.* [French, from *Gaſcon*, a nation eminent for boaſting.] A boaſt; a bravado.—Was it a *gaſconade* to pleaſe me, that you ſaid your fortune was increaſed to one hundred a-year ſince I left you? *Swift.*

To GASCONA'DE, *v. n.* To boaſt; to brag; to bluſter.

GAS'CONY, before the revolution, a conſiderable province of France, ſituated between the Garonne, the ſea, and the Pyrenées. Sometimes, but improperly, under the name of Gaſcony, Languedoc and the whole of Guienne were included. The Gaſcons have a great deal of ſpirit; but their exaggeration in deſcribing their exploits, has made the term *Gaſconade* proverbial. The Gaſcons who dwell near the Pyrenées, are originally from Spain.

GASCOON', *ſ.* A native of Gaſcony. *Scott.*

GASCUE'NA, a town of Spain, in the province of New Caſtile: thirty miles weſt-north-weſt of Cuença.

GAS'ERA, a city of Paleſtine, where Judas Maccabeus finally overcame Nicanor; a day's journey from Adaſa. 1 *Macc.* vii. 45.

To GASH, *v. a.* [from *hacher*, Fr. to cut. *Skinner.*] To cut deep ſo as to make a gaping wound; to cut with a blunt inſtrument ſo as to make the wound wide.—Wit is a keen inſtrument, and every one can cut and *gaſh* with it: but to carve a beautiful image requires art. *Tillotſon.*

Streaming with blood, all over *gaſh'd* with wounds,
He reel'd, he groan'd, and at the altar fell. *Phillips.*

GASH, *ſ.* A deep and wide wound.—Hamilton drove Newton almoſt to the end of the liſts: but Newton on a ſudden gave him ſuch a *gaſh* on the leg, that therewith he fell to the ground. *Hayward.*

But th' ethereal ſubſtance cloſ'd,
Not long diviſible; and from the *gaſh*
A ſtream of nectarous humour iſſuing flow'd. *Milton.*

The mark of a wound.—I was fond of back-ſword and cudgel play, and I now bear in my body many a black and blue *gaſh* and ſcar. *Arbuthnot.*

GAS'KET, *ſ.* A ſea term; a kind of plated cord faſtened to the ſail-yards of a ſhip, and uſed in furling the ſails.

GAS'KINS, *ſ.* [from *Gaſcoigne.* See GALLIGASKINS.] Wide hoſe; wide breeches. *An old ludicrous word:*

If one point break, the other will hold;
Or, if both break, your *gaſkins* fall. *Shakeſpeare.*

GASOM'ETER, or GAZOMETER, *ſ.* a machine conſtructed of ſeveral tubes and veſſels, for the purpoſes of chemical inveſtigation, in examining and defining the properties of the various kinds of gaſes. Lavoiſier firſt gave the name of *gazometer* to an apparatus which he invented for the purpoſe of meaſuring and transferring gaſes; which, by promiſing to become of great utility to the philoſophical world, ſoon excited the attention and induſtry of others in improving and extending ſo uſeful an invention. The moſt approved machines of this deſcription, with correct engravings, are given in the article CHEMISTRY, vol. iv. p. 374, 378, 380, &c.

To GASP, *v. n.* [from *gape, Skinner*; from *giſpe*, Dan. to ſob. *Junius.*] To open the mouth wide; to catch breath with labour.—The ladies *gaſp'd*, and ſcarcely could reſpire. *Dryden.*

Pale and faint,
He *gaſps* for breath; and, as his life flows from him,
Demands to ſee his friends. *Addiſon's Cato.*

To emit breath by opening the mouth convulſively:

I lay me down to *gaſp* my lateſt breath;
The wolves will get a breakfaſt by my death. *Dryden.*

To long for. This ſenſe is not proper, as nature never expreſſes deſire by gaſping.—The Caſtilian and his wife had the comfort to be under the ſame maſter, who, ſeeing how dearly they loved one another, and *gaſped* after their liberty, demanded a moſt exorbitant price for their ranſom. *Addiſon.*

GASP, *ſ.* The act of opening the mouth to catch breath. The ſhort catch of breath in the laſt agonies:

If in the dreadful hour of death,
If at the lateſt *gaſp* of breath,
When the cold damp bedews your brow,
You hope for mercy, ſhew it now. *Addiſon.*

GAS'PAR I'SLAND, a ſmall iſland in the Eaſtern Sea, which gives name to a channel between the iſlands of Banca and Billiton, called *Gaſpar Straits.* Lat. 1. 45. S. lon. 107. E. Greenwich.

GASPARI'NO (Barziza), one of the early Italian ſcholars, born in the latter part of the fourteenth century at Barziza, a place in the Bergamaſque, whence he derived his ſurname. His father's name was Bettino. He early acquired a taſte for the good authors of antiquity, and became a profeſſor of belles-lettres at the univerſity of Pavia, about the commencement of the fifteenth century, and continued there till 1407. He then paſſed ſome time at Venice, after which he was invited to the profeſſorſhip of rhetoric in Padua, where he alſo taught moral philoſophy. The charge he generouſly took upon himſelf of maintaining eight children of his deceaſed brother, reduced him to ſuch indigence, that he was compelled to ſell his books; but he was ſomewhat relieved by an augmentation of his ſalary. In 1418, Philip Maria Viſconti, duke of Milan, ſummoned him to his capital, in order to open a public ſchool of eloquence. He left Padua with regret; but the duke, by his friendſhip and munificence, rendered the change as agreeable as poſſible to him. He employed his leiſure time at Milan, in giving private inſtructions to young perſons of family, and in copying and correcting the manuſcripts of ancient authors. He likewiſe compoſed ſeveral works, in which he paid peculiar attention to the purity of his Latin ſtyle. The time of his death is not certainly known, but it was probably in the beginning of 1431. His works conſiſt of ſhort treatiſes on grammar and rhetoric; of orations compoſed upon various occaſions; of letters to his friends; and of other epiſtles written by way of exerciſe, and as models to his pupils. Of his Letters, there have been ſeveral editions, particularly one by Cord. Furietti, in 1723, to which are added his orations, and the works of his ſon Guiniforte, who was alſo a man of learning.

GASPE BAY, a bay on the coaſt of Canada, in the gulf of St. Lawrence, a little to the north of Cape Gaſpe: near which is the Indian ſettlement of Gaſpeſians.

GASPE'SIA, a country on the ſouth ſide of the mouth of St. Lawrence river, and on the north ſide of Chaleurs bay, in Lower Canada. Its eaſtern extremity is Cape Roſiers. The Indians called Gaſpeſians inhabit here.

GAS'SE, a town of Italy, in the principality of Piedmont, on the Po: five miles ſouth of Chivaſſo.

GASSEN'DI (Peter), a very eminent philoſopher and mathematician, born in 1592, at Chanterſier, about three miles from Digne, in Provence. He afforded early evidence that he poſſeſſed a lively genius, and a happy memory, which determined his parents, though they were but in moderate circumſtances, to beſtow upon him the beſt education in their power. When he was of a proper age to be ſent to ſchool, he was placed under the inſtructions of an excellent maſter at Digne, where he made a rapid progreſs in the knowledge of the Latin tongue, and alſo acquired a pre-eminence over his ſchool-fellows in rhetorical exerciſes. Afterwards he was ſent to ſtudy philoſophy for two years, under an able profeſſor at Aix; and at the expiration of that period, returned to his father's houſe at Chanterſier. He had not been long at home, before he was invited to teach rhetoric at Digne, when not quite ſixteen years of age; and about three years afterwards he was appointed to fill the vacant chair of philoſophy in the univerſity of Aix. During his reſidence at Digne he had ſedulouſly proſecuted his ſtudies in the learned languages, mathematics, and aſtronomy; and after a diligent examination of the different ſyſtems of philoſophy among the ancients, embraced that of Epicurus, of which he afterwards proved himſelf the moſt ingenious defender in modern times. When he entered upon his philoſophical profeſſorſhip at Aix, notwithſtanding that the authority of Ariſtotle was ſtill acknowledged in almoſt all the public ſchools, Gaſſendi, after the examples of Vives, Ramus, and others, ventured publicly to expoſe the defects of his ſyſtem. The lectures which contained his cenſures of the Ariſtotelian philoſophy, delivered in the indirect form of paradoxical problems, were publiſhed under the title of *Exercitationes Paradoxicæ adverſus Ariſtotelem.* This work, which gave great offence to thoſe who ſtill retained their predilection for ſcholaſtic ſubtlety, obtained the author no ſmall degree of reputation with ſeveral learned men, particularly with Nicholas Peireſc, the preſident of the univerſity of Aix, who determined to procure for him a ſituation in the church, in which he ſhould be enabled to purſue his favourite ſtudies at his leiſure, and without any moleſtation. After Gaſſendi had entered into holy orders, through the intereſt of Peireſc, and Joſeph Walter prior of Vallette, he was promoted to a canonry in the cathedral church of Digne, and admitted to the degree of doctor of divinity; and afterwards received the appointment of warden, or rector of the ſame church. In conſequence of theſe promotions he reſigned his profeſſorſhip at Aix, and retiring to Digne, applied himſelf cloſely to his philoſophical and aſtronomical purſuits. Among his other works which he wrote in this place was a ſecond book of his *Exercitationes Paradoxicæ*, intended to expoſe the futility of the Ariſtotelian logic. It was his firſt intention to purſue the plan ſtill further; but the violent oppoſition which he met with from ſome of the zealous and powerful advocates for the authority of Ariſtotle, induced him to deſiſt from all direct attacks upon his philoſophy. Still, however, he profeſſed his attachment to the ſyſtem of

of Epicurus, and defended it with great learning and ability. From Lucretius, Laertius, and other ancient writers, he undertook to frame a conſiſtent ſcheme of Epicurean doctrine, in which the phenomena of nature are immediately derived from the notion of primary atoms. But he was aware of the fundamental defect of this ſyſtem, and added to it the important doctrine of a divine ſuperintending mind, from whom he conceived the firſt motion and ſubſequent arrangement to have been derived, and whom he regarded as the wiſe governor of the world. He ſtrenuouſly maintained the atomic doctrine in oppoſition to the fictions of the Carteſian philoſophy, which were at that time obtaining great credit; and particularly aſſerted, in oppoſition to Des Cartes, the doctrine of a vacuum. On the ſubject of morals he explained the permanent pleaſure or indolence of Epicurus, in a manner perfectly conſiſtent with the pureſt precepts of virtue. In 1628 Gaſſendi, for the ſake of extending his acquaintance with the learned, viſited Holland, where his philoſophical and literary merit ſoon procured him many admirers and friends. While he was in that country he wrote an elegant and judicious apology for his friend the learned Merſenne, in reply to the cenſures of Robert Fludd, on the ſubject of the Moſaic philoſophy. After his return to France he continued his philoſophical, and particularly his aſtronomical, ſtudies, purſuing with great care a ſeries of celeſtial obſervations, in order to complete his ſyſtem of the heavens. Being called by a law-ſuit to Paris, he there formed an acquaintance with the men moſt diſtinguiſhed for learning and ſcience in that capital, and by his agreeable manners, as well as reputation, ſecured the eſteem of perſons of high rank and quality, and in particular of cardinal Richelieu, and of his brother the cardinal of Lyons. Owing to the application and intereſt of the latter, in 1645, Gaſſendi was appointed regius-profeſſor of the mathematics at Paris. This inſtitution being chiefly intended for aſtronomy, he read lectures on that ſcience to crowded auditories, by which he acquired great popularity, and roſe to high expectations. But the fatigues of that appointment were more than his ſtrength, already reduced by too intenſe application, was able to bear; and having caught a cold, which brought an inflammation upon his lungs, he was obliged, in 1647, to quit Paris, and to return to Digne, for the benefit of his native air. After having his health in ſome meaſure re-eſtabliſhed by the intermiſſion of his ſtudies, in 1653 he returned again to Paris, where he publiſhed the Lives of Tycho Brahe, Copernicus, Purbach, and Regiomontanus; and then reſumed, with as much intenſeneſs as ever, his aſtronomical labours. His feeble ſtate of health, however, was now unequal to ſuch exertions, which brought on a return of his diſorder, under which, with the aid of too copious and numerous bleedings, he ſunk in 1655, when in the ſixty-third year of his age. A little before he expired, he deſired his ſecretary to lay his hand upon the region of his heart; which when he had done, and remarked on the feeble ſtate of its pulſation, Gaſſendi ſaid to him, "You ſee how frail is the life of man!" which were the laſt words that he uttered.

Gaſſendi was the firſt perſon who obſerved the tranſit of Mercury over the ſun. Kepler had predicted that it would take place on the 7th of November, 1631. Gaſſendi, who was then at Paris, made due preparations to obſerve it; and, after having for ſome time miſtaken the appearance of that planet for a ſolar ſpot, became at length ſenſible of his error by the rapidity of its movement, and took care to calculate the time of its egreſs from the ſun's diſk, as well as its diſtance from the ſun's vertical point. From Gaſſendi's letters it appears, that he was often conſulted by the moſt celebrated aſtronomers of his time, as Kepler, Longomontanus, Snell, Hevelius, Galileo, Kircher, Bulliald, and others; and his labours certainly entitle him to a high rank among the founders of the reformed philoſophy. Gaſſendi poſſeſſed a large and valuable library, to which he added an aſtronomical and philoſophical apparatus, which, on account of their accuracy and worth, were purchaſed by the emperor Ferdinand III. and afterwards depoſited, with other choice collections, in the imperial library at Vienna. The manuſcripts which he left behind him, and the treatiſes formerly publiſhed by himſelf, were printed together, accompanied by the author's life, and publiſhed by Sorbiere, in ſix volumes, fol. 1658. They conſiſt of the philoſophy of Epicurus; the author's own philoſophy; aſtronomical works; the lives of Pierеſc, Epicurus, Copernicus, Tycho Brahe, Purbach, Regiomontanus, John Muller, &c. a refutation of the meditations of Des Cartes; and Epiſtles, and other treatiſes.

GAS'SION (John de), marſhal of France, born in 1609 at Pau, where his father was preſident of the parliament. At the age of ſixteen he entered into the gendarmes of the prince of Piedmont; and in 1627, and two years after, he ſerved under the duke de Rohan in the civil wars on the Calviniſt ſide, to which he was always attached. When the great Guſtavus entered Germany, Gaſſion joined him, and was made captain of his body-guard. He was afterwards raiſed to the rank of a field-officer in the cavalry, in which poſt he performed eſſential ſervices in many actions, and eſpecially at the battle of Leipſic. Guſtavus, who highly eſteemed his valour and fidelity, would have diſtinguiſhed him by ſome ſignal recompence, had he not ſoon after loſt his life at Lutzen. After that event, Gaſſion returned to France with his regiment, and entered under the marſhal de la Force in Lorrain, where he rendered himſelf the terror of the enemy. He performed many remarkable exploits, and was preſent in ſeveral conſiderable actions. The duke d'Anguien (Condé) gave him a liberal ſhare in the honour of the victory at Rocroi. He received a dangerous wound at the ſiege of Thionville, in recompence for which he obtained, in 1643, the marſhal's ſtaff. In the following year he was appointed lieutenant-general of the army in Flanders, nominally commanded by Gaſton duke of Orleans. He had a great ſhare in the capture of ſeveral towns in that diſtrict, which were formed into a government, and entruſted to him. At length, when at the height of his reputation, he received a mortal wound at the ſiege of Lens, in 1647. He was buried in the proteſtant church at Charenton. The marſhal de Gaſſion was characteriſed by a daring courage and ſpirit of enterpriſe which overcame all obſtacles. "Speculation (ſaid he) is a fine thing in the cloſet, but boldneſs and action are the requiſites in war." Richelieu, on this account, ſo much confided in him, that when urged with difficulties in a plan, he uſed to ſay, "They will be removed by Gaſſion." The marſhal himſelf, in anſwer to ſome repreſentations that were made him by an officer on the impoſſibility of ſomething he was going to undertake, replied, "I have that in my head and at my ſide which will overcome this ſuppoſed impoſſibility." He would never marry, giving as a reaſon, "that he valued life too little to impart it to any." The hiſtory of his life has been publiſhed by the abbé de Pure in four volumes, 12mo.

GAST, *ſ.* [Saxon.] A ghoſt; terror; gaſtlineſs.

To GAST, *v. a.* [from ȝaſt, Sax. See AGHAST.] To make aghaſt; to fright; to ſhock; to terrify; to fear; to affray:

When he ſaw my beſt alarm'd ſpirits
Bold in the quarrel's right, rous'd to the encounter,
Or whether *gaſted* by the noiſe I made,
Full ſuddenly he fled. *Shakeſpeare.*

GASTAL'DUS, *ſ.* In antiquity; an officer in a prince's court anſwering to the ſteward of the houſhold.

GASTAU'D (Francis), a French prieſt, and counſellor of eminence, born at Aix in Provence. When he was fourteen years of age he entered into the congregation of the Oratory, and went through his courſe of philoſophy at Marſeilles, and afterwards that of theology at Arles. At the expiration of five years he quitted the congregation, and removed to Paris, where he was admitted into orders, and officiated for ſome years in the pariſh church of St. Paul. He was greatly admired and followed as a preacher, and indeed poſſeſſed excellent qualifications for a pulpit orator. For, beſides much natural vivacity, he was diſtinguiſhed by the correctneſs and delicacy of his taſte, the eaſe of his addreſs, the chaſtity of his elocution, and, what is not often combined with the foregoing recommendations, the ſolidity and uſefulneſs of his matter. In 1699 he publiſhed, A Collection of Homilies on the Epiſtle to the Romans, &c. in two volumes 12mo. which is a work of conſiderable merit, and is preceded by an excellent delineation of the character of St. Paul. In the ſame year another piece came from his pen, of a very different nature from the former, entitled, The Funeral Oration of Maria-Angelica Carlier, Wife of M. Tiquet, Counſellor of the Parliament of Paris, who was beheaded for making an attempt upon the life of her huſband. This is a piece of pleaſantry, which the author's complaiſance towards ſome ladies of his acquaintance induced him to draw up, and it was ſent to the preſs without his knowledge. It occaſioned, however, ſome ſevere ſtrictures to be written againſt it by father Chauchemer, a Dominican, and a celebrated preacher, who very properly reproved the author for indulging in a ſportive vein on ſo ſerious a ſubject, and added to them A Moral and Chriſtian Diſcourſe on the Life and Death of Madame T.... Theſe pieces were collected together and publiſhed in 1699, in 8vo. The abbé Gaſtaud returned to Aix in 1700; and after the death of his elder brother, a celebrated advocate in the parliament of Provence, determined himſelf to embrace the ſame profeſſion. With this deſign he retired into the country, and applied with great diligence to the ſtudy of the law. He then took his degrees, and was admitted an advocate, after he had procured a diſpenſation from the court of Rome. At the bar he appeared with the ſame diſtinction as had formerly attended him in the pulpit, and was eminently ſucceſsful in conducting eccleſiaſtical cauſes, and thoſe in which the intereſts of the poor were involved. He was one of the warmeſt admirers of the celebrated Queſnel, and one of the moſt active opponents of father Giraud, and his brethren the Jeſuits, againſt whom he gained a famous cauſe in 1717. He alſo wrote a bitter piece againſt the order, entitled, The Policy of the Jeſuits unmaſked; and ſome treatiſes againſt the biſhop of Marſeilles, on the ſubject of grace and other topics, which occaſioned him to feel the ſevere vengeance of that prelate: for Gaſtaud was by his intereſt exiled to Viviers, in 1727; and after he had been permitted to return home, he was exiled to the ſame place a ſecond time in 1731, where he died in the courſe of the following year, and his corpſe was refuſed the rites of Chriſtian burial.

GAS'TEIN, a town of Germany, in the circle of Bavaria, and archbiſhopric of Saltzburg; celebrated for its warm baths and mines of lead, iron, and gold: thirty-ſix miles ſouth of Saltzburg, and ſixteen weſt-ſouth-weſt of Radſtadt.

GAS'TEL, a river of Wales, which runs into the Conway, in the county of Caernarvon.

GAS'TER, *ſ.* [Greek.] The medical term for the belly, the ſtomach, or the uterus.

GAS'TER, a fortreſs of Africa, in the country of Segilmeſſa.

GAS'TER, a bailiwic of Swiſſerland, belonging to the cantons of Schwitz and Glaris, to whom it was ſold by the houſe of Auſtria, in 1438.

GASTEROPEL'ECUS, *ſ.* in ichthyology. See SALMO *gaſteropelecus*.

GASTEROS'TEUS, *ſ.* in ichthyology, the STICKLEBACK; a genus of the thoracic order of fiſhes, the generic characters of which are, the tail carinated at the ſides, the back furniſhed with prickles, or ſpines, ſeparate one from the other. The body is long, laterally compreſſed, and covered with ſcuta, or bony plates, inſtead of ſcales. The head is long, and ſmooth; the jaws uſually of an equal length, and armed with ſmall teeth. The tongue is ſhort and blunt, the palate ſmooth. The eyes are placed on the ſides of the head; they are round, ſomewhat protruded, and covered with a membrane. The noſtrils are ſmall, lying midway between the eyes and mouth. The gill-coverts are round, ſtriated, and conſiſt of two laminæ. The membrane of the gills is in general quite concealed, and ſuſtained by from three to ſeven rays. The back is ſtraight, and the lateral line is parallel with it. The belly is thin. They have ſeven fins; two pectorals, two ventrals, one anal, one at the tail, and one at the back, with diſtinct ſpines between it and the head. The ventral fins are behind the pectorals, but above the ſternum: this ſhews an approach to the abdominal order.

Theſe fiſhes live in the ſea; but ſome ſpecies are found in freſh water. They feed on inſects, worms, and the ova of other fiſhes. No trace of this genus is to be found in the writings of the ancient naturaliſts. There are twenty-one ſpecies, three of which only are inhabitants of our rivers and ſhores; namely, that with three, that with ten, and that with fifteen, ſpines upon the back. The former are ſeen in immenſe quantities in the fens of Lincolnſhire, and the rivers that flow from them. At Spalding, they appear once every ſeven or eight years in the Welland, where they mount the river in ſuch vaſt columns, that they are uſed in manuring the land. An idea of their numbers may be formed, from a circumſtance mentioned by Pennant, of a man earning four ſhillings a-day by taking and ſelling them to the farmers at an halfpenny a buſhel. The cauſe of theſe temporary migrations of the ſtickleback, is ſuppoſed to ariſe from the vaſt quantities waſhed out of the fens by the floods, and collected in ſome deep hole, till, overcharged with numbers, they are obliged periodically to attempt a change of habitation. The endeavours they uſe, and the exertions they make, in getting from one place to another where obſtacles intervene, are very extraordinary; for, though many ſpecies among them are ſeldom known to be more than two inches in length, they have been ſeen to ſpring a foot and a half (nine times their own length) in perpendicular height from the ſurface of the water, and in an oblique direction much farther. They ſpawn in April and June on the aquatic plants; and are very ſhort-lived, ſcarcely ever attaining the third year. They are in general too ſmall to be of any eſſential ſervice as food to mankind; but in ſome parts of the continent they are of conſiderable uſe in fattening ducks and pigs.

1. Gaſteroſteus aculeatus, the three-ſpined ſtickleback, or banſtickle. The three ſpines on the back form the ſpecific character and the Engliſh name. There are 3 rays in the membrane of the gills, 10 in the pectoral fins, 2 in the ventrals, 9 in the anal, 12 in the tail, and 13 in the dorſal. The head is fore-ſhortened, and compreſſed at the ſides. The jaws are of equal length, and the aperture of the mouth pretty wide. The eyes are protruded; pupil black; iris ſilvery. The covert of the gills is large, and ſilver-coloured, as are the ſides. In ſome the neck and breaſt are of a beautiful red, which is ſo durable as to be viſible after the fiſh has been ſeveral months preſerved in ſpirits. Two of the ſcuta appear

pear at the breaſt, one at the belly, and thirteen on each ſide; at the tail, inſtead of the ſcuta, the ſkin is puffed up and wrinkled. The lateral line runs along above the bony plates, or ſcuta; it is ſomewhat irregular, but nearer to the back than to the belly. The fins are yellowiſh; thoſe of the belly are compoſed of a ſtrong ſpine jagged or toothed on both ſides, and of one ſoft ſhort ray; theſe ſpines are very ſharp and hard, and ſo knit into the bones, that even after the death of the fiſh it is a very difficult matter to bend them. Had not Providence given ſuch a protection to this little fiſh, which lives ſo ſhort a time, and which produces not a thouſandth part of the eggs that other fiſhes do, the race would ſoon be extinct. The firſt ray of the dorſal and anal fins is alſo a ſpine; the tail fin is ſtraight.

This fiſh is found both in running ſtreams and in ſtagnant waters. It grows not above three inches long; it ſpawns in April and May, laying its ova on aquatic plants; at that time they quit the lakes, and mount the communicating ſtreams. They live on the ova and young of other fiſh, and are reckoned very hurtful to the fiſhery, ſo that the fiſhermen always deſtroy them when they can; they feed alſo on worms and inſects. Though this ſpecies be very ſmall, it does not eaſily become a prey to the rapacious kinds on account of its ſtrong ſpines, as has been before remarked; but its moſt fatal enemies are various kinds of worms which pierce the inteſtines. Where the ſpecies is plenty, being little eſteemed as food, they are uſed as manure; near Dantzick they extract oil from them; and they are alſo uſed, mixed with clay, to fatten ducks, or to feed ſwine. Though this fiſh intrinſically be of ſmall value, yet it furniſhes ſome curious obſervations to the naturaliſt; this ſpecies is among fiſh what the ephemerides (who live but a day) are among the inſect tribe; for, while ſome ſpecies of fiſh live for ages, or at leaſt for many ſcores of years, this little creature finiſhes its courſe in the ſecond or third year after its birth; and, while others depoſit millions of eggs, this lays but very few. But Cepede ſees no reaſon to ſuppoſe this fiſh ſo ſhort-lived; he imagines the inſtances alluded to may have been accidental: and, if uſed as manure, ſurely the ſpecies muſt be prolific. The ſtomach is large, the inteſtinal canal ſhort, as in moſt of the voracious kinds. The liver is in three lobes; the gall-bladder is ſmall; the roe and ovary are double; the peritonæum (or membrane which encloſes the bowels) has ſeveral little black and white dots; and the ova, to the number of about 130 only in both ovaries, are of the ſize of millet-ſeed. There are fifteen ribs on each ſide; and the vertebræ are thirty in number.

The following are the remarks of Bloch on this ſpecies. "On the 9th of April, 1787, I examined ſeveral hundreds of theſe fiſhes. In ſome, whoſe body was much ſwelled, I found two ovaries, wherein the eggs were ſome whitiſh, ſome yellow, as large as poppy ſeed; in others, the eggs were not perfect; the fiſh were thin; and the ſoft roe conſiſted of lengthened quill-ſhaped bodies, ſo covered with yellow ſpots as to ſeem entirely of that colour: but in all, theſe parts were as yet very ſmall. Behind the roe, or the ova, were the kidneys, but I could diſcern no air-bladder. The liver, which was in two lobes, one long and the other ſhort, was in ſome reddiſh, in others yellow; in all, whoſe inteſtinal canal was furniſhed with fat, the liver was of the colour laſt-mentioned. The interior cavity of the belly was ſilver-colour, ſcattered with black dots. In ſome, the chin was of a bright yellow-green; in others, browniſh; in a few, red. In one only I found the ſolitary inteſtinal worm deſcribed by Pallas."

2. Gaſteroſteus ductor, the pilot-fiſh. Specific character, the body banded, four ſhort looſe ſpines on the back. The membrane of the gills has 6 rays, (Linnæus ſays 7, and makes it part of the ſpecific character,) the pectoral fins 15, the ventrals 6, the anal 16, the tail 18, the dorſal 24. The body is long. The head compreſſed, rounding off in front, without ſcales as far as the operculum. The mouth is ſmall; the jaws of equal length, and furniſhed with ſmall teeth; the palate has a curved row of ſimilar teeth in front, and the tongue has teeth all along; it is ſhort, fleſhy, and hardly moveable. The noſtrils are double, nearer the muzzle than the eyes; the eyes have a black pupil and yellow iris. We have remarked elſewhere that the colour of fiſhes, &c. is ſubject to much variation: this furniſhes one remarkable inſtance; for Muller deſcribes the iris as red; Haſſelquiſt black mingled with yellow; Pernetti yellow; Gronovius white; and Oſbeck yellow and white. The opercula are ſmooth, rounded, and without ſcales; the aperture of the gills is very wide, the membrane entirely covered. There are ſmall ſcales on the body; the back and belly are round and fleſhy; the anus is nearer the tail than the head. The lateral line is curved firſt upwards and then downwards, and is loſt at the end of the tail. The tail is raiſed on each ſide, which gives it a ſquare ſhape; ſimilar to many of the mackrel kind, among which this is placed by Bloch and ſeveral others: this ariſes from ſaw-ſhaped proceſſes on each ſide of the ſpondyles of the tail. The dorſal and anal fins have ſoft bifurcated rays; the rays of the other fins are variouſly ramified. The pectoral and ventral fins are of a grey colour, the anal and dorſal blueiſh; the tail-fin is grey at its origin, black in the middle, and white at the ends. There are five blue ſtripes or bands on the body; the intervals are white; but the number of ſtripes is not uniform.

This ſpecies is found in various parts of the world; Plumier made his drawing at the Antilles; Haſſelquiſt obſerved it in the Mediterranean near Ivica; Brunniche at Marſeilles; Oſbeck under the line; Loeffling in the Southern Ocean; Nieuhoff in the Eaſt Indies; and Kolbe at the Cape of Good Hope. It grows to a foot and a half in length; and is well-taſted. Pernetti calls it one of the beſt and handſomeſt fiſh of the ſea. Haſſelquiſt found the ſtomach filled with fiſh; indeed, its well-armed mouth ſhews it to be of the predatory kind. As it is commonly ſeen in company with the ſhark, it is called the *pilot-fiſh*, being ſuppoſed to point out prey to the ſhark: but this is very doubtful; it follows veſſels, as the ſhark does, to feed upon what may be thrown over-board, but it is obſerved to follow them after the ſhark has quitted them. Brunniche ſays they are ſeen at Marſeilles about the veſſels which winter there; Loeffling and Dutertre ſaw great numbers following veſſels when there were no ſharks; but they ſeek to ſwim near the ſhark for protection againſt other fiſh, for Haſſelquiſt obſerved that the dorado and other larger fiſh often devoured the pilot; but theſe are kept at a diſtance by the appearance of a ſhark; not that the ſhark has any friendſhip for the pilot, as pretended, or would ſpare him if in his power; but, as the ſhark turns about heavily to catch him, he nimbly jumps aſide; of which Dutertre was an eye-witneſs. Later writers however have juſtified the opinion of the ancients upon this matter. In the year 1802, in the philomathic ſociety of Paris, citizen Geoffroy, profeſſor in the muſeum of natural hiſtory, read a notice on certain habits common to the ſhark and to the fiſh called the *pilote* or pilot-fiſh, which was to the following effect: "An opinion long prevail d among mariners, that the ſhark has ſubjugated to its dominion a very ſmall fiſh of the *gadus* genus; and that this latter precedes his maſter in their voyages, points out to him ſuch places in the ſea as abound moſt in fiſh, diſcovers by the track the prey of which he is the fondeſt, and that, in recompence for ſuch ſignal ſervices, the ſhark, notwithſtanding his gluttonous diſpoſition, maintains the relations of peace and amity with ſo uſeful a companion. Naturaliſts, however, always on their guard againſt the exaggerations of voyagers, who could not divine the reaſons of ſuch an aſſociation, have

have called the fact in queſtion. I ſhall ſhew that this has been done erroneouſly; the obſervations that I have made on this ſubject, are accompanied with circumſtances ſo much in detail, as have ſcarcely, perhaps, occurred to any one before. On the 6th Prairial, year 6, (May 26, 1798,) I was on-board the frigate Alceſte, between Cape Bona and the Iſle of Malta. The ſea was calm, and the ſhip's company began to grow weary of its long duration, when their attention was ſuddenly directed to a ſhark, which they ſaw making towards the veſſel. He was preceded by his pilots, who kept about the ſame diſtance from the ſhark; the two pilots ſhaped their courſe towards the ſtern of the veſſel, viſited it twice, from one end to the other, and, after being ſatisfied there was nothing of which they could make their booty, they fell again into the track they were proceeding in before. During all their different movements, the ſhark never loſt them out of ſight, or rather followed them as exactly as if they had been drawing him in a train. No ſooner was the ſhark eſpied, than one of the ſeamen got ready a large hook, which he baited with a piece of bacon; but the ſhark and his companions had proceeded to the length of twenty metres and upwards (ſixty or ſeventy feet) before the man had adjuſted all his preparations; however, at a venture, he threw his lump of bacon into the ſea. The noiſe which the fall occaſioned was heard at a conſiderable diſtance; our voyagers were, it ſeems, aſtoniſhed at it, and ſuddenly ſtopped their courſe: on this the two pilots detached themſelves, and repaired to the poop of the veſſel in queſt of information. The ſhark, during their abſence, ſports on the ſurface of the water in a thouſand poſtures, throws himſelf on his back, replaces himſelf on his belly, dives in the ſea, but always appears again on the ſame ſpot. The two pilots, having got up to the ſtern of the Alceſte, came near the bacon, which they had no ſooner diſcovered, than they returned to the ſhark with more celerity than they had advanced. When they reached him, the ſhark was for proceeding on his route; but the pilots ſwimming, one at his right, and the other at his left, exert all their endeavours to get before him; ſcarcely had they done this, when they return together, and come a ſecond time to the ſtern of the veſſel; they were now followed by the ſhark, who thus, by the ſagacity of his companions, was enabled to diſcover the prey deſigned for him. It has been ſaid of the ſhark, that he has a very keen ſcent; I noticed with very particuliar attention (ſays citizen Geoffroy) what paſſed when he came up cloſe to the bacon. It appeared to me, that he only obtained his information at the inſtant when his guides had, as it were, indicated it to him; then it was that he ſwam with the greateſt velocity, or rather made a ſpring to catch at it. At firſt he brought off a piece, without being entangled by the harpoon; but, at the ſecond attempt, the hook pierced into his left lip, and he was taken and hoiſted on-board. It was not until two hours had elapſed, during which I was employed in the anatomy of this ſqualous fiſh, that I expreſſed my concern at not having ſeen more nearly the ſpecies of fiſh which became thus a volunteer in the ſervice of the ſhark: I was told, however, that it was eaſy to catch it, as it was certain it had not quitted the environs of the ſhip; and in a few moments after, I had the pleaſure to find one handed to me, which I knew belonged to the pilot or *fanfire* tribe, as the mariners call it, and to what is called the *gaſteroſteus ductor* by naturaliſts. It would undoubtedly be curious (adds citizen Geoffroy) to examine what intereſt could induce two animals, ſo different in their organization, their ſize, and their habits, to form this kind of aſſociation. Does the pilot feed on the excrements of the ſhark, as citizen Boſc imagines; and, in order to find ſafety and protection near ſo voracious a ſpecies, can it have impoſed on itſelf the painful duties of domeſticity?" Cepede has placed this and all the ſpecies which have more than two ſpinous rays to the ventral fin, in a ſeparate genus, *centronotus*, from κεντρον, a ſpine, and νωτος, the back; ſimilar in meaning therefore to *gaſteroſteus*.

3. Gaſteroſteus Japonicus, the Japan ſtickleback. Four dorſal ſpines, and the gill-membrane five-rayed. The dorſal fin has only 10 rays, the pectorals 12, the anal 9, the tail 22. Gmelin doubts whether it belongs to this genus or not; and Cepede has made it a diſtinct genus, naming it, from the nature of the ſcales, *lepiſacanthus*, (λεπις, a ſcale, and ακανθος, a ſpine,) for the ſcales are very broad, each armed with a recurved ſpine. Houttuyn obſerved it in the ſeas of Japan. Body yellow, five inches long. Head obtuſe; jaws rough, without teeth; gill-coverts not ſcaled, ſerrated behind; dorſal ſpines moveable, thick, ſtrong, unequal, placed in a cavity; ventral fins connected by a thick rigid ſpine an inch and a half long.

4. Gaſteroſteus occidentalis, the croſs-ſpine, or leather-coat. Specific character, ſeven looſe dorſal ſpines, and two before the anal fin. There is indeed another ſpine on the back, almoſt horizontal, pointed towards the head; but it is not moveable, and forms a part of the oſſa interſpinoſa. The ſpines are turned moſtly towards the tail; they are ſunk in a furrow, and faſtened to each other by a narrow ligament, which, when it pulls the firſt, cauſes the reſt to croſs each other; ſo that they look ſomething like *chevaux de friſe*. The membrane of the gills has 6 rays, the pectoral fins 16, the anal 9, the tail 16, and the dorſal 11. Behind the anal and dorſal fins, Bloch ſays, there are eight ſmall tufted fins, (called by Linnæus baſtard fins;) hence Bloch placed it among the Scombers.

The head is ſmall, ſmooth, and ſo compreſſed, that above the eyes it is not thicker than the blade of a knife; the noſtrils are ſingle, round, and midway between the mouth and eyes; the jaws are of equal length, armed with ſmall ſharp teeth; the two front teeth of the lower jaw are longer than the reſt, and behind theſe are ſeveral ſmall ones; the tongue is looſe, and ſlippery; the pupil of the eye is black, the iris ſilvery; the opercula are ſmooth; the hinder ones compoſed of three laminæ; the aperture is wide, the membrane concealed; the ſides are compreſſed, and without ſcales; the belly and back end ſharp. The lateral line is very faint; it forms an arch over the pectoral fin, then goes ſtraight to the middle of the tail fin, which is ſtiff. The anus is nearer to the head than to the tail; and lower down are two ſpines faſtened at the bottom by a membrane. The fins are blue, with four-branched rays; the pectorals and ventrals very ſhort. This ſpecies is found in ſeveral parts of the Mediterranean, eſpecially towards Provence and Languedoc. It is known alſo in ſeveral parts of America. Brown ſaw it at Jamaica, and Parra at the Havannah. It grows to a large ſize, weighing ſometimes forty pounds: it is good eating, ſome ſay better than the tunny.

5. Gaſteroſteus lyſan, the Arabian ſtickleback: 7 dorſal and 2 anal ſpines, and 8 rays in the membrane of the gills; 21 rays in the dorſal fin, 17 in the pectorals, 6 in the ventrals, 19 in the anal. Diſcovered by Forſkal on the coaſt of Arabia. Scales ſmall, lanceolate, ſhining; body blueiſh-brown, beneath white; ſhape oblong, lanceolate; lateral lines undulated about the operculum, ſtraight towards the tail.

6. Gaſteroſteus ovatus, the ovate ſtickleback. Specific character: dorſal ſpines 7, the firſt recumbent; anal ſpines 2. There are 6 rays in the membrane of the gills, 20 in the dorſal fin, 16 in the pectorals, 6 in the ventrals, 17 in the anal, 20 in the tail. Jaws and lips rough; dorſal ſpines directed alternately to the ſides, the firſt very ſmall, the next a little longer.

7. Gaſteroſteus Carolinus, the Carolina ſtickleback: 8 dorſal and 3 anal ſpines. The dorſal fin has 26 rays, the pectorals 18, ventrals 5, anal and tail 27 each. This

and

London, Published as the Act directs, August 2. 1806 by J. Wilkes.

and the following were ſent from Carolina by Dr. Garden to Linnæus. Inhabits Carolina. Body oblong-oval; lateral line ſtraight, ſubcarinate at the tail; dorſal and anal fins falcate; tail forked.

8. Gaſteroſteus Canadus, the Canadian ſtickleback: 8 dorſal ſpines, anal 0. Seven rays in the membrane of the gills, 33 in the dorſal fin, only 2 in each pectoral, 7 in each ventral, 26 in the anal, 20 in the tail. Inhabits Carolina; differs very little from the preceding.

9. Gaſteroſteus vadigo, the vadigo: 8 dorſal ſpines; lateral line crooked. The firſt dorſal ſpine is reclined towards the head; the pectoral fins conſiſt of many more than two rays; in other reſpects this differs little from the preceding. It is added by Cepede.

10. Gaſteroſteus ſaltatrix, the ſkipjack: 8 dorſal ſpines connected by a membrane, and 7 rays in the membrane of the gills. There are 26 rays in the dorſal fin, 16 in the pectorals, 6 in the ventrals, 27 in the anal, 21 in the caudal. This inhabits Carolina, deſcribed by Cateſby and Dr. Garden. It is perhaps the *Scomber ſaltiens* of Bloch, ſince the dorſal ſpines are not diſtinct, which is the generic character of the ſticklebacks. Gmelin ſays it is leſs prickly than the reſt, and reſembles a perch. There is only one row of teeth in the lower jaw, two in the upper; the dorſal ſpines are weak, occaſionally recumbent in a furrow, and the membrane which connects them is extremely thin. Tail-fin bifurcated.

11. Gaſteroſteus biaculeatus, the two-ſpined ſtickleback. Specific character: two dorſal ſpines. This and the following are deſcribed from Commerſon's manuſcripts, by Cepede; he has placed them in a diſtinct genus, as the tail is not carinated. The body and tail are covered with pretty large round ſcales, placed one over the other; but none are obſervable on the head, nor on the opercula, which are covered with broad plates. The teeth are ſmall, and ſtand apart; the lower jaw is the longeſt. The lateral line runs nearly in the middle of the body, and is marked with four very dark round ſpots. The dorſal fin begins about the middle or higheſt part of the back; it is falcated, and reaches to the tail; the anal fin is juſt oppoſite or under the dorſal, and is nearly of the ſame ſhape and extent; it is preceded by two ſpines inclined towards the tail; the tail-fin is very deeply furcated; the ventrals are much ſmaller than the pectorals.

12. Gaſteroſteus pentaculeatus, the five-ſpined ſtickleback. Specific character, five dorſal ſpines; ſcales hardly viſible. The head is much larger and thicker than in the preceding, and ends in a very blunt ſnout; the lateral line is crooked, and without any ſpot; the extremities of the tail-fin are much farther apart in proportion to their length, ſo that the fin ſeems rather ſemilunar than forked; the dorſal fin comes forwarder. The ſcales are not viſible to the naked eye. In other reſpects it reſembles the preceding.

13. Gaſteroſteus pemilipterus, the fat-finned ſtickleback. Specific character, 11 dorſal ſpines connected with the 13 articulated rays; part of that fin, the anal, and tail, adipous. Four rays in the membrane of the gills, 15 in each pectoral, 5 in each ventral, $\frac{3}{19}$ in the anal, and 19 in the tail, which is forked. This ſpecies is added by citizen Boſc; but Cepede has made it a ſeparate genus, *pimelipterus*, from *pimelè*, which in Greek ſignifies fat, and *pteron*, fin. It poſſeſſes ſome of the generic marks of the Gaſteroſteus, in particular the ventral fins lying farther back than the pectorals, but it has not the ſpines diſtinct on the back. Boſc diſcovered it in North America; and obſerves, that in habits it reſembles the G. ductor, or pilot fiſh, following the veſſels which traverſe the North Atlantic Ocean, and ſeizing with avidity the fragments of the nutritive ſubſtances which are thrown into the ſea. It is not eaſily caught, for it is cunning enough to take away the bait and avoid the hook. According to the ſame gentleman, the Engliſh diſlike this fiſh, but the French eat it. The head is ſmall; lips flexible; teeth ſmall but blunt; tongue oval. The irides brown mingled with white, and a ſilvery line underneath. The ſcales which cover the body and tail are round, large, and of a ſilvery colour, but brown at the ſides, joining into a conſiderable number of longitudinal brown ſtripes, which Cepede makes a part of the ſpecific character. The uſual length of this fiſh is eight inches, height two and a half, breadth one.

14. Gaſteroſteus auratus, the ſoft-finned ſtickleback. Specific character, the unarticulated rays of the fins almoſt as ſoft as the articulated ones; the lower lip hangs down very low. Six rays in the membrane of the gills, 23 in the dorſal fin, 11 in each pectoral, 6 in each ventral, 15 in the anal, and 12 in the tail, which is rounded. This and the following would not have been included in this genus but for the poſition of the ventral fins, for the dorſal contains, properly ſpeaking, no prickles. Cepede has made them a ſeparate genus, *cheilio*, which in Greek ſignifies a lip, in alluſion to the hanging lips. They are both from the manuſcripts of Commerſon, who met with them in the fiſh-market and boats at the Mauritius. The preſent ſpecies is of a gold yellow colour, with ſome little black dots on the lateral line. Its fleſh is white, and well taſted, but not much eſteemed becauſe the fiſh is very common; length a foot or more. The upper jaw is longeſt, and the upper lip is moveable; a row of ſmall teeth in each jaw, but none in the palate. The tongue is ſemi-cartilaginous, and partly free in its motions, but the tip of it is concealed under a little membrane ſtretching acroſs the lower jaw. The eyes are near together; the ſcales are ſmooth, and rounded, but do not cover the head and opercula; each operculum is compoſed of two pieces, and terminates in a membranous appendage; they are furrowed, but not prickly, nor dentated. The ſwimming-bladder lies along under the ſpine of the back. The whole fiſh is of a lengthened form; ſnout flatted; dorſal fin very long and low; ventrals very ſmall.

15. Gaſteroſteus fuſcus, the ſoft-finned brown ſtickleback. Specific character, unarticulated rays of the fins not rigid, lips pendent; colour brown; ventral fins white, and white ſpots on the dorſal and anal fins. This ſpecies reſembles the preceding in the number of rays in the fins, and in many other reſpects. It is, however, ſmaller, not exceeding nine or ten inches in length. The flat part of the ſnout is very ſhort; the pectoral fins are tranſparent, and the irides of a fiery red.

16. Gaſteroſteus pungitius, the ſmall or ten-ſpined ſtickleback. The number of ſpines, ten, is the ſpecific character. There are 3 rays in the membrane of the gills, 10 in the pectoral fins, 1 in the ventrals, 17 in the anal and tail, and 16 in the dorſal. The head of this little fiſh is like the *aculeatus*, but the body is of a more ſlender form. The ſides are yellow above the lateral line; below it, and on the belly, ſilvery; the ſides are ſmooth, having neither ſcales nor the ſcuta or bony plates of that ſpecies. The ventral fin conſiſts of one ſingle ſpine; and the firſt ray of the anal fin is ſharp alſo. The pectoral fins are yellowiſh; the anal, dorſal, and tail, grey; and the tail-fin is ſtraight, as in the preceding.

This fiſh weighs but an ounce and an half. "It is the ſmalleſt of all fiſh," ſays Bloch, "and the only one of which man can make no uſe." They are found in the Baltic and North Sea, and in all lakes and havens which communicate with the ſea; but are rarely caught, as on account of their diminutive ſize they eſcape through the meſhes of the nets: in the Seine they are found, according to Noel, higher up than Quilleboeuf. But, when taken among other fiſh, the fiſhermen generally throw them back as uſeleſs. According to Falck, they appear in ſhoals in all the freſh waters of Ruſſia and Siberia. The heart is triangular, and hardly ſo large as a grain of hemp-ſeed; but the liver is large, conſiſting of three lobes, one of which is ſo long that it reaches to

the anus; the little gall-bladder is faſtened to it. The ſpleen is triangular, and very ſmall. The ſtomach is long and large; the inteſtinal canal is ſhort, and has but one ſinuoſity. The roe and ovary are double. The air-bladder is ſimple, and the ſkin thereof thick. The peritoneum is white with black dots.

17. Gaſteroſteus ſpinachia, the fifteen-ſpined ſtickleback. Fifteen ſpines or prickles on the back are the certain mark to diſtinguiſh this ſpecies. There are 10 rays in the pectoral fins, 2 in the ventrals, 6 in the anal, 12 in the tail, and 6 in the dorſal. This is much larger than the preceding ſpecies; the body is ſlender, being only an inch thick, though ſometimes nine in length; the head is cylindrical; the body, towards the tail, is five-ſided; and the tail is flat. The head is ſmooth, brown above, white below. The aperture of the mouth is ſmall; the upper jaw protrudes beyond the lower; both are furniſhed with little ſharp teeth. The pupil of the eye is black; the iris ſilvery. The gill-covert, and ſcutum of the breaſt, are brown above, white and rayed below. The back and ſides are olive-coloured, the belly ſilvery. The lateral line is raiſed, ſharp, and compoſed of ſeveral ſmall ſcuta. On each ſide of the belly is a long narrow bony plate, which protrudes; the protruſion of theſe four corners with the ſpine of the dorſal fin give the fiſh the pentagonal form we have mentioned. The pectoral fins are lengthened; the ventrals conſiſt of two ſpines or prickles, of which the firſt is the longeſt; the firſt ray of the anal fin is a bent ſpine; the rays of the other fins are ſoft, and branched; the dorſal fin is oppoſite the anal; the tail-fin is round. The 15 ſpines on the back are bent backwards, and are not ſenſible to the touch when the fiſh has lowered them; they are ſmall compared with thoſe we have mentioned before. This ſpecies is found in the Baltic and North Seas: they are very plenty in Holland, and are often caught near Lubec. Willughby ſays they are never found on the coaſts of Britain; but in that he is wrong. They live on the ova and young of other fiſh, and on worms and inſects; ſmall crabs alſo have been found in their ſtomachs. This ſpecies remain always in the ſea, where they are caught among other fiſh; they are taken eaſily by making a great light, which draws them towards the nets. Lamp-oil is extracted from them, and they ſerve to manure the land: the poor people eat them.

18. Gaſteroſteus ſpinarella, the Indian ſtickleback. Four ſpines on the hind part of the head, the lateral ones as long as the belly. There are 3 rays in the membrane of the gills, 16 in the dorſal fin, 20 in the pectorals, 4 in the ventrals, 8 in the anal. As the ſpines are placed on the hind-head, and not abſolutely upon the back, Cepede, who multiplies genera at a vaſt rate, has created one for this fiſh, *cephalacanthus*, from κεφαλος, the head, and ακανθος, a ſpine or prickle. The head is broader than the body, and ſtriated all over; the two upper ſpines are more ſerrated, broader, but ſhorter, than the others; upon the whole the head ſomewhat reſembles that of the flying trigla. Inhabits India.

19. Gaſteroſteus centrolophus, the creſted ſtickleback. Specific character, a longitudinal creſt, and behind that a row of 3 ſpines, pointing forwards, very diſtinct from each other, but partly concealed under the ſkin. Four rays in the membrane of the gills, 17 in the pectoral fins, 6 in the ventrals, 21 in the anal, 39 in the dorſal fin, tail forked, with 23 rays. This is made a ſeparate genus by Cepede, for the ſame reaſon as the preceding, the ſpines being above the nape. He calls it Centrolophus; from *centron*, Greek, a ſpine, and *lophos*, a creſt. The dorſal and anal fins very low and long. Teeth very ſmall, equal, diſtinct; ſnout rounded; lower jaw longeſt; noſtrils double; the palate and tongue free from aſperities, the latter at liberty, white, dotted with black. The eyes are very large. Scales very ſmall, rhomboidal, and ſtrongly adherent, extending over the head and opercula as well as the body and tail; thoſe on the head extremely minute, and their ſhape not ſo well defined. The lateral line bends downwards, inſtead of following the curvature of the back. This ſingular ſpecies was tranſmitted from citizen Noel, of Rouen, to Cepede; it was caught at Fecamp, and nobody had ever ſeen ſuch a one before. The fiſhermen called it the *negro*, as it is entirely of a black colour; length one foot.

20. Gaſteroſteus acanthias, the ſmall-ſpined ſtickleback. Specific character, four ſmall ſpines before the dorſal fin, three rays in the membrane of the gills. Inhabits the ſeas of Denmark, according to Pontoppidan.

21. Gaſteroſteus glaucus, the blue ſtickleback. Specific character, 5 ſpines on the back, the firſt directed towards the ſnout; the lateral line undulated. This was called *glaucus* by the ancients, according to Rondeletius, from its blue or ſea-green colour. The body is long; the teeth very ſharp; the upper ſurface is of the colour quoted above, but the belly is very white. Fleſh fat, firm, and well-taſted.

GAST'LY, and its derivatives. See GHASTLY.

GAS'TON DE FOIX, duke of Nemours, and nephew of Louis XII. king of France, born in 1488. He was much beloved by his uncle, who called him his own work, and took pride in his opening virtues. He gave Gaſton the government of Milan, and made him general of his army in Italy. The young hero ſignaliſed his valour and abilities in various actions, which terminated in the battle of Ravenna, fought on Eaſter-day, 1512. After he had obtained the victory, he could not be diſſuaded from purſuing a body of Spaniſh infantry which retreated in good order. Making a furious charge on this brave troop, he was thrown from his horſe, and diſpatched by a thruſt of a pike. He periſhed in his twenty-fourth year, and the king's affliction for his death embittered all the joy ariſing from his ſucceſs.

GAS'TORF, a town of Bohemia, in the circle of Leitmeritz: eight miles ſouth-eaſt of Leitmeritz.

GASTOU'NI, a town of European Turkey, in the Morea: twelve miles eaſt of Chiarenza.

GAS'TRELL (Francis), a learned Engliſh prelate, born at Slapton, in Northamptonſhire, about the year 1662. He received his claſſical education at Weſtminſter ſchool, under the famous Buſby, where he was admitted king's ſcholar, and elected thence a ſtudent of Chriſt-church college, Oxford, in 1680. His collegiate ſtudies he proſecuted with great diligence and ſucceſs, and took his degree of bachelor of arts in 1684, and that of maſter of arts in 1687. Soon after this he was admitted into orders, and acquired diſtinguiſhed reputation by the ſolidity, elegance, and uſefulneſs, of his pulpit compoſitions. In 1694 he was admitted to the degree of bachelor of divinity, and was alſo appointed preacher to the honourable ſociety of Lincoln's-inn, London. The manner in which he acquitted himſelf in this reſpectable appointment gave ſo much ſatisfaction to his learned hearers, that in 1697 he was appointed to preach the lecture founded by the honourable Robert Boyle. During the ſame year he publiſhed the eight ſermons preached by him at that lecture, in one continued diſcourſe, that the ſtrength of the proofs therein uſed might appear more plainly from their connection, and entitled The Certainty and Neceſſity of Religion in general; or, the firſt Grounds and Principles of Humane Duty eſtabliſhed, &c. 8vo. As the reaſonings in this diſcourſe were principally intended to counteract the influence of atheiſtical notions, the author very properly determined to follow them up, by a ſeries of arguments in defence of the chriſtian religion againſt the deiſts. Accordingly, in 1699, he publiſhed another diſcourſe as a ſecond part of the ſame important ſubject, entitled The Chriſtian Revelation, and the Neceſſity of believing it eſtabliſhed; in Oppoſition to all the Cavils and Inſinuations of ſuch as pretend to allow Natural Religion, and reject the Goſpel, 8vo. In the year 1700 Mr. Gaſtrell

trell commenced doctor of divinity; at which time he was chaplain to the houſe of commons. In 1702 he was preſented by queen Anne to a canonry of Chriſt-church, in Oxford. At this time the diſpute between doctors South and Sherlock concerning the Trinity, being ſtill kept up with much zeal and ill temper, Dr. Gaſtrell publiſhed Some Conſiderations concerning the Trinity, and the Way of managing that Controverſy, 8vo. which ſoon paſſed through two editions; and coming to a third, in 1707, the author ſubjoined to that edition a vindication of it, in anſwer to ſome animadverſions of Mr. Anthony Collins in his Eſſay concerning the Uſe of Reaſon. In 1707, likewiſe, Dr. Gaſtrell publiſhed his excellent performance, entitled The Chriſtian Inſtitutes, or the ſincere Word of God; being a plain and impartial Account of the whole Faith and Duty of a Chriſtian; collected out of the Writings of the Old and New Teſtament: digeſted under proper Heads, and delivered in the Words of Scripture, 8vo. In the year 1711 Dr. Gaſtrell was choſen proctor in convocation for the chapter of Oxford; and was alſo nominated one of the chaplains in ordinary to queen Anne. In 1714 he publiſhed Remarks upon Dr. Clarke's Scripture Doctrine of the Trinity, to which that eminent man returned an anſwer at the end of his Reply to Mr. Nelſon, with candid and liberal acknowledgments of the learning and ſkill diſcovered by the remarker, and due commendations of the becoming temper and ſpirit with which he had written. Dr. Gaſtrell held the preacher's place at Lincoln's-inn till this year; when he reſigned it upon his promotion to the ſee of Cheſter. Of this dignity the merits of Dr. Gaſtrell rendered him well worthy; and as the revenues attached to it were but ſmall, he was permitted ſtill to hold his canonry of Chriſt-church *in commendam*. Dr. Gaſtrell was much afflicted with the gout during ſeveral years of his life, and at length fell a ſacrifice to that diſorder towards the latter end of 1725, when he was about ſixty-three years of age. His piety and virtues have been highly ſpoken of by his contemporaries; and of his learning and abilities his excellent writings afford ample proof. Beſides the articles already enumerated, he was the author of a ſermon, preached at the anniverſary meeting of the charity ſchools in London, and entitled The religious Education of poor Children recommended; and A moral Proof of a future State, publiſhed without his name. Other anonymous pieces have been attributed to him, but upon uncertain authority.

GAS'TRIC, *adj.* [from γαστηρ, Gr. the belly.] Belonging to the belly or ſtomach.

GASTRIC-JUICE, in phyſiology, a thin pellucid liquor, which diſtils from certain glands in the ſtomach, for the dilution and digeſtion of the food. See the article CHEMISTRY, vol. iv. p. 367.

GASTRIL'OQUIST, *ſ.* [from γαστηρ, Gr. the belly and *loquor*, Lat. to ſpeak.] One who ſpeaks from his belly, without ſeeming to move his lips. The ſame as VENTRILOQUIST.—*Gaſtriloquiſts* are perſons, who have acquired the art of modifying their voice, ſo that it affects the ear of the hearers, as if it came from another perſon, or from the clouds, or from under the earth. *Reid.*

GASTRI'TIS, *ſ.* [Greek; from γαστηρ, the ſtomach.] An inflammation of the ſtomach.

GASTROBRAN'CHUS, *ſ.* in ichthyology, the blind-fiſh, a genus of chondropterygious fiſhes, diſtinguiſhed by two little ſpiracles, or air holes, under the belly. This animal was firſt noticed by Kalm, as a ſpecies of lamprey; Linnæus (who has been followed by many naturaliſts) deſcribed it as a worm, making it his genus *Myxine*, next to the blood-ſuckers or leaches; but Modeer, Retzius, Abilgard, Bloch, Cepede, Turton, and Shaw, conſider it a fiſh. In order to account for this diverſity of opinion amongſt men of ſuch literary eminence, we ſhall be more particular in delineating its external and internal conformation, and have devoted an entire plate to the ſubject.

1. Gaſtrobranchus cæcus, the blind-fiſh. Specific character, no eyes, length not more than twelve inches. The utmoſt endeavours have in vain been taken to diſcover the optical organs, ſo extremely neceſſary in providing nouriſhment and food; and doubtleſs, as they are wanting, this animal muſt be endowed with the ſenſe of feeling in an exquiſite degree, that it may thence diſcover its food, and eſcape danger. It is ſhaped like an eel, and is uniform in thickneſs quite to the tail; very ſlippery; the ſides are reddiſh, the belly white, the back bluiſh. The mouth opens underneath, and is of an oblong ſhape, like that of the lamprey; there are two barbles, or feelers, on each ſide the mouth, and four above; between theſe laſt, there is an aperture, fig. 1. *a.* through which the fiſh, when it has faſtened upon any thing, ſpirts out the water it had ſucked in; and this aperture has a valve, which the fiſh can cloſe at pleaſure. There are two rows of teeth like a comb, the ſhape of which is ſeen at fig. 4. *bb.* there are nine in the upper range, eight in the lower, and they are of a bony ſubſtance, not cartilaginous as in the lamprey. In the palate there is a wrinkled membrane ſurrounding an oblong ſlit, fig. 3. *a.* by which the water paſſes to the aperture mentioned above; behind this ſlit is a recurved tooth, fig. 4. *a.* and then comes the aperture of the throat. The wrinkled membrane mentioned above is ſuppoſed by Cepede to be the organ of ſmell. There is no tongue, noſtrils, lateral line, ſcales, pectoral or ventral fins. The dorſal, anal, and tail, fins, are low, or narrow, and run into one, furniſhed with ſoft flexible rays, which cannot be counted becauſe of the thick membrane which covers them. Down both ſides, from head to tail, is a row of little apertures, fig. 1. *cc.* which produce a viſcous humour in great abundance. The two gills appear on the belly, as at fig. 2. *a.* and the anus is a long ſlit, fig. 2. *b.* there is a projecting line between them.

On the ſubject of the viſcoſity, or ſlime, produced by this fiſh, Kalm writes as follows: "I put one of theſe fiſh into a large veſſel of freſh ſea-water; in one hour the water was filled with a white clammy matter, like clear tranſparent glue; with a quill or ſtick it might be drawn out in threads, which would dry in the air; on ſtirring it about, this ſlime would ſtick about the inſtrument to the thickneſs of an inch, and then appeared like a covering of ice; at laſt the water became ſo thick, that, drawing it out in ropes, the fiſh was brought away with it. Freſh water was poured in; which, in about a quarter of an hour, became nearly as thick as the firſt. And I have been aſſured, that a boat half-full of water, if only one of theſe fiſhes were left in it, would, in a few hours, be entirely converted into this gluey matter." This fiſh, one would ſuppoſe, might be uſed with profit in the making of glue; but hitherto we believe this has never been done. The viſcoſity, or ſlime, is probably given to this animal as a defence from danger, to which the want of ſight muſt continually expoſe it. This fiſh is ten or twelve inches long; it is found in Denmark, Sweden, Norway, and Greenland. It can live only three or four hours out of the water. Among its ſingularities muſt be reckoned its mode of feeding, or gaining its nouriſhment: it faſtens by ſuction upon ſome fiſh, and with its comb-ſhaped teeth tears their fleſh, and they cannot ſhake it off, becauſe it hooks itſelf ſtill more ſecurely by means of the recurved tooth which we have deſcribed in the palate; but it ſeems impoſſible that this fiſh ſhould find its way by the anus into the body of the *gadus callarias*, or aſellus, to gnaw its inſide, as Gunner aſſerts; it is much more probable that thoſe fiſhes in whoſe body this has been found, have ſwallowed it, as they are moſtly voracious fiſh within whom it is ſaid to have been found.

It will appear from what has been ſaid, that the outward ſtructure of this fiſh is different in many points from all others hitherto known. Its interior conforma-

tion

tion differs no leſs. Removing the ſkin from the neck, a long, round, hollow, muſcle, appears, fig. 3. *b.* which encloſes a longer conical muſcle, which eaſily ſeparates, fig. 4. *dd.* The interior muſcle terminates towards the jaws in two broad tendons, the exterior in two narrow tendons. Theſe muſcles contain ſeveral parcels of filaments running tranſverſely. Behind theſe muſcles is the gullet, which, without widening much, paſſes to the inteſtinal canal, and this runs, without any ſinuoſity, to the anus; but the canal has ſeveral folds running lengthwiſe. The aqueous veſſels begin at fig. 3. and 4. *cc.* and conduct the water into ſmaller veſſels leading to the back and its veſſels; the aqueous veſſels at fig. 4. *ee.* carry the water towards the mouth, fig. 3. *ee.* whence it runs out, or elſe paſſes through the aperture above. The heart, fig. 3. *f.* ſends the blood to each veſicle through a branch of the great artery which covers the heart, and which divides into an infinity of ſmall veſſels. The large arteries and their branches being removed, there appear along the ſpine of the back as many veins, fig. 4. *ff.* conducting the arterial blood to the vena cava, which ſends it back to the heart. This arrangement cools the blood by means of the ſmall veſſels, which, in other fiſhes, is performed by the gills and their apertures. The lampreys, the rays, and the ſharks, have alſo fixed and immoveable gills; they breathe therefore as this does, with this difference, firſt, that the blood-veſſels are there ſeparated by a ſkin ſomewhat bending, while theſe veſſels in the preſent ſubject are ſtretched upon a rounded ſkin; ſecondly, the former ſuck in water through ſeven apertures, the latter has but two for that purpoſe. As the ſhark has five gills, the lamprey ſeven, our fiſh, which has ſix, ſhould, in the ſyſtem, be placed between theſe two genera. However, this is not the only fiſh with veſicular gills; the little ſea-horſe has veſſels inſtead of fringes at the gills.

The liver is in two parts, fig. 3. *gg.* of which the lower is the largeſt. On one ſide the inteſtinal canal appear the eggs, fig. 3. *h.* on the other a long and narrow kidney, *i.* the eggs are held together by a very thin membrane. Another fiſh which was examined contained beſides theſe ſmall eggs, ſeveral others of an oblong ſhape, of the ſize repreſented at fig. 4. *gggg.* they lie along the ſpine of the back, from the diaphragm nearly to the anus. Theſe eggs differ conſiderably from thoſe of fiſhes in general; they reſemble the ova of ſerpents. And in this fiſh the vent is much longer than in moſt others, and like the *ſilurus aſcitus*; but whether the eggs are hatched in the belly of the animal, ſo as to make this fiſh belong to the viviparous claſs, can only be determined by accurate obſervers on the ſpot where they breed. The pituitary glands are ranged on each ſide, as at fig. 4. *hh.* their outward orifices have been already ſhewn at fig. 1. *cc.*

2. Gaſtrobranchus magnus, the large blind-fiſh. Specific character, no eyes, length more than twelve inches. This is deſcribed by Cepede from a dried ſpecimen brought to the national muſeum at Paris by Dombey, and never noticed before. It is evidently of the ſame family, but belongs to another climate, being found about Chili, and probably in other parts of South America. It is at leaſt twice as long and thick as the preceding; the head is rounded, and thicker than the body; there were four barbles from the upper lip, but from the decayed ſtate of the ſpecimen it could not be determined whether there had been two depending from the lower lip, or not. The teeth were ſharp, compreſſed, triangular, and diſpoſed in two circular rows, the outer row conſiſting of twenty-two teeth, the inner of fourteen; a tooth longer than the reſt, and bent backwards, appears in the upper part of the mouth. The natural colours of this fiſh could not be determined. The tail is ſhort, rounded at the tip, and its fin unites to the anal. Theſe are the only fins; they are very ſhort, hardly perceptible, and conſiſting of membranes, but the rays could not be diſcerned in the dried ſpecimen.

GAS'TROCELE, *ſ.* [Greek; from γαστηρ, the ſtomach, and κηλη, a tumour or hernia.] A tumour or rupture of the ſtomach.

GASTROCNE'MIUS, *ſ.* [Greek; from γαστηρ, abelly, and κνημη, the leg.] A muſcle forming the belly or thick part of the leg.

GASTROCOL'ICUS, *ſ.* [Greek; from γαστηρ, the ſtomach, and κολον, the colon.] A medical term applied to a vein which proceeds from the ſtomach to the colon.

GASTRODYN'IA, *ſ.* [Greek; from γαστηρ, the ſtomach, and οδυνη, pain.] A pain or diſorder in the ſtomach.

GASTROL'ATER, *ſ.* [from γαστηρ, the belly, and λατρευω, Gr. to worſhip.] A glutton, one that makes a god of his belly. *Scott.*

GASTROL'OGY, *ſ.* [from γαστηρ, the belly, and λογος, Gr. a deſcription.] A treatiſe on the ſtomach and omentum.

GAS'TROMANCY, *ſ.* [γαστηρ, belly, and μαντεια, Gr. divination.] A ſpecies of divination practiſed among the ancients by the art of the ventriloquiſt, or by words ſeeming to come out of the belly. There is another kind of divination called *gaſtromancy*, which is performed by means of round tranſparent glaſſes, within which certain figures appear by magic art; and ſo called, becauſe the figures appear as in the *belly* of the veſſels.

GASTROR'APHY, *ſ.* [γαστηρ and ραπτω, Gr.] In ſtrictneſs of etymology this word ſignifies no more than ſewing up any wound of the belly; yet in common acceptation it implies, that the wound of the belly is complicated with another of the inteſtine. *Sharp.*

GASTROT'OMY, *ſ.* [*gaſtrotomia*, Lat. of γαστηρ, the belly, and τεμνω, to cut.] The operation of cutting open the belly and uterus, as in the Cæſarean operation.

GAT, the preterit of *get*.—Moſes *gat* him up into the mount. *Ex.* xxiv. 18.

GA'TA, a town of Spain, in the province of Eſtramadura, on a river of the ſame name: fifteen miles north-north-weſt of Corea.

GA'TA, a river of Spain, which riſes near the town of Gata, and runs into the Alagon, fifteen miles ſouth-weſt of Corea.

GAT'AKER (Thomas), a learned Engliſh divine, critic, and commentator, born in the parſonage-houſe of St. Edmund the King, in London, of which pariſh his father was incumbent, in 1574. He gave early indications of an uncommon genius, a moſt retentive memory, and ſurpriſing application. Having paſſed through the claſſes in the grammar-ſchool at ſixteen years of age, he was ſent in 1590 to St. John's college, Cambridge, where he diſtinguiſhed himſelf by the exemplarineſs and modeſty of his manners. He became an early proficient in the Greek tongue, and at the ſame time made himſelf maſter of the Hebrew; and he was held in ſo high eſteem for his learning and piety, that the truſtees of Sidney college, of which the foundation was laid in 1596, appointed him one of the fellows of that inſtitution, even before the building was erected. He at length quitted the univerſity, and, about the year 1601, he was elected preacher to the ſociety of Lincoln's Inn, the duties of which he diſcharged for ten years, much admired and careſſed by his reſpectable and learned auditory. In 1603, he took his degree of bachelor of divinity at Cambridge; and in 1611, having entered into the matrimonial ſtate, he was preſented to the rectory of Rotherhithe, in Surry, with which he was importuned to retain his former office; but he reſigned it, to the great regret of the learned body who had ſo long profited under his miniſtry. After entering on his new cure, he applied himſelf to the diſcharge of his paſtoral functions with great diligence and fidelity, notwithſtanding that for a long time he was afflicted by an almoſt perpetual headach, to which, very probably, his late and early ſtudies did not a little contribute. Mr. Gataker now main-

The Blind Fish, or Myxine glutinosa of Linnæus.

London Published as the Act directs. Febʸ 2. 1806. by J. Wilkes.

tained a literary correſpondence with Dr. Uſher, afterwards archbiſhop of Armagh, on the ſubject of ſome curious manuſcripts which he poſſeſſed, and among others of the famous Robert Groſthead, biſhop of Lincoln. Several of theſe letters are preſerved in the collection ſubjoined to the Life of Archbiſhop Uſher, by Dr. Richard Parr, and afford evidence not only of his profound erudition and critical acumen, but of his great modeſty and humility, and of the high eſteem in which he was held by that learned prelate. He publiſhed a volume of his ſermons, under the title Of the Nature and Uſe of Lots, a Treatiſe hiſtorical and theological, 1619, 4to. This work is diſtinguiſhed by great accuracy of method, acuteneſs of reaſoning, profound learning, perſpicuity, and elegance of ſtyle for the time in which it was written. It was deſervedly received with much applauſe by the greater part of the learned world; but at the ſame time it excited the ſtrictures of ſome individuals, with whom the author afterwards engaged in controverſy.

When, in 1642, the aſſembly of divines was appointed to ſit at Weſtminſter, Mr. Gataker was nominated one of that body, and attended in his place, from a pure deſire of rendering what ſervice he could to the religious intereſts of his country at that momentous criſis. Mr. Gataker alſo engaged with other members in writing the Annotations upon the Bible, which were publiſhed in the name of the aſſembly, and was, in particular, the author of thoſe upon Iſaiah, Jeremiah, and the Lamentations, which have been generally allowed to poſſeſs great merit. While he was thus employed, the earl of Mancheſter offered him the maſterſhip of Trinity college, which was the beſt preferment in the univerſity of Cambridge; but he declined it, partly from his ill ſtate of health, and partly on account of his devoting what time he could to the compoſition of two works, in which his learning and talents were advantageouſly diſplayed. The firſt was entitled *De Nomine Tetragrammato Diſſertatio, quâ Vocis Jehovah apud noſtros receptæ Uſus defenditur*, &c. 1645, 8vo. It has been often reprinted, and is inſerted among the author's *Opera Critica*, printed at Utrecht in 1698, folio, under the care of the celebrated Hermann Witſius. In the ſame collection may be found the other learned work, entitled *De Dipthongis ſive Bivocalibus Diſſertatio philologica, in qua Literarum quarundarum Sonus germanus Natura genuina Figura nova & Scriptura vetus veraque inveſtigatur*, 1646, 8vo. In 1648, he preſented to the world a work on the ſtyle of the New Teſtament, which juſtly gained him the character of being one of the ableſt philologiſts of his age. Its title is, *Thomæ Gatakeri Londinatis de Novi Teſtamenti Stylo Diſſertatio: qua Viri doctiſſimi Sebaſtiani Pfochenii de Linguæ Græcæ Novi Teſtamenti Puritate, in qua Hebraiſmis quæ vulgo finguntur quam plurimis larva detrahi dicitur Diatribe ad Examen revocatur*, &c. 4to. This work was but the *præcurſor* to a larger one of the ſame nature, of great uſe in illuſtrating the ſenſe of difficult paſſages in the Old and New Teſtaments. It is entitled *Thomæ Gatakeri Londinatis Cinnus; ſive Adverſaria miſcellanea Animadverſionum variarum, Libris ſex comprehenſa*, &c. 1651, 4to. The remaining books of this collection were publiſhed after the author's death by his ſon, Charles Gataker, under the title of *Adverſaria Miſcellanea-Poſthuma*, &c. 1659, folio. The pieces laſt mentioned are to be found in the author's *Opera Critica*. In 1651, Mr. Gataker alſo publiſhed a learned Latin diſcourſe on infant baptiſm, entitled *De Baptiſmatis Infantilis Vi & Efficacia Diſceptatio privatim habita inter V. C. Dom. Samuelem Wardum, Theol. Sac. Doct. & in Acad. Cantab. Prof. & Thomam Gatakerum*, 8vo. Three years afterwards he publiſhed another treatiſe on the ſame ſubject, entitled *Strictura ad Epiſtolam Joannis Davenantii de Baptiſmo Infantum*, 8vo. In 1652, he gave to the world his excellent edition of the emperor Antoninus's Meditations, with a valuable preliminary diſcourſe on the philoſophy of the Stoics. In the evening of his days he was attacked by the famous aſtrologer William Lilly, in his *Annus Tenebroſus*, becauſe that in the annotations on Jeremiah, ch. x. ver. 2, he had, with great ſenſe and learning, expoſed the vanity and abſurdity of the pretended ſcience of judicial aſtrology. Mr. Gataker's growing infirmities now indicated that his end was approaching; and ſoon after the publication of the piece laſt mentioned, he was ſeized with a fever, which proved fatal to him in the eightieth year of his age. Echard ſays of him, that he was "the moſt celebrated among the aſſembly of divines, being highly eſteemed by Salmaſius, and other foreigners; and it is hard to ſay which is the moſt remarkable, his exemplary piety and charity, his polite literature, or his humility and modeſty in refuſing preferments."

GA'TAM, [Heb. lowing of cattle.] A man's name.

GATE, *ſ.* [ȝeat, Sax.] The entrance or door of a city, caſtle, palace, or large building:

Open the *gate* of mercy, gracious God!
My ſoul flies through theſe wounds to ſeek thee. *Shakeſ.*

A frame of timber upon hinges, to give a paſſage into encloſed grounds:

Know'ſt thou the way to Dover?
—Both ſtile and *gate*, horſeway and footpath. *Shakeſ.*

An avenue; an opening.—Auſtria had done nothing but wiſely and politickly, in ſetting the Venetians together by the ears with the Turks, and opening a *gate* for a long war. *Knolles.*

In primitive times, the gates of cities were the places of judicature and common reſort. Here the governors, or elders of the city, met to hear complaints, adminiſter juſtice, make conveyances of titles and eſtates, and to tranſact all the affairs of the place, whence that verſe in the Pſalms, "They ſhall not be aſhamed when they ſpeak with their enemies in the gate," i. e. when they are accuſed by them before the court of magiſtrates. It is probable that the room, or hall, where the magiſtrates ſat, was over the gates, becauſe, in the ſcriptures, Boaz is ſaid to go up to the gate. The like did David, when he went to weep for the death of Abſalom. How conſiderable they became in time for largeneſs and ſumptuouſneſs, appears by the two kings of Iſrael and Judah being preſent at one of them in all their royal ſplendor, and convening thither four hundred prieſts of Baal, beſides their own guards and officers. It ſeems as if theſe places had been at firſt choſen for the conveniency of the inhabitants, who being all huſbandmen, and forced to paſs and repaſs, morning and night, as they went and came from their labour, might be more eaſily called as they went by, whenever they were wanted to appear in any buſineſs. Theſe gates were likewiſe markets for proviſions, like thoſe of the Romans, as appears by the prophet Elijah's foretelling an incredible plenty to happen the next day in the midſt of a famine, at the gates of Samaria. Thoſe who preſided were the elders, the heads of the people, the judges, and the officers. Abraham could not make his purchaſe from Ephron the Hittite, without having recourſe to the city gates.—See Gen. xxiii. 10.

GATE, at the end of the names of places, ſignifies a way or path, from the Saxon ȝeat, i. e. *porta*. The cuſtody of the gates of the city of London, is granted to the lord mayor, by charter king Henry IV.

GA'TEHOUSE, a town of Scotland, in the county of Kircudbright, ſituated near the mouth of the Fleet, not far from the Iriſh ſea, with a cotton manufacture. Sloops come up near to the town: thirteen miles weſt of Kircudbright, and ſixteen ſouth-weſt of New Galloway.

GATES, a county of the American States, in Edenton eaſtern diſtrict, north of Carolina, bounded on the north by the ſtate of Virginia, and ſouth by Chowan co. It contains 5392 inhabitants: chief town, Hertford.

GA'TESHEAD, a village of England, in the county of

of Durham, on the ſouth ſide of the Tyne, oppoſite to Newcaſtle, to which it appears like a ſuburb; celebrated for its grindſtones, which, under the name of Newcaſtle, are exported to all parts of the world.

GA'TEVEIN, *ſ.* The great vein which conveys the blood to the liver. *Bacon.*

GA'TEWAY, *ſ.* A way through gates of incloſed grounds.—*Gateways* between incloſures are ſo miry, that they cannot cart between one field and another. *Mortimer.*

GATH, a city of the Philiſtines, and the capital of the lordſhip of the Gittites: here part of the Anakims, the ancient terror of the Iſraelites, retreated after their expulſion from Canaan by Joſhua; and here the ark of God was carried in triumph during its captivity in this country, to the great terror and deſtruction of its inhabitants. Gath was ſettled as a frontier town of Philiſtia, on the borders of Iſrael, in the days of Samuel; and in the reign of Saul king of Iſrael, Goliath, a man of gigantic ſtature, and a native of this place, openly defied the armies of Iſrael, and was overcome by David, who in this gained a ſignal victory for Iſrael; for the Philiſtines, finding their champion defeated, immediately fled, and were purſued by the Iſraelites with great ſlaughter, to the gates of Ekron and of this city. Here David afterwards fled to avoid the fury of Saul; and we are informed that ſix hundred Gittites followed David from this place, who remained attached to his intereſt even during the rebellion of Abſalom. After this, in the wars of David with the Philiſtines, Gath and its dependencies ſurrendered to him; and in a ſubſequent battle, near this place, the race of Goliath was totally extirpated, and Gath very probably rendered of no conſequence, as nothing more occurs reſpecting it till Rehoboam's reign, who is ſaid to have built or rebuilt and fortified this city, with many others, for the defence of his kingdom. It was taken from Judah by Hazael king of Syria in the reign of Joaſh; and we again find it poſſeſſed by the Philiſtines in the reign of Uzzah, who, in his wars with them, deſtroyed the wall of Gath. See Joſh. xi. 21. xiii. 3. 1 Sam. v. 8. vii. 14. xvii. xxvii. 2 Sam. xv. 18, &c. 2 Kings, xii. 17. 1 Chron. xviii. 1. xx. 4, &c. 2 Chron. xi. 8. xxvi. 6.

GATH-HE'PHER, a city of Paleſtine, the birth-place of the prophet Jonah. 1 Kings, xiv. 25.

GATH-RIM'MON, a city of Paleſtine, ſituated in the tribe of Dan; and one of the cities of the Levites of the family of Kohath. Joſh. xix. 45. and xxi. 24. Alſo the name of another city of Paleſtine, ſituated in the half tribe of Manaſſeh weſt of Jordan, and one of the cities of the Levites of the family of Kohath. Joſh. xxi. 25.

To GATH'ER, *v. a.* [ȝaðeꝛian, Sax.] To collect; to bring into one place.—*Gather* ſtones—and they took ſtones and made an heap. *Gen.*—To get in harveſt.—The ſeventh year we ſhall not ſow, nor *gather* in our increaſe. *Lev.* xxv. 20.—To pick up; to glean.—Caſt up the highway, *gather* out the ſtones. *If.* lxii. 10.—To crop; to pluck:

What have I done?
To ſee my youth, my beauty, and my love,
No ſooner gain'd, but ſlighted and betray'd;
And like a roſe juſt *gather'd* from the ſtalk,
But only ſmelt, and cheaply thrown aſide,
To wither on the ground! *Dryden.*

To aſſemble.—They have *gathered* themſelves together againſt me. *Job.*—To heap up; to accumulate.—He that by uſury and unjuſt gain increaſeth his ſubſtance, ſhall *gather* it for him that will pity the poor. *Proverbs.*—To ſelect and take.—Save us, O Lord, and *gather* us from among the heathen, to give thanks unto thy holy name. *Pſ.* cvi. 47.—To ſweep together.—The kingdom of heaven is like unto a net that was caſt into the ſea, and *gathered* of every kind. *Mat.* xiii. 47.—To collect charitable contributions. To bring into one body or intereſt.—I will *gather* others to him, beſides thoſe that are *gathered* unto him. *If.* lvi. 8.—To draw together from a ſtate of diffuſion; to compreſs; to contract:

Immortal Tully ſhone,
The Roman roſtra deck'd the conſul's throne;
Gath'ring his flowing robe he ſeem'd to ſtand,
In act to ſpeak, and graceful ſtretch'd his hand. *Pope.*

To gain:

He *gathers* ground upon her in the chace;
Now breathes upon her hair with nearer pace. *Dryden.*

To collect logically; to know by inference.—From this doctrine of the increaſing and leſſening of ſin in this reſpect, we may *gather*, that all ſins are not alike and equal, as the ſtoics of ancient times, and their followers, have falſely imagined. *Perkins.*

Return'd
By night, liſtening where the hapleſs pair
Sat in their ſad diſcourſe, and various plaint,
Thence *gather'd* his own doom. *Milton.*

To pucker or draw together in needlework.

To GATHER *Breath.* [A proverbial expreſſion.] To have reſpite from any calamity:

The luckleſs lucky maid
A long time with that ſavage people ſtaid,
To *gather breath*, in many miſeries. *Spenſer.*

To GATH'ER, *v. n.* To be condenſed; to thicken:

When the rival winds their quarrel try,
South, Eaſt, and Weſt, on airy courſers borne,
The whirlwind *gathers*, and the woods are torn. *Dryden.*

To grow larger by the accretion of ſimilar matter.—Their ſnow-ball did not *gather* as it went; for the people came in to them. *Bacon.*—To aſſemble.—There be three things that mine heart feareth: the ſlander of a city, the *gathering* together of an unruly multitude, and a falſe accuſation. *Eccl.* xxvi. 5.—To generate pus or matter.—Aſk one, who by repeated reſtraints hath ſubdued his natural rage, how he likes the change, and he will tell you 'tis no leſs happy than the eaſe of a broken impoſthume after the painful *gathering* and filling of it. *Decay of Piety.*

GATH'ER, *ſ.* Pucker; cloth drawn together in wrinkles:

Give laws for pantaloons,
The length of breeches, and the *gathers.*
Part cannons, periwigs, and feathers. *Hudibras.*

GATH'ER-BAG, *ſ.* With hunters, the membrane incloſing a red deer in the hind's belly. *Phillips.*

GATH'ERER, *ſ.* One that gathers; one that collects; a collector.—I will ſpend this preface about thoſe from whom I have gathered my knowledge; for I am but a *gatherer* and diſpoſer of other men's ſtuff. *Wotton.*—One that gets in a crop of any kind.—I was a herdman and a *gatherer* of ſycamore fruit. *Amos.*

Nor in that land
Do poiſonous herbs deceive the *gatherer's* hand. *May.*

GATH'ERING, *ſ.* Collection of charitable contributions.—Let every one lay by him in ſtore, that there be no *gatherings* when I come. 1 *Cor.* xvi. 2.

GATINOI'S, or GASTINOIS, before the revolution, a province of France, which had in the eleventh century counts of its own; it was afterwards joined to Anjou. Of late years, it has partly belonged to the government of Orleans, and partly to the government of the Iſle of France, and diſtinguiſhed by the names of *Gatinois-Orleanois* and *Gatinois-François.* It now forms part of the departments of the Seine and Marne, Seine and Oiſe, and Loiret.

GATSCH, a town and caſtle of Hungary: twelve miles eaſt of Korpona.

GATT, a ſtrait of the ſea, between the Frich-Haff and the German Ocean.

GAT'TEN-TREE, *ſ.* The cornelian cherry. See CORNUS *maſcula*, vol. v. p. 212.

GATTEVIL'LE, a town of France, in the department of the Channel, a little to the north of Barfleur.

GATTINA'RI, a town of Italy, in the lordſhip of Vercelli, on the Seſia: it contains one parochial and ſeveral other churches and convents: ſix miles ſouth of Borgo di Seſia, and fifteen miles north of Vercelli.

GAT'TON. See AGATTEN.

GAT'TON, an ancient borough in the county of Surrey, three miles from Ryegate, and twenty from London. It was formerly a conſiderable town, though now reduced to a ſmall village. From the number of coins and other antiquities found here, it is ſuppoſed to have been a Roman ſtation. It was once deſtroyed by the Danes. It is a borough by preſcription; and has ſent members to parliament ever ſince the 29th of Henry VI. The river Mole riſes at Gatton; where it is noted for a valuable quarry of white free-ſtone.

GAU, GAW, GOU, or GOW, a termination in the German language, which ſignifies country, canton, or diſtrict.

GAV'ALS, a town of Ruſſia, in the government of Viborg: twenty-eight miles ſouth of Viborg.

GAVAN'TI (Bartholomew), a learned Italian writer, born at Monza, in the Milaneſe, about the year 1568. He entered into the congregation of clerks regular of St. Paul, called *Barnabites*, at Milan, and applied with great diligence to the ſtudy of the Greek and Hebrew languages, theology, and eccleſiaſtical antiquities. The reputation to which he roſe for his acquaintance with the ceremonials of the Romiſh church, its rubrics, and diſcipline, occaſioned his being called to Rome by pope Clement VIII. who appointed him to one of the principal poſts in the congregation of rites; and he was alſo elected general of his order. He died at Milan in 1638, in his ſeventieth year. He was the author of a work entitled *Theſaurus Sacrorum Rituum, &c.* which made its firſt appearance in 1627. It conſiſts of a commentary on the Rubrics of the Miſſal, and Roman Breviary, which has been very widely circulated, and paſſed through more than twenty editions, of which the beſt was publiſhed at Turin, with additions, by Merati, in 1736–1740, five volumes 4to. with engravings. An abridgment of it in the Latin language, and a tranſlation of the ſame into French, by Claude Arnaud, were publiſhed at Paris towards the middle of the ſeventeenth century. Gavanti was alſo the author of *Manuale Epiſcoporum*, 4to. and a Latin treatiſe On the Manner of conducting Diocеſan Synods, 1639, 4to.

GAU'BIL (Antony), a diſtinguiſhed Jeſuit, born at Caillac, in 1708. He was ſent by his ſociety as a miſſionary into China, where he paſſed thirty-ſix years, ſupporting by his aſtronomical knowledge and general ſcience, that reſpectability which the Jeſuits above all other Europeans have maintained among a people of ſuch diſſimilar manners. He obtained a knowledge of the Chineſe hiſtory and literature, which ſurpriſed the learned natives themſelves. He publiſhed A Hiſtory of Gentchiſcan, and of all the Dynaſty of the Mongous his Succeſſors, Conquerors of China; drawn from the Hiſtory of China; Paris, 1739, 4to. Gibbon ſays of it, "This tranſlation is ſtamped with the Chineſe character of domeſtic accuracy and foreign ignorance." He alſo gave a tranſlation of the Chouking; Paris, 1771, 4to. and he ſent ſeveral memoirs to father Souciet and Freret, which they have uſed in their works. This learned and laborious father died in 1759.

GAU'BIUS (Jerome-David), profeſſor of medicine at Leyden, and fellow of the royal ſociety of London, born in 1705, at Heidelberg. He received the firſt part of his education among the Jeſuits; but a fear leſt he ſhould be obliged to abjure his religion, induced his father to place him under the care of Franke, in the Orphan-houſe of Halle. The diſcipline in this eſtabliſhment, to which he had been entirely unaccuſtomed, was ſo ſevere, that he begged to be removed from it, and with this requeſt his father complied, and ſent him to Amſterdam to his brother John, a celebrated practitioner in medicine. His attention was now devoted to the ſtudy of phyſic, which he afterwards purſued with more diligence at Hardwyk, where he reſided a year; but the great celebrity of Boerhaave induced him to repair to Leyden, and this proved to him a fortunate change, as the penetrating eye of that immortal phyſician ſoon diſcovered the latent genius of his pupil, and thoſe talents by which he afterwards diſtinguiſhed himſelf. When Boerhaave, oppreſſed by his great labours and increaſing years, had reſolved to reſign his chemical chair, Gaubius, in conſequence of his recommendation, was appointed to ſucceed him. In 1738, he publiſhed his Inſtructions for writing Recipes, which gained him great and deſerved eſteem. But the moſt important of his works, is his Principles of Noſology, in which he ſhewed himſelf not unworthy of his great preceptor. He next publiſhed, in 1771, *Adverſaria varii Argumenti*, which was particularly intereſting to chemiſts; and in 1775 he excited conſiderable notice by his oration, delivered on the two-hundredth anniverſary of the foundation of the academy of Leyden, in which he traced out the principal epochs of the arts and ſciences in Holland. Beſides theſe and other works, Gaubius was the author of ſeveral papers in the Tranſactions of the Society of Haerlem, and ſuperintended new editions of different works, ſuch as, *Cramer's Elementa Artis Docimaſticæ*, Lug. Bat. 1749; *Albinus de Preſagienda Vita & Morte*, ibid. 1733: and he had a great ſhare in the tranſlation of Swammerdam's Book of Nature. He enjoyed the happineſs of continued good health to his ſeventieth year, and died on the 29th of November, 1780, at the age of ſeventy-five. His works, beſides thoſe already mentioned, are, *Inſtitutiones Pathologicæ Medicinalis*, Lug. Bat. 1758, 8vo. The ſcarcity of this valuable manual of pathology in Germany, and its great utility in academical lectures, induced profeſſor Ackerman of Altdorf to give a fourth edition of it, at Nuremberg, in 1787, with a great many additions, which tend partly to illuſtrate obſcure paſſages of the original, and partly contain new diſcoveries. *De Regimine Mentis quod Medicorum eſt, Sermo prior & alter*, Lug. Bat. 1747, 1764, 8vo. Argent. 1776, 8vo.

GAUDE, *ſ.* [The etymology of this word is uncertain: Skinner imagines it may come from *gaude*, French, a yellow flower, yellow being the moſt gaudy colour. Junius, from αγανος; and Mr. Lye finds *gaude*, in Douglaſs, to ſignify deceit or fraud, from *gwawdio*, Welſh, to cheat. It ſeems moſt eaſily deducible from *gaudium*, Latin, joy; the cauſe of joy; a token of joy: thence aptly applied to any thing that gives or expreſſes pleaſure.] An ornament; a fine thing; any thing worn as a ſign of joy. *It is not now much uſed:*

He ſtole th' impreſſion of her fantaſy,
With bracelets of thy hair, rings, *gaudes*, conceits,
Knacks, trifles, noſegays, ſweetmeats. *Shakeſpeare.*

Some bound for Guinea, golden ſand to find,
Bore all the *gaudes* the ſimple natives wear;
Some for the pride of Turkiſh courts deſign'd,
For folded turbants fineſt holland bear. *Dryden.*

To GAUDE, *v. a.* [*gaudeo*, Lat.] To exult; to rejoice at any thing:

Go to a goſſip's feaſt, and *gaude* with me,
After ſo long grief ſuch nativity. *Shakeſpeare.*

GAU'DEN, or GAWDING (John), an eminent Engliſh prelate, born in 1605, at Mayland, in Eſſex, of which pariſh his father was miniſter. He received his grammar-learning at Bury St. Edmund's; whence, at ſixteen years of age, he was ſent to St. John's college in Cambridge. About the year 1630, he married a daughter of ſir William Ruſſel, bart. of Chippenham, in Cambridgeſhire, and, removing to Oxford, became a member of Wadham college. In 1635, he was admitted to the degree of bachelor in divinity; and was afterwards appointed chaplain to Robert earl of Warwick, and pre-

ferre

ferred to the rectory o Brightwell, in Berkſhire, and to the vicarage of Chippenham in Wilts. The earl of Warwick's politics being in direct oppoſition to thoſe of the court, his chaplain embraced the ſame ſide, and preached a ſermon before the houſe of commons in November, 1640, which proved ſo acceptable to them, that they voted him a preſent; and in 1641, he proceeded to the degree of doctor of divinity, and was preſented by the parliament to the valuable deanery of Bocking, in Eſſex. When the *covenant* was under diſcuſſion in the houſes of parliament, Dr. Gauden publiſhed a treatiſe againſt it, entitled, Certain Scruples and Doubts of Conſcience about taking the Solemn League and Covenant, &c. 1643, 4to. but after ſubſcription to it was enjoined by the votes of the lords and commons, he complied, and by that means retained his valuable livings. During the year 1648, the celebrated treatiſe entitled Εικων Βασιλικη, or the Portraiture of his Sacred Majeſty King Charles, in his Solitude and Sufferings, was firſt printed, and before the cloſe of it went through ſeventeen editions in England, beſides different impreſſions on the continent. That Dr. Gauden was the principal inſtrument in bringing it before the public, cannot be diſputed; and that he had a conſiderable ſhare in drawing it up, ſeems upon the whole more probable than that it was a production of king Charles himſelf. By aſcribing this treatiſe to the king, however, the moſt favourable impreſſions were created, both at home and abroad, of his piety, meekneſs, and humanity; and lord Shafteſbury ſuppoſes that it contributed, in a great meaſure, to procure for him in the church, the titles of *ſaint* and *martyr*. Dr. Gauden alſo publiſhed, *Hieraſpiſtes*, or, a Defence of the Miniſtry and Miniſters of the Church of England, 1653, 4to. The Caſe of Miniſters Maintenance by Tythes, plainly diſcuſſed in Conſcience and Prudence, 4to. A Treatiſe of Chriſtian Marriages, 1654, 4to. A petitionary Remonſtrance to Oliver, Protector, 1659, 4to. and Ιερα Δακρυα; *Eccleſiæ Anglicanæ Suſpiria*: the Tears, Sighs, Complaints, and Prayers, of the Church of England, ſetting forth her former Conſtitution, compared with her preſent Condition; alſo the viſible Cauſes, and probable Cures, of her Diſtempers; in four Books, 1659, folio.

After the death of biſhop Brownrigg, in 1659, Dr. Gauden was choſen his ſucceſſor as preacher at the Temple; and upon the reſtoration of Charles II. in the following year, he was made chaplain to his majeſty. He now zealouſly devoted himſelf to further all the meaſures of the court; and in a few months he publiſhed his *Antiſacrilegus*, or a Defenſative againſt the Plauſibleneſs or gilded Poiſon of that nameleſs Paper (ſuppoſed to be the plot of Dr. Cornelius Burgeſs and his partners) which attempts the King by the Offer of 500,000l. to make good by an Act of Parliament to the Purchaſers of Biſhops, &c. Lands, or illegal Bargain for ninety-nine Years, 4to. his ΑΝΑΑΥΣΙΣ: the looſing of St. Peter's Bands; ſetting forth the true Senſe and Solution of the Covenant in point of Conſcience, ſo far as it relates to the Government of the Church by Epiſcopacy, 4to. and his Analyſis of the Covenant, 4to. Dr. Gauden was not ſo modeſt but that he could plead with the king the merit of his ſervices to the church in theſe performances, and could dwell particularly on the honour which he had been the means of rendering to his father's memory, by publiſhing the Εικων Βασιλικη; in recompence of which he was promoted to the vacant ſee of Exeter, before the cloſe of the year 1660. That appointment proved a very beneficial one; for, from the fines for the renewal of leaſes, which had not been levied during the abolition of epiſcopacy, in a few months he realiſed the ſum of twenty thouſand pounds. But his ambition was not ſatisfied, and he loſt no opportunity of urging the king to tranſlate him to a better ſee; alleging that Exeter *had a high rack but a low manger*, and pleading his deſert and great ſervices. In the mean time he went on publiſhing different treatiſes in defence of the liturgy of the church of England, together with the Life of Mr. Hooker; and when, by the death of biſhop Duppa, in 1662, a vacancy took place in the rich ſee of Wincheſter, biſhop Gauden applied to the king to become his ſucceſſor; but his majeſty thought proper to beſtow it on Dr. Morley biſhop of Worceſter, and Gauden was forced to be contented with a tranſlation to the ſee which had been juſt quitted by his more fortunate rival. The diſappointment of his ambition had ſuch an effect upon him, that it brought on a violent malady, which put an end to his life ſoon after his removal to his new biſhopric, when he was about fifty-ſeven years of age.

GAUDEN'TIUS, a ſaint in the Romiſh calendar, and biſhop of Breſcia at the end of the fourth and beginning of the fifth century. We find no particulars related concerning him before his election to the ſee of Breſcia, in the year 387. He was one of the deputation ſent to Conſtantinople in 404, or 405, by Honorius and the Weſtern biſhops, to appeaſe the emperor Arcadius's reſentment againſt St. Chryſoſtom, and to intercede for his peaceable re-eſtabliſhment in his ſee. How long he lived after this is uncertain; ſome writers placing his death in the year 410, and others in 427. To him has been generally attributed The Life of Philaſter, which may be found in Surius, under the 18th of July; and he was the author of fifteen Diſcourſes, and other treatiſes on different ſubjects, addreſſed to Benevolus, one of the moſt conſiderable men in Breſcia; Letters, and other pieces, which are inſerted in the fifth volume of the Bibliotheca Patrum. The laſt and moſt complete edition of his works was publiſhed at Breſcia, in 1738, folio, together with thoſe of Philaſter, under the inſpection of cardinal Quirini.

There was another GAUDENTIUS, who flouriſhed at the ſame time with the preceding, and was a biſhop among the Donatiſts in Numidia. He wrote two Apologies in defence of his ſect, addreſſed to the tribune Dulcitius, the emperor's lieutenant in Africa; in conſequence of which he was involved in a controverſy of ſome continuance with St. Auguſtine. And there was alſo a third prelate of the ſame name, and of ſome celebrity, who lived about the commencement of the fifth century, and filled the ſee of Novara.

GAU'DERY, *ſ.* Finery; oſtentatious luxury of dreſs. —The triumph was not pageants and *gaudery*, but one of the wiſeſt and nobleſt inſtitutions that ever was. *Bacon.*

A plain ſuit, ſince we can make but one,
Is better than to be by tarniſh'd *gaud'ry* known. *Dryden.*

GAU'DIES, *ſ. pl.* Double commons, the commons allowed on gaudy days.

GAUDIL'OQUOUS, *adj.* [*gaudium*, joy, and *loquor*, Lat. to ſpeak.] Declaring good news. *Scott.*

GAUDIA'NO, a town of Italy, in the kingdom of Naples, and province of Baſilicata: ten miles north-eaſt of Venoſa.

GAU'DILY, *adv.* Showily.

GAU'DINESS, *ſ.* Showineſs; tinſel appearance.

GAU'DISCHKEHN, a town of Pruſſian Lithuania, ſituated on the Angerapp: five miles eaſt-ſouth-eaſt of Gumbinnen.

GAU'DIUM, *ſ.* [חדה *chadah*, to rejoice.] Joy; a term with phyſicians for a pleaſant commotion of the ſpirits.

GAU'DY, *adj.* Showy; ſplendid; pompous; oſtentatiouſly fine:

Coſtly thy habit as thy purſe can buy,
But not expreſt in fancy: rich, not *gaudy*;
For the apparel oft proclaims the man. *Shakeſpeare.*

GAU'DY, *ſ.* [*gaudium*, Lat.] A feaſt; a feſtival; a day of plenty. *A word uſed in the univerſity.*—He may ſurely be content with a faſt to-day, that is ſure of a *gaudy* to-morrow. *Cheyne.*

GAVE, the preterite of *give*:

Thou can'ſt not every day give me thy heart;
If thou can'ſt give it, then thou never *gav'ſt* it:
Love's riddles are, that though thy heart depart,
It ſtays at home, and thou with loſing ſav'ſt it. *Donne.*

GAVE,

GAVE, *ſ.* A term uſed in the ſouth-weſt part of France, to expreſs a river or brook; as, the Gave of Oleron, the Gave of Pau, &c.

GAV'EL, *ſ.* [ȝafel, Sax.] Tribute, toll, cuſtom, or yearly revenue; of which we had in old time ſeveral kinds.

GAV'ELCESTER, *ſ.* [Sax. *ſextarius victigalis*, Lat.] A certain meaſure of rent-ale: and among the articles to be charged on the ſtewards and bailiffs of the manors belonging to the church of Canterbury in Kent, according to which they were to be accountable, this of old was one; *de* gavelceſter *cujuſlibet bracini braciati infra libertatem maneriorum, viz. unam lagenam & dimidiam cerviſiæ.* This duty elſewhere occurs under the name of *tolceſter*; in lieu whereof the abbot of Abingdon was wont of cuſtom to receive the penny mentioned by Selden in his Diſſertation annexed to Fleta, cap. 8. Nor does it differ from what is called *oakgavel* in the Gloſſary at the end of Hen. I. *Law's Sax. Dict.*

GAV'ELET, *ſ.* [*gaveletum*, Lat.] An ancient and ſpecial kind of *ceſſavit* uſed in Kent, where the cuſtom of gavelkind continues, whereby a tenant, if he withholds his rents and ſervices due to the lord, ſhall forfeit his land: it was intended where no diſtreſs could be found on the premiſes, ſo that the lord might ſeize the land itſelf in the nature of a diſtreſs, and keep it a year and a day; within which time, if the tenant came and paid his rent, he was admitted to his tenement to hold it as before; but if not, the lord might enter and enjoy the ſame. The lord was to ſeek by the award of his court, from three weeks to three weeks, to find ſome diſtreſs upon the land or tenement, until the fourth court; and if in that time he could find none, at the fourth court it was awarded that the tenement ſhould be ſeized as a diſtreſs, and kept in the lord's hands a year and a day without manuring; and if the tenant did not in that time redeem it, by paying the rent and making amends to the lord, the lord, having pronounced his proceſs by witneſſes at the next county court, was awarded by his court to enter and manure the land as his own: and if the tenant would afterwards have it again, he was to make agreement with the lord. *Fitz. Ceſſ.* 60.

The word *gavelet* in its original ſignification imported *rent*; but it means alſo a proceſs for the recovery of rent peculiar to Kent, and London.—The gavelet thus prevailing by the cuſtom of Kent may be uſed whether there is a ſufficient diſtreſs on the land or not; but is reſtricted to gavelkind tenure. *Robins. on Gavelk.* 243. To London this writ was given for rent-ſervice generally by ſtat. 10 Edw. II. which is therefore called the ſtatute of gavelet. But by the words of the ſtatute it only lies where the lord cannot obtain payment by diſtreſs. *Wright's Ten.* 197. This remedy of gavelet, as well as that of ceſſavit, is now fallen into diſuſe; nor, whilſt they continued in uſe, were they applicable, except where the tenure was in fee. 1 *Inſt.* 142. *n.* 2.

GAVELET IN LONDON, *breve de gaveleto in London, pro reddito ibidem, quia tenementa fuerent indiſtringibilia.* The writ uſed in the huſtings of London, where the parties, tenant and demandant, appear by *ſcire facias*, to ſhew cauſe why the one ſhould not have his tenement again on payment of his rent, or the other recover the lands, on default thereof.

GAV'ELKIND, *ſ.* in law, a peculiar tenure or cuſtom, annexed and belonging to lands in Kent, whereby the lands of the father are equally divided at his death among all his ſons; or the land of the brother among all the brethren, if he have no iſſue of his own. *Lit.* 210. See the article TENURE. All the lands in England, it is ſaid, were of the nature of gavelkind before the year 1066, and deſcended to all the iſſue equally; but after the Norman conqueſt, when knight ſervice was introduced, the deſcent was reſtrained to the eldeſt ſon for the preſervation of the tenure. *Lamb.* 167. 3 *Salk.* 129. Except in Kent, for the ſuppoſed reaſon recorded in Blount, who relates that the Kentiſh men ſurrounding William the Conqueror with a moving wood of boughs, thus obtained a confirmation of their ancient rights.

In the reign of Henry VI. there were not above forty perſons in all Kent that held by any other tenure than this of gavelkind; which was afterwards altered upon the petition of divers Kentiſh gentlemen, in much of the land of that county, ſo as to be deſcendible to the eldeſt ſon, according to the courſe of the common-law, by ſtat. 31 Hen. VIII. c. 3; though the cuſtom to deviſe gavelkind land, and the other qualities and cuſtoms, remain. *Co. Lit.* 140. By ſtat. 34 and 35 Hen. VIII. c. 26, all gavelkind lands in Wales were made deſcendible to the heir, according to the common-law; whereby it appears, that the tenure of gavelkind was likewiſe in that principality.

Blackſtone relies on the nature of tenure in gavelkind, as a pregnant proof that tenure in free ſocage was a remnant of Saxon liberty. It is univerſally known what ſtruggles the Kentiſh men made to preſerve their ancient liberties, and the ſucceſs with which thoſe ſtruggles were attended. And as it is principally here that we meet with the cuſtom of gavelkind, we may fairly conclude that this was a part of thoſe liberties; agreeable to Mr. Selden's opinion that gavelkind, before the Norman conqueſt, was the general cuſtom of the realm. Yet tenure in gavelkind is ſaid to be only a ſpecies of a ſocage tenure, modified by the cuſtom of the country; the lands being holden by ſuit of court and fealty, which is a ſervice in its nature certain. *Wright*, 211. Wherefore, by a charter of king John, Hubert archbiſhop of Canterbury was authoriſed to exchange the gavelkind tenures holden of the ſee of Canterbury into tenures by knight's ſervice: and by the ſtatute of 21 Hen. VIII. c. 3, for diſgavelling lands in Kent, they are directed to be deſcendible, for the future, like other lands which were never holden by ſervice of ſocage. Now the immunities which the tenants in gavelkind enjoyed were ſuch as cannot be conceived ſhould be conferred on mere ploughmen and peaſants: from all which the learned commentator conceives it to be ſufficiently clear that tenures in free ſocage are in general of a nobler original than is aſſigned by Littleton, or after him by the bulk of common lawyers. 2 *Comm.* 84, 5. c. 6.

A father having gavelkind lands, had three ſons, one of whom died in the life-time of his father, leaving iſſue a daughter; and it was held that the daughter ſhall inherit the part of her father *jure repræſentationis*; and yet ſhe is not within the words of the cuſtom of dividing the land between the heirs male, for ſhe is the daughter of a male and heir by repreſentation. 1 *Salk.* 243. The heir at the age of fifteen years, it is ſaid, may give and ſell his lands in gavelkind, and ſhall inherit. *Co. Lit.* 111. The cuſtom of gavelkind is not altered, though a fine be levied of the lands at common law; becauſe it is a cuſtom that runs with the land. 6 *Edw.* VI.

Land in gavelkind was deviſed to the huſband and wife for life, remainder to the next heir male of their bodies, &c. They had three ſons, and it was adjudged that the eldeſt ſon ſhould not have the whole. *Dyer*, 133. A donee in tail of gavelkind lands had iſſue four ſons; and it was held, that all ſhould inherit: but if a leaſe for life is made of gavelkind, remainder to the right heirs of A.B. who hath iſſue four ſons, in this caſe the eldeſt ſon ſhall inherit the remainder, becauſe, in caſe of purchaſe, there can be but one right heir. 1 *Rep.* 102. If gavelkind lands come to the crown, and are regranted to hold *in capite*, &c. the land ſhall deſcend to all the heirs male as gavelkind. *Nelſ. Abr.* 895.

A wife ſhall be endowed of gavelkind land, of a moiety of the land whereof her huſband died ſeiſed, during her widowhood. *Co. Lit.* 111. And it has been adjudged, that the widow cannot have election to demand her thirds or dower at common law, ſo as to avoid the cuſtom, by which ſhe ſhall loſe her dower if ſhe marry a ſecond huſband. *Moor*, 260. The huſband ſhall be tenant by the curteſy of half the gavelkind lands of the wife, during the

the time he continues unmarried, without having any iſſue by his wife; but if he marry, he ſhall forfeit his tenancy by the curteſy. *Co. Lit.* 111. If the huſband had iſſue by his wife, and ſhe die, he ſhall be tenant by the curteſy of the whole land; and though he marry, he ſhall not forfeit his tenancy. 1 *Lil. Abr.* 649. It was formerly ſuppoſed, that although a father was attainted of treaſon or felony, the heir of gavelkind land ſhould inherit; for the cuſtom, as was ſaid, was, 'the father to the bough, and the ſon to the plough.' *Doct. & Stud.* c. 10. But it has been held, that, in matters of treaſon, which ſtrike at the foundations of policy and government, even gavelkind lands are forfeitable, and always were.

All lands in Kent ſhall be taken to be gavelkind, except thoſe which are diſgavelled by particular ſtatutes. 1 *Mod.* 98. If lands are alleged to be in Kent, it ſhall be intended that they are gavelkind, if the contrary doth not appear. 2 *Sid.* 153. By Hale Ch. J. Gavelkind law is the law of Kent, and is never pleaded, but preſumed; and it has been held, that the ſuperior courts may take notice of gavelkind generally without pleading: though not of the ſpecial cuſtom of deviſing it, which ought to be pleaded ſpecially. *Cro. Car.* 465. *Lutw.* 236, 754.

The gavelkind deſcent of lands in Ireland was an incident to the cuſtom of Taniſtry: and as ſuch fell to the ground with its principal, in conſequence of a ſolemn judgment againſt the latter in a caſe ann. 5 Jac. I. But in the reign of queen Anne the policy of weakening the Roman-catholic intereſt in Ireland was the cauſe of an Iriſh ſtatute to make the lands of papiſts deſcendible according to the gavelkind cuſtom, unleſs the heir conformed within a limited time. *Rob. on Gavelk.* c. 17. However, now by an Iriſh ſtatute of the preſent reign, 17 and 18 Geo. III. c. 49, the deſcent of the lands of papiſts is again reduced to the courſe of the common law. 1 *Inſt.* 176. *n.* 1.

GA'VELKOVEN, a town of Germany, in Lower Bavaria: twenty miles ſouth-eaſt of Landſhut.

GAVEL'LO, formerly an epiſcopal town of the Venetian ſtates, belongs at preſent to the kingdom of Italy: it is well-peopled, and ſituated on the road of Ferrara.

GAV'ELMAN, *ſ.* A tenant liable to tribute. And hence gavelkind has been thought to be land in its nature taxable. *Blount.*

GAV'ELMED, *ſ.* The duty or work of mowing graſs, or cutting of meadow land, required by the lord from his cuſtomary tenants: *Conſuetudo falcandi quæ vocatur* gavelmed. *Somn.*

GAU'ER, a river of Scotland, which forms a communication between Loch Lydoch and Loch Rannock.

GAV'EREN, a town of Flanders, on the Scheldt: ſeven miles from Ghent.

GAV'EREN. See WAVEREN.

GAU'ERS, a town of Sileſia, in the principality of Neiſſe: five miles north-north-weſt of Patſchau.

GAVE'TA (La), a town of Italy, in the kingdom of Naples, and province of Capitanata: ſixteen miles ſouth-ſouth-weſt of Manfredonia.

GAUGAME'LA, in ancient geography, a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It was not far from a more conſiderable place called *Arbela*; whence the latter gave the name to the victory. See ARBELA, vol. i. p. 37—38.

To GAUGE, *v. a.* [from *gauge, jaugé*, Fr. a meaſuring rod. It is pronounced, and often written, *gage.*] To meaſure with reſpect to the contents of a veſſel. To meaſure with regard to any proportion.—The vanes nicely *gauged* on each ſide, broad on one ſide, and narrow on the other, both which miniſter to the progreſſive motion of the bird. *Derham.*

GAUGE, *ſ.* A meaſure; a ſtandard.—If money were to be hired, as land is, or to be had from the owner himſelf, it might then be had at the market rate, which would be a conſtant *gauge* of your trade and wealth. *Locke.*

GAUGE-LINE, *ſ.* A line marked on the common gauging rod, uſed for the purpoſe of gauging liquids.

GAUGE-POINT, *ſ.* in ſolid meaſure, is the diameter of a circle, whoſe area is expreſſed by the ſame number as the ſolid content of that meaſure. Or it is the diameter of a cylinder, whoſe altitude is 1, and its content the ſame as that meaſure. Thus, the ſolid content of a wine gallon being 231 cubic inches; if a circle be conceived to contain ſo many ſquare inches, its diameter will be 17·15; which is therefore the gauge-point for wine meaſure. And an ale gallon containing 282 cubic inches; by the ſame rule, the gauge-point for ale meaſure will be found to be 18·95. And after the ſame manner may the gauge-point for any other meaſure be determined. Hence it follows, that when the diameter of a cylinder in inches is equal to the gauge-point in any meaſure, given likewiſe in inches, every inch in its length will contain an integer of the ſame meaſure. So in a cylinder whoſe diameter is 17·15 inches, every inch in height contains one entire gallon in wine meaſure; and in another, whoſe diameter is 18·95, every inch in length contains one ale gallon.

GAU'GER, *ſ.* An officer appointed by the commiſſioners of exciſe, to gauge, meaſure, or examine, all caſks, tuns, pipes, barrels, hogſheads, of beer, wine, oil, &c. before they are permitted to be ſold or otherwiſe diſpoſed of.

GAU'GING, *ſ.* The art of meaſuring the capacities or contents of all kinds of veſſels, and determining the quantity of fluids, or other matters contained within them. Theſe are principally pipes, tuns, barrels, rundlets, and other caſks; alſo backs, coolers, vats, &c. As to the ſolid contents of all priſmatical veſſels, as cubes, parallelopipedons, cylinders, &c. they are found by multiplying the area of the baſe by their altitude. And the contents of all pyramidal bodies, and cones, are equal to 1-3d of the ſame.

In gauging, it has been uſual to divide caſks into four varieties or forms, denominated as follows, from the ſuppoſed reſemblance they bear to the fruſtums of ſolids of the ſame names: viz. 1. The middle fruſtum of a ſpheroid; 2. The middle fruſtum of a parabolic ſpindle; 3. The two equal fruſtums of a paraboloid; 4. The two equal fruſtums of a cone. And particular rules, adapted to each of theſe forms, may be found in moſt books of gauging. But as the form is imaginary, and only gueſſed at, it hardly ever happens that a true ſolution is brought out in this way; beſides which, it is very troubleſome and inconvenient to have ſo many rules to put in practice. We ſhall therefore give one rule, which is not only general for all caſks that are commonly met with, but quite eaſy, and very accurate. Thus, add into one ſum, 39 times the ſquare of the bung diameter, 25 times the ſquare of the head diameter, and 26 times the product of thoſe diameters; multiply the ſum by the length of the caſk, and the product by the number ·00034; then this laſt product divided by 9 will give the wine gallons, and divided by 11 will give the ale gallons.

Or, $\overline{39B^2 + 25H^2 + 26BH} \times \frac{L}{114}$ is the content in inches; which being divided by 231 for wine gallons, or by 282 for ale gallons, will be the content. *For Example:* If the length of the caſk be 40 inches, the bung diameter 32, and the head diameter 24:

Here	-	$32^2 \times 39$	= 39936
and	-	$24^2 \times 25$	= 14400
and	-	$32 \times 24 \times 26$	= 19968
		the ſum -	74304
		multiplied by -	49
		and divided by 114)	2972160
		gives -	26071 cubic inches;

this divided by 231 gives 112 wine gallons, or divided by 282 gives 92 ale gallons.

GAUGING *by the Diagonal Rod*, is a method adapted for

for determining the contents of caſks by meaſuring the diagonal only, viz. the diagonal from the bung to the extremity of the oppoſite ſtave next the head. This is done by a ſquare rule, having 4 ſides or faces, being uſually 4 feet long, and hence called the *four-feet gauging rod.*—See a figure of it in the Engraving of *Gages.* Upon one face of this rule is a ſcale of inches, for taking the meaſure of the diagonal; to theſe are adapted the areas, in ale gallons, of circles to the correſponding diameters; and upon the oppoſite face are two ſcales, of ale and wine gallons, expreſſing the contents of caſks having the correſponding diagonals; and theſe are the lines which chiefly conſtitute the difference between this inſtrument and the ſliding rule; for all the other lines upon it are the ſame with thoſe in that inſtrument, and are to be uſed in the ſame manner.

To uſe the diagonal or four-feet GAUGING-ROD.—Unfold the rod, and put it in at the bung-hole of the caſk to be gauged, till its end arrive at the interſection of the head and oppoſite ſtave, or to the fartheſt poſſible diſtance from the bung-hole, and note the inches and parts cut by the middle of the bung; then draw out the rod, and look for the ſame inches and parts on the oppoſite face of it, and annexed to them are found the contents of the caſk, both in ale and wine gallons.—*For Example:* Let it be required to find, by this rod, the content of a caſk whoſe diagonal meaſures 34·4 inches; which anſwers to the caſk in the foregoing example, whoſe head and bung diameters are 32 and 24, and length 40 inches; for if to the ſquare of 20, half the length, be added the ſquare of 28, half the ſum of the diameters, the ſquare root of the ſum will be 34·4 nearly. Now, to this diagonal 34·4, correſponds, upon the rule, the content 91 ale gallons, or 111 wine gallons; which are but 1 leſs than the content brought out by the general rule above given.

The GAUGING SLIDING RULE, is alſo particularly adapted to the purpoſes of gauging. It is a ſquare rule, of four faces or ſides, three of which are furniſhed with ſliding pieces running in grooves. The lines upon them are moſtly logarithmic ones, or diſtances which are proportional to the logarithms of the numbers placed at the ends of them; which kind of lines was placed upon rulers by Mr. Edmund Gunter, for expeditiouſly performing arithmetical operations, uſing a pair of compaſſes for taking off and applying the ſeveral logarithmic diſtances: but inſtead of the compaſſes, ſliding pieces were afterwards added by Mr. Thomas Everard, as more certain and convenient in practice, from whom this ſliding rule is often called *Everard's Rule.*

GA'VI, a town of Italy, in the ſtate of Genoa, once very ſtrong, but the fortifications have been deſtroyed: twenty-five miles north of Genoa.

GA'VIA, a town of Spain, in the province of Grenada: four miles ſouth-ſouth-weſt of Grenada.

GAUJAC', a town of France, in the department of the Lannes: four leagues ſouth-eaſt of Dax.

GAUL, the name given by the Romans to the country which afterwards formed the kingdom of the Franks, or France.—See the article FRANCE, vol. vii. p. 647; and GALLIA, p. 192, of this volume.

GAUL'FRIDE, a man's name. *Chaucer.*

GAUL'MIN (Gilbert), a French writer, born at Moulins in 1585. He was of the profeſſion of the law, and became dean of the maſters of requeſts, counſellor of ſtate, and intendant of the Nivernois. He obtained the reputation of being one of the moſt learned men and acute critics of his time; but it has been aſſerted that his talents were rather thoſe which fitted him for ſhining in an aſſembly of ſuperficial admirers of literature, than for compoſing works of ſolid erudition. He was accuſtomed to harangue in public at the Luxemburgh, amid a crowd of auditors; and whatever might be his deficiencies, he certainly did not want confidence in his own acquirements. He was warmly attached to cardinal Mazarin, and ſeverely epigrammatiſed his enemies of the parliament. Upon the refuſal of the rector of his pariſh, for ſome reaſon, to marry him to the object of his choice, he declared in his preſence that he took ſuch a woman for his wife, and afterwards lived with her as ſuch. This circumſtance gave the name of *marriages à la Gaulmine* to unions of this kind, and their validity was legally examined, and pronounced null. His writings conſiſt of ſome Latin poems, and of notes and commentaries on ſeveral works of antiquity. He firſt publiſhed the Greek romance of Iſmenias and Iſmene, attributed to Euſtatius, with a Latin commentary. He died in 1665.

GAUL'ONITES, a ſect among the Jews, ſo named from Judas Gaulonites, who oppoſed the tribute raiſed by Cyrenius in the time of Auguſtus.

GAU'LOS, in ancient geography, a ſmall iſland of Sicily, in the African ſea, adjoining to Melite or Malta, with commodious harbours; a colony of Phœnicians, with a cognominal town. Gaulonitæ, the people. Now called *Gozo*, five miles to the weſt of Malta.

GAULT (Le), a town of France, in the department of the Loir and Cher, and chief place of a canton, in the diſtrict of Montdoubleau: eight miles north of Montdoubleau.

GAULTHE'RIA, *ſ.* [ſo named by Kalm from *Gaulthier*, a phyſician and botaniſt of Canada.] In botany, a genus of the claſs decandria, order monogynia, natural order bicornes, (erica, *Juſſ.*) The generic characters are—Calyx: perianthium double, approximating, permanent; outer two-leaved, ſhorter; leaflets half-ovate, concave, obtuſe; inner one-leafed, five-cleft, bell-ſhaped; ſegments half ovate. Corolla: one-petalled, ovate, half-five-cleft; border ſmall, rolled back; nectary of ten ſubulate, upright, very ſhort, bodies, or glands, ſurrounding the germ within the ſtamens. Stamina: filaments ten, ſubulate, bent in, ſhorter than the corolla, inſerted into the receptacle; antheræ two-horned, with the horns bifid. Piſtillum: germ roundiſh, flatted; ſtyle cylindric, the length of the corolla; ſtigma obtuſe. Pericarpium: capſule roundiſh, obtuſely five-cornered, flatted, five-celled, five-valved, opening into five parts at the top, covered all round with the inner perianth, changed into a roundiſh coloured berry, pervious at the top. Seeds: very many, ſubovate, angular, bony.—*Eſſential Character.* Calyx, outer two-leaved, inner five-cleft; corolla ovate; nectary with ten dagger points; capſule five-celled, covered with the inner calyx, now become a berry.

Species. 1. Gaultheria procumbens, or trailing gaultheria: leaves alternate, ovate, entire; ſtem ſhrubby, trailing. This plant has the appearance of Pyrola or Vaccinium, with a creeping root. It is a ſmall evergreen trailing ſhrub, a ſpan high, and ſcarcely branched; leaves terminating the ſtem, three or four, obovate, ſmooth, coriaceous, ſpreading, with a few acuminate ſerratures; flowers ſolitary, axillary, pendulous, peduncled; inner calyx and corolla white, or of an herbaceous colour, and rarely ſucceeded by fruit in England. The fruit is red on the outſide and fleſhy, reſembling a berry; the capſule within is very thin, and tubercled with the protuberance of the ſeeds; the partitions alſo within are very thin, and are faſtened to the axis and the furrows of the ſhell: there are five receptacles, which are fleſhy, flatted, bowed, fixed at the baſe, but looſe in the other parts, or connected with the axis of the fruit by a very thin membrane; ſeeds very ſmall, ſmooth, ſhining, ferruginous. Native of Canada, on a dry, ſterile, ſandy, ſoil. The leaves are uſed there in an infuſion, inſtead of tea.

2. Gaultheria antipoda, or antipodean gaultheria: leaves ſcattered, roundiſh, ſerrate-toothed; ſtem ſhrubby, diffuſed. Native of New Zealand.

Propagation and Culture.—1. The method of preſerving this plant in a garden, is to ſet it in a pot, filled with looſe undunged earth, placing it in the ſhade, and frequently watering it. Thus the plant may be kept alive two or three years, and bear flowers, but not fruit.

GAU'NERSDORFF, a town of Germany, in the archi-

archduchy of Auſtria: nine miles weſt of Ziſterzdorf, and ſixteen north-north-eaſt of Vienna.

GAUN'LESSE, a river of England, in the county of Durham, which runs into the Wear, at Biſhops Auckland.

GAUNT, *adj.* [as if *gewant*, from ȝepanian, Sax. to leſſen.] Thin; ſlender; lean; meagre:

Two maſtiffs, *gaunt* and grim, her flight purſu'd,
And oft their faſten'd fangs in blood embru'd. *Dryden.*

GAUNT'LY, *adv.* Leanly; ſlenderly; meagerly.

GAUNT'LET, *ſ.* [*gantelet*, Fr.] An iron glove formerly uſed for defence, and thrown down in challenges. It is ſometimes in poetry uſed for the *ceſtus*, or boxing glove.—A ſcaly *gauntlet* now, with joints of ſteel. *Shakeſp.*

Feel but the difference, ſoft and rough;
This a *gauntlet*, that a muff. *Cleaveland.*

GAVOT', *ſ.* [*gavotte*, Fr.] A kind of dance.—The diſpoſition in a fiddle to play tunes in preludes, ſarabands, jigs, and *gavots*, are real qualities in the inſtrument. *Arbuthnot.*

GAUPP (John), a German lutheran divine, and able mathematician, the ſon of a rich tradeſman at Lindau, in Swabia, where he was born, in 1667. The early part of his education he received at his native place, whence he was ſent to Ulm in 1682. Three years afterwards he removed to the univerſity of Jena, where he took the degree of maſter of arts. Having in that place contracted an acquaintance with John Andrew Schmid, he received from him a ſtrong bias in favour of mathematical ſtudies, and made conſiderable progreſs in them under his inſtructions. Afterwards he ſpent ſome time in different German univerſities, improving himſelf in theology and the mathematics; and then viſited Amſterdam and London, whence he returned to his native town. In 1693 he was admitted to the office of the miniſtry, in which he roſe to the ſtation of firſt paſtor of Lindau, about the year 1728. That part of his time which was not neceſſarily devoted to the duties of his profeſſion, he employed in mathematical purſuits, particularly in the ſtudy of aſtronomy and gnomonics. On theſe ſubjects he delivered lectures to a number of young perſons, and maintained a correſpondence with the moſt learned mathematicians of his time. His Ephemerides, and Obſervations, were very favourably received by the royal academies of ſciences at Paris and Berlin, and ſeveral of them are inſerted in the Memoirs of thoſe learned bodies. Many of the inſtruments which he made uſe of were conſtructed by himſelf, and he had begun the erection of an obſervatory, when death terminated his labours in 1738, at which time he had reached the ſeventy-firſt year of his age. He was the author of *Gnomonica Mechanica Univerſalis*, 1708, 4to. various calendars, and deſcriptions of eclipſes; ſermons; and treatiſes on the ſubject of finding Eaſter according to the Gregorian computation.

GAUR, a country of Aſia, ſituated between Balk and Candahar, with a town of the ſame name: 125 miles north-north-weſt of Candahar, and 150 eaſt of Herat.

GAUR, *ſ.* A Perſian prieſt.—The compariſon between the Bramins and the Perſian *gaurs*, who pretend to be the diſciples and ſucceſſors of the ancient magi, the followers of Zoroaſter, may be thought worth a learned diſquiſition. *Guthrie.*

GAU'RA, a town of Peru, in the juriſdiction of Chancay, containing about two hundred houſes and two churches, ſituated in a fertile country, and watered by a river of the ſame name: its chief commerce conſiſts in ſalt and ſalt beef.

GAU'RA, *ſ.* [from γαυρος, Gr. proud.] In botany, a genus of the claſs octandria, order monogynia, natural order calycanthemæ, (onagræ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, ſuperior, deciduous; tube cylindric, long, thicker at the baſe, containing four oblong glands growing to it; border four-cleft; diviſions oblong, acute, reflex. Corolla: petals four, oblong, riſing towards the upper lip, equal, with narrow claws, placed on the tube of the calyx. Stamina: filaments eight, filiform, broader at the top, ſtraight, ſhorter than the corolla: a nectareous gland of a conical form within the baſe of each; antheræ oblong, verſatile. Piſtillum: germ oblong, inferior, four-celled, many-ſeeded; the ſeeds fixed to a columnar receptacle; ſtyle filiform, length of the ſtamens; ſtigmas four, columnar, ovate, ſpreading. Pericarpium: drupe ovate, four-cornered, the corners flatted; often with one cell only, and one ſeed, with the veſtiges of the partitions and the abortive ſeeds. Seed: nut with one ſeed, oblong, angular, of a yellowiſh-bay colour, with a brown callus at the baſe.—*Eſſential Character.* Calyx four-cleft, tubulous; corolla four-petalled, riſing towards the upper ſide; nut inferior, one-ſeeded, four-cornered.

Gaura biennis, or biennial gaura, a ſingle ſpecies. Stem four or five feet high, ſending out ſeveral branches; leaves oblong, ſmooth, pale-green, ſitting pretty cloſe; flowers in cloſe tufts at the ends of the branches, pale roſe-coloured; appearing in September, and when the autumn proves favourable, ripening the ſeeds towards the end of October. Gaura agrees with Spathelia and Nitraria in having the ſhell of the fruit valved at the end. If there be only one ſeed, then it is oblong, and much acuminated; but Linnæus was miſtaken in ſuppoſing this to be the natural number. Native of Virginia and Pennſylvania. If the ſeeds are ſown on an open border ſoon after they are ripe, they will more certainly ſucceed than when they are ſown in the ſpring. When the plants come up, keep them clean from weeds, and thin them if they are too cloſe; tranſplant them in autumn where they are to ſtand, and ſupport the branches to prevent the autumnal winds from breaking them. See COMBRETUM and GUAREA.

GAVRAY', a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Coutances: four leagues and a quarter north of Avranches, and three ſouth of Coutances.

GAU'RICO (Luca), an aſtronomer, equally famous for the ancient ſcience of aſtrology, born in 1475, at Giſuni in the kingdom of Naples. He became eminent for aſtronomical knowledge, and after having for ſome time taught that ſcience at Naples, he was appointed profeſſor in it at Ferrara, in 1507; at which time alſo he practiſed judicial aſtrology, and began to diſtinguiſh himſelf by bold predictions. One of theſe coſt him dear; for having foretold that John Bentivoglio would loſe his ſovereignty of Bologna, he was impriſoned by him, and received five violent ſhocks from a cord tied to his arm, while he was ſucceſſively let fall from a conſiderable height. He then removed to Venice, and thence to Rome in 1535. Pope Paul III. who was a believer in aſtrology, conferred upon him, in 1545, the biſhopric of Civita in Naples, with a liberal penſion; but he reſigned his epiſcopal office in 1550, and returned to Rome, where he quietly purſued his aſtronomical ſtudies. He died in 1558, in his eighty-third year. The works of Gaurico were publiſhed collectively at Baſil in three volumes, folio, 1575.

GAU'RICO (Pomponio), brother of the preceding, a learned profeſſor in the univerſity of Naples, and preceptor of Ferrante Sanſeverino, prince of Salerno. He acquired reputation by his Latin poems, conſiſting of eclogues, elegies, and epigrams, which are accounted to diſplay a poetical genius, though ſomewhat looſe in their ſtyle. He alſo publiſhed the lives of the Greek poets, and ſeveral treatiſes in architecture and phyſiognomy. He publiſhed ſome elegies under the name of Cornelius Gallus, but they were ſoon detected as ſpurious. His end was unfortunate; for having ſet out on a journey in 1530, on the road from Sorrento to Caſtel-

Caſtellamare, he was never more heard of; and it was conjectured that he was murdered and thrown into the ſea, in conſequence of the diſcovery of an amour which he had with a lady of rank.

GAU'RUS, a mountain of Campania, famous for its wines. *Lucan.*

GAUTHI'ER, or GAULTHIER (John Baptiſt), a French eccleſiaſtic, and voluminous writer, born at Louviers, in 1685. After being educated in grammar learning at his father's houſe, he was ſent to the college of Harcourt at Paris, where he went through his courſe of philoſophy; and in 1704, he entered on a courſe of theology in the ſchools of the Sorbonne. This he completed in 1706, and might have been admitted to his degrees, if he had not embraced the Janſeniſt opinions, which would not permit him to ſubſcribe to the requiſite formularies, and particularly to an approbation of the bull Unigenitus. He now entered into the ſeminary of St. Magloire, where he purſued his theological ſtudies with induſtry and ſucceſs, and acquired much eſteem by the exemplarineſs of his manners, the modeſty of his converſation, and the ardour of his piety. Returning afterwards to his native place, he was admitted into ſub-deacon's orders, and commenced a ſeries of catechetical lectures to young people, and of conferences for the inſtruction of junior eccleſiaſtics. The reputation which he acquired in theſe employments attracted the notice of M. le Normand, biſhop of Evreux, who prevailed upon him to enter into his family, where he applied himſelf cloſely to the ſtudy of eccleſiaſtical antiquities. But in this ſituation he could not eſcape his ſhare of the troubles with which thoſe of his party were haraſſed by the Jeſuits, after the year 1713; and being obliged to quit the dioceſe of Evreux, was received into the houſe of M. de Langle, biſhop of Boulogne. By that prelate he was admitted into prieſt's orders, and, after taking his degrees in law, nominated to a canonry in his cathedral. M. Gauthier's ſentiments, however, proving a bar to his taking poſſeſſion of that benefice, the biſhop made him his proctor, and afterwards his vicar-general. From this time M. Gauthier was the boſom friend and counſellor of his benefactor, who employed him in eſtabliſhing and conducting conferences among his eccleſiaſtics, and availed himſelf of his pen in various publications, particularly in the Letters and Memoirs, which he printed during his diſpute with the archbiſhop of Rheims, in 1723. After the death of M. de Langle, Gauthier retired to Paris, where he ſpent the remainder of his days in ſupport of the party with whom he had embarked againſt the Jeſuits. He loſt his life in 1755, in conſequence of an injury he received by being overturned in a carriage on his journey from Evreux to Paris, at which time he was ſeventy-one years of age. His writings bear teſtimony to the author's learning and acuteneſs, but at the ſame time ſhew that his pen was not unfrequently dipped in gall. They are, 1. The Poem of Pope, entitled an Eſſay on Man, convicted of Impiety, 1746, 12mo. 2. Letters intended to forearm the Faithful againſt Irreligion, 12mo. 3. The Jeſuits convicted of obſtinately ſanctioning the Practice of Idolatry in China, 1743, 12mo. 4. The Life of M. John Soanen, Biſhop of Senez, 1750, 8vo. 5. The Perſian Letters convicted of Impiety, 1751, 12mo. 6. A ſuccinct Hiſtory of the Parliament of Paris, during the Troubles at the Commencement of the Reign of Louis XIV. 1754, 12mo. 7. A poſthumous production, entitled, Theological Letters, in which the Sacred Scriptures, and the Faith of the Church on the Subjects of the Myſteries of the Trinity and the Incarnation, are vindicated and maintained, in Oppoſition to the impious and ſocinian Syſtem of Fathers Berruyer and Hardouin, Jeſuits, 1756, in 3 vols. 12mo. Prefixed to the firſt volume is a ſhort life of the author; and to the third is ſubjoined a tranſlation by him, from the Greek into French, of that valuable remain of Chriſtian antiquity, The Epiſtle to Diognetus.

GAUTS. See GHAUTS.

GAUZE, *ſ.* [from *gaze*, becauſe it may be ſeen through.] In commerce, a very thin ſlight tranſparent kind of ſtuff, woven ſometimes of ſilk, and ſometimes only of thread. To warp the ſilk for making of gauze, they uſe a peculiar kind of mill, upon which the ſilk is wound. There are alſo figured gauzes; ſome with flowers of gold and ſilver on a ſilk ground, which are chiefly brought from China.

GAUZEPOUR', a town and *pergunna* or diſtrict of Hindooſtan, ſituated on the eaſtward of Benares, in the territory of the *nawaub* or nabob of Oude.

GAW'AIN, GAW'EIN, a woman's name, ſiſter to king Arthur. *Chaucer.*

GAW'DED, *adj.* Fluſhed:

Our veil'd dames
Commit the war of white and damaſk in
Their nicely *gawded* cheeks. *Shakeſpeare.*

GAW'ILE, or GYALGUR', a town of Hindooſtan, in the country of Berar: twenty miles north-north-weſt of Ellichpour, and ſeventy-five weſt of Deogur.

GAWK, *ſ.* [ȝeac, Sax.] A cuckow. A fooliſh fellow. In both ſenſes it is retained in Scotland.

GAWN, *ſ.* [corrupted from *gallon.*] A ſmall tub, or lading veſſel. *A provincial word.*

GAW'NAGH LOUGH, a lake of Ireland, in the county of Longford, fifteen miles north-eaſt of Longford.

GAWN'TREE, *ſ.* [Scottiſh.] A wooden frame on which beer-caſks are ſet when tunned.

GAW'RAH, a river of Hindooſtan, which runs into the Ganges, five miles north of Canoga, in the country of Oude.

GAY, *adj.* [French.] Airy, cheerful, merry, frolic:

Smooth flow the waves, the zephyrs gently play;
Belinda ſmil'd, and all the world was *gay*.—
Ev'n rival wits did Voiture's fate deplore,
And the *gay* mourn'd, who never mourn'd before. *Pope.*

Fine; ſhowy.—A virgin that loves to go *gay*. *Bar.* vi. 9.

GAY, *ſ.* An ornament; an embelliſhment.—Moroſe and untractable ſpirits look upon precepts in emblem, as they do upon *gays* and pictures, the fooleries of ſo many old wives tales. *L'Eſtrange.*

GAY (John), an eminent Engliſh poet, born near Barnſtaple in Devonſhire, in 1688. He was deſcended from an ancient but reduced family; and, after receiving a ſlight education in the free-ſchool at Barnſtaple, was put apprentice to a ſilk-mercer in London; but he ſoon ſhewed his diſlike to ſuch a ſtation, and ſeparated from his maſter after a few years' negligent attendance. It is not improbable that a taſte for poetry might have been infuſed into him by his Barnſtaple ſchoolmaſter, Mr. Luck, who publiſhed a volume of Latin and Engliſh verſes. Poetical compoſition appears, at leaſt, to have been his purſuit from the time of his releaſe: and in 1711 he gave to the public his Rural Sports, inſcribed to Pope, then a young poet of the ſame age with himſelf, but riſing faſt to literary fame. This compliment, joined with the unaſſuming temper of Gay, laid a foundation of mutual friendſhip which death alone could divide. Gay was indolent and improvident, and his intercourſe with wits was not likely to improve his pecuniary circumſtances; he therefore accepted an offer in 1712, of reſiding with the ducheſs of Monmouth in quality of her ſecretary; an office, probably, only conſidered by her as an appendage of that princely rank which ſhe affected. This afforded him ſufficient leiſure to continue his court to the muſes, and the ſame year produced his mock-heroic poem entitled Trivia, or the Art of Walking the Streets of London. In a prefixed advertiſement he acknowledges himſelf indebted for ſeveral hints to Dr. Swift, to whoſe taſte ſuch a ſeries of comic delineation

was peculiarly ſuited. About this time Gay likewiſe engaged in dramatic writing. The Mohocks, a tragi-comical Farce, is attributed to his pen; and he brought upon the ſtage at Drury-lane, a comedy ſtyled The Wife of Bath, the reception of which was by no means flattering. His next appearance from the preſs, in 1714, was upon a ſingular occaſion. Pope and Ambroſe Philips had quarrelled about the reſpective merit of their paſtorals, of which thoſe of the former were written in the poliſhed, thoſe of the latter in the ruſtic, ſtyle. Gay, to ſerve the cauſe of his friend, undertook to compoſe a ſet of burleſque paſtorals, in which the manners of the country ſhould be exhibited in their natural coarſeneſs, with a view of proving, by a ſort of caricature, the abſurdity of Philips's ſyſtem of paſtoral. He entitled his work The Shepherd's Week, as the ſix pieces of which it conſiſted were denominated by days of the week. They go through the uſual topics of a ſet of paſtorals, in a ſtrain of parody which is often extremely humorous. But the effect was in one reſpect different from the original purpoſe, though it eſtabliſhed the credit of the poet. His pictures of rural life and its accompanying ſcenery were ſo extremely natural and amuſing, and intermixed with circumſtances ſo truly beautiful and touching, that they proved the moſt popular works of the kind in the language, and were read with pleaſure by thoſe who could not enter into the jeſt; and they have certainly gone far in eſtabliſhing the critical maxim, that paſtorals muſt be indebted for all their value to a cloſe adherence to nature. This performance was dedicated to lord Bolingbroke; and Gay, at this period, ſeems to have obtained a large ſhare of favour from the tory party then in power. As a proof of their kindneſs, he was appointed ſecretary to the earl of Clarendon in his embaſſy to the court of Hanover. The queen's death ſoon recalled him from this ſtation, and threw a damp upon his proſpects; but he was adviſed by his friends not to neglect the opportunity it had afforded him of ingratiating himſelf with the new family. He accordingly wrote a poetical epiſtle upon the arrival of the princeſs of Wales, which compliment procured him the honour of the attendance of the prince and princeſs at the exhibition of his next dramatic piece, in 1715, The What d'ye call it. This was a kind of mock-tragedy, conſiſting of ſerious action with comic language, ſo that the audience were at a loſs whether to laugh or cry. Its novelty, however, gave it temporary ſucceſs, and it was thought worthy of an attack from the preſs in a pamphlet. Gay's notions of true comedy ſeem not to have been very juſt; for the piece which he next brought on the ſtage, entitled Three Hours after Marriage, though aided by the conjoined wit of Pope and Arbuthnot, met with an unfavourable reception, owing, apparently, to the introduction of ſome incidents of too trivial a kind. His tragedy of The Captives, however, was received with applauſe in 1723. Some inſtances of court favour cauſed him next to employ himſelf in one of the works for which he is beſt known—his Fables, written profeſſedly for the inſtruction of the duke of Cumberland, and publiſhed with a dedication to that prince in 1726. Fable had not, in the Engliſh language, attained that rank in poetical compoſition which it had done in the French; nor can Gay ever ſtand in competition with La Fontaine. Yet there is conſiderable eaſe in his mode of narration, with much lively and natural imagery. In his ideas of the character of fable, he is far from accurate, and his morals are often negligently pointed. A ſecond part of the Fables, wholly directed to political topics, was publiſhed after his death, but was never much read in compariſon with the firſt, which has very generally been put into the hands of youth, and at this day forms one of the moſt popular works in Engliſh verſe. He naturally expected a handſome reward for this performance, but upon the acceſſion of George II. in 1727, nothing better was offered him than the poſt of gentleman-uſher to the young princeſs Louiſa. This he took rather as an indignity than a favour; and he declined the offer in a meſſage to the queen, ſaying that he was too old for ſuch a place. Solicitations were afterwards made in his behalf, but nothing was obtained, and his hopes at court came thus to an end. Had he remained a courtier, it is probable that he would never have been the author of a performance which acquired him public applauſe, far beyond any he had hitherto experienced. This was his famous Beggar's Opera, acted in 1727 at Lincoln's-inn-fields, after being refuſed at Drury-lane. Its origin is ſaid to have been a ſuggeſtion of Swift's, who, always in ſearch of the ludicrous, had remarked to Gay what an odd pretty ſort of a thing a Newgate Paſtoral might make. Gay turned it in his mind, but changed the idea for a Newgate Comedy, and joined to it the purpoſe of burleſquing the Italian operas. With this his diſappointments led him to blend much political ſatire, and the reſult was a compoſition unique in its kind, and of which the ſucceſs could not with any certainty be foreſeen. Its fate was for ſome time in ſuſpenſe; but at length it ſtruck the nerve of public taſte, and received unbounded applauſe. Sixty-three ſucceſſive repreſentations were inſufficient to ſatiate the metropolis, and it was performed a proportional number of times at all the provincial theatres. If the cauſe of this extraordinary ſucceſs be enquired, the anſwer is perhaps not very obvious. But it ſeems to indicate a kind of coarſeneſs in the national taſte, which could be delighted by the repetition of popular ballad-tunes, and the delineation of ſcenes of vice and vulgarity, painted indeed in a natural ſtyle, and in their incidents appealing to the feelings implanted in every human breaſt. But if the Beggar's Opera obtained applauſe on the ſtage, it underwent more ſerious cenſure in other places than almoſt any dramatic piece that has been exhibited. By making a highwayman the hero, and bringing him off in a kind of triumph, the author has been charged with rendering the character of a freebooter an object of popular ambition; and by furniſhing his perſonages with a plea for their diſhoneſty, drawn from the univerſal depravity of mankind, and particularly of thoſe in offices of authority, he has been accuſed of ſapping the foundations of ſocial morality. But that Gay himſelf had no miſchievous intentions in writing it, is univerſally admitted; and his friend Swift warmly defended it as a wholeſome ſatire againſt the corruption of the times. It is ſtill occaſionally repreſented; but ſo much has the taſte for muſic got above the ridicule attempted to be thrown upon it, that it is now neceſſary to decorate with all the graces of ſtudied melody, thoſe ſimple and popular airs which were meant as an humorous contraſt to Italian execution.

The unfavourable opinion of the tendency of the Beggar's Opera, entertained by the perſons then in power, became manifeſt by the refuſal of the lord chamberlain to permit a ſecond part of it, entitled Polly, to be acted. Gay's friends, and the party in oppoſition, gave, however, ſuch encouragement to its publication, that it was more profitable to him than even the firſt part; yet it was a very feeble and languid performance, and has ſunk into total neglect. A further recompence for any injury he ſuſtained by this exertion of power, was the kind patronage of the duke and ducheſs of Queenſbury, who took him into their houſe, and condeſcended to manage his pecuniary concerns. In ſuch a ſituation he might be thought to be raiſed above the impreſſions of court diſfavour; yet the dejection of ſpirits into which he fell, is in part aſcribed to this cauſe, though his natural indolence, and an habitual diſpoſition to bilious complaints, may ſufficiently account for it. He continued to employ his intervals of health and ſpirits in compoſition, and produced his Acis and Galatea, and the opera of Achilles, not acted till after his death; which event took place in December 1732, from an inflammation of the bowels, when he was aged only forty-four. He was ſincerely

cerely lamented by his friends, and his memory was honoured by a monument in Weſtminſter abbey, where he was interred, and an epitaph was written, in a ſtrain of uncommon ſenſibility, by Pope. The private character of Gay was that of eaſy good-nature and undeſigning ſimplicity. He was much beloved by his friends, who treat him in their letters, eſpecially Swift, with a freedom of advice partaking more of affection than of reſpect. He poſſeſſed little energy of mind, and had too much good nature to ſupport that independence to which his principles inclined him. Beſides the works already mentioned, he wrote ſeveral ſhort pieces of poetry, of which his two pleaſing ballads, All in the Downs, and 'Twas when the Seas were roaring, are the beſt known. Though as a poet he cannot be ranked in the higher claſs, yet he ſeldom fails to give his readers an ample ſhare of gratification, and perhaps we have no writer whoſe images and pictures are drawn with more originality from a ſtore of innate obſervation and abilities. Mr. Coxe, in his review of the life and literary character of Gay, agrees as little with Dr. Johnſon in his eſtimate of Gay as a poet, as he does on the tendency of the Beggar's Opera. Johnſon ſays that "Gay was a poet of the *lower* order; that he had in no degree the *mens divinior*, or dignity of genius." Mr. Coxe will not allow this to be a fair appreciation of Gay's poetical merit. He juſtly obſerves that 'Though Gay cannot be claſſed among the higheſt ranks in the temple of fame, yet he certainly does not deſerve to be placed in the loweſt order.—Although he did not attempt to excel in the higher flights of poetry, yet many paſſages in his Poems prove, that he was capable of uniting elevation of ſentiment with correſponding dignity of language.—His chief aim was to pleaſe, rather than to ſurpriſe; and it may be juſtly remarked, that few poets ever wrote with more ſucceſs on a greater variety of ſubjects than Gay;—Tragedy, Comedy, Operas, Fables, Ballads, Moral, Epic, Ruſtic, Town Eclogues, Paſtorals, and Poetical Epiſtles.—Next to Pope, perhaps, he is the Engliſh poet who moſt excelled in ſmoothneſs of verſification, correctneſs, felicity of diction, and in the purity of the rhymes; and none ever ſurpaſſed him in expreſſing ſimple thoughts in an appropriate manner.—That he was a moſt excellent claſſical ſcholar, is proved from his works; for no poet ever more frequently or more happily imitated the claſſics. He was no leſs converſant with the Italian poets, whom he imitated with equal felicity.—As a writer of Fables, Gay ſtands in a pre-eminent ſituation; the difficulty of this ſpecies of compoſition is ſufficiently evident from the ſmall number of writers who have excelled in Fables.—Since the æra of letters to the time of Gay, ſcarcely five authors can be mentioned, who deſerve peculiar notice: Æſop, Phædrus, Pilpay, and Fontaine; and of theſe only Phædrus and Fontaine wrote in verſe.' —Gay did not undoubtedly poſſeſs either the elegant brevity of Phædrus, or the captivating *naïveté* of La Fontaine; yet he diſplays more originality of invention than even Phædrus or La Fontaine. Their ſtories were moſtly taken from preceding authors; his, with a few exceptions, are entirely his own.—His language is a model for this ſpecies of compoſition; ſeldom above or below the ſubject: it is poetical without being too elevated; and familiar without being low.—Of his Fables may be ſaid, what Gay obſerves of Gulliver's Travels: —"From the higheſt to the loweſt this book is univerſally read, from the cabinet council to the nurſery."—And to him may be applied what La Harpe ſaid of Fontaine; that "he was at the ſame time the poet of children, and the poet of philoſophers."

GAY-HEAD, a peninſula on Martha's Vineyard, in North America, four miles in length and two in breadth, and almoſt ſeparated from the other part of the iſland by a large pond. The Indians inhabiting this part, when lately numbered, amounted to only 203. The ſoil is good, and only requires cultivation to produce moſt vegetables in perfection. There are evident marks of there having been volcanoes formerly on this peninſula. The mouths of four or five craters are plainly to be ſeen. The moſt ſoutherly and probably the moſt ancient, as it is grown over with graſs, now called the Devil's Den, is at leaſt twenty rods over at the top, fourteen and a half at the bottom, and full 130 feet at the ſides, except that which is next the ſea, where it is open. It is ſaid that veſſels uſed to guide themſelves in the night by the lights that were burning upon Gay-head. The ſea has made ſuch encroachments here, that, within thirty years, it has ſwept off twenty rods of land. The extremity of Gay Head is the ſouth-weſt point of the Vineyard. Lat. 41. 20. N. lon. 70. 50. W. Greenwich.

GAY'A, a town of Moravia, in the circle of Hradiſch: ten miles north-weſt of Straſnitz.

GAYE'TA, a town of Spain, in the province of Valentia: thirty miles from Valentia.

GAY'ETY, *ſ.* [*gayeté*, Fr. from *gay*.] Cheerfulneſs; airineſs; merriment; acts of juvenile pleaſure:

And from thoſe *gayeties* our youth requires
To exerciſe their minds, our age retires. *Denham.*

Finery; ſhow:

Our *gayety* and our guilt are all beſmirch'd,
With rainy marching in the painful field. *Shakeſpeare.*

GAY'LY, *adv.* Merrily; cheerfully; airily. Splendidly; pompouſly; with great ſhow:

The ladies, *gayly* dreſs'd, the Mall adorn
With curious dies, and paint the ſunny morn. *Gay.*

Like ſome fair flow'r, that early ſpring ſupplies,
That *gayly* blooms, but ev'n in blooming dies. *Pope.*

GAY'NESS, *ſ.* [from *gay*.] Gayety; finery. Not much in uſe.

GAZ. See GAS.

GA'ZA or AZ'ZA, a city of the Philiſtines, and the capital of the lordſhip of the Gazathites or Gazites; this city and its dependencies were a part of the original conqueſt of the Iſraelites, and reckoned in the tribe of Judah, it being taken, together with Aſkelon and Ekron, by that tribe; a part of the Anakims having ſheltered themſelves there after their expulſion from Canaan. It was again in the poſſeſſion of the Philiſtines when Samſon appeared; who when confined by them in this place, eluded their purpoſe of putting him to death by carrying off its gates, &c. here alſo happened the event that terminated Samſon's life. It was ſmitten by the king of Egypt in the days of Jeremiah, and in the Maccabean wars this place is frequently mentioned; as when Jonathan being denied admittance, laid ſiege to it and burned its ſuburbs, after which they treated with him, giving hoſtages of the ſons of the chief man of the city; it was however ſoon after entirely ſubdued by Simon the ſucceſſor of Judas, who diſplaced its refractory inhabitants and dwelt there with his followers. Gen. x. 19. Joſh. xi. 22. xv. 47. Judges i. 18. xvi. 1 Macc. xi. 61. 62. xiii. 43. &c.

GA'ZA or ADA'SA, a city of Paleſtine, ſituated in the tribe of Ephraim, upon the borders of that province, being a day's journey from Gaſera; here Judas Maccabeus encamped previous to the battle wherein he overcame Nicanor. 1 Chron. vii. 28. 1 Macc. vii. 40. 45.

GA'ZA, a town of Aſia, in Paleſtine, about a mile from the Mediterranean ſea, formerly a magnificent city, and ſtrongly fortified; it is now much reduced from its ancient grandeur, and hardly contains two thouſand inhabitants. The environs are exceedingly fertile, and produce, without art, pomegranates, oranges, dates, and flowers, in great requeſt even at Conſtantinople. Here is a manufacture of cotton, which employs five hundred looms in the town and neighbourhood; there are likewiſe great quantities of aſhes made by the Arabs, and

uſed

uſed in the manufacture of ſoap; but this manufacture has lately declined. The principal branch of commerce is furniſhed by the caravans, which paſs and repaſs between Egypt and Syria; and eſpecially the plunder of thoſe and other caravans which the Arabs bring thither, and diſpoſe of at a ſmall part of the real value. It is the reſidence of a Turkiſh pacha: fifty miles ſouth-weſt of Jeruſalem. Lat. 31. 28. N. lon. 52. 30. E. Ferro.

GA'ZA (Theodore), a learned Greek, native of Theſſalonica; after the deſtruction of which city by the Turks in 1430, he took refuge in Italy. He put himſelf to the ſchool of Vittorino da Feltre at Mantua, in order to learn Latin, at the ſame time aſſiſting his maſter in teaching Greek to his ſcholars; and ſuch was his application, that in three years he acquired the Latin language ſo perfectly as to become one of the moſt eloquent writers of it in his time. He was a profeſſor in the univerſity of Ferrara from 1441 to 1450, and was appointed its firſt rector upon its reform under the duke Leonello. He there taught Greek from a grammar of his own compoſition, and explained ſome of the orations of Demoſthenes. Before this period he was in ſuch a ſtate of indigence as to be obliged to copy Greek manuſcripts for a livelihood. From Ferrara he went into the ſervice of pope Nicholas V. and alſo obtained the munificent patronage of cardinal Beſſarion, who took him into his houſe, and placed ſo much confidence in his integrity, as to entruſt him with large ſums of money. After the pope's death he was ſome time with king Alphonſo at Naples; upon whoſe deceaſe he returned to Rome. In the time of Sixtus IV. he finiſhed his tranſlation of Ariſtotle upon Animals, undertaken at the inſtance of Nicholas V. and preſented it to his holineſs; but receiving from him only the paltry reward of fifty crowns, he is ſaid in a fit of indignation to have thrown the money into the Tyber. He then returned to Ferrara, and afterwards retired into Calabria, where it is probable that he died in 1478, though ſome writers make Rome the place of his death. Theodore Gaza was one of the moſt learned of thoſe of his country who imported Grecian literature into the Weſt, and has been highly commended by the principal ſcholars of that time. His Greek Grammar was firſt printed by Aldus in 1495, together with his treatiſe On the Grecian Months. He tranſlated from Greek into Latin, beſides Ariſtotle's work upon Animals, the Aphoriſms of Hippocrates, and Commentaries upon them by Galen; Theophraſtus on Plants; the Problems of Alexander Aphrodiſeus; Ælian's Tactics; *Dionyſius Halicarn. de Compoſitione Orationis*; ſome Homilies of John Chryſoſtom; and ſome other works. He alſo tranſlated *Cicero de Senectute* and *Somnium Scipionis* from Latin into Greek; and likewiſe a work of Savonarola. He engaged in the controverſy between the Platoniſts and Ariſtotelians, and compoſed a work againſt the notions of the former.

GAZA'LI, ſurnamed ABOU HAMED MOHAMMED ZEIM EDDIN AL THOUSI, was one of the moſt celebrated of the muſſulman doctors, born at Thous, a town in Khoraſan, in the year 450 of the Hegira, or 1058 of the Chriſtian æra. Nezam Almulk gave him the appointment of profeſſor in the college which he had founded at Bagdat, under the reign of Malec Schah; but Gazali relinquiſhed this ſituation for the ſake of embracing a life of retirement and ſtudy; and after having made the pilgrimage to Mecca, he returned to his native country, where he died in the year 505 of the Hegira. The reputation which he acquired by his learning and virtues, occaſioned him to be diſtinguiſhed, in the oriental manner, by many magnificent titles. Being aſked what means he had uſed to arrive at that eminence in ſcience to which he had attained, he anſwered, "that he had never been aſhamed to aſk for information on ſubjects concerning which he was ignorant." His moſt famous production is entitled *Ahia ôloum Eddin*, or The different Claſſes of the Sciences which relate to Religion. He was alſo the author of another work, entitled *Anis fil ovahedat*, or the Companion of Solitude, attributed to *Abou Hamel al* GAZALI, who is ſaid to have died in the year 705 of the Hegira; and he is to be diſtinguiſhed from another GAZALI, ſurnamed *Ali Ben Cofaibah*, who died in the year 878 of the Hegira, and was the author of a work entitled *Eſtehathâth al merahem*, or The Means of obtaining the Mercy of God.

GAZ'ARA or GAZERA, a ſtrong fortreſs in Paleſtine, where a detachment of the army of Gorgias, under Timothy, retreated after their defeat by Judas Maccabeus; and after ſuſtaining a ſiege of four days, the place was carried by ſtorm, and Timothy himſelf ſlain. It was again fortified by Simon the ſucceſſor of Judas, and occupied by John and the forces under him. 1 Macc. iv. 15. xiii. 53. xiv. 34. xvi. 1. 19. 2 Macc. x. 32. &c.

To GAZE, *v. n.* [ⲁγαζεσθαι, Gr. or rather ȝeȝean, Sax. to ſee.] To look intently and earneſtly; to look with eagerneſs.—*Gaze* not on a maid, that thou fall not by thoſe things that are precious in her. *Eccleſ.* ix. 5.—A lover's eyes will *gaze* an eagle blind. *Shakeſpeare.*

High ſtations tumults, but not bliſs, create;
None think the great unhappy, but the great.
Fools *gaze* on envy; envy darts a ſting,
Which makes a ſwain as wretched as a king. *Young.*

To GAZE, *v. a.* To view ſtedfaſtly:

Strait toward heav'n my wond'ring eyes I turn'd,
And *gaz'd* awhile the ample ſky. *Milton.*

GAZE, *ſ.* Intent regard; look of eagerneſs or wonder; fixed look.—Pindar is a dark writer, wants connexion as to our underſtanding, ſoars out of ſight, and leaves his readers at a *gaze*. *Dryden.*

With ſecret *gaze*,
Or open admiration, him behold,
On whom the great Creator hath beſtow'd
Worlds. *Milton.*

The object gazed on:

I muſt die
Betray'd, captiv'd, and both my eyes put out;
Made of my enemies the ſcorn and *gaze*;
To grind in brazen fetters, under taſk,
With my heav'n-gifted ſtrength. *Milton.*

GA'ZEFUL, *adj.* Looking intently:

The brightneſs of her beauty clear,
The raviſh'd hearts of *gazeful* men might rear
To admiration of that heavenly light. *Spenſer.*

GA'ZEHOUND, *ſ.* [ȝeze-hunꝺ, Sax.] A large ſpecies of grey-hound, anciently uſed in chaſing deer. See the article CANIS, vol. iii. p. 718.

See'ſt thou the *gazehound!* how with glance ſevere
From the cloſe herd he marks the deſtin'd deer! *Tickel.*

GAZ'EL, in zoology. See the article CAPRA, vol. iii. p. 775.

GA'ZEMENT, *ſ.* View:

Then forth he brought his ſnowy Florimele
Cover'd from people's *gazement* with a vele. *Spenſer.*

GA'ZER, *ſ.* [from *gaze*.] He that gazes; one that looks intently with eagerneſs or admiration.—His learned ideas give him a tranſcendent delight; and yet, at the ſame time, diſcover the blemiſhes which the common *gazer* never obſerved. *Watts.*

In her cheeks the virmil red did ſhew,
Like roſes in a bed of lilies ſhed;
The which ambroſial odours from them threw,
And *gazers* ſenſe with double pleaſure fed. *Spenſer.*

GA'ZER, the name of the place to which David purſued

purſued the Philiſtines. 2 Sam. v. 25. It is probably the ſame with GAZARA, or GAZERA.

GAZ'ERA. See GAZARA.

GAZ'ET, *ſ.* A ſmall Venetian coin.—A *gazet* is almoſt a penny, whereof ten do make a livre, that is, nine pence. *Coryat's Crudities.*

GAZ'ET (William), a Flemiſh prieſt, and ingenious writer, born at Arras in 1554. When young he taught the claſſics in the univerſity of Louvain, and about the year 1580 was preſented to the living of St. Mary Magdalen, at Arras. Afterwards he obtained a canonry of the cathedral church of St. Peter, at Aire, in Artois, and kept both thoſe benefices till his death in 1612, when fifty-ſeven years of age. His writings are, 1. *Magdalis, Tragœdia ſacra*, 1589, 8vo. 2. The Order and Succeſſion of the Biſhops and Archbiſhops of Cambray, 1597, 8vo. including a ſhort hiſtory of the moſt memorable events of their time, &c. 3. The Order of the Biſhops of Arras, after the Separation of that See from the Biſhopric of Cambray, 1598, 8vo. 4. *Theſaurus Precum & Litaniarum, ex Scripturæ Sacræ ſanctorumque Patrum Gazophylaciis depromptus*, 1602, 12mo. 5. The Eccleſiaſtical Hiſtory of the Low-countries, publiſhed after the author's death, 1614, 4to. 6. The Lives of the Saints, with moral Reflections, alſo poſthumous, in 2 vols. 1613, 8vo. 7. The Mirror of Conſcience. 8. The Holy Feaſt, or Exerciſes preparatory to the Reception of the Euchariſt. 9. Spiritual Exerciſes and Litanies for the whole Week, with Prayers, &c.

GAZET'TE, *ſ.* [*gazetta* is a Venetian halfpenny, the price of a news paper, of which the firſt was publiſhed at Venice.] A paper of news; a paper of public intelligence. It is accented indifferently on the firſt or laſt ſyllable.—An Engliſh gentleman without geography, cannot well underſtand a *gazette*. *Locke.*

All, all but truth, falls dead-born from the preſs;
Like the laſt *gazette*, or the laſt addreſs. *Pope.*

The firſt gazette in England was publiſhed at Oxford, the court being there, in a folio half-ſheet, Nov. 7, 1665. On the removal of the court to London, the title was changed to the *London Gazette*.

GAZETTEER', [from *gazette*.] A writer of news. An officer appointed to publiſh news by authority, whom Steele calls the loweſt miniſter of ſtate:

Satire is no more: I feel it die:
No *gazetteer* more innocent than I. *Pope.*

A book containing the names of cities, towns, villages, &c. in any kingdom or country. A title for a newſpaper:

Glaſſes and bottles, pipes and *gazetteers*,
As if the table even itſelf was drunk,
Lie a wet broken ſcene. *Thomſon.*

GA'ZI, *ſ.* A title among the Turks and Arabs, given to ſuch as have made war on Chriſtians, and extended the religion of Mahomet. *Scott.*

GA'ZINGSTOCK, *ſ.* A perſon gazed at with ſcorn or abhorrence.—Theſe things are offences to us, by making us *gazingſtocks* to others, and objects of their ſcorn and deriſion. *Ray.*

GAZ'NA, a decayed city of Aſia, once the capital of the Gaznavian empire; but which is now either entirely ruined, or become of ſo little conſideration, that it is not even noticed in our books of geography.—See the article HINDOOSTAN.

GAZ'NIN, a town of Aſia, in the kingdom of Candahar: 106 miles eaſt of Candahar.

GAZOL'DO, a town of Italy, in the duchy of Mantua: thirteen miles weſt-north-weſt of Mantua.

GAZO'LO, a town of Italy, in the duchy of Mantua: thirteen miles ſouth-weſt of Mantua.

GAZOM'ETER. See GASOMETER.

GA'ZONS, *ſ.* in fortification, turfs, or pieces of freſh earth covered with graſs, cut in form of a wedge, about a foot long, and half a foot thick, to line or face the outſide of works made of earth, to keep them up, and prevent their mouldering.

GA'ZUL, *ſ.* An Egyptian weed, of which the fineſt ſort of glaſſes are made.

GDOV, a town of Ruſſia, in the government of Peterſburg, on the eaſt coaſt of the Tchudſkoc Lake: ninety miles ſouth-ſouth-weſt of Peterſburg.

GE-HO, a town of Chineſe Tartary: twenty-three miles ſouth-ſouth-eaſt of Pora, and one hundred north-eaſt of Pekin.

GEAR, *ſ.* [ȝyꝑian, to clothe; ȝeaꝑne, Sax. furniture.] Furniture; accoutrements; dreſs; habit; ornaments.—Array thyſelf in her moſt gorgeous *gear*. *Spenſer.*

To ſee ſome radiant nymph appear
In all her glitt'ring birthday *gear*,
You think ſome goddeſs from the ſky
Deſcended, ready cut and dry. *Swift.*

The traces or furniture by which horſes or oxen draw:

The frauds he learned in his frantic years
Made him uneaſy in his lawful *gears*. *Dryden.*

Stuff. *Hanmer.*—If fortune be a woman, ſhe is a good wench for this *gear*. *Shakeſpeare.*—[In Scotland.] Goods or riches: as, he has *gear* enough.—[From ȝeaꝑa, Sax.] Employment.—That to ſir Calidore was eaſie *geare*. *Spenſer.*—Such is alſo the plain ſenſe of the word in that paſſage of Milton's Comus, which Johnſon has grievouſly misjoined to the firſt ſenſe. *Maſon's Suppl.*

To GEAR, *v. a.* To dreſs; to put harneſs on a horſe.

GE'ARON, or JAROON, a town of Perſia, in the province of Farſiſtan; celebrated for its excellent fruits, raiſins, pomegranates, dates, and quinces: ſeventy miles ſouth-eaſt of Schiras.

GEARS, *ſ.* A ſea term; the jeers, an aſſemblage of ſmall tackle.

GE'ASON, *adj.* [ȝæꝛne, Sax. *rarus*.] Wonderful.—It to Leeches ſeemed ſtrange and *geaſon*. *Hubb.*

GEAS'TER, *ſ.* in botany. See LYCOPERDON.

GEAT, *ſ.* [corrupted from *jett*.] The hole through which the metal runs into the mold. *Moxon.*

GEAUNE, a town of France, in the department of the Landes, and chief place of a canton, in the diſtrict of St. Sever: four leagues ſouth-eaſt of St. Sever, and ſix eaſt-north-eaſt of Orthez.

GE'BA, a city of Paleſtine, ſituated in the tribe of Benjamin, and one of the cities of the Levites of the family of Kohath. Here was a garriſon of the Philiſtines in the reign of Saul, that was routed by his ſon Jonathan; and from this place David purſued the Philiſtines to Gazer. It was rebuilt by king Aſa with the ſtones intended for the building of Ramah; from this place alſo were the idolatrous prieſts and worſhip expelled by Joſiah; and near this place Holofernes encamped in the days of Judith. Joſh. xxi. 17. 1 Sam xiii. 3. 2 Sam. v. 25. 1 Kings, xv. 22. 2 Kings, xxiii. 8. Judith, iii. 10.

GE'BA, a town and country of Africa, on a river of the ſame name, which ſoon after joins the river St. Domingo. Lat. 12. 10. N. lon. 13, 30. W. Greenwich.

GE'BAH. See GIBEAH.

GE'BAL, the name of a place mentioned by Ezekiel; the ancients of which are ſaid to have been the calkers of the ſhips of Tyre. Ezek. xxii. 9. Mr. Maundrell, who viſited this place, obſerves, "This was probably the city of the Giblites mentioned Joſh. xiii. 5. whom king Hiram made uſe of, in preparing materials for Solomon's temple, as appears from 1 Kings, v. 18, where the word rendered *ſtone-ſquarers*, is in the Hebrew *Giblim*, or Giblites, and in the Septuagint, *Biblioi*, or the men of Byblus; the former the Hebrew, and the latter the Greek, name of this place, which difference may alſo be obſerved in Ezek. xxvii. 9, where our tranſlation has *the ancients of Gebal*, and the Septuagint *the elders of Byblus*. It was famous for the birth and temple of Adonis,

Adonis, and was anciently a place of great beauty, and no ſmall extent, as appears from the many heaps of ruins, and the fine pillars ſcattered up and down in the gardens near the town." See BYBLUS.

GEBAU', a town of Bohemia, in the circle of Boleſlaw: ſix miles ſouth of Benatek.

GEBAU' (New), a town and caſtle of Sileſia, in the principality of Oppeln: nine miles and a half ſouth-eaſt from Falkenburg.

GEB'BAR, a town of Aſiatic Turkey, in the province of Diarbekir: ten miles ſouth-eaſt of Jadida.

GEBEN'NA, a town and mountain of Gaul. *Lucan.*

GE'BER (John), a chemiſt and aſtronomer, commonly conſidered as an Arabian, though born at Seville in Spain; but Leo Africanus aſſerts, that he was a Greek, who afterwards embraced Mahometaniſm. As the word *geber* ſignifies a king, this circumſtance, it is probable, gave riſe to the fabulous report of his having been a ſovereign in India. The events of his life, and the period when he flouriſhed, are at beſt uncertain. According to ſome, he was a nephew of Mahomet, and lived in the ſeventh century; whilſt others place him in the eighth or ninth. He was not only an excellent aſtronomer, and corrected many errors in the Almageſt of Ptolemy, but was alſo the firſt reviver of chemiſtry; and therefore he is mentioned with great reſpect by Boerhaave, who ſays that he found in his works many obſervations and experiments which were afterwards publiſhed as new. That he involved himſelf in the myſteries of alchemy muſt be aſcribed to the taſte of the period at which he lived. The alchemiſts make him the inventor of an univerſal medicine, as Cardan does of algebra. His works were written in Arabic, but were eagerly tranſlated into other languages. They were preſented by Golius, in Arabic manuſcript, to the library of the univerſity of Leyden, where they are ſtill preſerved. Thoſe which have been printed are: 1. *Syntaxis Aſtronomica, ſive Demonſtrativum Opus Aſtrologiæ, Libri IX.* Nuremberg, 1533, folio, tranſlated by Gerrard de Sabionetta. 2. *De Inveſtigatione Perfectionis*, Baſle, 1561, folio, with ſome alchemiſtic works, collected by Gratarola. 3. *Liber Fornacum*, in Gratarola's collection, ibid. 1572, 8vo. 4. *De Alchymia, Traditio Summæ Perfectionis, in duos Libros diviſa.* 5. *Liber Inveſtigationis Magiſterii*, Straſb. 1588, 8vo. 6. *Summa Perfectionis Magiſterii*, Venice, 1542, 8vo. improved from a manuſcript in the Vatican, Dantzic, 1682, 8vo. 7. *Chymia, ſive Traditio Summæ Perfectionis & Inveſtigatio Magiſterii*, Leyden, 1668; of this work there is another edition improved by George Horn, with the addition of *Medulla Alchymiæ Gebricæ.* 8. *Enarratio Methodica trium Gebri Medicinarum, in quibus continetur Lapidis Philoſophici vera Confectio*, Amſterdam, 1678, 8vo. 9. *La Eſpoſizione di molti Secreti della Natura*, Venice, 1544, 8vo. 10. *Geomanica*, tranſlated into Italian, 1552. Golius gave a Latin tranſlation of the alchemical works of Geber, under the title of *Lapis Philoſophorum*, which was publiſhed firſt at Leyden, in folio, and afterwards in quarto. An Engliſh tranſlation, by Richard Ruſſel, appeared at Leyden, in 1668, 8vo.

GE'BERSDORF, a town of Germany, in the circle of Upper Saxony, and principality of Querfurt: one mile north of Dahme.

GEBESEE', a town of Germany, in the circle of Upper Saxony, in Thuringia: eight miles north-north-weſt of Erfurt.

GE'BIM, a city of Paleſtine, ſituated moſt probably in the tribe of Judah. Iſaiah, x. 31.

GEB'LITZ, a town of Bohemia, in the circle of Leitmeritz: two miles ſouth-weſt of Leitmeritz.

GE'BRES. See GABRES, p. 151, of this volume.

GEC'CO, *ſ.* A name given by the Indians to the poiſon with which they anoint their arrows, or infuſe under their nails, or inſtil by a puncture, to deſtroy the life of an enemy, or thoſe they wiſh to kill by a ſlow poiſon. See the article POISON.

GECK, *ſ.* [ȝeac, Sax. a cuckow; *geck*, Germ. a fool; *gawk*, Scottiſh.] A bubble eaſily impoſed upon. *Hanmer. Obſolete.*—Why did you ſuffer Jachimo to taint his noble heart and brain with needleſs jealouſy, and to become the *geck* and ſcorn o' th' other's villainy? *Shakeſp.*

Why have you ſuffer'd me to be impriſon'd,
And made the moſt notorious *geck* and gull,
That e'er invention play'd on? *Shakeſpeare.*

To GECK, *v. a.* To cheat; to trick.

GECK'O, *ſ.* A ſpecies of lizard. See LACERTA.

GEDALI'AH, [of גדל Heb. greatneſs, and יה the Lord, i. e. the greatneſs of the Lord.] A governor left at Jeruſalem during the Babyloniſh captivity.

GED'DES (Alexander), a learned Scotch catholic divine, born at Arradowl in Bamffſhire, in 1737. His parents were reputable, but not opulent; and in whoſe library the principal book was an Engliſh edition of the Bible, which they taught their ſon to read at a very early period. By the care and frequency with which he peruſed that book, the principal facts contained in it became familiar to his mind in his infancy, and before he attained his eleventh year, he knew all its hiſtory by heart. In 1758, he was ſent to the Scotch college at Paris; and not long after he began to attend the lectures in the college of Navarre, under M. Buré and de Sauvent, and of Lavocat for the Hebrew language, at the Sorbonne. His proficiency intereſted the laſt-mentioned profeſſor ſtrongly in his favour, who wiſhed him to remain at Paris; but through the advice of other friends he was prevailed upon to return to Scotland in 1764. The firſt appointment which he had as prieſt was among the catholics in the county of Angus; from which ſituation he removed, in 1765, to Traquaire, where he reſided nearly three years in the capacity of domeſtic chaplain to the earl of that name. In the autumn of 1768 he quitted Traquaire, and returned to Paris, where he ſpent the following winter, devoting his time to the conſultation of books and manuſcripts in the king's and other libraries, and making extracts from the Hebrew. In the ſpring of 1769 he returned to Scotland, and undertook the charge of a conſiderable Roman-catholic congregation at Auchinhalrig, in Bamffſhire. In 1779 the univerſity of Aberdeen, from a regard to his learning and merits, conferred on him the degree of doctor of laws: an honour by which that body had not before diſtinguiſhed any Roman-catholic ſince the reformation. About this period Dr. Geddes removed to London, for the ſake of being within reach of greater facilities for proſecuting the grand work to which his courſe of ſtudies had for ſome time been ſubſervient, which was a new Engliſh tranſlation of the Books of the Old and New Teſtament from their original languages. For a few months after his arrival at the metropolis, he officiated as prieſt in the imperial ambaſſador's chapel, till it was ſuppreſſed at the end of the year 1780, by an order from the emperor Joſeph II. and afterwards he preached occaſionally at the chapel in Duke-ſtreet, Lincoln's-inn-fields, till Eaſter, 1782, at which time it is believed that he entirely declined the public exerciſe of all clerical functions. Dr. Geddes had formed the deſign of a new tranſlation of the Bible while he was a ſtudent at Paris; and about the year 1760, he began a courſe of reading neceſſary to qualify him for entering on ſo great an undertaking. When it was underſtood that Dr. Geddes was ſeriouſly bent on the deſign of a new tranſlation of the Bible, he met with much diſcouragement and oppoſition from the leſs enlightened members of his own communion, originating in their well-known dread of permitting the laity to have acceſs to the ſcriptures in their native language. In theſe circumſtances, ſays he, "I had but little hopes of ever being able to proſecute the plan, when Providence threw me into the arms of ſuch a patron as Origen himſelf might have been proud to boaſt of: a patron who, for theſe ten years paſt, has, with a dignity peculiar to himſelf, afforded me every convenience that my heart

heart could desire towards the carrying on and completing my arduous work." That patron was the late lord Petre, a catholic nobleman, whose memory is entitled to the respect of Christians of every denomination, for the zeal which he discovered in promoting the extension of biblical literature. In 1786, Dr. Geddes published his Prospectus of a new Translation of the Bible, from corrected Texts of the Originals, compared with the ancient Versions, &c. 4to. which attracted considerable notice, and afforded evidence of the approbation which the author's plan met with from distinguished protestant ecclesiastics, particularly the late Dr. Kennicott, "on whose tomb," as Dr. Geddes justly observed, "every biblical student ought annually to strew the tributary flower." In the following year he published an Appendix to the preceding, in the form of a Letter to Dr. Louth, Bishop of London, suggesting a variety of queries, doubts, and difficulties, relative to a vernacular version of the Scriptures; and also, A Letter to Dr. Priestley, intended to prove, by one prescriptive Argument, that the Divinity of Jesus Christ was a primitive Tenet of Christianity, 8vo. In 1788, Dr. Geddes published his proposals for printing by subscription this new Translation of the Bible, &c. containing, besides the conditions of subscription, specimens of his translation and notes. In 1790, he published A General Answer to the Queries, Counsels, and Criticisms, that have been communicated to him since the Publication of his Proposals, &c. replete with learning, ingenuity, and good humour. Annexed to it is a list of the subscribers to his work, in perusing which the liberal mind will be gratified by observing catholic monasteries in Germany, colleges in the English and Scotch universities, catholic and protestant bishops, and clergy of different denominations, all united in giving encouragement to a design for promoting a more intimate acquaintance with the sacred scriptures. But, notwithstanding that the list of subscribers was respectable, their number was by no means adequate to the magnitude of the undertaking, and could scarcely afford the author hopes of being reimbursed the expences which his work must necessarily require, much less compensate him for the excessive exertion to which he had devoted himself. And, though lord Petre's generosity secured to him all the comforts of life, and the means necessary to commence his work, yet it could not be expected that it could indemnify him against the risk attending a plan which demanded an extensive public patronage. Trusting, however, that, when the first fruits of his labours made their appearance, the liberal and discerning would not suffer his services in the cause of literature and truth to want encouragement, he determined to commence the publication of his great undertaking. Accordingly, in 1792, the first volume appeared, entitled The Holy Bible, or the Books accounted Sacred by Jews and Christians, &c. faithfully translated from the corrected Texts of the Originals; with various Readings, explanatory Notes, and critical Remarks, 4to. This volume comprises the Pentateuch and the book of Joshua, and sufficiently satisfied all liberal and competent judges, that the author had not undertaken a task to which his learning and abilities were inadequate. Soon after its publication, however, three catholic bishops, sustaining the character of vicars-apostolic, and the titles of Rama, Acanthos, and Centuriæ, addressed pastoral letters to their respective flocks, warning them against the reception and use of Dr. Geddes's version. This episcopal stretch of power occasioned a correspondence between Dr. Geddes and the bishop of Centuriæ, in the course of which the latter announced his suspension of the doctor from the exercise of his ecclesiastical functions, unless, within a prescribed time, he should submit to an injunction contained in the pastoral letters. Such conduct the doctor resented with becoming spirit, and wrote a highly animated letter to the bishop, informing him that he was not afraid of his threatenings, and should laugh at his censures, so long as he was conscious that he deserved them not; and that he would never submit to the injunction, because he deemed it rash, ridiculous, and informal. In 1794, the author published a longer Letter to the Right Reverend John Douglas, Bishop of Centuriæ, and Vicar-Apostolic in the London District, in which he protested to the world against the bishop's tyrannical proceedings, and exposed them, on the ground of reason, as well as on received principles of ecclesiastical discipline, with much solid argument, not unmixed with a happy vein of irony. In 1797, he published the second volume of his new translation, containing the books of Judges, Samuel, Kings, Chronicles, and the Prayer of Manasseh. In 1800, he also published, A modest Apology for the Roman-catholics of Great Britain, addressed to all moderate Protestants, and particularly to the Members of both Houses of Parliament, 8vo. In this work the author's learning, accurate knowledge of ecclesiastical history, liberality, and moderation, appear to eminent advantage; and it affords such a view of the creed of the more enlightened part of the modern British catholics, as shews that they neither merit proscription nor persecution; while it ably and satisfactorily establishes their claims, on the footing of justice and policy, to a share in every privilege which the most favoured of their fellow-subjects enjoy. It was Dr. Geddes's next intention to present to the public a new translation of the Book of Psalms; but, during the last year of his life, his studies and literary labours were greatly interrupted by attacks of a painful disease, which baffled all remedies or palliatives, and terminated his life on the 26th of February, 1802, when in the sixty-fifth year of his age. No person was a more strenuous and uniform advocate for uncontrouled freedom of opinion, and freedom of discussion, than Dr. Geddes; and he was, in the strictest sense of the word, a genuine catholic, extending his good-will to all of every sect and party, and disposed to grant to others every privilege which he claimed for himself. Besides the articles already mentioned, Dr. Geddes was the author of, 1. A Letter to a Member of Parliament, 1787, 8vo. on the expediency of a general repeal of all penal statutes that regard religious opinions. 2. *Epistolæ macaronica ad Fratrem de iis quæ gesta sunt in nupero Dissentientium Conventu, &c.* 1790, 4to. 3. *Carmen Seculare pro Gallica Gente, Tyrannide aristocratica erepta*, of the same date, 4to. 4. *Ver-vert*, or the Parrot of Nevers, a Poem, in four Cantos, freely translated from the French of J. B. Greffet, 1793, 4to. 5. The Battle of B—ng—r, or the Church triumphant, a comic-heroic Poem, in nine Cantos, 1797, 4to. and several other poetical pieces, satirical or sprightly, written by way of relaxation from his severer studies.

GED'DES (James), a learned Scotch philosophical writer, born at Tweedale in 1710. At a proper age he was sent to the university of Edinburgh, where he studied the different branches of philosophy, and made great proficiency in the mathematical sciences under the celebrated Colin Maclaurin. After he had finished his philosophical course, his attention was directed to the law, for which profession he was designed; and when he had gone through the usual preparatory studies, he was admitted an advocate. For several years he practised at the bar with growing reputation, and afforded flattering hopes of rising to eminence in his profession; but they were frustrated by his being carried off in a decline, when aged between thirty and forty years. He retained through life that relish for ancient literature which he had imbibed in his youth; and devoted what time he could spare from the duties of his profession and the necessary affairs of his family, to the study of the ancient poets, philosophers, and historians. The only production of his pen which has been published is posthumous, and

and entitled An Eſſay on the Compoſition and Manner of Writing of the Ancients, particularly Plato, 1748, 8vo. Several other papers were left behind him in an unfiniſhed ſtate, which were deſigned to form another volume.

GED'DES (Michael), a learned Engliſh divine, who flouriſhed in the beginning of the eighteenth century. He was for ſome time ſettled at Liſbon, in the capacity of chaplain to the Engliſh factory in that city, the duties of which he diſcharged from the year 1678 to 1688, when he returned to his native country, where he died in 1714. His works conſiſt of, 1. The Hiſtory of the Church of Malabar, from the Time of its being diſcovered by the Portugueſe in 1501, and of the Synod of Diamper, celebrated in the year 1599; 1694, 8vo. 2. The Church Hiſtory of Ethiopia, including an Account of the two great Roman Miſſions into that Empire, &c. 1696, 8vo. 3. The Council of Trent no free Aſſembly; more fully diſcovered by a Collection of Letters and Papers of the learned Dr. Vargas, and other great Miniſters, who aſſiſted at the ſaid Synod in conſiderable Poſts, &c. 1697, 8vo. 4. Miſcellaneous Tracts, in three volumes, 1702, 8vo. &c. relating to ſubjects in civil and eccleſiaſtical hiſtory, particularly that of Spain and Portugal, and to the catholic controverſy; and a poſthumous volume, entitled Several Tracts againſt Popery, together with the Life of Don Alvaro de Luna, 1715, 8vo.

GE'DEON, a man's name in the book of Judith.

GE'DER, a city of Paleſtine, and the ſeat of one of the kings ſubdued by Joſhua. Joſh. xii. 13.

GED'ERAH, a city of Paleſtine, belonging to the tribe of Judah; ſituated in the low parts of that province. Joſh. xv. 36.

GED'ERN, a town of Germany, in the circle of the Upper Rhine, belonging to the prince of Stolberg: ſeven miles north-eaſt of Ortenburg, and twenty-four eaſt-north-eaſt of Frankfort on the Maine.

GED'EROTH, a city of Paleſtine, belonging to the tribe of Judah; ſituated in the low parts of that province. It was taken by the Philiſtines in the reign of Ahaz king of Judah. Joſh. xv. 41. 2 Chron. xxviii. 18.

GEDEROTHA'IM, a city of Paleſtine, belonging to the tribe of Judah; ſituated in the low parts of that province. Joſh. xv. 36.

GEDI'DA, a town of Arabia Deſerta: ſixty miles weſt of Ana.

GE'DOR, a city of Paleſtine, belonging to the tribe of Judah; ſituated in the mountains of that province. The Simeonites ſeized upon this place in the reign of Hezekiah, on account of the excellent paſture it was poſſeſſed of. Joſh. xv. 58. 1 Chron. iv. 39, 40, 41.

GEDO'YN (Nicholas), a celebrated abbé, born at Orleans in 1667. He was educated at the Jeſuits' college in Paris, and afterwards entered into the ſociety, in which he continued ten years. He then quitted it, and appeared in the world in the character of a man of letters. In order to improve himſelf in politeneſs, he frequented the ſchool of the celebrated Ninon de l'Enclos, who had the credit of forming ſo many perſons of taſte and faſhion. He was preſented with a canonry of the Holy Chapel in 1711, and the abbacy of Notre-Dame de Beaugency in 1732. His literary reputation opened to him the doors of the academy of belles-lettres in 1711, and of the French academy in 1719. He died in 1744. The abbé Gedoyn obtained great applauſe by two tranſlations, that of Quintilian, and of Pauſanias. The firſt is accounted one of the moſt elegant performances of the kind; but in avoiding a ſervile tranſcription of his author, he has ſometimes indulged himſelf in deviations from his ſenſe. The tranſlation of Pauſanias is alſo elegant, and is enriched with learned notes; its exactneſs has, however, been called in queſtion. He likewiſe publiſhed *Œuvres Diverſes*, 1745, 12mo. a collection of diſſertations on moral and literary topics: and he left in manuſcript ſeveral curious diſſertations, among which is an Examination of Milton's Paradiſe Loſt, which he decides to be a gloomy work; a ſentence which reflects no credit on his literary acumen.

GEE, a term uſed by waggoners to their horſes when they would have them go faſter, or to the right hand.

GEELE, or GHEELE, or GHELE, a town of Brabant: ten miles north-weſt of Dieſt.

GEEMSKER'SKOI NOS, a cape on the eaſt coaſt of Nova Zembla. Lat. 77. 10. N. lon. 95. E. Ferro.

GEEONG', a town of the iſland of Borneo. Lat. 5. 10. N. lon. 117. 10. E. Greenwich.

GEER. See GEAR.

GEER (Charles de), knight of the polar ſtar, member of the academies of Stockholm and Upſal, and a celebrated naturaliſt, born in 1720, and in his fourth year accompanied his parents to Holland, from which he returned to Sweden at the age of eighteen. He ſtudied at Utrecht, and having conceived an early attachment to entomology, in conſequence of ſome ſilk-worms being preſented to him, his fondneſs for the ſtudy of nature was confirmed by an acquaintance with the celebrated Muſchenbroek. In the mean time he continued his ſtudies at Upſal, under Klingenſtierna, Celſius, and Linnæus; and, on account of the great progreſs he made, he was allowed to undertake the management of his property four years ſooner than he otherwiſe could have done. As he had a conſiderable ſhare in the iron works of Dannemora, and it was exceedingly difficult and expenſive to keep them free of water, he did a great ſervice to theſe mines by the activity with which he promoted the improvements in the machinery. About this period alſo he invented an apparatus for drying corn by the heat of the ſmelting-houſes, which had been before loſt, ſo that from 12 to 14,000 tons of corn were dried annually in this manner at his works. The riches which he thus acquired he privately ſhared with the poor; he alſo built or repaired churches, and eſtabliſhed various ſchools. Though the direction of ſo many objects required the greater part of his time and attention, he devoted his hours of recreation to the ſtudy of inſectology, which, by means of his great penetration and the helps he employed, ſuch as works of every kind on the ſubject, magnifying glaſſes, &c. he carried to a great degree of perfection. In 1761, he was appointed marſhal of the court, and knight of the polar ſtar; and in 1772 he was made commander of the order of Vaſa, with the grand croſs, and the year after a baron. Through his life he was tormented with the gout, which, having attacked the vital parts, put an end to his exiſtence on the 8th of March, 1778. De Geer had a ſtrong attachment to natural hiſtory from his youth, and particularly entomology. He cauſed the obſervations he made to be inſerted in the tranſactions of learned ſocieties; but as they daily increaſed, he reſolved to publiſh them in ſeparate volumes, the firſt of which appeared in 1752, under the title of *Mémoires pour ſervir à l'Hiſtoire des Inſectes*, with 37 plates. Nineteen years after, the ſecond volume appeared; and in 1779, the ſeventh and laſt. In this elaborate work the ingenious author has brought forward a great deal of new information in regard to inſects; and many of the figures were delineated by himſelf. But this work, conſiſting of ſeven large volumes quarto, with a great many plates, was exceedingly dear; and it had alſo become ſcarce, for the greater part of the copies of the firſt volume were deſtroyed by fire. This deficiency, however, was in ſome meaſure ſupplied by a German tranſlation, the production of the celebrated Goeze of Quedlingburg, and by theſe means the work was made much better known. The tranſlator enriched it with a variety of notes, and conſiderable additions, together with references to various other writers. Profeſſor Retzius, of Lund, has given a kind of extract from de Geer's

work in Latin, for the uſe of thoſe who cannot procure the original, and who are unacquainted with the French or the German. It is entitled *Car. L. B. de Geer Genera & Species Inſectorum, e generoſiſſimis Auctoris Scriptis extraxit, digeſſit, Latinè quoad partim reddidit, & terminologiam Inſectorum Linneanam addidit, A. J. Retzius*, Lipſ. 1783, 8vo. De Geer wrote alſo, in the Swediſh language, An Oration on the Procreation of Inſects, Stock. 1754; together with various papers in the Tranſactions of the academies of Stockholm and Upſal.

GEER'VLIET, a town of Holland, in the iſland of Putten: five miles from the Brill.

GEESCH, a village of Africa, in Abyſſinia, near the ſource of the Nile. Lat. 10. 59. N. lon. 86. 56. E. Greenwich.

GEESE, the plural of *gooſe*.

GEETE, a river of Brabant, which runs into the Demer at Dalen.

GEE'VACH, mountains of Ireland, between the counties of Leitrim and Roſcommon: nine miles north-eaſt of Boyle.

GEFFERY, a man's name.

GEF'LE, a river of Sweden, which paſſes by the town ſo called, and runs into the Gulf of Bothnia about ten miles below.

GEF'LE or GIAWLE, a town of Sweden, in the province of Geſtricia, on an arm of the Gulf of Bothnia, which divides the town and ſurrounds it, forming two iſlands. The town is ancient, populous, and commercial, with many rich merchants, but neither regular nor handſome. The harbour is good: the principal exports are iron, pitch, tar, and planks. Two thirds of the inhabitants are fiſhermen: ſixty miles north of Upſal. Lat. 60. 50. N. lon. 17. 1. E. Greenwich.

GEFREE'S, a town of Germany, in the circle of Franconia, and principality of Bayreuth: twelve miles north-north-eaſt of Bayreuth.

GEGA'NII, a family of Alba, part of which migrated to Rome under Romulus. One of the daughters called Gegania was the firſt of the veſtals created by Numa. *Plutarch.*

GE'GE, a river of Pruſſian Lithuania, which runs into the Wilde two miles ſouth-eaſt of Plaſchken.

GEGEN'DE, a town of European Turkey, in the province of Bulgaria, on the Danube: twenty miles weſt of Nicopoli.

GE'GENY, a town of Hungary; twenty-three miles eaſt of Gros Wardein.

GEHA'ZI, [Heb. the valley of viſion.] A man's name.

GEHEN'NA, [Heb. the valley of Hinnom.] A valley near Jeruſalem where the idolatrous Iſraelites ſacrificed their children to Moloch.

GEH'MEN, a town of Germany, and capital of a lordſhip, in the circle of Weſtphalia, ſituated on the Aa, within the biſhopric of Munſter. The inhabitants are lutherans and calviniſts, and have each a church: ſixteen miles north-eaſt of Weſel. Lat. 51. 55. N. lon. 24. 29. E. Ferro.

GEHO'FEN, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld: three miles ſouth of Artern.

GEHR'DEN, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg: ſix miles weſt-ſouth-weſt of Hanover.

GEH'REN, a town of Germany in the circle of Upper Saxony, and county of Schwartz: ten miles ſouth of Arnſtadt.

GEGUIOM'ENUS, *adj.* [Gr. from *γυιοω*, to diſmember.] In pathology, enervated; weak; deficient in the uſe of the limbs, or functions of the body.

GEISO'MA, *ſ.* [Gr. from *γεισον*, the eaves of a houſe.] In phyſiology, the prominent parts of the eye-brows, which hang over the eyes like the eaves of a houſe.

GE'JER (Martin), a learned German lutheran divine, born at Leipſic in 1614, and received his education at the univerſity in his native city. He was created a doctor of divinity, profeſſor of Hebrew, miniſter of St. Thomas's, and afterwards preacher, confeſſor, and member of the eccleſiaſtical council of the elector of Saxony. He died in 1681, in the ſixty-ſeventh year of his age. He was the author of learned and uſeful Commentaries, in the Latin language, on the Pſalms, Proverbs, Eccleſiaſtes, and the Book of Daniel; a treatiſe On the Mourning of the Hebrews, in the ſame language; and many other works abounding in erudition. They were collected together and printed in two volumes folio, at Amſterdam, in 1695 and 1696.

GEI'ERSBERG, a mountain of Sileſia, in the principality of Neiſſe: ſeven miles ſouth of Ziegenhals.

GEI'KIN, a river of Perſia, which ſeparates the province of Kerman from Mecran, and runs into the Indian ſea, twenty leagues ſouth-weſt of Cape Jaſques.

GEIL, a river of Germany, which riſes in the county of Tyrol, paſſes through the country of Upper Carinthia, and joins the Drave, near Willach.

GEIL'BERG, a mountain of Germany, in the duchy of Carinthia: ſix miles north-weſt of Mauten.

GEIL'DORF. See GAILDORF.

GEIL'EKIRCHEN, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers: eight miles north-weſt of Juliers. Lat. 51. 2. N. long. 23. 42. E. Ferro.

GEILS'DORF, a town of Germany, in the circle of Upper Saxony, and country of the Vogtland: five miles ſouth-ſouth-weſt of Plauen.

GEI'SENFELD, a town of Germany, in Upper Bavaria: ten miles north of Pfaffenhofen, and nine ſouth-eaſt of Ingolſtadt.

GEI'SENHEIM, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: ſeventeen miles weſt of Mentz.

GEI'SING, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſein: one mile ſouth of Lauenſtein.

GEI'SINGEN, a town of Germany, in the circle of Swabia, in the principality of Furſtenberg: fourteen miles north of Schaffhauſen, and twenty-nine north-weſt of Conſtance.

GEIS'LEDE, a river of Germany, in the circle of the Lower Rhine, which runs into the Leine, near Heiligenſtadt, in the territory of Eichsfeld.

GEISLIN'GEN, an imperial town of Germany, in the circle of Swabia, on the Kocher; containing two churches, and four gates: twelve miles weſt of Ulm. Lat. 48. 34. N. lon. 27. 31. E. Ferro.

GEIS'MAR, a village of Germany, in the circle of the Upper-Rhine, and principality of Heſſe-Caſſel, with a mineral ſpring: three miles weſt-north-weſt of Fritzlar, and thirteen ſouth-ſouth-weſt of Caſſel.

GEIS'MAR, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe: fourteen miles north-north-weſt of Caſſel, and twenty-two weſt of Gottingen. Lat. 51. 19. N. lon. 26. 43. E. Ferro.

GAIS'SELBORING, a town of Germany, in Lower Bavaria: nine miles ſouth-weſt of Straubing.

GEIS'SERN, a town of Germany, in the circle of Bavaria, and archbiſhopric of Saltzburg: thirty-two miles ſouth of Saltzburg.

GEIS'SING SEE, a lake of Germany, in the duchy of Carinthia: twelve miles north of Feltkirchen.

GEIS'TAL, a river of Germany, in the duchy of Stiria, which runs into the Kainach, near Moſkirchen.

GEIST UNS FRAU, a town of Germany, in the duchy of Stiria: ſix miles from Windiſch Weiſtritz.

GEIS'POLTZHEIM or GEISPOTZHEIM, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Straſburg: two leagues ſouth-ſouth-weſt of Straſburg, and two eaſt of Molſheim.

GEIS'ZLINGEN. See GEISLINGEN.

GEITH'AYN, a town of Germany, in the circle of Upper Saxony, and circle of Leipzig; twenty miles ſouth-ſouth-eaſt of Leipzig, and forty weſt of Dreſden. Lat. 51. 1. N. lon. 30. 25. E. Ferro.

GEKELEMUEKPECHU'ENK, a town of the Delaware Indians, on a creek of the ſame name, a head water of the Muſkingum. This was the northernmoſt Moravian ſettlement on Muſkingum river: twelve miles north-eaſt by north of Salem, and ſeventy-eight north weſterly of Pittſburg.

GE'LA, a town on the ſouthern parts of Sicily, about ten miles from the ſea, according to Ptolemy, which received its name from a ſmall river in the neighbourhood, called *Gelas*. It was built by a Rhodian and Cretan colony, 713 years before the chriſtian era. After it had continued in exiſtence 404 years, Phintias, tyrant of Agrigentum, carried the inhabitants to Phintias, a town in the neighbourhood, which he had founded, and he employed the ſtones of Gela to beautify his own city. Phintias was alſo called *Gela*. The inhabitants were called *Gelenſes*, *Geloi*, and *Gelani*. *Virgil*.

GEL'ABLE, *adj.* [from *gelu*, Lat.] What may be congealed, or concreted into a gelly.

GELA'LA, *ſ.* in botany. See ERYTHRINA.

GELA'NOR, a king of Argos, who ſucceeded his father, and was deprived of his kingdom by Danaus the Egyptian. *Pauſanias*.

GELAS'INUS, *ſ.* [Gr. from γελαω, to laugh.] An epithet, in phyſiology, of the four middle fore-teeth, becauſe they are ſhewn in laughter.

GELA'SIUS I. pope of Rome, an African by birth, admitted to the papal dignity in 492, on the death of Felix III. to whom he had been ſecretary. He was the author of various writings, ſtill extant: among which are Sixteen Letters, and ſeveral fragments of letters, directed to different public characters; a treatiſe, *De Anathematis Vinculo*; A Diſcourſe againſt the Senator Andromachus, and other Romans, who wiſhed to reſtore the feaſt called *lupercalia*, which Gelaſius had ſuppreſſed; A Treatiſe againſt the Pelagian Hereſy; and An Account of the Circumſtances which took place on the Abſolution of the Prelate Miſenus. The above-mentioned pieces are all inſerted in the fourth volume of the *Collectio Conciliorum*. But the moſt celebrated of this pontiff's productions is A Treatiſe againſt Eutyches and Neſtorius, concerning the two Natures in Chriſt. Several catholic writers, among others Baronius and Bellarmine, have attempted to prove that this is not a genuine production of this Gelaſius, but is to be attributed to Gelaſius of Cyzicus. In Cave and Dupin, however, the reader may find the moſt ſatisfactory proofs of its genuineneſs. The treatiſe itſelf is inſerted in the eighth volume of the *Biblioth. Patr.* and in the *Antidotum adverſus Hæreſes*, publiſhed at Baſil in 1528, folio. Gelaſius alſo is thought to have been the author of the *Codex Sacramentarius*, which is a collection of ſuch forms of public prayers and adminiſtration of the ſacraments as were in uſe in the church of Rome in his time, digeſted in a new order, and including many additional forms of his own. The manuſcript of this Codex lay hid unnoticed for many ages, until, in 1562, upon the diſperſion of the Florentine library, it fell into the hands of Paul Petau, by whoſe ſon it was placed in the library of Chriſtina queen of Sweden. By that princeſs it was entruſted to Joſeph Maria Thomaſius, who printed it for the firſt time at Rome, in 1680, 4to. In 1685 it was reprinted at Paris, under the inſpection of father John Mabillon, together with ſome other ancient liturgies, and very learned diſſertations on the old Gallican liturgy, in one volume 4to.

GELA'SIUS II. pope, deſcended from an illuſtrious family at Gaeta in Campania, of which city he was a native. His chriſtian name was John, and the ſurname by which he was commonly diſtinguiſhed before his elevation to the pontificate was taken from the place of his birth. In early life he embraced the monaſtic ſtate among the Benedictines at Monte Caſſino, where he applied himſelf with great diligence to his ſtudies, and acquired a high character for learning, abilities, and virtue. Upon the death of pope Paſchal in 1118, John of Gaeta was unanimouſly choſen his ſucceſſor by the cardinals and Roman clergy, when he took the name of Gelaſius II. He however held this dignity but little more than one year; for being attacked by the pleuriſy, he cauſed himſelf to be carried to the monaſtery of Clugny, where he died in January 1119. There are extant ſix Letters of his in the tenth volume of the *Collectio Concil.* and The Life of Eraſmus biſhop of Gaeta, in Latin proſe, and thoſe of Anatolia and Cæſarius, in Latin verſe. The pieces laſt mentioned were publiſhed at Rome, with the Life of Gelaſius, by the abbot Conſtantine Cajetan, in 1639.

GELA'SIUS, biſhop of Cæſarea, in Paleſtine, nephew of St. Cyril of Jeruſalem, ſucceeded Euzoius in the ſee of Cæſarea in the year 380. Theodoret ſpeaks in high terms of his character, and praiſes a homily of his on the Epiphany, of which he has preſerved a fragment in his third dialogue concerning Hereſies. St. Jerome alſo claſſes him among the eccleſiaſtical writers of his age, and commends him for the correctneſs and poliſh of his ſtyle, but ſays that he would not publiſh his works. According to father Labbé, ſome fragments of the writings of this biſhop, explanatory of the Apoſtles' Creed, and of the traditions of the church, are to be found in the Greek collection of teſtimonies, under the name of John Damaſcenus, in the Codex Claromont. Photius aſſures us, that he had read a tranſlation into Greek by this author, of the two books in continuation of Euſebius, written by Ruffinus. Fabricius, however, maintains, that the work which Photius read, was no other than the Hiſtory of the Council of Nice; and he aſks, how the hypotheſis that this biſhop of Cæſarea ſhould have been the tranſlator of Ruffinus's Hiſtory is to be reconciled with chronology? ſince the latter was not given to the public till the year 400, and Gelaſius was dead in 394.

GELA'SIUS, ſurnamed CYZICENUS, from the place of his birth, was the ſon of a preſbyter of the church at Cyzicum, and flouriſhed about the year 476. By ſome writers he is ſaid to have been biſhop of Cæſarea, in Paleſtine; but others, and thoſe particularly who appear to have examined with the greateſt care the circumſtances related concerning him, make no mention of his having been raiſed to the epiſcopal dignity. When young, he found in his father's poſſeſſion a manuſcript containing an account of the proceedings of the council of Nice, which had formerly belonged to Dalmatius biſhop of Cyzicum. As the Catholics were at that time perſecuted by the Eutychians, under the countenance of the emperor Baſiliſcus, and as that ſect boaſted that the decrees of the council of Nice were favourable to their principles, he determined to draw up a new hiſtory of that council, with the deſign of confuting their repreſentations. This hiſtory was publiſhed at Paris, by Robert Balfour, a Scotchman, in Greek and Latin, with notes, in 1559, octavo; and it is inſerted in the ſecond volume of the *Collectio Concilior.*

GELAS'MUS, *ſ.* [Gr. from γελαω, to laugh.] That ſpecies of inſanity which burſts forth in violent laughter, without any apparent or aſſignable cauſe.

GEL'ATINE or GELAT'INOUS, *adj.* [*gelatus*, Lat.] Formed into a jelly; viſcous; ſtiff and coheſive.—That pellucid *gelatinous* ſubſtance is an excrement caſt off from the ſhoals of fiſh that inhabit the main. *Woodward.*—You ſhall always ſee their eggs laid carefully up in that ſpermatic *gelatine* matter, in which they are repoſited. *Derham.*

To

To GELD, *v. a.* preter. *gelded* or *gelt*; part. paſſ. *gelded* or *gelt*; [*gelten*, Germ.] To caſtrate; to deprive of the power of generation.—*Geld* bull-calf and ram-lamb as ſoon as they fall. *Tuſſer.*—Lord Say hath *gelded* the commonwealth, and made it an eunuch. *Shakeſpeare.*—To deprive of any eſſential part:

He bears his courſe, and runs me up
With like advantage on the other ſide,
Gelding th' oppoſed continent as much
As on the other ſide it takes from you. *Shakeſpeare.*

To deprive of any thing immodeſt, or liable to objection.—They were diligent enough to make ſure work, and to *geld* it ſo clearly in ſome places, that they took away the very manhood of it. *Dryden.*

GEL'DENHAUR (Gerard), a divine and hiſtorian, born at Nimeguen in 1482. He received his education firſt at Deventer, and then at Louvain, where he contracted an intimacy with Eraſmus. Being recommended to the court of Charles V. then archduke, he was for ſome time reader and hiſtorian to that prince; but his inclination for a more ſettled life cauſed him to accept of the poſt of Latin ſecretary and private reader to Philip biſhop of Utrecht, which he held till the death of that prelate. In 1526 he was ſent by Maximilian of Burgundy to Wittemberg, in order to examine the ſchools and the ſtate of religion in that country. He was ſo much impreſſed with what he there ſaw, that he openly joined the lutheran party, and went to Worms, where he married, and undertook the education of youth. His friend Eraſmus was ſo diſpleaſed with his change of religion, that he wrote againſt him, under the name of Vulturius, and complains much of his conduct towards himſelf. Geldenhaur removed to Augſburg, and then to Marpurg, where he was firſt profeſſor of hiſtory, and afterwards of theology. He died of the plague in that place, in 1542. He publiſhed Latin poems, orations, and epiſtles, and alſo ſeveral hiſtorical works, of which the principal are, *Hiſtoria Batavica*; *Hiſtoriæ ſuæ Ætatis Lib.* VII. *Germanicarum Hiſtor. Illuſtratio*; *Deſcriptio Inſulæ Batavorum*; *De Viris illuſtribus Inferioris Germaniæ*; *Catalogus Epiſcoporum Traject.* He alſo wrote ſome pieces in controverſial divinity.

GEL'DER, *ſ.* [from *geld.*] One that performs the act of caſtration:

Geld later with *gelders*, as many one do,
And look of a dozen to geld away two. *Tuſſer.*

GEL'DER-ROSE, *ſ.* [A roſe brought from *Guelderland.*] In botany. See VIBURNUM.

GEL'DING, *ſ.* [from *geld.*] Any animal caſtrated, particularly an horſe. See the article HORSE.—Though naturally there be more males of horſes, bulls, or rams, than females; yet artificially, that is, by making *geldings*, oxen, and wethers, there are fewer. *Graunt.*

GEL'ENAU, a town of Germany, in the circle of Upper Saxony, and circle of Erzgeburg: five miles weſt-north-weſt of Greiffenſtein.

GEL'ID, *adj.* [*gelidus*, Lat.] Extremely cold:

From the deep ooze and *gelid* cavern rous'd,
They flounce. *Thomſon.*

GELID'ITY, *ſ.* [from *gelid.*] Extreme cold.

GEL'IDNESS, *ſ.* [from *gelid.*] Extreme cold.

GEL'ILOTH, a city of Paleſtine, belonging to the tribe of Benjamin; ſituated upon the ſouthern boundary of that province. Joſh. xviii. 17.

GELE'NIUS (Sigiſmund), born of a good family at Prague, about the year 1498. Eraſmus, conceiving an eſteem for him at Baſil, recommended him to John Frobenius as a corrector of his preſs; which laborious office he accepted, and had a great number of Hebrew, Greek, and Latin, books, to correct: he alſo tranſlated many works from the Greek into Latin; and publiſhed a dictionary in four languages, Greek, Latin, German, and Sclavonian. Profitable and honourable employments were offered him in other places, but nothing could tempt him to quit his peaceful ſituation at Baſil. He died in 1555. All his tranſlations are highly eſteemed.

GELI'SE, a river of France, which runs into the Baiſe at Lavardac.

GEL'LERT (Chriſtian Furchtegott), extraordinary profeſſor of philoſophy at Leipſic, a favourite writer of the Germans, and one of the moſt eſteemed of their poets, born in 1715, at Haynichen, near Freyberg, where his father was a clergyman. His poetical genius made its firſt appearance at the early age of thirteen; but as it was obſerved and foſtered by no friend, Gunther, Neukirch, and Hanke, were the models whom he imitated. At the ſchool of Meiſſen, where he was initiated in the ſciences, he formed a friendſhip with Gartner and Rabener, which continued during their lives. In 1734 he ſtudied theology at Leipſic; and at the end of four years returned home and commenced preacher; but, being of a timid diſpoſition, he made no figure as an orator. As the natural weakneſs of his conſtitution, ſickly and hypochondriac from infancy, forbade him to aim at extenſive learning, he endeavoured to acquire only as much as might render him uſeful. His firſt attempts in poetry, called *Beluſtigungen des Verſtandes und Witzes*—Amuſements of Reaſon and Wit, begun in 1742, procured him a great deal of reſpect, on account of his eaſy and agreeable manner of writing, as well as of the goodneſs of heart every where diſplayed in theſe productions. The bad ſtate of his health, and the labour which his ſermons coſt him, induced him to lay aſide his eccleſiaſtical views, and to devote himſelf entirely to the academical inſtruction of youth. In this ſituation, he endeavoured not only to enrich the minds of his pupils with uſeful knowledge, but to form their taſte, improve their hearts, and inſpire them with ſentiments of religion and virtue. In 1744 he took the degree of maſter of arts; and next year publiſhed the firſt volume of his Fables, ſome plays, and The Swediſh Counteſs, the firſt original German romance worthy of notice. On account of the infirm ſtate of his health, he ſolicited for no public employment; but in 1751 he was appointed to the office of extraordinary profeſſor of philoſophy, with a handſome ſalary. This he retained until his increaſing indiſpoſition put an end to his exiſtence on the 13th of December, 1769. By the agreeable and ſimple ſtyle which Gellert employed in his writings, he contributed, in a great degree, to improve taſte and morals throughout Germany, and particularly among the higher and lower orders. In his fables and ſpiritual ſongs he has diſplayed the whole force of his genius. In the former, he ſucceſsfully imitates La Fontaine, and ſhews the ſame delicate vein of humour, the ſame livelineſs and eaſe, united to the keeneſt ſatire. Gellert's firſt attempt in the theatrical way was his comedy of The Mendicant Nun, which originated from one of the tales he was then compoſing. All his comedies abound with the moſt beautiful traits and nobleſt thoughts; but they are deficient in the true *vis comica*, continued intereſt in the plan, and ſpirit and preciſion in the language. His characters are borrowed from the circle of city life, and are all truly German. In 1745 he wrote The Affectionate Siſters, a piece in three acts, which is remarkable for being the firſt affecting comedy in the German language. The Prize in the Lottery, of all Gellert's pieces, was the beſt received on the ſtage. The Sick Wife is an after-piece, in one act, in which the poet converted one of his tales into a drama. Gellert's different works have gone through a great many editions, and have been tranſlated into almoſt all the languages of Europe. The following are the German editions: 1. *Leben der Schwediſchet Grafinn*—Life of the Swediſh Counteſs, Leipſic, 1745, 8vo. ibid. 1758. 2. *Luſtſpiele*—Comedies, ibid. 1747, 8vo. 3. *Troſtgründe Wider ein ſiccches Leben*, ibid. 1747, 8vo. 4. Fables and Tales, ibid. 1748; there is a Hebrew tranſlation

tranſlation of theſe fables by Abraham, a Jew. 5. *Briefe nebſt einer praktiſchen Abhandlung von dem guten Geſchmak in Briefen*—Letters, together with a practical Treatiſe on good Taſte in Letter-writing, ibid. 1751, 8vo. 6. *Lehrgedicht und Erzälungen*—Didactic Poems and Tales, ibid. 1754. 7. *Sammlung vermiſchter Schriften*—Collection of Miſcellaneous Pieces, ibid. 1757, 8vo. 8. *Geiſtliche Oden und Lieder*—Sacred Odes and Hymns, ibid. 1757, 8vo. 9. *Gellerts und Rabeners achtzehn Briefe*—Gellert's and Rabener's eighteen Letters, ibid. 1760. 10. *Von der Beſchaffenheit dem Umfang und Nutzen der Moral*—On the Nature, Extent, and Uſe of Morality, ibid. 1766, 8vo. 11. *Moraliſche Vorleſungen*—Moral Eſſays, publiſhed after the author's death, by J. A. Schlegel and G. L. Heyer, ibid. 1770, 2 vols. 8vo. 12. *Sammtliche Schriften*—Complete Collection of his Works, ibid. 1766, 10 vols. 8vo. this is a beautiful edition, but incomplete: a new edition improved by ſome of his friends appeared after his death at Leipſic, in eight volumes, with engravings. 13. *Anhang zu ſeinem Sämmtliche Schriften*—Appendix to his Works, 1770.

GELL'HEIM, a town of Germany, in the circle of the Upper Rhine, and principality of Naſſau Weilburg: thirteen miles weſt of Worms, and twenty-three north-weſt of Manheim.

GEL'LI (Giambatiſta), an Italian poet, born at Florence in 1498. He was of mean origin, and followed the trade of a cordwainer. He was not void, however, of the advantages of education, and he became diſtinguiſhed for literature in his native place, and was one of the chief ornaments of the academy degli Umidi. His two proſe comedies, entitled *La Sporta* and *L'Errore*, were accounted the beſt compoſitions of the kind then in the language. He tranſlated into Italian from the Greek, the Hecuba of Euripides. His other works are *I Capprici del Bottaio*, conſiſting of dialogues, which are ſaid to be faulty in point of decency; other dialogues, chiefly on phyſical topics, entitled *La Circe*; ſome remarks on the difficulty of reducing the Italian language to rule; diſſertations upon the poems of Dante and Petrarch; other tranſlations, verſes, &c. He died in 1563.

GEL'LIBRAND (Henry), an Engliſh mathematician and aſtronomer in the ſeventeenth century, born at London in 1597. When he was eighteen years of age he was admitted a commoner of Trinity college, in Oxford, where in 1619 he took his degree of bachelor of arts. He very early conceived a ſtrong inclination for the mathematics, upon accidentally hearing one of ſir Henry Saville's lectures in that ſcience, and applied to it with equal diligence and ſucceſs. Having taken orders, he ſettled as a curate at Chiddingſtone, in Kent; but his paſſion for mathematical ſtudies determined him to quit that ſituation, and to return to the univerſity. Here his ſole attention was devoted to the mathematics, in which he made ſuch proficiency at the time of his taking his degree of maſter of arts in 1623, that he attracted the friendſhip of ſeveral able mathematicians who flouriſhed at that time, particularly of the celebrated Henry Briggs, then Savilian profeſſor of geometry at Oxford. While he continued in the purſuit of theſe ſtudies, the profeſſorſhip of aſtronomy in Greſham college, London, becoming vacant by the death of the celebrated Gunter, Mr. Gellibrand became a candidate, and was choſen to fill that poſt by the electors, in January 1626. From that time he lived in a cloſe intimacy with Mr. Briggs, who took great pleaſure in communicating to him his mathematical diſcoveries, and at the time of his death confided to him the taſk of completing his Britiſh Trigonometry, which he did not live to finiſh. Mr. Gellibrand having added to it a preface, and the application of the logarithms to plane and ſpherical trigonometry, conſtituting the ſecond book of the work, the whole was printed at Gouda in Holland, under the care of Adrian Vlacq, in 1663. It was entitled, *Trigonometria Britannica, ſive de Doctrina Triangulorum, Libri duo*, &c. folio. From Mr. Gellibrand's ſituation at Greſham college, and his intercourſe with the lovers of mathematical ſtudies, he had an opportunity of contributing ſeveral pieces to the improvement of navigation, which ſcience would probably have been farther benefited by him, had he not been immaturely carried off by a fever in 1636, in the fortieth year of his age. Beſides his part of the *Trigonometria Britannica*, he was the author of An Appendix concerning Longitude, ſubjoined to Captain Thomas James's Voyage for the Diſcovery of the North-weſt Paſſage, 1633, 4to. 2. A Diſcourſe mathematical on the Variation of the magnetic Needle; together with the admirable Diminution lately diſcovered; annexed to Wright's Errors in Navigation detected, &c. 1635, 4to. 3. A Preface to the Sciographia of John Wells, of Brambridge, Eſq. 1635, 8vo. 4. An Inſtitution trigonometrical, explaining the Doctrine of plane and ſpherical Triangles, after the moſt exact and compendious Way, by Tables of Sines, Tangents, &c. with the Application thereof to Queſtions of Aſtronomy and Navigation, 1634, 8vo. and afterwards republiſhed with enlargements by William Leybourn, 1652, 8vo. 5. An Epitome of Navigation, with the neceſſary Tables, &c. and an Appendix concerning the Uſe of the Quadrant, Fore-ſtaff, and Nocturnal, 8vo. 6. *Oratio in Laudem Gaſſendi Aſtronomiæ, habita in Aula Ædis Chriſti, Oxon*; and of ſeveral unpubliſhed manuſcripts on the Doctrine of Eclipſes, Lunar Aſtronomy, Ship-building, &c.

GEL'LIUS (Aulus), called by ſome writers AGELLIUS, a learned Roman grammarian and critic, flouriſhed at Rome, his native city, in the ſecond century, under the emperors Adrian and Antoninus Pius, and died at the beginning of the reign of Marcus Aurelius Antoninus. He ſtudied grammar under Sulpicius Apollinaris, and rhetoric under Titus Caſtritius and Antonius Julianus. In his youth, he viſited Athens, and enjoyed the ſociety of many learned men, particularly Calviſius Taurus, Peregrinus, Proteus, and Herodes Atticus. To gratify a laudable curioſity, and to collect literary and philoſophical information, he travelled through a great part of Greece. On his return to Rome he devoted himſelf to the ſtudy and practice of the law, and was appointed a judge. He was converſant with the ancient writers on the Roman law, and ranked among his friends many reſpectable lawyers of his own time. The frequent citations which are made from his work by writers on Roman law, render it probable that he poſſeſſed a conſiderable ſhare of profeſſional reputation. The *Noctes Atticæ* of Aulus Gellius may be juſtly allowed a reſpectable place among the treaſures of antiquity. The author, as he himſelf informs us in his preface, gave the name of Attic Nights to his work, from the circumſtance that a great part of it was written while he reſided in Athens, and furniſhed an amuſing occupation for many long winter evenings. His object was, to provide his children as well as himſelf with that kind of entertainment, with which they might properly relax and indulge themſelves, in the intervals of more important buſineſs. From the manner in which the collection was made, its contents are neceſſarily miſcellaneous, and of unequal value. "Whatever book," ſays he, "came into my hand, whether it was Greek or Latin, or whatever I heard, that was either worthy of being recorded, or agreeable to my fancy, I wrote down without diſtinction and without order." Theſe minutes became the baſis of this work, in which the author takes up his collections in the ſame accidental arrangement in which they were made, and comments upon them. The work conſiſts of a vaſt variety of critical obſervations upon authors; of hiſtorical and biographical anecdotes, with reflections; of brief diſcuſſions on various topics, grammatical, antiquarian, moral, philoſophical, phyſical, &c. among which, if many things be trivial, or unintereſting, there are alſo much amuſing information, and many ingenious obſervations: it is particularly valu-

able, as a large collection of fragments of ancient authors, not elsewhere to be found. Whatever place critics may agree to assign to Aulus Gellius among Roman authors with respect to Latinity, he will not be denied the praise of diligent research, and extensive erudition. This work was first edited, in folio, at Rome in 1469, by Sweinheim and Panartz, and notes on this author were published the same year at Rome by the learned John Andreas, bishop of Aleria. The second edition was published in 1472 by Jenson at Venice; several other editions appeared in the fifteenth century. Among the editions of the sixteenth century are those of Aldus, in 8vo. at Venice in 1515; at Paris with the notes of Badius Ascensius, in folio, 1519, 1524, and 1536; at Basil, in 8vo. with the notes of Mosellanus, in 1526; and, at Paris, with the valuable critical researches of Henry Stephens, in 8vo. 1585. Later editions, worthy of notice, are, in 8vo. *in usum Delphini*, 1681, in 18mo. by the Elzevirs, at Amsterdam, 1651; *cum Notis Variorum*, at Leyden, 1660; by Gronovius, in 4to. 1706; and, at Leipsic, in two volumes 8vo. by Conradus, in 1762. A very elegant translation of this amusing, but in many parts obscure and difficult author, with useful notes, was given in English, in three volumes 8vo. by Mr. Beloe, in 1795.

GEL'LY, *s.* [*gelatus*, Lat.] Any viscous body; viscidity; glue; gluey substance.—The white of an egg will coagulate by a moderate heat, and the hardest of animal solids are resolvable again into *gellies*. *Arbuthnot*.

The tapers of the gods,
The sun and moon, become like waxen globes,
The shooting stars end all in purple *gellies*,
And chaos is at hand. *Dryden*.

GEL'LY CAI'RN, a mountain of Scotland, in the county of Perth: eight miles north of Creiff.

GEL'MAH or KALMAH, a town of Africa, in the country of Algiers: fifty miles east of Constantina.

GELMU'DEN or GELMUYEN, a town of the United Dutch States, in Overissel, situated on the south side of the Vecht, near the Zuyder See: six miles east-north-east of Campen, and three south-east of Vollenhove.

GELN'HAUSEN, a town of Germany, in the circle of the Upper Rhine, and county of Hanau Munzenburg, on the Kintzig; declared imperial by a sentence of the chamber of justice, in 1734; but the count of Hanau and the elector Palatine, to whom it was mortgaged, refused their consent: and the town is now subject to the count of Hanau, who purchased the elector's lesre: twelve miles east of Hanau. Lat. 50. 7. N. lon. 26. 48. E. Ferro.

GE'LON, king or tyrant of Syracuse. See SYRACUSE.

GELOSCOPY, *s.* [γελος, laughter, and σκοπεω, Gr. to view.] A kind of prediction drawn from the manner in which any one laughs. *Scott*.

GELSEM'INUM, *s.* in botany. See BIGNONIA and JASMINUM.

GELT, *s.* [from *geld*.] A castrated animal; gelding. *Not used*.—The spayed *gelts* they esteem the most profitable. *Mortimer*.

GELT, the participle passive of *geld*.—Let the others be *gelt* for oxen. *Mortimer*.

GELT, *s.* [corrupted for the sake of rhyme from *gilt*.] Tinsel; gilt surface:

I won her with a girdle of *gelt*,
Emboss with bugle about the belt. *Spenser*.

GELT, a river of England, in the county of Cumberland, which runs into the Irting, about a mile south-east from Brampton.

GEM, *s.* [*gemma*, Lat.] A jewel; a precious stone of whatever kind.—The basis of all *gems* is, when pure, wholly diaphanous, and either crystal or an adamantine matter; but we find the diaphaneity of this matter changed, by means of a fine metallic matter. *Woodward*.

Stones of small worth may lie unseen by day;
But night itself does the rich *gem* betray. *Cowley*.

Features of men who on fame's list enroll'd,
Gave life and lustre to the world of old;
Worthies, whose statues fail'd time's flood to stem,
Yet live effulgent in the deathless *gem*.

The first bud of any thing:

From the joints of thy prolific stem
A swelling knot is raised, call'd a *gem*;
Whence, in short space, itself the cluster shows. *Denham*.

In mineralogy, the word *gem* denotes all such stones as are considered by mankind as precious. These are the diamond, the ruby, the sapphire, the topaz, the chrysolite, the beryl, the emerald, the hyacinth, the amethyst, the garnet, the tourmalin, the opal; and to these may be added, rock crystal, the finer flints or pebbles, the cat's eye, the oculus mundi or hydrophanes, the chalcedony, the moon-stone, the onyx, the cornelian, the sardonyx, agates, and the Labrador stone; for all which, see under their respective titles in this work; and the article MINERALOGY.—With respect to their lustre and colour, the diamond is valued for its transparency, the ruby for its purple, the sapphire for its blue, the emerald for its green, the hyacinth for its orange, the amethyst carneol for its carnation, the onyx for its tawny, the jasper, agate, and porphyry, for their vermilion, green, and variegated colours, and the garnet for its transparent blood-red. These gems are found more or less coloured and spotted, and sometimes quite limpid and colourless. In this case the diamond-cutter or polisher knows how to distinguish their different species, and appreciate their value, by their different degrees of hardness upon the mill. For the cutting or polishing of gems, the fine powder of the fragments of those that are next in degree of hardness is always required to grind away the softer; but as none of them are harder than the diamond, this can only be polished by its own powder.

With regard to the texture of gems, M. Magellan observes, that all of them are foliated or laminated, and of various degrees of hardness. Whenever the edges of these laminæ are sensible to the eye, they have a fibrous appearance, and reflect various shades of colour, which change successively according to their angular position. These are called by the French *chatoyantes*; and what is a blemish in their transparency, often enhances their value on account of their rarity. But when the substance of a gem is composed of a broken texture, consisting of various sets of laminæ differently inclined to each other, it emits at the same time various irradiations of different colours, which succeed one another according to their angle of position. This kind has obtained the name of *opals*, and are valued in proportion to the brilliancy, beauty, and variety, of their colours. Their crystallization depends on the same cause which produces that of salts, earths, and metals, which see under the article CRYSTALLOGRAPHY, vol. v. p. 414–425.

OF FACTITIOUS GEMS.

Factitious or artificial gems are commonly called *pastes*; many of which possess all the lustre and brilliancy of real gems, but want their hardness. The art of compounding factitious gems is both interesting and ingenious; and has long formed a very considerable branch of the jeweller's trade.—The rules to be observed in making the bases or pastes are, 1. That the vessels in which they are made be firmly luted, and the lute left to dry before they are put into the fire. 2. That such vessels be chosen for the work as will best resist the fire. 3. That the powders be prepared on a porphyry stone; not in a metal mortar, which would communicate a foreign tinge to them. 4. That the just proportion in the quantity of the several ingredients be nicely ob-

ſerved. 5. That the materials be all well mixed; and, if not ſufficiently baked the firſt time, to be committed to the fire again, without breaking the pot: for if this be not obſerved, they will be full of bliſters and air-bladders.—To render the paſte as hard as poſſible, and capable of retaining the utmoſt durability and beauty: Take of prepared cryſtal ten pounds; ſalt of polverine ſix pounds; ſulphur of lead two pounds: mix theſe well together into a fine powder; make the whole with pure water into a hard paſte; and make this paſte into ſmall cakes of about three ounces weight each, with a hole in their middle; dry them in the ſun, and afterwards calcine them in a potter's furnace. After this, levigate them to a perfect fineneſs on a porphyry ſtone, and ſet this powder in pots in a glaſs-furnace to purify for three days; then caſt the whole into water, and afterwards return it into the furnace, where let it ſtand fifteen days, in which time all foulneſs will diſappear, and the paſte will greatly reſemble the natural jewels. To give this the colour of the emerald, add to it braſs thrice calcined; for a ſea-green, braſs ſimply calcined to a redneſs; for a ſapphire, add zaffer, with manganeſe; and for a topaz, manganeſe and tartar. All the gems are imitated in the ſame way of working as the making of coloured glaſſes; the baſes for which are ſo hard, that they very much approach the natural gems.

The colours of all the gems made of the ſeveral paſtes, ſhould be deeper or lighter, according to the work for which the ſtones are deſigned; and it is to be obſerved that ſmall ſtones for rings, &c. require a *paler* colour, and large ones a *paler*. Beſides the colours made from manganeſe, verdegris, and zaffer, which are the ingredients moſt commonly uſed, there are ſeveral ſuperior ones which care and ſkill may often fabricate. Very fine red may be made from gold, and one not much inferior from iron; a very fine green from braſs or copper; a ſky-colour from ſilver, and a much finer one from the granite of Bohemia.

Another much-approved method of making paſte for coloured gems, is this: Take a quantity of ſaccharum ſaturni, or ſugar of lead, made with vinegar in the common way; ſet it in ſand, in a glaſs veſſel well luted from the neck downwards; leave the mouth of the veſſel open, and continue the fire twenty-four hours; then take out the ſalt, and if it be not red, but yellowiſh, powder it fine, and return it into the veſſel, and keep it in the ſand-heat twenty-four hours more, till it becomes of the colour of red cinnabar. The fire muſt not be ſo ſtrong as to melt it, for then the proceſs would be ſpoiled. Pour diſtilled vinegar on this calcined ſalt, and ſeparate the ſolution from the dregs; let the decanted liquor ſtand ſix days in an earthen veſſel, to give time for the finer ſediment to ſubſide; filter the liquor, and evaporate it in a glaſs veſſel, and there will remain a pure ſalt of lead; dry this well, then diſſolve it in fair water; let the ſolution ſtand ſix days in a glazed pan; let it ſubſide, then filtre the clear ſolution, and evaporate it to a yet more pure ſalt; repeat this operation three times; put the now perfectly pure ſalt into a glaſs veſſel, ſet it into a ſand-heat for ſeveral days, and it will be calcined to a fine impalpable powder, of a lively red. This is *the true ſulphur of lead*.—Take all the other ingredients as in the common compoſition of the paſtes of the ſeveral colours, only inſtead of red lead, uſe this powder; which will well reward the trouble of the operation.

A paſte or baſis proper for receiving colours may alſo be made by well-pounding and mixing ſix pounds of white ſand cleanſed, three pounds of red lead, two pounds of purified pearl-aſh, and one pound of nitre. A ſofter paſte may be made in the ſame manner, of ſix pounds of white ſand cleanſed; red lead, and purified pearl-aſh, of each three pounds; one pound of nitre, half a pound of borax, and three ounces of arſenic. For common uſe a pound of common ſalt may be ſubſtituted for the borax. This glaſs cannot be recommended, as being very ſoft, and will not bear much wear if employed for rings, or ſuch imitations of ſtones as are expoſed to much rubbing; but for ear-rings, ornaments worn on the head, or breaſt, &c. it may laſt a conſiderable time.—To give paſte the different colours, the proceſs is as follows:

AMETHYST.—Take ten pounds of either of the compoſitions deſcribed under *Colouring of* GLASS, (in this volume,) one ounce and a half of manganeſe, and one dram of zaffer; powder and fuſe them together.—For *Black*. Take ten pounds of either of the above compoſitions, one ounce of zaffer, ſix drams of manganeſe, and five drams of iron, highly calcined; and proceed as before.—For *Blue*. Take of the ſame compoſition ten pounds, of zaffer ſix drams, and of manganeſe two drams; and proceed as with the foregoing.

CHRYSOLITE.—Take of either of the compoſitions for paſte above-deſcribed, prepared without ſaltpetre, ten pounds, and of calcined iron five drams; and purſue the ſame proceſs as with the reſt.

RED CORNELIAN.—Take of the compoſitions mentioned under *Colouring of* GLASS, two pounds; of glaſs of antimony one pound; of ſcarlet oker two ounces; and of manganeſe one dram. Fuſe the glaſs of antimony and manganeſe with the compoſition; then powder them, and mix them with the other, by grinding them together, and fuſe them with a gentle heat.

WHITE CORNELIAN.—Take of the compoſition juſt referred to two pounds; and of yellow oker well waſhed two drams; and of calcined bones one ounce. Mix them, and fuſe them with a gentle heat.

DIAMOND.—Take of the white ſand ſix pounds; of red lead four pounds; of pearl-aſh purified three pounds; of nitre two pounds; of arſenic five ounces; and of manganeſe one ſcruple. Powder and fuſe them.

EAGLE-MAKINE.—Take ten pounds of the compoſition under GLASS; three ounces of copper highly calcined with ſulphur; and one ſcruple of zaffer. Proceed as before.

EMERALD.—Take of the ſame compoſition with the laſt nine pounds; three ounces of copper precipitated from aquafortis; and two drams of precipitated iron.—Or, Take of natural cryſtal four ounces; of red-lead four ounces; verdegris forty-eight grains; crocus martis, prepared with vinegar, eight grains: let the whole be finely pulverized and ſifted; put this into a crucible, leaving one inch empty: lute it well, and put it into a potter's furnace, and let it ſtand there as long as they do their pots. When cold, break the crucible; and a matter will remain of a fine emerald colour, which, after it is cut and ſet in gold, will equal in beauty an oriental emerald.

GARNET.—Take two pounds of the compoſition under GLASS; two pounds of the glaſs of antimony, and two drams of manganeſe.—For vinegar garnet, take of the compoſition for paſte deſcribed above, two pounds; one pound of glaſs of antimony, and half an ounce of iron, highly calcined; mix the iron with the uncoloured paſte, and fuſe them; then add the glaſs of antimony powdered, and continue them in the heat till the whole is incorporated.—For *Gold yellow*, Take of the compoſition ten pounds, and one ounce and a half of iron ſtrongly calcined; proceeding as with the other.—For *Deep purple*, take of the compoſition ten pounds; of manganeſe one ounce; and of zaffer half an ounce.

RUBY.—Take one pound of either of the above compoſitions for paſte, and two drams of *calx Caſſii*, or precipitation of gold by tin; powder the paſte, and grind the calx of gold with it in a glaſs, flint, or agate, mortar, and then fuſe them together. A cheaper ruby may be made with half a pound of either of the above compoſitions, half a pound of glaſs of antimony, and one dram and a half of the calx of gold proceeding as before.

Sapphire.—Take of the compoſition for paſte ten pounds; of zaffer three drams and one ſcruple; and of the *calx Caſſii* one dram. Powder and fuſe them. Or the ſame may be done by mixing with the paſte one-eighth of its weight of ſmalt.

Topaz.—Take of the compoſitions mentioned under Glass in this volume, ten pounds, omitting the ſalt-petre; and an equal quantity of the *Gold-coloured hard* Glass. Powder and fuſe them.—For *Turquoiſe*, Take of the compoſition for blue paſte already deſcribed, ten pounds; of calcined bone, horn, or ivory, half a pound. Powder and fuſe them.—For *Opake white*, Take of the compoſition for paſte ten pounds; and one pound of calcined horn, ivory, or bone; and proceed as before.

Such is the method of manufacturing factitious gems by the working jewellers in London.—The following is the mode adopted by the jewellers in France, as deſcribed by M. Fontanieu, of the royal academy of ſciences in Paris:

Of the Bases or Pastes.—Although the different calces of lead are all adapted to produce the ſame effect in vitrification, yet M. Fontanieu prefers lead in ſcales, and next to that minium, as being the moſt conſtantly pure. It is neceſſary to ſift through a ſilk ſieve the preparations of lead one wiſhes to make uſe of in the vitrification, in order to ſeparate the groſſer parts, as alſo the lead found in a metallic ſtate when white lead in ſcales is employed. The baſe of factitious gems is calx of lead and rock-cryſtal, or any other ſtone vitrifiable by the calces already mentioned. Pure ſand, flint, and the tranſparent pebbles of rivers, are ſubſtances equally fit to make glaſs: but as it is firſt neceſſary to break the maſſes of cryſtal, ſtones, or pebbles, into ſmaller parts; ſo by this operation particles of iron or copper are frequently introduced, and to theſe duſt or greaſy matters are alſo apt to adhere. The artiſt therefore begins by putting the pounded cryſtal or pebbles into a crucible, which he places in a degree of heat capable of making the maſs red hot; he then pours it into a wooden bowl filled with very clear water; and ſhaking the bowl from time to time, the ſmall portions of coals furniſhed by the extraneous bodies ſwim on the ſurface of the water, and the vitrifiable earth, with the iron, &c. reſts on the bottom. He then decants the water; and having dried the maſs, he pounds it, and ſifts the powder through the fineſt ſilk ſieve: he then digeſts the powder during four or five hours with marine acid, ſhaking the mixture every hour. After having decanted the marine acid from the vitrifiable earth, he waſhes the latter until the water no longer reddens the tincture of turnſol. The ſaid earth being dried, is paſſed through a ſilk ſieve, and is then fit for uſe. Nitre, ſalt of tartar, and borax, are the three ſpecies of ſalts that enter with quartz and the ſeveral calces of lead into M. Fontanieu's vitrifications.

Much of the ſucceſs in the jeweller's art depends on the accurate proportion of the ſubſtances made uſe of to form the cryſtal which ſerves as a baſe to the factitious gems. After having tried a great variety of receipts, our author found they might be reduced to the following:—1. Take two parts and a half of lead in ſcales, one part and a half of rock-cryſtal or prepared flints, half a part of nitre, as much borax, and a quarter part of glaſs of arſenic. Theſe being well pulverized and mixed together, are to be put into a Heſſian crucible, and ſubmitted to the fire. When the mixture is well melted, pour it into cold water: then melt it again a ſecond and a third time; taking care, after each melting, to throw it into freſh cold water, and to ſeparate from it the lead that may be revived. The ſame crucible ſhould not be uſed a ſecond time, becauſe the glaſs of lead is apt to penetrate it in ſuch a manner as to run the riſk of loſing the contents. One muſt alſo be careful to cover the crucible well, to prevent any coals getting into it, which would ſpoil the compoſition.

2. Take two parts and a half of white ceruſe, one part of prepared flints, half a part of ſalt of tartar, and a quarter part of calcined borax: melt the mixture in a Heſſian crucible, and then pour it into cold water; it is then to be melted again, and waſhed a ſecond and a third time, the ſame precautions being obſerved as for the firſt baſe.

3. Take two parts minium, one part rock cryſtal, half a part of nitre, and as much ſalt of tartar: this mixture being melted, muſt be treated as the former.

4. Take three parts of calcined borax, one part of prepared rock-cryſtal, and one part of ſalt of tartar; theſe being well mixed and melted together, muſt be poured into warm water: the water being decanted and the maſs dried, an equal quantity of minium muſt be added to it; it is then to be melted and waſhed ſeveral times as directed above.

5. That paſte called by Fontanieu *Mayence baſe*, and which he conſiders as one of the fineſt cryſtalline compoſitions hitherto known, is thus prepared: Take three parts of fixed alkali of tartar, one part of rock-cryſtal or flint pulverized: the mixture to be well baked together, and then left to cool. It is afterwards poured into a crucible of hot water to diſſolve the frit; the ſolution of the frit is then received into a ſtone-ware pan, and aquafortis added gradually to the ſolution till it no longer effervеſces: this water being decanted, the frit muſt be waſhed in warm water till it has no longer any taſte; the frit is then dried, and mixed with one part and a half of fine ceruſe or white lead in ſcales; and this mixture muſt be well levigated with a little diſtilled water. To one part and a half of this powder dried add an ounce of calcined borax: let the whole be well mixed in a marble mortar, then melted and poured into cold water as the other baſes already deſcribed. Theſe fuſions and lotions having been repeated, and the mixture dried and powdered, a twelfth part of nitre muſt be added to it, and then melted for the laſt time; after which a very fine cryſtal will be found in the crucible.

6. For a compoſition for furniſhing very fine white paſte: Take eight ounces of ceruſe, three ounces of rock-cryſtal pulverized, two ounces of borax finely powdered, and half a grain of manganeſe; having melted and waſhed this mixture in the manner directed above, it will produce a very fine white cryſtal paſte.

Of the Colours.—The calces of metals are the ſubſtances uſually employed to colour factitious gems; and on the preparation of theſe calces depends the vividneſs of their colours.

From Gold.—To obtain the mineral purple known by the name of *precipitate of Caſſius*, M. Fontanieu employs the following different proceſſes:—1. Diſſolve ſome pure gold in aqua regia, prepared with three parts of precipitated nitrous acid and one part of marine acid; and to haſten the diſſolution, the matraſs ſhould be placed in a ſand bath. Into this ſolution pour a ſolution of tin in aqua regia. The mixture becomes turbid, and the gold is precipitated with a portion of the tin, in the form of a reddiſh powder; which, after being waſhed and dried, is called precipitate of Caſſius. The aqua regia employed to diſſolve the tin is compoſed of five parts nitrous acid and one part of marine acid: to eight ounces of this aqua regia are added ſixteen ounces of diſtilled water. Some leaves of Malacca tin, about the ſize and thickneſs of a ſixpence, are then put into this diluted aqua regia, till it will diſſolve no more of them: which operation requires twelve or fourteen days; though it might probably be haſtened by beating the tin ſtill thinner, and then rolling it into the form of a hollow cylinder, or turning it round into ſpiral convolutions, and thus expoſing a greater extent of ſurface to the action of the menſtruum. In order to prepare more readily the precipitate of Caſſius, M. Fontanieu puts into a large jug eight ounces of ſolution of tin, to which he adds four pints of diſtilled water: he after-

wards pours into this metallic lye a ſolution of gold, drop by drop, taking care to ſtir the whole with a glaſs tube: when the mixture becomes of a deep purple colour, he ceaſes dropping the ſolution of gold; and in order to haſten the precipitation of the mineral purple, pours into the mixture a pint of freſh urine. Six or ſeven hours after, the precipitate is collected at the bottom of the veſſel: the fluid is then decanted; and the precipitate, waſhed once or twice, is dried till it becomes a brown powder for uſe.—2. Pour into a veſſel of fine tin with a thick bottom four ounces of the ſolution of gold; three minutes after add two pints of diſtilled water. Let this mixture ſtand in the tin veſſel during ſeven hours, taking care to ſtir it every hour with a glaſs tube; afterwards pour it into a conical glaſs jug, and add to it a pint of freſh urine: the mineral purple is ſoon precipitated, and then it is to be waſhed and dried. —3. Diſtil in a glaſs cornute placed in a bath of aſhes, ſome gold diſſolved in aqua regia, made with three parts nitrous and one part marine acid; when the acid is paſſed over and the gold contained in the cornute appears dry, leave the veſſel to cool, then pour into it ſome new aqua regia, and proceed to diſtil as before. Replace the aqua regia twice upon the gold, and diſtil the ſame. After theſe four operations, pour by little and little into the cornute ſome oil of tartar *per deliquium*, which will occaſion a briſk effervescence: when this ceaſes, diſtil the mixture till it becomes dry, and then put ſome warm water into the cornute. Shake the whole, and pour it into a cucurbit, when a precipitate is depoſited, the colour of which is ſometimes brown and ſometimes yellow: after having waſhed this precipitate, dry it. M. Fontanieu ſays, this mineral purple was much ſuperior to the foregoing, ſince two grains of it only were ſufficient to an ounce of the baſe, whilſt it required of the other two a twentieth part of the baſe. And he adds, that he found a means of exalting the colour of the precipitate of Caſſius, by putting to it a ſixth part of its weight of glaſs of antimony finely powdered, and of nitre in the proportion of a dram to eight ounces of the baſe.

From Silver.—The calx of ſilver, being vitrified, produces a yellowiſh-grey colour. This calx enters only into the compoſition of the yellow artificial diamond, and the opal. M. Fontanieu introduces it into the baſe in the form of luna cornea. In order to prepare it, he directs to diſſolve the ſilver in precipitated nitrous acid, and afterwards to pour into it a ſolution of ſea-ſalt: a white precipitate is obtained; which, being waſhed and dried, melts very readily in the fire, and is ſoon volatilized if not mixed with vitrifiable matters. To make the yellow diamond, twenty-five grains of this luna cornea are put to an ounce of the fourth baſe above deſcribed: the doſe of ſilver may be diminiſhed according to the ſhade of yellow that one wiſhes to procure.

From Copper.—The calx of copper imparts to white paſte or glaſs the fineſt green colour; but if this metal be not exactly in a ſtate of calx, it produces a browniſh red colour. *Mountain blue*, *verdegris*, and the reſidue of its diſtillation, are the different preparations of copper which this artiſt employs to make the artificial emeralds.

From Iron.—Although it has been aſſerted, that the calces of iron introduce a very fine tranſparent red colour into white glaſs, M. Fontanieu could only obtain from it a pale red a little opake. The calx of iron that he employed was in the proportion of the twentieth part of the baſe.—There are ſeveral ways of preparing the calx of iron called *crocus Martis*, or *ſaffron of Mars*. By digeſting filings of ſteel with diſtilled vinegar, then evaporating and replacing the vinegar ten or twelve times upon theſe filings and drying them alternately, a calx of iron is obtained, which muſt be ſifted through a ſilk ſieve, and then calcined. The calx of iron thus obtained by the vinegar, introduces into the baſes a green colour, inclining to a yellow. By the following proceſs a ſaffron of Mars of the fineſt red colour is obtained: Let an ounce of iron filings be diſſolved in nitrous acid in a glaſs cornute, and diſtilled over a ſand-bath to dryneſs. After having replaced the acid or the dry calx, and re-diſtilled it a ſecond and a third time, it is then edulcorated with ſpirits of wine, and afterwards waſhed with diſtilled water.

From the Magnet.—It is neceſſary to calcine the magnet before it be introduced into the vitrifications: having therefore torrified the magnet during two hours, it muſt be waſhed and dried. It is only employed in compoſitions of the opal.

From Cobalt.—The calx of cobalt is only proper to introduce a blue colour into glaſs gems; but this metal is rarely found free from iron and biſmuth, and therefore it is firſt neceſſary to ſeparate them from it. This is done by calcining the ore of cobalt in order to diſengage the arſenic: afterwards the calx muſt be diſtilled in a cornute with ſal ammoniac, and the iron and the biſmuth are found ſublimed with this ſalt. The diſtillation muſt be repeated with the ſal ammoniac till this ſalt is no longer coloured yellow. The cobalt which remains in the cornute is then calcined in a potſherd, and becomes a very pure calx; which being introduced into the baſe, in the proportion of a nine-hundredth part, gives it a very fine blue colour, the intenſity of which may be increaſed at diſcretion by the addition of calx of cobalt. In order to prepare *black enamel* reſembling that which is called *black agate* of Iceland; melt together a pound and a half of one of the baſes, two ounces of the calx of cobalt, two ounces of crocus Martis, prepared with vinegar, and two ounces of manganeſe.

From Tin.—The calx of tin is not vitrifiable alone, and when deprived of its caloric is of a white colour; it renders opake the glaſs with which it is melted, and forms white enamel. For this purpoſe, calcine the putty of tin; then waſh and dry it, and ſift it through a ſilk ſieve. Take ſix pounds of the ſecond baſe, the ſame quantity of the calcined putty of tin, and forty-eight grains of manganeſe.

From Antimony.—Antimony is only ſuſceptible of vitrification when its calx contains caloric, and then it produces a reddiſh or hyacinth coloured glaſs; but if the antimony be in a ſtate of abſolute calx, ſuch as the diaphoretic antimony, then it is no longer vitrifiable, and may be ſubſtituted for calx of tin to make white enamel. M. Fontanieu introduces the glaſs of antimony in the compoſition of artificial topazes. For the oriental topaz, he takes twenty-four ounces of the firſt baſes and five drams of the glaſs of antimony. To imitate the topaz of Saxony, he adds to each ounce of the baſe five grains of the glaſs of antimony. For the topaz of Brazil, he takes twenty-four ounces of the firſt baſe, one ounce twenty-four grains of glaſs of antimony, and eight grains of the precipitate of Caſſius.

From Manganese.—This mineral, employed in a ſmall quantity, renders the glaſs whiter; a larger quantity produces a very fine violet colour, and a ſtill larger proportion renders the glaſs black and opake.

There are two ways of preparing manganeſe: 1. The moſt ſimple conſiſts in expoſing it to a red heat, and then quenching it with diſtilled vinegar; it is afterwards dried and powdered, and paſſed through a ſilk ſieve. 2. Haudiquer de Blancour deſcribes the ſecond manner of preparing the manganeſe, proper to furniſh a red colour, and names it *fuſible manganeſe*. Take of manganeſe of Piedmont one pound; torrify and pulverize it; then mix it with a pound of nitre, and calcine the mixture during twenty-four hours; afterwards waſh it repeatedly in warm water, till the water of the lyes has no longer any taſte; dry the manganeſe, and mix with it an equal weight of ſal ammoniac; levigate this mixture on a ſlab of porphyry with oil of vitriol diluted with water to the ſtrength of vinegar. Dry the mixture, and introduce it into a cornute; diſtil by a graduated fire;

fire; and when the ſal ammoniac is ſublimed, weigh it, and add to the mixture an equal quantity. Then diſtil and ſublime as before, and repeat the operation ſix times, being careful at each time to mix the ſal ammoniac and the manganeſe upon the porphyry with diluted oil of vitriol.

Of the Heat necessary for Factitious Gems.—M. Fontanieu obſerves, that there are three degrees of heat very different in their energy. The fire kept up in the wind furnaces in the laboratories of chemiſts, is leſs active than that whoſe effect is accelerated by the means of bellows; and a fire ſupported by wood, and kept up during ſixty hours without interruption, produces ſingular effects in vitrification, and renders the glaſs finer and leſs alterable. When recourſe is had to the forge, in order to operate a vitrification, it is neceſſary to turn about the crucible from time to time, that the maſs may melt equally. Some coal alſo ſhould be replaced, in proportion as it conſumes towards the nozel of the bellows; for without this precaution, we ſhould run the riſk of cooling the crucible oppoſite to the flame, and probably of cracking it, when all the melted maſs running among the coals would be totally loſt. Though this is the readieſt way of melting, it ſhould not be employed out of choice; for the crucible often breaks, or coals get into it, and reduce the calx of lead to a metallic ſtate.

Compositions for imitating the choicest Gems.—1. For the white diamond: Take the baſe of Mayence. This cryſtal is very pure, and has no colours.—2. For the yellow diamond: To an ounce of the fourth baſe, add for colour twenty-five grains of luna cornea, or ten grains of glaſs of antimony.—3. For the emerald: To fifteen ounces of either of the baſes, add for colour one dram of mountain-blue, and ſix grains of glaſs of antimony. Or, to an ounce of the ſecond baſe, add for colour twenty grains of glaſs of antimony and three grains of calx of cobalt.—4. For the ſapphire: To twenty-four ounces of the Mayence baſe, add for colour two drams forty-ſix grains of the calx of cobalt.—5. For the amethiſt: To twenty-four ounces of the Mayence baſe, add for colour four drams of prepared manganeſe and four grains of precipitate of Caſſius.—6. For the beril: To twenty-four ounces of the third baſe, add for colour ninety-ſix grains of glaſs of antimony and four grains of calx of cobalt.—7. For the black agate: To twenty-four ounces of either of the baſes, add two ounces of the mixture directed above under *Cobalt*.—8. For the opal: To an ounce of the third baſe, add for colour ten grains of luna cornea, two grains of magnet, and twenty-ſix grains of abſorbent earth.—9. For the oriental topaz: To twenty-four ounces of the firſt or third baſe, add for colour five drams of glaſs of antimony.—10. For the topaz of Saxony: To twenty-four of the ſame baſe, add for colour ſix drams of the glaſs of antimony.—11. For the topaz of Braſil: To twenty-four ounces of the ſecond or third baſe, add for colour one ounce twenty-four grains of the glaſs of antimony and eight grains of precipitate of Caſſius.—12. For the hyacinth: To twenty-four ounces of the baſe made with rock-cryſtal, add for colour two drams forty-eight grains of glaſs of antimony.—13. For the oriental ruby: To ſixteen ounces of the Mayence baſe, add for colour a mixture of two drams forty-eight grains of the precipitate of Caſſius, the ſame quantity of crocus Martis prepared in aquafortis, the ſame of golden ſulphur of antimony and of fuſible manganeſe, with the addition of two ounces of mineral cryſtal. Or, to twenty ounces of the baſe made with flint, add half an ounce of fuſible manganeſe and two ounces of mineral cryſtal.—14. For the balaſs ruby: To ſixteen ounces of the Mayence baſe, add the above colouring powder, but diminiſhed a fourth part. Or, to twenty ounces of the baſe made with flints, add the ſame colouring powder, but with a fourth leſs of the manganeſe.

The *factitious* gems are diſtinguiſhed from the *natural*, by their ſoftneſs and fuſibility; by their ſolubility in acids; by their cauſing only a ſingle refraction of the rays of light; and, in many caſes, by their ſpecific gravity, which exceeds 2·76 in all precious gems of the firſt order, as the diamond, ruby, ſapphire, &c.

Beſides the imitation of the gems above deſcribed, the jewellers have a method of making counterfeit brilliants, called *doublets*, which are formed of two pieces of white tranſparent glaſs, or of cryſtal, laid over each other, and cemented uniformly together, with the colouring matter incloſed in the centre. The manner of conſtructing them is as follows: Let the cryſtal or glaſs be firſt cut in the form of a brilliant, except that the figure muſt be compoſed from two ſeparate pieces, divided in an horizontal direction a little lower than the middle. After the two plates of the intended gem are thus cut, and fitted ſo exactly that no diviſion can appear when they are laid together, the upper part muſt be poliſhed ready for ſetting; and then the colour muſt be put betwixt the two plates by the following method. "Take of Venice or Cyprus turpentine two ſcruples; and add to it one ſcruple of the grains of maſtich perfectly pure, and finely powdered. Melt them together in a ſmall ſilver ladle, or other veſſel, and put to them gradually any of the coloured ſubſtances mentioned below, ſtirring them together as the colour is put in, that they may be thoroughly commixed. Warm then the doublets to the ſame degree of heat as the melted mixture; and paint the upper ſurface of the lower plate, and put the upper one inſtantly upon it, preſſing them to each other, but taking care that they may be conjoined in the moſt equable manner. When the cement or paint is quite cold and ſet, the redundant part of it, which has been preſſed out of the joint of the two pieces, ſhould be carefully ſcraped off the ſide, till there be no appearance of any colour on the outſide of the doublets: and they ſhould then be ſkilfully ſet; obſerving to carry the mounting over the joint, that the deception might not be diſcovered, and that the upper piece may be well ſecured from ſeparating from the under one.—The colours are communicated by the following pigments, &c.—The ruby may be imitated by mixing a fourth part of carmine with ſome of the fineſt crimſon lake that can be procured.—The ſapphire may be counterfeited by very bright Pruſſian blue, mixed with a little of the above-mentioned crimſon lake, to give it a caſt of purple. The Pruſſian blue ſhould not be very deep-coloured, or but little of it ſhould be uſed: for otherwiſe, it will give a black ſhade that will be injurious to the luſtre of the doublets.—The emerald may be counterfeited by diſtilled verdigris, with a little powdered aloes. But the mixture ſhould not be ſtrongly heated, nor kept long over the fire after the verdigris is added: for the colour may be ſoon impaired by it.—The reſemblance of the garnet may be made by dragon's blood; which, if it cannot be procured of ſufficient brightneſs, may be aſſiſted by a very ſmall quantity of carmine.—The amethyſt may be imitated by the mixture of ſome Pruſſian blue with the crimſon lake; but the proportions can only be regulated by experiment, as different parcels of the lake and Pruſſian blue vary extremely in the degree of ſtrength of the colour.—The yellow topazes may be counterfeited by mixing powdered aloes with a little dragon's blood, or by good Spaniſh arnotto: but the colour muſt be very ſparingly uſed, or the tinge will be too ſtrong for the natural appearance of that ſtone.—The chryſolite, hyacinth, vinegar garnet, eagle marine, and other more dilute colours, may be formed in the ſame manner, by leſſening the proportions of the colours, or by compounding them together correſpondently to the hue of the gem to be imitated; to which end it is proper to have an original ſtone, or an exact imitation of one, at hand when the mixture is made, in order to the more perfect adaptation of the colours to the effect deſired: and when

these precautions are taken, and the operation well conducted, it is practicable to bring the doublets to so near a resemblance of the true gems, that none but the best judges can distinguish them. The method of detecting them, is to hold the doublet betwixt the eye and the light, in such a position that the light may pass through the upper plate of the brilliant, when it will be readily seen that there is no real colour in the substance of the gem.

Of ANTIQUE GEMS.

There is perhaps no species of research which falls under the eye of the antiquarian, so full of interest and valuable information, as far as regards the taste and refinement of remote ages, and the consequent progress of the fine arts, as that which results from an investigation of the antique gems. These consist of all the precious stones above described, cut and polished by the art of the lapidary, and engraved or ornamented by the inimitable artists of ancient days, with the portraits of heroes and gods, of legislators and philosophers, of hieroglyphics, allegories, and attributes, and of numberless figures under various forms and attitudes, as devices for busts, medallions, signets, rings, bracelets, and all those ancient ornaments wherewith princes and princesses were wont to be distinguished, when they were "sumptuously decked out with jewels and precious stones." The object which artists had in view by engraving these gems, was to record or immortalize, on such unperishable materials, the noble actions of their ancestors, the attributes of the gods, the feats of kings and heroes, the celebration of religious rites, of victories, and the secular games, by which devices the mind might be furnished at a single glance, with a retrospective view of the principal passages and events in the history and mythology of ancient times.

In what age, or in what country, the art of grinding and engraving precious stones first took its rise, has been a question of great difficulty and doubt; and concerning which the opinions of mankind have been much divided. The honour of this invention was for a long time attributed to the Greeks, and afterwards to the Egyptians; but more modern research seems now inclined to bear away the palm in favour of the Asiatics, and the aboriginal inhabitants of Hindoostan; from whence it appears to have found its way into Egypt, and thence to the Greeks. For this information the public are principally indebted to the laudable exertions of the literary society of Calcutta, founded by the late ingenious and learned sir William Jones; from whose investigation of the Shanscrit language, and the rites and ceremonies of the ancient bramins, it is shewn that the art of polishing and engraving precious stones was practised in Asia long before the time of Moses. Though the figures expressed on these very antique gems are in some respects neatly and cleanly cut, yet they have the awkward coarseness and stiffness of the Egyptian style, which adds but little to the beauty of the stone, or to the ornament of the wearer. But the stone itself, and the symbol engraved upon it, were at first the only objects of consideration, without regard to elegant forms, or resplendent colours; and however coarsely or slightly these Asiatic and Egyptian antiques are finished, they will for ever afford the highest gratification to those who set a just value upon authentic monuments of the infant world, and of the origin and progress of its ideas and arts—which we have indeed inherited, but not always improved.

Many of these curious antiques, by the signs and symbols impressed upon them, manifest the most ingenious and correct representations of nature. Death was represented with crooked legs; beauty and youth, by long tresses of hair; power, by long hands; swiftness and agility, by long feet. These gradations of antique gems rank among the earliest of the Grecian arts; and are not, as Winckelmann insinuates, "precious gems of Etruscan workmanship." It has been shewn by M. Pauw, that the Egyptians engraved the *pietrê durê*, or gems, full two thousand years before the christian era; but it has been proved that similar works of art amongst the ancient Greeks, cannot date from an earlier period than the time of Homer; which is generally, and upon rational grounds, conceived to have been about the time of the reign of David and Solomon in Judea: yet it appears that the mechanical art of common engraving had reached the Greeks long before they began to reckon by Olympiads. Their gems being engraved in intaglio, on the flat part of perforated scarabees, demonstrates that they were not worn or mounted as rings, though they might be used for sealing; and as they are evident imitations of the old Egyptian sacred scarabees with hieroglyphical figures, it follows pretty obviously that the art of cutting and engraving gems came long afterwards to the Greeks by the way of Egypt,—as did their architecture and many other branches of science; which has been satisfactorily proved by M. Denon and others, in their recent promulgation of Egyptian antiquities.—See the article EGYPT, vol. vi. p. 374-378.

Indeed, if the silence of Homer as to the knowledge of engraved gems in any part of Greece is not decisive of the fact above stated, we have the unexceptionable authority of the sacred writings in support of it; in which we find that the Egyptians and the Israelites, in the time of Moses, had rings and engraved gems long before the epoch of the siege of Troy; and at a period when, by whatever system of chronology we chuse to reckon, the Greeks had not even emerged from barbarity. For at a much more remote era, Pharaoh had taken the sealring from his finger, and placed it on that of Joseph; and Moses had been directed to build the holy sanctuary from the offerings of the people, among which were "onyx-stones, and stones to be set in the ephod of the high-priest and his breast-plate." *Exod.* xxv. 7. Of these he was directed to take "two onyx-stones, and *grave* on them the names of the children of Israel; six of their names on one stone, and the other six names on the other stone, according to their birth." And "with the work of an engraver in stone, like the engravings of a *signet*, shalt thou engrave them; and set them in ouches of gold, and put them on the shoulders of the ephod, that Aaron the high-priest bear their names before the Lord upon his shoulders for a memorial." And he was further directed to "make for Aaron a breast-plate of judgment, and to set it in settings of stones, four rows, each containing three; which stone shall be, with the names of the children of Israel, twelve, according to their names, like the engravings of a signet." *Exod.* xxviii. 9-21. It is also to be noticed, that the onyx-stones, and stones to be set for the ephod, were brought, not by the *commonalty* of the Israelites, but by the *rulers of the people*; *Exod.* xxv. 27; which plainly indicates their *then* great scarcity and high prices, much beyond the reach of common people. And it is curious to remark that the diamond, which was then found only in Asia, is mentioned as one of the *engraved* stones in the second row of the breast-plate; and that consequently the art of engraving and cutting it must be of much higher antiquity than is commonly supposed.

But when the art of cutting and engraving gems had diffused itself throughout the Persian, Grecian, and Roman, empires, there seems to have been no bounds to the extravagance of the rich and great in procuring those jewels for dress and ornament. Rings, bracelets, earrings, necklaces, clasps, girdles, sashes,—nay, even the robes, gowns, and shoes, of the great and noble, were richly set and variegated with engraved gems. The same taste and profusion also adorned the helmets, breast-plates, bucklers, sword-handles, and scabbards,—and even the saddles and horse-furniture of their warriors. And indeed this profusion of ornamental gems is still anxiously sought for by the Turkish and Persian nobles, and

and by the beys of Egypt. Yet the art of engraving gems amongſt the eaſtern nations was at firſt cultivated, not ſo much to gratify an oſtentatious pride, as from the neceſſity which compelled thoſe people to have recourſe to ſeals or ſtamps; for no writing was held to be authentic, unleſs accompanied with the ſignet of the perſon who dictated it. Jezebel, writing a letter in the name of Ahab, carefully impreſſes it with the ſeal of that prince, that her orders might be executed without heſitation. The Perſian and Parthian monarchs practiſed the ſame cuſtom; and Ahaſuerus preſented his ring to Eſther, as the uſual mark of confidence and eſteem. Alexander, the conqueror of Darius, always uſed the ſeal of that unfortunate monarch when he ſent his mandates into Aſia; and at Babylon, every great man had his particular ſignet; a manifeſt proof of the high antiquity of private ſeals, which are ſo much the taſte in our own times.

It would be ſuperfluous for us to enumerate the various kinds and uſes of the ornamental rings of the ancients, enriched with the moſt curious devices of the deſigner and engraver.—"They loaded their fingers with princely fortunes,"—ſays Pliny, xxxiii. 1. and ſome of the greateſt and moſt renowned warriors had ſo high a regard for their rings and engraved gems, that they bequeathed them to the commonwealth, to prevent dilapidation. Pompey placed in the capitol of Rome the rings, gems, and jewels, which he had collected among the ſpoils of Mithridates. Cæſar gave to the temple of Venus Genetrix his cabinet of *dactyliotheca*, which he had collected at an immenſe expence. Marcellus dedicated his invaluable ſtore to the temple of Apollo Palatinus. And ſo infatuating was this rage for ornamental rings, that the inferior claſſes,—juſt the ſame as in our own days,—were ſo anxious of imitating their ſuperiors, that gilt, and braſs, and even iron, rings, were coveted and worn, from the faſcinating principle of faſhion alone, among the very loweſt orders of the people. *Pliny* xxxiii. 1.

Among the Egyptian gems, the greater part have the form of the conſecrated ſcarabeus or beetle, and the figures are engraven on its ſurface. They afterwards ground or cut away the lower part of the ſcarabeus, preſerving the upper ſurface, cut into an oval form, to be more commodiouſly ſet into a ring or ſeal. Such was the origin of the oval engraved ſtones, which are ſtill called *ſcarabs*, although the figure of the inſect no longer appears. The ſcarabeus was conſidered by the Egyptians as a ſymbol of the ſun, the ſource of generation, probably becauſe they imagined that the ſcarab poſſeſſed the faculty of ſelf-production; it was alſo regarded as an emblem of courage, for they imagined that all theſe inſects were males, and conſequently beheld them with a kind of veneration. The Etruſcan ſcarabs, which are numerous, rarely exceed the natural ſize of the inſects they repreſent; but thoſe of the Egyptians are frequently of an extraordinary thickneſs, and ſome of them are four inches in length. Engraved ſtones of this kind were eſteemed as amulets or preſervatives from unlucky accidents, or from the malice of enemies. With theſe the forms of divinities and the veſtments of the prieſts were decorated, and they were diſtributed as honourable diſtinctions to perſons who had become eminent either in military employments, or in the offices of civil adminiſtration. That theſe ſtones were generally attached to the dreſs or to the perſon, appears by their being perforated, ſo as to admit a ſtring, by which they were either ſuſpended from the neck or faſtened on the arm.

It has excited ſurpriſe among antiquarians, that the Etruſcans, a nation ſo diſtant from Egypt, ſhould have had the ſame ſingular kind of engraved ſtones; but the circumſtance merely ſhews that the Etruſcans copied the Egyptians, and probably, in adopting the ſcarabs of Egypt, they likewiſe adopted the ſuperſtitious practices then prevailing in that country. But from theſe Egyptian and Etruſcan gems, which are to be claſſed among the earlieſt productions of the glyphic art, we may conclude, that although they carried the mechanic operation to a conſiderable height, they made little or no progreſs in the poetical or more refined part. We muſt however diſtinguiſh the real Egyptian ſtyle from the Egyptio-Grecian, which took place when Egyptian gems were afterwards executed by Greek artiſts.

We diſcover on thoſe gems the divinities of the country, and all the hieroglyphics of their ſymbolical writing. Among theſe divinities we find their Iſis, Oſiris, Horus, Anubis, Harpocrates, &c. ſometimes ſingle, and ſometimes united. The flower of the lotus or perſea often ornaments their forehead, or its ſtalk is held like a ſceptre in the hand of the divinity, who is ſometimes repreſented as ſailing in a bark of the papyrus. The ſiſtrum or rattle, the ſitula or ewer, and the whip or ſcourge, are occaſionally repreſented.—See the engravings which illuſtrate the article EGYPT in our ſixth volume.

The Greeks, when once in poſſeſſion of the art of engraving gems, were not long in bringing it, like other arts of fancy and delineation, to the higeſt imaginable perfection. Raſpe, the editor of Taſſie's catalogue, juſtly obſerves, that their improvements were not improvements of the mechanical parts of the art, or of the tools or method of engraving, for theſe, on account of their great ſimplicity, could have undergone but little variation from their beginning. The improvements of the Greeks aroſe from a more extenſive uſe of the tool—a better choice, and happier treatment of their ſubjects—from their conſummate knowledge and imitation of nature, and finally, from a ſublimer taſte, in which Homer was their maſter, and nature their guide.

The Egyptian ſculpture has one remarkable deficiency; the Egyptian ſtatues hang their limbs in idleneſs and inactivity; their legs and their arms adhere to the body in one dead maſs. Grecian art firſt made the marble ductile, and the ſtone ſuſceptible of delicate forms. It breathed life into a ſtatue, and touched into motion the fairy group contained in a ring. The commercial intercourſe of the Greeks with other nations—their conſtant emulation, ariſing from their own ſmall independent ſtates—their encouragement from aſpiring individuals, who purchaſed fame with the talents of the artiſt—their athletic exerciſes, and the natural beauty of their forms, and the genial influence of their country and climate—all conſpired to give the moſt powerful impulſe to their genius; and not the leaſt of theſe cauſes was the varied enchantment of their fabled heroes, gods, and goddeſſes. Was it wonderful that they, who ſo early felt the merits of Homer, ſhould expreſs his beauties by the efforts of the glyphic art? beauties ſo different from the infantine inventions of Africa and Aſia, ever cramped and confined by the ſuperſtition of their mythology. From the ſtudy of nature and her laws, the Greeks formed their immortal works; ſhe alone was their ſtandard, the teſt of art and ſcience, of genius and taſte.

The Romans before they were acquainted with the Greeks, from the earlieſt period of the republic, were in the habit of wearing rings. Thoſe of their ſenators were originally made of iron, and veſtiges of this primæval ſimplicity were perceivable in their marriage ceremonies and in their triumphs. In the former, the bridegroom preſented an unadorned ring of iron to his bride; and in the latter, the triumpher, while the ſlave placed on his head a crown of gold, wore, like that ſlave, a ſimple iron ring on his finger. Such was the plain ornament with which Marius triumphed over Jugurtha. In proceſs of time, only their ambaſſadors enjoyed the privilege of publicly wearing a gold ring. The nobility were at length diſtinguiſhed by this mark from the plebeians; theſe latter were only allowed rings of ſilver; and when a ring of gold was beſtowed on one of them by a dictator or a queſtor, he was admitted into the equeſtrian order.

On

On the contrary, whenever a Roman knight had diſſipated his wealth, he was compelled to give up his gold ring; and if any diſgraceful act rendered a citizen incapable of holding a public office, he was deſpoiled of his ring, and his ſeal was eraſed.

This famous republic for a long time regarded the liberal arts with diſdain, not diſtinguiſhing them from mere manual employments; they therefore made ſcarcely any progreſs in them. Afterwards, when they penetrated with their arms into Greece and Aſia, and obſerved the high eſteem in which artiſts were held, they ſeemed to poſſeſs other eyes and finer feelings. The rude conquerors admired and pillaged theſe treaſures of Greece, and invited Dioſcorides, Solon, and their numerous brethren, to the Roman capital. Yet for a length of time the Romans were debarred by their religious inſtitutions from the uſe of the graver. Numa, following the example of Pythagoras, had long conceived that a knowledge of the divinity could only be acquired by the mind, and imagined that it was derogatory to employ material and periſhable objects to repreſent it. The Romans therefore abſtained from engraving any image of the gods; but afterwards adopting the religious rites of other nations, they became, like thoſe nations, the ſlaves of ſuperſtition. Caprice at length invented all kinds of ſubjects to be engraven on their ſeal-rings.

A multiplicity of rings, which had been hitherto prohibited, was now allowed; and, from having been originally uſed as ſeals, became curious as well as neceſſary ornaments. They adorned the ſtatues of their gods with them, that they might have a plea for their own profuſion, and at length became ſo faſtidiouſly delicate, that they had lighter rings to wear in the ſummer. The Greeks and other nations had adopted the finger on the left hand for the honourable diſtinction of the ring; on the left hand it was more conveniently worn; more ſecure from friction, while the right was free to act. But when magnificence ſucceeded to the ancient frugality, they covered all their fingers with rings, and even carried ſeveral on one finger, and mounted ſeveral engraved ſtones in one ring.

Among their domeſtic uſes of rings and ſeals was that of their being ſubſtituted for the uſe we make of keys; one part of the ſeal formed the wards of a key. They ſealed their cheſts, and their wine veſſels, and whatever they wiſhed to preſerve from the rapacity of their domeſtics. But their chief uſe was to ſeal their letters. After the letter was folded, or their tablet cloſed, they tied round it a flaxen ſtring, and at the point where the tie finiſhed they put their wax. The letter thus ſealed became a ſacred depoſit; and when the bearer preſented it to the perſon addreſſed, he was very particular to make him obſerve both the cover and the ſeal. This cuſtom has been preſerved from age to age. In the middle ages they appear at times to have been diſtreſſed for ſeals; for St. Bernard apologiſes, in one of his letters, for not having ſealed them, having miſlaid his ring; and he informs pope Eugenius, that his ſeal having been *counterfeited*, he intends for the future to have a ſeal which ſhall bear his portrait and his name.

As the head of every family had his own ring, no engraver was permitted to make the ſame ring for two different perſons, and they employed the moſt ſevere prohibitions againſt it. Yet forgeries were numerous; and frauds and ſtratagems were ſucceſsfully accompliſhed by ſuch means, by the enemies of the Romans. Pompey, (the ſon of Pompey the Great) a naval commander, anticipating his melancholy end, and fearful of the purpoſe to which his enemies might convert his ring, threw it into the ſea after his defeat. At the bed alſo of a dying man, his friends and heirs ſolicitouſly ſtood to watch the fate of his ring. From various motives many called aloud to incloſe it in his funeral urn; and if the dying man was ſilent reſpecting its deſtiny, they indecently ſnatched it from his finger ere he expired: a circumſtance which the moral Seneca condemns among the perverted manners of his age.

Julius Cæſar had for his ſeal, a Venus armed with a dart, of which there are numerous copies; this was to flatter his pride of anceſtry, pretending that he deſcended from Venus and Æneas. Auguſtus, when he aſſumed the empire, had a ſphynx, which, at length, he abandoned to elude the pleaſantries of the wits; this ſphynx, they ſaid, portends riddles. Afterwards he adopted the head of Alexander; and at length his own portrait, engraved by Dioſcorides. Pompey's ſeal was a lion holding a ſword: when, after his aſſaſſination, it was preſented to Cæſar, the crafty rival burſt into tears. The ſeal of Mecænas was a frog; an animal which he made highly dreadful to the people; for as it was uſually annexed to his tax bills, the hoarſe voice of the frog they declared to be truly unmuſical. It was ſaid that this amphibious animal was ſymbolical of the power Mecænas was inveſted with, both in land and ſea affairs. Sylla, become haughty by taking Jugurtha priſoner, had the event engraven on the ſeal with which he conſtantly ſealed his letters. This (ſays Plutarch) touched Marius to the quick; ſo ſlight and frivolous was the beginning of the enmity of thoſe celebrated rivals, which afterwards produced ſuch implacable animoſity, and cauſed ſo much Roman blood to be ſhed. Scipio Africanus bore on his ſeal the portrait of Syphax, whom he had conquered. Theſe inſtances ſufficiently ſhew that engraved ſtones recorded hiſtorical events of the higheſt importance, at the ſame time that they performed the office of ſeals. And thus we find that gems preſerve to us a multitude of ſigns and ſymbols intereſting towards the hiſtory of the manners and cuſtoms of antiquity. The fineſt copies of ſtatues and groupes, ſome of which ſtill exiſt, while others are loſt and gone, are executed on precious ſtones; the faces and features of illuſtrious men, eminent for their genius or their power, are faithfully retained, and often more perfectly than on medals, which are ſo frequently injured by friction and time. In gems, the artiſts have found an infinite number of ſubjects for their imitation and improvement, from the age of Raphael and Michael Angelo, to Reynolds and Fuſeli; poets and hiſtorians are no leſs indebted. From theſe precious treaſures of antiquity we may every day learn more and more to perfect our taſte, exerciſe our curioſity, and adorn our imagination with the moſt elevated and the moſt beautiful ideas. They conſtitute a library without books, a gallery of pictures without paintings, and ſculpture without marble.

Cold and phlegmatic minds, however, have frequently murmured at the expence of time neceſſary to inveſtigate and acquire this art, as well as againſt thoſe charming fictions with which Homer, Heſiod, and ſucceeding poets, have embelliſhed their works; but did theſe inventions not diſcloſe important truths, and frequently the moſt uſeful inſtructions, ſtill can it be wiſe to deſtroy a ſyſtem which peopled and animated all nature, a mythology which made a ſolemn temple of the vaſt univerſe? "Thoſe flowers whoſe ſparkling and varied beauty we ſo much admire, are the tears of Aurora. It is the breath of Zephyrus which gently agitates the leaves, while the murmurs of the waters are the ſighs of the Naiads. A god impels the wind; a god pours out the rivers! Grapes are the gift of Bacchus. Ceres preſides over the harveſt. Orchards are the care of Pomona. Does a ſhepherd ſound his reed on the ſummit of a mountain, it is Pan who with his paſtoral pipe returns the amorous lay. When the ſportſman's horn rouſes the inchanted ear, it is Diana armed with her bow and quiver; more nimble than the ſtag ſhe purſues, when ſhe takes the diverſion of the chaſe. The ſun is a god, who, riding on a car of fire, ſcatters through the univerſe a flood of light. The ſtars are divinities, who meaſure the eternal path of time with their golden beams.

beams. The Moon, the lovely ſiſter of the Sun, with milder glory ſlowly paces on her car through the ſilence of the night, and conſoles the world for the abſence of her brother. Neptune reigns in the ſeas, ſurrounded by the Nereids, who dance to the joyous ſhells of the Tritons. In the higheſt heaven is ſeated Jupiter, the father and ſovereign of men and gods; ſubſervient to his will rolls the thunder, formed by the Cyclops in the cavern of Lemnos; his ſmile rejoices nature, while his nod ſhakes the foundations of Olympus. Circling the throne of their ſovereign, or recumbent on purple beds, the other divinities quaff ambroſia from the golden cup preſented by the youthful Hebe. In the midſt of this bright circle ſhines with diſtinguiſhed luſtre the unrivalled beauty of Venus, adorned only by her magic ceſtus, about which the Graces, the Smiles, and the Sports, for ever play; in her hand is a ſmiling boy, whoſe power all earth, all heaven, confeſs and feel."—See the elegant diſplay of Antique Gems, publiſhed by Murray, 4to. 1804.

Of the IMITATION of ANTIQUE GEMS.

Since faſhion, in all ages, has been found to lead the follies and the fancies of mankind; and ſince the prices of precious ſtones and engraved gems, while thus the vogue, were ſo enormous that none but the higher ranks could accompliſh their purchaſe; it is not ſurpriſing that the idea of counterfeiting them in coloured paſte or glaſs, ſhould have been very early ſuggeſted by the ancient lapidaries; particularly as ſuch brilliant baubles, from their reſplendent colours, and beautiful workmanſhip, have alike excited the admiration and taſte of the bulk of the people in every nation on the earth, whether ſavage or civilized. No wonder then that the famous old glaſs manufactories of Egypt, Tyre, and Sidon, ſhould have furniſhed ſo many of theſe articles as objects of commerce. In Egypt they made, even in the remoteſt antiquity, rich coloured glaſs jewels, emeralds, and enamels, which they ſold to the Phœnician traders, who diſperſed them in commerce over different parts of the world,—juſt as our Chriſtian traders have ſince done on the coaſts of Guinea, Senegal, and Madagaſcar, bartering theſe and ſuch like baubles for amber, gold, ſlaves, girls, and other commodities.

In this artifice of imitating the antique gems by coloured paſtes and glaſs enamel, both the Greeks and Romans made ſuch wonderful progreſs, that for a long time they paſſed off theſe counterfeits for real jewels, and highly elevated and enriched the fabricators of them. The Romans, from their perfect imitation of the *lapis obſidianus*, an Ethiopian opaque ſtone ſimilar to the black glaſſy lava of Iceland, called it *vitrum obſidianum*; and the red opaque, like jaſper, they called *hæmatimon*; and they had likewiſe, as Pliny adds, Hiſt. Nat. xxxvi. 26, "*album, et murrhinum, aut hyacinthos ſapphiroſque imitatum, et omnibus aliis coloribus.*" By *vitrum murrhinum*, Pliny undoubtedly meant a glaſs or paſte which imitated the reſplendent colours of thoſe celebrated *vaſa murrhina*, which were firſt exhibited at Rome in the triumphal entry of Pompey, after his victory over Mithridates; and for which afterwards ſuch extravagant prices were paid by the Romans, that it almoſt ſurpaſſes the conception or belief of the moſt credulous antiquarian. Three hundred talents!—no leſs than 30,000l. ſterling—Petronius is ſaid to have paid for one ſingle bowl of that kind; and which he afterwards broke to pieces to prevent Nero from ſeizing it, who had boaſted that he ſhould enrich his ſideboard with this coſtly and precious veſſel. Antiquarians have been extremely puzzled to find out what theſe *vaſa murrhina* could poſſibly have been made of. Variegated agate, ſardonyx, china, and even glaſs externally ornamented with cameo-work, have been tried and fitted to the occaſional deſcriptions which the ancients have left us of theſe vaſes; but in a manner which is far from proving ſatisfactory. For neither do the materials of china or glaſs correſpond with the extraordinary prices for which they ſold; nor agree in their fabric with Pliny's deſcription, who ſays that "they were held in the higheſt eſtimation on account of the ſingularity and refulgence of their colours, their ſpots winding round into purple and milk-white, and a third bright, burning, reddiſh, or flame-colour, ariſing alternately from the different ſhades of this inimitable admixture. All the accounts too, of the country from which the *myrra, murrha*, or myrrhine vaſes, were brought, appear equally vague and uncertain; it ſeems however agreed, that they were the product of the *eaſt*, or India. If indeed theſe vaſes were formed of variegated agate, or ſardonyx, with ſtrata or ſtripes of milk-white onyx, or chalcedons, and ſaturated with amethyſt, or purple, bright red, and the varying ſhades thence ariſing, and cut into the ſize and thinneſs which Pliny mentions, the ſubſtance being very little thicker than that of a goblet, then they muſt have been wonders in nature and art, which the rich and luxuriant might fancy and buy at exorbitant prices. Even in theſe, or in any other days, they would be looked upon deſervedly and juſtly as great curioſities; for extenſive as our knowledge is in the productions of the mineral kingdom, where ſhall we find agates and ſardonyxes of the ſize which Pliny and other writers deſcribe, as neceſſary to give the dimenſions or content of the myrrhine vaſes, without flaw or fracture?

But although the origin of the real murrhine vaſes ſtill remains in a ſtate of doubt and uncertainty, yet the ingenious imitation of them in glaſs and porcelain, of which we were ſpeaking, has been clearly and ſatisfactorily aſcertained. Of this ſpecies is the juſtly prized Barbarini vaſe, which was brought to England by ſir William Hamilton, and now in the poſſeſſion of his grace the duke of Portland. It is perhaps one of the moſt intereſting examples of the powers of the imitative art now exiſting, in the improvement or enhancement of the value of cheap materials. But ſtill further to ſhew the ingenuity of our anceſtors in this imitative ſcience, thouſands of antique impreſſions of gems of coloured glaſs or paſte, have been dug up amongſt the ruins of Alexandria, Rome, Naples, Puzzolo, and other ſeats of ancient magnificence. Many of the moſt admired engravings in the real antique gems, are now only to be found in imitative paſte impreſſions; but which having been formed from the laſt originals, are in conſequence become of a ſimilar value. Inſtances of this fact are verified in the Florentine Muſeum; in Stoſch's elaborate work on Ancient Gems; in Winckelman's Deſcription of Stoſch's Cabinet; and, above all, in Mr. Townley's noble collection, which has long done honour to the Britiſh metropolis.

Heraclius, in the ninth century, was a diſtinguiſhed fabricator of antique gems, which were frequently uſed as jewels in royal and ducal crowns, in ornaments about the altar, and in ſtate equipage and furniture. In that age of ſuperficial enquiry, coloured glaſs or paſte was often ſold for fine emerald, ſapphire, and ruby. The famous emerald of the abbey of Reichenaw near Conſtance, though a choice preſent from the emperor Charlemagne, has of late been diſcovered to be nothing more than a lump of fine green-coloured glaſs.—The equally celebrated emerald vaſe in the cathedral at Genoa, came into the poſſeſſion of the Genoeſe as an equivalent for a large ſum of money, in 1101, at the taking of Cæſarea in Paleſtine; nor was any impoſition ever ſo much as ſuſpected; for in 1319 they pawned, and afterwards redeemed it, for 1200 marcs of gold, which is nearly 30,000l. ſterling: and yet this jewel turns out to be nothing but a lump of coloured glaſs!

This imitative art of fabricating the antique gems in paſte and glaſs, though of ſo much importance to the jeweller's trade, was at firſt a ſecret in the hands only of ſome particular individuals, and it died with them;

ſo that every new artiſt was for a long time obliged to re-invent the method; until at length M. Homberg, having once more brought the art to great perfection, generouſly gave the whole proceſs to the world, never again to be forgotten or loſt.

The great object of the operation is to take the impreſſion of the gem in a very fine earth, and to preſs down upon this a piece of pure glaſs, ſoftened or half melted at the fire, ſo that the figures of the impreſſion made in the earth may be nicely and perfectly expreſſed upon the glaſs. In general, the whole proceſs much reſembles that of the common foundery. But when it is brought to the trial, there occur a number of difficulties which were not to be foreſeen, and which would not at all affect the common works of the founder. For his purpoſe, every earth will ſerve that is fine enough to receive the impreſſion, and ductile enough not to crack in the drying: theſe all ſerve for the founder's uſe, becauſe the metals which they caſt are of a nature incapable of mixing with earth, or receiving it into them, even if both are melted together, ſo that the metal always eaſily and perfectly ſeparates itſelf from the mould; but it is very different in theſe caſts of glaſs. They are compoſed of a matter which differs in nothing from that of the mould, but that it has been run into this form by the agency of fire, and the other has not yet been ſo run, but is on any occaſion ready to be ſo run, and will mix itſelf inſeparably with the glaſs in a large fire: conſequently, if there be not great care taken, as well in the choice of the glaſs as in the manner of uſing it, when the whole is finiſhed there will be found great difficulty in ſeparating the glaſs from the mould, and often this cannot be done without wholly deſtroying the impreſſion.

All earths run more or leſs eaſily in the fire, as they are more or leſs mixed with ſaline particles in their natural formation. As all ſalts make earths run into glaſs, and as it is neceſſary to uſe an earth on this occaſion for the making a mould, it being alſo neceſſary to the perfection of the experiment that this earth ſhould not melt or run, it is our buſineſs to ſearch out for this purpoſe ſome earth which contains but very little ſalt. Of all the ſpecies of earth which M. Homberg examined, none proved ſo much diveſted of ſalts, or ſo fit for the purpoſe, as the common tripoli, uſed to poliſh glaſs and ſtones. Of this earth there are two kinds; the one reddiſh, and compoſed of ſeveral flakes or ſtrata; the other yellowiſh, and of a ſimple ſtructure. Theſe are both to be had in the ſhops. The yellowiſh kind is the beſt of the two, and is commonly called *Venetian tripoli*. This receives the impreſſions very beautifully; and never mixes with the glaſs in the operation, which the red kind is apt to do. M. Homberg employed both kinds at once in the following manner: firſt, powder a quantity of the red tripoli in an iron mortar, and ſifting it through a fine ſieve ſet it by for uſe; then ſcrape with a knife a quantity of the yellow tripoli into a ſort of powder, and afterwards rub it till very fine in a glaſs mortar. The finer this powder is, the finer will be the impreſſion, and the more accurately perfect the caſt. The artificer might naturally ſuppoſe, that the beſt method to obtain a perfect fine powder of this earth, would be by waſhing it in water; but he muſt be cautioned againſt this. There is naturally in this yellowiſh tripoli a ſort of unctuoſity, which when it is formed into a mould keeps its granules together, and gives the whole an uniform gloſſy ſurface: now the waſhing the powder takes away this unctuoſity; and though it renders it much finer, it makes it leave a rough granulated ſurface in the mould.

When the two tripolis are thus ſeparately powdered, the red kind muſt be mixed with ſo much water as will bring it to the conſiſtence of paſte, ſo that it may be moulded like a lump of dough between the fingers: this paſte muſt be put into a ſmall crucible of a flat ſhape, and about half an inch or a little more in depth, and of ſuch a breadth at the ſurface as is a little more than that of the ſtone whoſe impreſſion is to be taken. The crucible is to be nicely filled with this paſte lightly preſſed down into it, and the ſurface of the paſte muſt be ſtrewed over with the fine powder of the yellow tripoli not wetted. When this is done, the ſtone, of which the impreſſion is to be taken, muſt be laid upon the ſurface, and preſſed evenly down into the paſte with the finger and thumb, ſo as to make it give a ſtrong and perfect impreſſion; the tripoli is then to be preſſed nicely even to its ſides with the fingers, or with an ivory knife. The ſtone muſt be thus left a few moments, for the humidity of the paſte to moiſten the dry powder of the yellow tripoli which is ſtrewed over it: then the ſtone is to be carefully raiſed by the point of a needle fixed in a handle of wood; and the crucible being turned bottom upwards, it will fall out, and the impreſſion will remain very beautifully and correctly taken.

The red tripoli being the more common and the cheaper kind, is here made to fill the crucible only to ſave the other, which alone is the ſubſtance fit for taking the impreſſion. When the ſtone is taken out, it muſt be examined, to ſee whether any thing be lodged in any part of the engraving, becauſe if there be any of the tripoli left, there will certainly be ſo much wanting in the impreſſion. When the crucible and paſte are dry, a piece of glaſs muſt be choſen of a proper colour, and cut to a ſize proper for the figure; this muſt be laid over the mould, but in ſuch a manner that it does not touch the figures, otherwiſe it would ſpoil them. The crucible is then to be brought near the furnace by degrees, and gradually heated till it cannot be touched without burning the fingers; then it is to be placed in the furnace under a muffle, ſurrounded with charcoal. Several of theſe ſmall crucibles may be placed under one muffle; and when they are properly diſpoſed, the aperture of the muffle ſhould have a large piece of burning charcoal put to it, and then the operator is to watch the proceſs, and ſee when the glaſs begins to look bright: this is the ſignal of its being fit to receive the impreſſion. The crucible is then to be taken out of the fire; and the hot glaſs muſt be preſſed down upon the mould with an iron inſtrument, to make it receive the regular impreſſion: as ſoon as this is done, the crucible is to be ſet at the ſide of the furnace out of the way of the wind, that it may cool gradually without breaking. When it is cold, the glaſs is to be taken out, and its edges ſhould be grated round with pincers, which will prevent its flying afterwards, which is an accident that ſometimes happens when this caution has been omitted, eſpecially when the glaſs is naturally tender. The different coloured glaſſes are of different degrees of hardneſs, according to their compoſition; but the hardeſt to melt are always the beſt for this purpoſe, and this is known by a few trials.

If it be deſired to copy a ſtone in relief which is naturally in creux, or to take one in creux which is naturally in relief; there needs no more than to take an impreſſion firſt in wax or ſulphur, and to mould that upon the paſte of tripoli inſtead of the ſtone itſelf: then proceeding in the manner before directed, the proceſs will have the deſired ſucceſs.

A more ſimple and eaſy method than the above, is by taking the caſts in gypſum, or plaſter of Paris as it is commonly called. For this purpoſe, the gypſum muſt be finely pulveriſed, and then mixed with clear water to the conſiſtence of thick cream. This is poured upon the face of the gem or ſeal of which the impreſſion is wanted, and which muſt be previouſly moiſtened with oil to facilitate the ſeparation of the caſt; and in order to confine the liquid plaſter, it is only neceſſary to pin a ſlip of oiled paper round the ſides of the ſeal by way of a cap or rim. When the plaſter is dry, it is to be taken off, and ſet before the mouth of the furnace, in order to free it entirely from moiſture; then it is fit to be uſed as a matrix in the ſame way as that formed with the tripoli

Antique Seals or Signets, Rings, Bracelets &c.

London, Published as the Act directs, Dec.r 22 d 1806, by J. Wilkes

earths. Only no crucible or other receptacle is at all neceſſary; the caſts being formed like ſo many ſmall cakes half an inch thick, and thus put into the furnace with the bits of glaſs upon them. The glaſs, after coming to a proper heat, is preſſed down upon the mould with an iron ſpatula to receive the deſired impreſſion, the preſſure requiſite being more or leſs according to the ſize of the ſtone.

The art of taking impreſſions of gems ſeems not to have been altogether loſt even in the Gothic ages; and it was revived in Italy in the time of Laurence of Medici and Pope Leo X. but it was not cultivated in an extenſive manner till the beginning of the eighteenth century, when M. Homberg reſtored it, as already mentioned. In this he is ſaid to have been greatly aſſiſted and encouraged by the then duke of Orleans regent of France, who uſed to amuſe himſelf with that celebrated chemiſt in taking off impreſſions in paſte from the king of France's and his own collections of gems. M. Clachant the elder, an engraver of ſome note, who died at Paris in 1781, alſo learned this art from his royal highneſs, to whoſe houſehold his father ſeems to have belonged. Mademoiſelle Feloix next cultivated this art. She had been taught by her father, who in quality of garçon de chambre to the regent had often aſſiſted in the laboratory of his maſter, where he acquired this knowledge. Her collection conſiſted of 1800 choice imitations, with many originals, of the antique gems.

Baron Stoſch, a Pruſſian, who travelled over Europe in queſt of original engraved ſtones and impreſſions of ancient gems, for the elegant work which he publiſhed and Picart engraved, was well acquainted with this art. He had taught it to his ſervant Chriſtian Dehn, who ſettled at Rome, where he made and ſold his well known ſulphur impreſſions and paſtes. He had collected 2500 articles. Dolce has arranged them in a ſcientific order, and given a deſcriptive catalogue of them. It was chiefly from Dehn's collection that the taſte for ſulphurs and paſtes has become ſo univerſal. They are great objects of ſtudy, and often require much learning to explain them. They have unqueſtionably ſerved to extend and improve the art of engraving on ſtones; and have been of infinite uſe to painters, to ſtatuaries, and to other artiſts, as well as to men of claſſical learning and fine taſte.

It is however very difficult to take off impreſſions, and perfectly to imitate various coloured cameos. It cannot be properly done in wax, ſulphur, plaſter, or glaſs of one colour only. The difficulties ariſing from their ſize and form, and from the various nature of the different ſorts of glaſs, which do not well unite into different ſtrata, are very numerous: nor could the completeſt ſucceſs in this chemical and mechanical branch of the art for a long time produce a tolerable cameo. Impreſſions or imitations, if unaſſiſted by the tool of the engraver, do not ſucceed; becauſe the undercutting and deep work of moſt of the originals require to be filled up with clay or wax, that the moulds may come off ſafe without injuring them. Hence the impreſſions from theſe moulds come off hard and deſtitute of delicacy, ſharpneſs, and preciſion of outline, till the underworking of the moulder is cut away. But Mr. Reiffenſtein at Rome, by his genius, perſeverance, and the aſſiſtance of able artiſts, at length overcame theſe difficulties; and had the ſatisfaction of ſucceeding, and producing variegated cameos which can hardly be diſtinguiſhed from the originals.

M. Lippart of Dreſden, an ingenious glazier, and an enthuſiaſt in the fine arts, practiſed this branch not unſucceſsfully; but not finding ſufficient encouragement for his paſtes of coloured glaſs, or perhaps from local difficulties in making them well and cheap, he abandoned the purſuit. He ſubſtituted in its place impreſſions of fine white alabaſter or ſelenite plaſter. Such impreſſions, when carefully ſoaked in a ſolution of white Caſtile ſoap, then dried, and rubbed over with a ſoft bruſh, take a very agreeable poliſh. They ſhow the work perhaps to better advantage than red or white ſulphurs do; but they are not ſo durable, and are liable to be defaced by rubbing. Of theſe impreſſions M. Lippart publiſhed three different collections, each of them containing one thouſand articles; and to the merit of having increaſed the number of Mademoiſelle Feloix and Chriſtiano Dehn's collections, which are all inſerted in his, he added that of employing two learned Germans to arrange and deſcribe them. The firſt thouſand were arranged and deſcribed by the late profeſſor Chriſt at Leipſic, and the ſecond and third thouſand by profeſſor Heine at Goettingen. Nor did M. Lippart ſtop here: but to make the ſtudy of antiquity more eaſy and acceptable to artiſts, he ſelected out of the whole collection of three thouſand, a ſmaller one of two thouſand of the beſt and moſt inſtructive ſubjects, of which he himſelf drew up and publiſhed a deſcription in Germany.

But of all the ingenious men who have taken impreſſions of engraved gems in ſulphur and in paſte, no one has carried that art to ſuch perfection as Mr. James Taſſie of Leiceſter-ſquare, London. His knowledge in various branches of the fine arts, particularly in that of drawing, naturally led him to it. The elegant portraits which he models in wax, and afterwards moulds and caſts in paſte, which entirely reſemble cameos, are highly eſteemed by the public. Mr. Taſſie, profiting of all the former publications of this ſort, and by expence, induſtry, and acceſs to many cabinets in England and other kingdoms to which former artiſts had not obtained admiſſion, has now increaſed his collection of impreſſions of ancient and modern gems to the number of upwards of ſixteen thouſand articles. It is the greateſt collection of this kind that ever exiſted; and ſerves for all the purpoſes of artiſts, antiquaries, ſtudents, men of taſte, and even philoſophers. The great demand for his paſtes was perhaps at firſt owing to the London jewellers, who introduced them into faſhion by ſetting them in rings, ſeals, bracelets, necklaces, and other trinkets. The reputation of this collection having reached the late empreſs of Ruſſia, ſhe was pleaſed to order a complete ſet; which being executed in the beſt ſtyle, were arranged in elegant cabinets, and placed in the noble apartments of the ſuperb palace at Czarſko Zelo.

Mr. Taſſie, in executing this commiſſion, availed himſelf of all the advantages which the improved ſtate of chemiſtry, the various ornamental arts, and the knowledge of the age, ſeemed to afford. The impreſſions were taken in a beautiful white enamel compoſition, which is not ſubject to ſhrink or form air-bladders; which emits fire when ſtruck with ſteel, and takes a fine poliſh; and which ſhows every ſtroke and touch of the artiſt in higher perfection than any other ſubſtance. When the colours, mixed colours, and nature of the reſpective originals, could be aſcertained, they were imitated as completely as art can imitate them; inſomuch that many of the paſte intaglios and cameos in this collection are ſuch faithful imitations, that artiſts themſelves have owned they could hardly be diſtinguiſhed from the originals. And when the colour and nature of the gems could not be authenticated, the paſtes were executed chiefly in tranſparent colours; conſtant attention being beſtowed to preſerve the outlines, attributes, and inſcriptions. And it is to this valuable collection of Mr. Taſſie's antique gems, that the editors of the Encyclopædia Londinenſis are indebted for moſt of the ſcarce and valuable ancient portraits given in this elaborate work.

In the hope of inviting into more general notice this intereſting, but neglected, branch of the fine arts, we are further induced to give ſome engravings of curious antique and other Gems, ſelected and copied from the choiceſt caſts in the valuable collection of Mr. Taſſie, above-mentioned. The ſubjects in Plate I. are as follow:

low: Fig. 1. An Egyptian antique, in green jaſper; the device an eye, with a ſquare faſtened to the under eye-lid, and a ſmall triangle: the whole incloſed in a ring of a ſerpent, the emblem of eternity. 2. An hieroglyphic inſcription, in burnt cornelian, very deeply cut with the engraver, in the ſame manner as on the obeliſks and other monuments of Egyptian antiquity, which ſee under the article EGYPT, vol. vi. p. 348, &c. 3. An Egyptian prieſt, in cornelian, ſitting upon a throne of a mitred ſphynx, giving his benediction with his right hand, and holding in his left a ſceptre in the form of a javelin. Before him ſtands a nilometer, and over his head a winged globe. Mr. Raſpe, the ingenious editor of Mr. Taſſie's "Deſcriptive Book of Gems," 2 vols. 4to. obſerves on this gem, "that figures of bearded men are not to be found among any of the Egyptian works of remote antiquity; for that the Egyptians always ſhaved." He therefore hazards a conjecture, "whether this figure might not be the image of *Phtha*, the only God of the primitive Egyptians; and whoſe wiſdom and benevolence were repreſented by the ſphynx and the ſerpent Cnuphis; and which the Gnoſtics afterwards repreſented by the ſymbol of the abraxas, or elſe by the figure of a bearded old man crowned, whom they called *God the Father, creator of the univerſe*. Theſe bearded figures are frequently found upon the monuments of Perſepolis, and upon the Perſepolitan cylinders, with ſymbols and hieroglyphics undoubtedly Egyptian; ſo that the monuments repreſenting the cuſtoms of Egypt and ancient Perſia, might probably belong to Egypt, while under the dominion of the Perſians, or even to the Perſians after the conqueſts of Cambyſes."

Fig. 4. A prieſt of Iſis, in green jaſper, fighting with a griffin; a very curious Egyptian antique. 5. A winged ſphynx, in cornelian, ſcratching its ear with the left foot. 6. A lion, conſecrated to Cybele, with a gooſe ſtanding on his back, in jaſper; one of the moſt antique gems at preſent known, and a true emblem of the rude or primitive ſtate of engraving on precious ſtones. 7. A Perſian lady, in yellow cornelian, ſitting in the manner of the people of the eaſt upon a ſopha, having a child upon her knee playing with a crown. 8. An Indian king and queen, with their guards or attendants, of rude antique workmanſhip, cut in lapis lazuli. They are ſeated on a kind of throne, dreſſed in the ſtyle and manner of the ancient Indian bas-reliefs found near Bombay, in the grottos of Salſette, and the iſland of Elephanta, as well as in ſeveral other parts of India, either in grottos, choultries, or ancient pagodas, built and decorated with a profuſion of ſimilar characters, which the reader will ſee by turning to the two engravings of ancient Indian columns, p. 66-67, in our ſecond volume, under the article ARCHITECTURE. 9. A Perſian cylinder of loadſtone, with an inſcription; and in the other compartment a magician with a beard, a tiara, and long plaited robe, having his two hands raiſed on high, holding a ſceptre terminating in a lotus; oppoſite to him ſtands a ſoldier, as if in deep conſultation. There are likewiſe two ſmall figures in tunics, turned towards the ſoldier, and occupying the interval which ſeparates them. Between the two lines of the inſcription are four curious heads. The characters are Perſepolitan; and are found in numerous long inſcriptions among the ruins of Chelminar in Perſia, which antiquarians conſider as the ſcite of the once magnificent Perſepolis, or Suſa, the ſumptuous reſidence of the Perſian kings. There has been ſome controverſy between philologiſts concerning the alphabet to which theſe characters ought to be aſſigned; and from a ſuppoſition that it contains only five different figures, an analogy has been imagined to ſubſiſt between theſe and certain Iriſh characters called *ogham*, which only conſiſt of unity repeated to the fifth time, and whoſe value changes according to the manner in which it is placed relatively to an imaginary line.—See Vallancey's Iriſh Grammar, 4to. On a cloſe examination, however, it will be found that they perfectly reſemble the Chineſe character, which is not a character of articulate ſounds, but of ideas; and that ſome of theſe very characters are to be found in the Chineſe dictionary, ranged by roots or elementary figures, called *pou*. And with reſpect to theſe cylinders or amulets, whether they were made in Perſia as commonly ſuppoſed, or in Egypt for the Perſians after they had conquered that country, they will nevertheleſs tend to prove, 1ſt. the very great antiquity of the Chineſe character: 2d. that it has been formerly known and cultivated on this ſide of the Ganges: 3d. that the Perſians, or their magi, uſed it before they adopted the Phœnician, Chaldean, Syrian, Armenian, or Arabian, characters: and, 4thly, that even the Egyptians when conquered by the Perſians, were converſant with theſe amulets, and had ſome idea of the characters. The partizans, therefore, of that ſingular analogy which pretends to explain Egyptian hieroglyphics by the old Chineſe characters, may derive ſome advantage from this diſcovery. They will no longer be under the neceſſity of ſending Egyptian colonies to Perſepolis, to the Indies, or to China, in this viſionary enquiry, which appears upon the whole little leſs than chimerical.

Fig. 10. A Parthian king on horſeback, very elegantly cut in an amethyſt, with an inſcription; brought from Baſſora. 11. A curious Perſian cylinder of black jaſper, with allegorical figures in front. 12. A continuation of the figures drawn out from the ſame cylinder, which was ſuppoſed to be a protecting charm againſt danger and diſeaſe. 13. An Egyptian cylinder of chalcedony or white agate, with a good engraving of the ſymbolical god *Apis*, which is the true Egyptian character, and plainly demonſtrates that theſe amulets were manufactured as well in Egypt as in Perſia.—All the gems repreſented in this engraving are of the higheſt antiquity.

Plate II. contains the following very curious antiques, chiefly in ſeals, rings, bracelets, &c. Fig. 14. An onyx, with the buſt of *Horus* or Harpocrates prieſt of the Egyptian *Oſiris*, as a child, making the ſignal for ſilence. He has a flower of the lotus on his forehead, and upon his breaſt a globe, from whence two ſerpents iſſue. The head is ſhaved, except a ſmall treſs of hair behind the right ear, agreeable to *Macrobius*, i. 21. who ſays, "The Egyptians repreſented the Sun with the head ſhaved, except on the right ſide, where the hair was left." He is alſo ſeen with a ſimilar treſs of hair on the knee of the figures of *Iſis*, brought from the mummy-pits; which circumſtance correſponds with the obſervations of the learned Bryant, who has demonſtrated *Horus* or *Orus* to be an Egyptian title of the ſun, from *our*, or *ur*, light and fire; whence Ὧρος or Ἱερεὺς, as a prieſt or deity. This gem, conſidering its great antiquity, and as being of Egyptian workmanſhip, has great merit in the attitude and force of expreſſion. 15. A winged lion couchant, cut in a yellow cornelian, with an inſcription. It is a ſeal of the ancient Perſians. 16. A cupid, in cornelian, with the right hand ſecured in a bandage, and a wreath of flowers round his neck; a ſignet of the Greeks. 17. A cornelian, with the uncovered head of a ſatyr or faun, the excellent production of ſome unknown Greek artiſt. 18. A ſulphur, with the head of Io in front, characteriſed by the tips of her horns juſt emerging out of her beautiful hair, which expreſſes the moment of her tranſformation into an heifer. According to Ovid, ſhe became a goddeſs by the name of Iſis; and accordingly we here find the necklace of Iſis as a further deſignation of her character. 19. A cornelian, with a Perſian device, repreſenting a ſoldier in the act of killing a winged lion: very ancient. 20. A Perſian ſignet, cut in cornelian, with an inſcription extremely well executed. Of this gem general Campbell gives the following account: "It was the ſeal of queen Fatima, of the race of Mahomed el Mudany. She was daughter of the ſultan Khan Mahomed Goſſein Kelany, of the race of the kings

J. Chapman sc.

Historical and Allegorical Subjects.

London, Published as the Act directs, Nov.r 2.d 1806, by J. Wilkes.

of Ghilan in Perſia; who, flying from his country, ſettled in the city of Tunda, now called *Ghour*, and which, in its proſperity, was the capital of the extenſive kingdom of Patan. The verſes engraved upon the ſeal ſignify: Thou gaveſt me for my help ſix gifts; knowledge, experience, liberality, faith, clemency, and health; but thou alone, O God, art juſt! the only one upon whoſe title there is no ſpot." The date, which clears up all doubts as to the identity and the epoch of this Fatima, is not expreſſed in numeral figures, but by the numeral letters of the inſcription itſelf, taken together and calculated by addition; whence it appears that this Perſian queen muſt have lived about ſix hundred years after the birth of Muhamed el Mudany; and conſequently this ſeal muſt have been engraved between ſeven and eight hundred years.

Fig. 21. Two winged lions rampant, on a ſulphur; betwixt them an erected palm-branch or hieroglyphical figure, with an inſcription at the top: it is a Perſian ſignet. 22. Mercury, or *Hermes Pſychagogos*, the conductor of ſouls, cut in a ſtriped onyx, carrying in his left arm the figure of an old man naked. He is characteriſed by the petaſus on his right ſhoulder, and the caduceus in his right hand. In mythology, Mercury is conſidered as the pacificator amongſt men, as well as the meſſenger of the gods. His petaſus or winged cap is the emblem of his ſervitude to the ſuperior deities; and his caduceus is the emblem of peace, and was the inſtrument he uſed in performing his office of conducting the ſouls of men to *hades*, the regions of the dead. 23. Achilles putting on his buſkins, in cornelian; at a diſtance Minerva is ſeen in the act of caſting the javelin. This and the preceding are very curious gems in the old Grecian ſtyle. The latter is very ſingular, and perhaps unique, with regard to the Roman inſcription PERIC, which ſeems to allude to the great danger of the Greeks, which Achilles went to diſpel. 24. A typhon or giant, cut in white agate or chalcedony, with his left arm wrapped in a ſkin, and throwing a huge ſtone with his right. Thus the giants were of old depicted, having the lower extremities formed like the bodies and tails of ſerpents, in the place of legs and feet. 25. A cornelian, with Cybele mounted on a lion, wearing a mural crown, her ſceptre in the left hand, and a bunch of corn in her right, emblematical of the fecundity of the earth. 26. A cornelian, with a nereid, perhaps Amymone, carried off by a triton: it is a beautiful gem. 27. A yellow jaſper, with two winged lions, bearing the heads of kings, bearded, and crowned: it is a very ancient Perſepolitan gem. 28. A ſulphur, with an Indian bull, characteriſed by the bunch upon the back, and a creſcent or half moon on the rump: it is a very ancient and uncommon gem, of Indian workmanſhip. 29. An emerald, with a lion, over which is an inſcription in Shanſcrit characters; this is alſo an Indian gem, brought from Benares in Bengal. 30. A hyacinth, with the buſt of a Parthian or Perſian king, having a tiara on his head ornamented with pearls, and pendants in his ears. The inſcription is in a character at preſent undefined, though it bears a great reſemblance to the Chaldaic Hebrew. Whether theſe gems repreſent the Parthian Arſæcidæ, whoſe ſucceſſion is well known, or the Perſian Saſſanides, who ſubdued the Parthians that were ſo formidable to the Romans in the 225th year of the Chriſtian era, and who reigned over Perſia till 651, has not been ſatisfactorily aſcertained; though it appears that they had preſerved a part of the cuſtoms and religious practices of the ancient Perſians, who were anceſtors both of the Parthians and Saſſanides. Theſe gems found their way to England from Baſſora. 31. An Arabian device in the ſhape of a heart, cut in green jaſper, very ſplendidly engraved, with an Arabic inſcription in the centre, and written round in a form reſembling embroidered muſlin. 32. An Egyptian buſt of Iſis, in green jaſper, with a head-dreſs of feathers placed on her veil, which hangs down upon her ſhoulders, and ſeems to be decorated with embroidery and fillets of pearls, as well as round her neck. The head-dreſs is nothing more than the veil folded back upon the forehead, and lined with feathers; ſo that it bears ſtrict analogy with the wings that are conſtantly found with a globe and two ſerpents among the hieroglyphics ſculptured upon the Egyptian monuments and temples; hence the gem is perfectly characteriſtic. The gems in this engraving are claſſed from the choiceſt ſpecimens in Mr. Taſſie's vaſt collection.

Plate III. conſiſts principally of cameos. Fig. 33. A group of the nymphs of Nyſa teaching the young Bacchus to ride upon a lion: a gem very finely executed. 34. Jupiter hurling his thunderbolts at the giants; deſcriptive of the Titanic war. This fine ſubject was preſerved in the Farneſe Muſeum at Naples, with the name of the artiſt ΑΘΗΝΙΟΝ, and has deſervedly a place among the choiceſt of the cameos. In the heathen mythology, the giants and Titans are fabled to have ſprung from the earth, and are repreſented with two ſerpents inſtead of thighs and legs, in alluſion to their origin being ſimilar to that of reptiles, which creep out of, and return into, the bowels of the earth. Authors, however, are not agreed as to the preciſe form or number of the Titans. The forms are ſculptured on many ancient monuments, but with ſome variation. In this cameo the ſerpents commence cloſe up to the trunk; but in a ſarcophagus of the ſculptor Penna, preſerved in the pope's muſeum at Rome, they commence only at the knees. Ten Titans appear there in combat, but the gods are not repreſented. In the muſeum of the Roman college is alſo preſerved a relievo, in ſilver, of Pallas ſtriking Enceladus, one of the Titans, with lightning; a ſubject which is alſo found among the moſt valuable gems and medals. In reference to the Titanic war, or war of the giants, Milton alludes in that ſublime paſſage,

Hell heard th' unſufferable noiſe—
——————confounded chaos roar'd,
And felt tenfold confuſion! *Paradiſe Loſt.*

Fig. 35. Roman nuptials. This gem is a ſardonyx; and the figures repreſent a female friend, or perhaps Juno Pronuba, delivering the betrothed to her ſpouſe, who receives her in the attitude of ceremony, holding her right hand in his. The ceremony may be that called *coemptio*, which was much more common than the *diffareatio*. Tacitus ſays the latter, which was the more ſolemn form, was generally laid aſide, becauſe it included many troubleſome and expenſive ceremonies. The contract of the coemptio was made by the parties mutually giving and receiving a piece of money. The bride was crowned with flowers, marjoram, or vervain; and her head and upper part of the face was covered with the *flammeum* or wedding veil. This we find diſtinctly repreſented in all remains of ancient ſculpture which exhibit the marriage rite. In the beautiful gem in the collection of his grace the duke of Marlborough, repreſenting the marriage of Cupid and Pſyche, the flammeum covers the face of the little god as well as that of the bride. In this gem the figures are moſt claſſically expreſſed, and the draperies are inimitable.

Fig. 36. This cameo repreſents Danae in gentle repoſe, and not at all elated by the golden ſhower which pours into her boſom. The god of love appears ſolicitous to drop the curtain or veil, to obſtruct or provoke the deſires of Jupiter. The figure of Danae is extremely well ſtudied, after a bas-relief of Leda, by Michael Angelo.

Fig. 37. Ganymede giving the cup to the eagle; executed probably after a deſign of Michael Angelo. This cameo is beautifully engraved, and is in the collection of his grace the duke of Marlborough. 38. Minerva deſtroying a giant; in antique paſte. 39. A cornelian, with an heroic figure of Jupiter. In his right hand he holds the thunderbolt, and the ægis or goat's ſkin in his left;

left; upon which the obſervations of the abbé Winckelman are both learned and juſt. It is, according to Herodotus, a kind of Lybian dreſs, different from the buckler; for here the buckler, ſeen from within, is at the feet of Jupiter. The eagle is on his right hand. In the field is inſcribed the name of the excellent but unknown artiſt.

Fig. 40. An amethyſt, repreſenting Scylla in the act of killing a youth by the blows of a paddle, whom ſhe holds by twiſting her ſerpents round his body, while he is furiouſly attacked by her dogs. She is figured in this gem conformably to the fine deſcriptions given of her by Virgil, Ecl. iv. v. 74. Æn. iii. v. 424; and by Ovid, Met. xiv. v. 59; which pourtray the lower parts as terminating in a fiſh, bull-dogs, and ſerpents; and much like the ſublime fancy of Milton in his portraiture of *Sin*. 41. An emblem of Victory, preparing to ſacrifice a bull to the god of war. This is an antique paſte, in the choice collection of Charles Townley, Eſq. whoſe invaluable gems have furniſhed numerous caſts to Mr. Taſſie's catalogue.

Plate IV. exemplifies ſeveral beautiful ſubjects in the fabulous hiſtory and gymnaſtic or ſecular games of the ancients. Fig. 42. One of the Genii, or benevolent ſpirits, which, in demonology, was ſuppoſed to preſide over the affairs of men. See the articles DÆMON, and DEMONOLOGY, in our fifth volume. 43. Mount Olympus, the ſeat or court of Jupiter and the gods. This beautiful cameo is in the collection of his grace the duke of Marlborough; which collection, for the honour of this country, is allowed to be the fineſt and moſt valuable in Europe. 44. A ſulphur, with Apollo's victory over Marſyas. This gem is not more valued on account of the inimitable grace and ſpirit diſplayed by the artiſt, than for the preciſion and truth with which it illuſtrates the fable. The ſubject is, Marſyas bound to a tree in order to be flayed alive; a puniſhment inflicted on this preſumptuous muſician for his temerity in attempting to contend in muſical ſkill with Apollo. The god is repreſented in a fine attitude, holding his lyre, and looking contemptuouſly on his fallen rival, whoſe hands are bound behind him to a tree. The young Scythian, employed to flay him, kneels at the feet of the god, as if ſupplicating for mercy; it has been conjectured that he is meant for Olympus, the diſciple of Marſyas. The double pipe of Marſyas is ſuſpended on a leafleſs tree. An air of triumphant dignity marks the character of Apollo, which is finely contraſted with the tortured and convulſive ſenſations of Marſyas, the anatomical markings of which are bold and decided. The conception of the attitude is perfect, for the figure powerfully characteriſes defeat and ſubjection, and the blighted tree to which he is bound is, perhaps, no bad emblem of his faded honours. This was the ſubject which the cruel Nero adopted for his ſeal. He had the folly to conceive himſelf to be the firſt muſician of his age; and when he ſelected for the ſubject of his ſeal, Apollo the vanquiſher of Marſyas, he intimated to his rivals that they ſhould not expect a more fortunate end, if they attempted to contend with him. Another prince, of a very different character, and who only felt his happineſs to conſiſt in diffuſing it around him, the magnificent Lorenzo de Medicis, alſo choſe the ſame ſeal, but from a more laudable motive: he ſelected it for the finiſhed beauty of the workmanſhip: it bears his initials, and on all his choiceſt gems he had them engraven. This antique is, in fact, one of the moſt precious remains of ancient art, and the applauſe which it has obtained in all times is ſufficiently proved by innumerable copies. The fable of Marſyas is perhaps beſt told by Diodorus Siculus. The hiſtorian records, "that they contended who could produce the greateſt pleaſure and effect, each on his own inſtrument. The inhabitants of Nyſa were their judges. The god opened the conteſt by playing an air on his lyre. Marſyas then breathed on the double flute, his own invention; and the judges, enchanted by the ſoftneſs and novelty of the ſounds which he ſkilfully drew forth, awarded him the prize. Apollo, having obtained a further hearing, mingled the celeſtial powers of his voice with the varied ſounds of his lyre; and thus carried the votes: but Marſyas repreſented, that the queſtion to be decided was not the charm of the voice, but that of the inſtrument; and that it was unjuſt to contend with a ſingle art, by blending two which were diſtinct. The god replied, that he had employed no other means than thoſe which Marſyas himſelf had uſed; the *finger*, and the *mouth*. The argument of the god was held to be good; and on the third trial, Apollo was finally declared triumphant. Indignant at the temerity of the unfortunate Marſyas, his inhuman rival flayed him alive." Such is the tale of Diodorus. The allegorical explanation of this fable by Fortunio Liceti, in his Hieroglyphics, is very ingenious. He conceives this fable was invented to expreſs the ſuperiority of the lyre over the flute; or rather vocal over inſtrumental muſic.

Fig. 45. An agate, with Juno riding upon an eagle, having a ſceptre in her hand, and a flowing veil above, which forms a circle round her head, incloſing ſeven of the brighteſt ſtars. This gem has been copied upon ſeveral of the imperial medals, and particularly on thoſe of Fauſtina, to deſignate the conſecration of a Roman empreſs. 46. An antique paſte, with one of the ſecular games. The ſubject is that of a deſultor or vaulter, changing his attitudes on twelve horſes in full ſpeed, holding a crown in his right hand, with Victory by his ſide, who puts another crown on his head. Theſe aſtoniſhing performances of the ancient *deſultores*, appear to have influenced the equally ſurpriſing feats of horſemanſhip now exhibited in the circus of London, and in that of Weſtminſter. Frederic the Great, king of Pruſſia, was the owner of this gem, on which he put a high value.—See the article DESULTOR, vol. v. p. 766. Fig. 47. An amethyſt, with a ſuperb figure of Amphitrite, traverſing the ocean on a pair of ſea-horſes, conducted by a cupid, and her feet ſupported by a dolphin: a gem of great value.

Fig. 48. A magnificent engraving, in rock-cryſtal, repreſenting the chariot-races in the circus of ancient Rome. Here are eight cars, with four horſes to each, running the courſe round the *ſpina*, which is ornamented with an obeliſk in the centre, ſix boundaries, two altars, a chapel, and two *preſbeutæ* or diſtributors of prizes, which ſeem to be a branch of palm, and a vaſe. The emblem of Victory is pourtrayed on a high column at the ſide of the ſpina. The *agonothetes* or crier, who regulates the ſignal for ſtarting, is placed in the foreground of this gem; which is allowed to give a better idea of the interior of the Roman circus, than any monument of antiquity at preſent known. On each ſide of the courſe are the repoſitories for the chariots; and at the upper end are the ſeats and boxes for the ſpectators, ſupported by colonnades, which form the entrance into the circus.

Fig. 49. A cornelian, on which is engraved a quoit-player throwing his quoit; one of the ſecular games. 50. A cornelian, with a boxer in the attitude of engaging his adverſary, having on a pair of thoſe horrid gauntlets or gloves, which were called *ceſtus*, and which were loaded or armed with lead, in order to give a more terrible blow. Virgil, in his beautiful deſcription of the feſtivals at the funeral of Anchiſes, has given an affecting repreſentation of their manner and effect. 51. A ſulphur, on which is engraved the genius or emblem of Victory, ſtopping a chariot with two horſes in full ſpeed, ſuppoſed to be one of the greateſt acquiſitions of a charioteer. 52. A cornelian, with another figure of Victory, drawn in a car by two large ſerpents; emblematic of the games of the circus.

The reader will notice, that the lines drawn under each

J. Chapman sculp.t

Mythology and Secular Games.

London Published as the Act directs, Febry 7th 1807, by J. Wilkes

each figure in the four correſponding engravings, denote the ſize or dimenſions of the gem from which each of the drawings was taken.

The great object of the ſecular games, both in Greece and Rome, was to promote military exerciſes, and to acquire that agility, addreſs, and valour, which decided the fate of battles, created emulation in the ranks, and rouſed men to hazard every danger. They were the ſchool and exhibition of the only virtue which was then regarded, *military* virtue; and hence reſembled the tournaments in the age of chivalry. We are ſtruck with the force of an obſervation made by the ingenious Mr. Raſpe on this ſubject: "In whatever point of view we conſider theſe games, ſays he, they are too much neglected at preſent. We have the parade, military exerciſes, and martinets ſufficient for all the great military evolutions; but have we any to form the mind, the heart, or the body, of the ſoldier? We are tormented with a number of diſeaſes, ſince we have loſt the prudence and the habit of preventing or curing them by ſuitable exerciſes. We become dull, heavy, awkward, and embarraſſed, becauſe we have not learnt, or have ceaſed to employ, the ſtrength of our limbs. There are ſoldiers who can ſcarcely walk, and horſemen who know not how to mount their horſes, and even ſailors who are afraid of their element. The education, the diſcipline, and manner of living, of the ancients, had great advantages over ours. I do not view theſe games with the prejudices of the antiquary, nor with a predilection for maſters of dancing, fencing, riding, wreſtling, or boxing; their merits have been diſcuſſed by phyſicians and by military men. Baron Grothauſs pronounced in 1778, at the univerſity of Gottingen, a curious diſcourſe on the ſubject, and has ſince proved by his own and his ſervants example, that nothing is wanting but reſolution to attain, by proper exerciſes, the activity, agility, and ſtrength, of the ancient ſoldier."

In the opinion of others, however, the ancients carried their gymnaſtic exerciſes to a dangerous extreme; which conſiderably injured their health, and rendered them incapable of more uſeful employments. The acute and eccentric De Pauw, in his obſervations on the Greeks, declares "that the gymnaſtic was a moſt pernicious art, and only enervated the human race. Thoſe who conſtantly exerciſed themſelves in boxing or wreſtling, became leaner every day from their thighs to their feet, while their ſuperior parts acquired a prodigious bulk. Thoſe who inceſſantly practiſed leaping or foot-racing became meagre from their head to their haunches, while their inferior parts were of an enormous ſize. The *Diſcoboli* were thoſe athletics who flung large and heavy quoits, made of wood or ſtone, but much thicker in the middle than at the extremity; theſe they were to launch to the extremity of the career, which muſt have required a moſt violent exertion. Theſe men had monſtrous fleſhy arms, with necks that loſt all their flexibility, which they could neither turn to the right or left, becauſe the head violently preſſed the vertebra, to increaſe the power of flinging the quoit. The nervous ſyſtem of man cannot, without injury, undergo theſe violent exerciſes, which the new theories of new philoſophers have lately attempted to revive. When nature feels herſelf oppreſſed in any part of the human body, ſhe inſtantly avenges her own cauſe; thus theſe violent wreſtlers found, while their hands became ſtronger, their feet became more feeble; while the foot-racer found his feet fortified at the expence of his weakened arms." A moderated uſe of theſe games, it has been contended, would certainly not have proved ſo pernicious; but it is anſwered by M. de Pauw, that this moderation could never have been practiſed, becauſe the whole was founded on emulation; each was reſolved to out-do his antagoniſt or rival, and for one athlete who won a wreath, a hundred periſhed in their feeble eſſay, and bit the duſt on which a rival triumphed.—See the article GAME, p. 199, of this volume.

The colours of antique gems, as choſen by artiſts for particular purpoſes, appear not to have been altogether fortuitous, but in many inſtances ſtudied, and judiciouſly adapted to the ſubjects and paſſages which were to be illuſtrated or expreſſed. Thus we find Neptunes and Leanders engraved on beryl, which, from its beautiful ſea-green colour, ſeems by nature adapted to ſuch ſubjects. Hence alſo Bacchus's and Silenus's, the lovers of wine, are depicted on the purple amethyſt; Apollo, or the Sun, on the golden topaz; Proſerpines and Plutos, on jet and lava: an obſervation worthy of notice, inaſmuch as it tends to prove the ſtrict attention of the ancients to minuteneſs of character, and uniformity of claſſification, in their numerous works.

To GEM, *v. a.* [*gemma*, Lat.] To adorn, as with jewels or buds.

To GEM, *v. n.* [*gemmo*, Lat.] To put forth the firſt buds:

Laſt roſe, in dance, the ſtately trees, and ſpread
Their branches, hung with copious fruit; or *gemm'd*
Their bloſſoms. *Milton.*

GEMAAGIDID', or DELGUMUTU, a town of Africa, in the empire of Morocco: forty-five miles ſouth-weſt of Morocco.

GEMAP'PE, or JEMAPPE, a town of Hainault, ſituated at the junction of the rivers Haiſne and Trouille; remarkable on account of an obſtinate battle fought there on the 5th of November, 1792, between the Auſtrians and the French republican army commanded by general Dumourier, for particulars of which ſee the article FRANCE, vol. vii. p. 783.

GEMA'RA, or GHEMARA, the ſecond part of the ſcriptures of the Jews.—See the article TALMUD.

GEMA'TRIA, *ſ.* in Jewiſh antiquity, a kind of arithmetical cabbala.

GEM'BIEZ, or GEMBOCK, a town of Poland, in the palatinate of Kaliſh: ſixteen miles eaſt-north-eaſt of Gneſne.

GEMBLOU'RS, or GIBLOU, a town of Brabant, ſituated on the river Orneau, which runs into the Sambre; it is more conſiderable on account of its ancient abbey than on any other account; which had anciently the privilege of coining money; and was formerly in poſſeſſion of a celebrated library, containing a number of valuable and ancient manuſcripts, among which was the *Chronicum Gemblacenſe*, well known among the learned, begun by Sigebert, a monk, who died in the year 1112, and continued by Anſelm, the abbot, to his death, in 1137. The town was twice burned down, viz. on the 6th of Auguſt, 1678, and on the 17th of Auguſt, 1712. On the 31ſt of January, 1578, a battle was fought near Gemblours between the Spaniards, under Don John of Auſtria, and the army of the States General: moſt of the chief officers of the latter were abſent at Bruſſels, only the ſieur de Coigny, and colonel Barflour, a Scotchman, remaining with the troops; they wiſhed to have retreated, but were compelled to an engagement, in which they loſt their cannon, thirty pair of colours and four ſtandards, and de Coigny himſelf was taken priſoner. Ten miles north-weſt of Namur, and eleven north-eaſt of Charleroy.

GEMEAU'X, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Is-ſur-Tille: two miles ſouth-eaſt of Is-ſur-Tille.

GEMEL'LI CARRE'RI (Francis), a writer of travels, and an advocate at Naples. He made a tour through Europe in 1683, of which he publiſhed a relation in one volume. In 1693 he undertook a voyage round the world, which he completed in 1698: and of this he publiſhed an account in 1700, which was ſeveral times re-

edited,

edited, and was tranſlated into French and Engliſh. It is an entertaining performance, but of dubious authority, abounding with fabulous narrations. He is, however, frequently quoted, and his book is conſidered as valuable for the objects of curioſity it points out, and the direction it gives for ſafe and uſeful travelling.

GEMELLIP'AROUS, *adj.* [*gemelli* and *pario*, Lat.] Bearing twins.

GE'MENT, *adj.* [*gemo*, Lat. to lament.] Lamenting, groaning. *Not much uſed. Cole.*

GEMERI'AH, *ſ.* [Heb. completion.] A man's name.

GEM'ERIE, *ſ.* [from *gem.*] A cabinet, a place in which jewels are kept. *Not uſed. Cole.*

GEMESI'E, a ſtrong fort on the river St. John, in North America, which was taken by the Engliſh in 1674.

To GEM'INATE, *v. a.* [*gemino*, Lat.] To double.

GEMINA'TION, *ſ.* [from *geminate.*] Repetition; reduplication.—Be not afraid of them that kill the body; fear him, which, after he hath killed, hath power to caſt into hell: yea, I ſay unto you, with a *gemination*, which the preſent controverſy ſhews not to have been cauſeleſs, fear him. *Boyle.*

GEMIN'GEN, a town of Germany, in the palatinate of the Rhine: ſix miles north-weſt of Heilbronn.

GEM'INI, in aſtronomy, a conſtellation of the northern hemiſphere, one of the forty-eight old conſtellations, and the third in order of the zodiacal ſigns, Aries, Taurus, Gemini, &c. This conſtellation is denoted by two children, or twins, and is diſtinguiſhed by this mark, ♊, in almanacs and books of aſtronomy. This conſtellation was anciently depicted by a couple of young kids, by the Egyptians and eaſtern nations, as denoting that part of the ſpring when theſe animals bring forth; but the Greeks altered them to two children, which ſome of them make to be Caſtor and Polltix, ſome Hercules and Apollo, and others Triptolemus and Jaſon; but the Arabians afterwards changed the figures into two peacocks, their religion not allowing them to paint or draw any human figure. Sir Iſaac Newton thinks the figures had ſome reference to the Argonautic expedition. The ancients attributed to every ſign of the zodiac one of the principal deities for its tutelary power. Phœbus had the care of Gemini, and hence the argument of aſtrologers about the agreement of the ſun and this conſtellation. The ſtars in the ſign Gemini are, in Ptolomy's catalogue 25, in Tycho's 25, in Hevelius's 38, and in the Britannic catalogue 85.

GEMINIA'NI (Francis), an eminent muſician, born at Lucca about 1680. He ſtudied the theory of muſic under Aleſſandro Scarlatti, and the practice of the violin under Lunati, furnamed Il Gobbo, and finally under Corelli. The reputation he obtained cauſed him for a time to be placed at the head of the orcheſtra at Naples. In 1714 he came to England, where he excited great admiration by his performances, and was patroniſed by many of the nobility. His particular patron was baron Kilmanſegge, favourite of George I. to whom he dedicated his firſt work in 1716, conſiſting of twelve ſolos for the violin. Theſe were allowed to be more maſterly and elaborate than thoſe of Corelli, and gave a high idea of his muſical talents. He afterwards formed twelve ſolos of Corelli, and ſix of his ſonatas, into concertos. In 1732 he publiſhed his ſix firſt concertos, entitled *Opera Seconda*; and ſoon after, *Opera Terza*, a ſecond ſet of concertos; which works placed him at the head of all living maſters in that kind of compoſition. His ſecond ſet of ſolos, commonly called his *French Solos*, appeared in 1739; "but, (ſays Dr. Burney,) they were more admired than played;" his third ſet, in 1741, "was ſo laboured, difficult, and fantaſtical, as never to be played, in either public place, or private concert." In 1742 he printed a long-promiſed work, entitled *Guida Armonica, o Dizionario Armonico*, or a ſure Guide to Harmony and Modulation, &c. of which the muſical critic above-mentioned ſays, that "it was a kind of mill, in which good muſic was to be ground with little trouble and no genius." He ſpeaks alſo with little reſpect of Geminiani's next work, a Treatiſe on Good Taſte, and Rules for playing in Good Taſte; but he mentions as a very uſeful performance, his Art of Playing on the Violin, 1748. About 1756 he publiſhed a very ſingular compoſition, called The Enchanted Foreſt, in which he endeavoured to repreſent by mere ſound all the events of the fine epiſode in the thirteenth canto of Taſſo's Jeruſalem. His other works were two books of Harpſichord Pieces, and two books on the Art of Accompaniment, both mentioned as too difficult for practice. In 1761 he paid a viſit to his friend and pupil Dubourg, in Dublin, where he was maſter of the royal band. The loſs of an elaborate treatiſe on muſic in that city, ſaid to have been ſtolen from his chamber, is ſuppoſed to have haſtened his death, which took place in September, 1762. Dr. Burney ſums up his character by ſaying, that "he was a great maſter of harmony, and very uſeful to our country in his day; but though he had more variety of modulation, and more ſkill in diverſifying his parts, than Corelli, yet his melody was inferior, and there is a confuſion in the effect of the whole, which gives to each of his compoſitions the effect of a rhapſody, or extemporaneous flight, rather than a poliſhed and regular production." He allows, however, that his ſixth concerto of the ſecond ſet is the moſt perfect and pleaſing compoſition of the kind within his knowledge.

GEM'INOUS, *adj.* [*geminus*, Lat.] Double.—Chriſtians have baptized theſe *geminous* births, and double connaſcencies, with ſeveral names, as conceiving in them a diſtinction of ſouls. *Brown.*

GE'MIST (George), ſurnamed Pletho, an eminent Greek philoſopher, born at Conſtantinople in 1390. He appears to have reſided principally in the Peloponneſus, where he acquired a high character for learning, prudence, and exemplary manners. He was a zealous advocate for Platoniſm, as it was modelled in the Alexandrian ſchools, and maintained a violent controverſy with the Ariſtotelians. He was alſo a ſtrenuous defender of the Greek church againſt the Latins, and obtained ſo high a reputation in his own communion, that the moſt learned men in it were accuſtomed to conſult him on the points in debate between them and their adverſaries. Gemiſt loſt no opportunity of expatiating on the ſuperior excellence of his favourite ſyſtem, and made many converts from among the literary characters of that age; and had the honour of ranking the illuſtrious Coſmo de Medici in the liſt of his diſciples. By his influence with that patron of ſcience and literature, the foundation of a Platonic academy was laid at Florence; and he was the firſt preſident of that inſtitution. He died at the advanced age of one hundred years, but at what place is not known. He was the author of numerous works written in the Greek language, which afford ample evidence of his profound and various erudition, and of his intimate knowledge of the Alexandrian philoſophy. The principal of them are, *De Geſtis Græcorum poſt Pugnam ad Mantineam, duobus Libris digeſta*, firſt printed in the original by Aldus, together with Xenophon and Herodian, 1503, folio, and with a Latin verſion by Mark Ant. Antimachus, 1540; *De Virtutibus Libellus*, firſt publiſhed in Greek and Latin, 1552, 8vo. and afterwards in various forms, and with the comments of different annotators; *De Rebus Peloponneſiaſis conſtituendis Orationes duæ*, printed by Plantin in Greek and Latin, 1575, folio, with an Appendix, containing a deſcription of all the places in the Peloponneſus, their longitudes and latitudes, taken from Ptolemy, and corrected by the author; *De Platonicæ et Ariſtotelicæ Philoſophiæ Differentiæ*, printed at Paris in Greek in 1541, 8vo. and with a Latin verſion at Baſil, in 1574, 4to. and *In Oracula magica Zoroaſtris Commentarii*, firſt printed in Greek and Latin at Paris, in 1538, 8vo. in which

which the author exhibits twelve fundamental articles of the Platonic religion, and gives an elegant compendium of the whole Platonic philoſophy.

GEM'ITUS, *ſ.* [from *gemo*, to groan.] The medical term for groaning: the noiſe made by a perſon in pain.

GEM'MA, *ſ.* in botany, the bud or rudiment of the embryo leaf or bloſſom, called alſo the *gem*. It conſiſts of ſtipules, or petioles, or cortical ſcales; hence buds or gems are called *ſtipular*, *petiolar*, or *cortical*. See BOTANY, vol. iii.

GEM'MA (Reinier), a learned Dutch mathematician, born at Dockum in Frieſland, in 1508. He was educated to the medical ſcience, of which he became a profeſſor in the univerſity of Louvain. But he was more eminent for his proficiency in mathematics and aſtronomy, which he taught with diſtinguiſhed reputation, and the character of being one of the beſt aſtronomers of his time. The fame of his great ſcientific knowledge, and of the excellent inſtruments which he made uſe of in the illuſtration of it, occaſioned his being frequently invited to the court of the emperor Charles V. but he always modeſtly declined the overtures made to him, preferring the tranquillity of his literary retreat to the honours which he might expect from princely favour. He died at Louvain in 1555, at forty-ſeven years of age. He had the ſurname of *Friſius* given him, from the country in which he was born. The moſt celebrated of his works were, 1. *Methodus Arithmeticæ*. 2. *De Uſu Annuli aſtronomici*. 3. *De Locorum deſcribendorum Ratione, deque Diſtantiis eorum inveniendis*. 4. *Libellus de Principiis Aſtronomiæ & Coſmographiæ, &c.* 5. *Demonſtrationes Geometricæ de Uſu Radii aſtronomici, &c.* 6. *De Aſtrolabio Catholico Liber*. Gemma had a ſon, named CORNELIUS, born at Louvain in 1535, and died in 1579. He was a poet, philoſopher, and phyſician, and taught the mathematical ſciences at Louvain with conſiderable reputation. He was the author of, 1. *De Arte Cyclognomicæ, &c.* 2. *De Naturæ divinis Characteriſmis, ſeu Coſmocritico*. 3. *De prodigioſa Specie Naturaque Cometæ*, occaſioned by the extraordinary new ſtar in the conſtellation Caſſiopeia, in 1572.

GEM'MARY, *adj.* Pertaining to gems or jewels.—The principle and *gemmary* affection is its tranſfluency: as for irradiancy, which is found in many gems, it is not diſcoverable in this. *Brown*.

GEMMA'TION, *ſ.* [*gemmatio*, Lat. from *gemma*, a bud.] In botany, the formation of buds; in mineralogy, the formation of gems.

GEM'MEOUS, *adj.* [*gemmeus*, Lat.] Tending to gems.—Sometimes we find them in the *gemmeous* matter itſelf. *Woodward*.—Reſembling gems.

GEM'MI, a mountain of Switzerland, making part of the great chain which ſeparates the canton of Berne from the Valais: twenty miles eaſt of Sion.

GEMMIF'EROUS, *adj.* [*gemma*, a gem, and *fero*, Lat. to bear.] Bearing gems; producing jewels. *Cole*.

GEMMIP'AROUS, *adj.* [from *gemma*, a bud, and *pario*, Lat. to produce.] Producing; bearing buds.

GEMMOS'ITY, *ſ.* The quality of being a jewel.

GEMO'NA, on the road from the Venetian territory to Germany, is an old but opulent borough, where all merchandiſe coming from Germany are detained and ſearched by officers of the cuſtoms: its diſtrict contains two villages, and two thouſand inhabitants.

GEMO'NA, a town of Italy, in the country of Friuli, taken by the French republican army in the beginning of 1797: twelve miles north-north-weſt from Udina.

GEMO'NIÆ SCA'LÆ, or GRADUS GEMONII, *ſ.* Among the Romans, the place or rather the inſtrument by which criminals ſuffered death, ſimilar to the gallows or gibbet in England. Some ſay they were thus denominated from the perſon who raiſed them; others, from the firſt criminals that ſuffered on them; and others, from the verb *gemo*, "I ſigh or groan."—The *gradus gemonii*, according to Publius Victor or Sextus Rufus, was a place raiſed on ſeveral ſteps, from whence they precipitated their criminals; others repreſent it as a place whereon offenders were executed, and afterwards expoſed to public view. The *gemoniæ ſcalæ* were in the tenth region of the city, near the temple of Juno. Camillus firſt appropriated the place to this uſe, in the year of Rome 358.

GEMO'NIS, *ſ.* [Gr. from γεμω, to be full.] The eagle-ſtone; ſo called becauſe it was thought to aſſiſt women in travail.

GEMO'TE, *ſ.* A meeting; the court of the hundred. *Obſolete*.

GEM'OZAC, a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of Saintes: three leagues and a half ſouth of Saintes, and one and three quarters weſt of Pons.

GEM'UND, or GMUND, an imperial town of Germany, in the circle of Swabia. The magiſtracy is choſen out of the body of the people. Its aſſeſſment in the matricula of the empire was 142 florins; and the tax to the chamber of Wetzlar 101 rixdollars 41 kruitzers: twenty-four miles eaſt of Stuttgart. Lat. 48. 46. N. lon. 27. 24. E. Ferro.

GEM'UND, or GEMUNDEN, a town of Germany, in the circle of Franconia, and biſhopric of Wurzburg, on the north ſide of the Maine, where it is joined by the united ſtreams of the Saal and the Sinn: thirty-ſeven miles eaſt of Frankfort, and twenty-five weſt of Schweinfurt.

GEM'UND, a town of Germany, in the duchy of Carinthia: ten miles north-eaſt of Saxenburg, and thirty-two north-weſt of Clagenfurt. Lat. 46. 56. N. lon. 31. 14. E. Ferro.

GEM'UND, or GEMUNDEN, a town of Germany, in the archduchy of Auſtria, ſituated on the Traun See; celebrated for its ſalt-works: twenty-four miles ſouth-ſouth-weſt of Lintz, and 108 weſt-ſouth-weſt of Vienna. Lat. 47. 56. N. lon. 31. 33. E. Ferro.

GE'MUND, a town of Germany, in the archduchy of Auſtria: twelve miles north-north-weſt of Zwetl, and ſixty-eight north-weſt of Vienna. Lat. 48. 32. N. lon. 32. 42. E. Ferro.

GEM'UNDE, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers, on the Ruhr: forty-one miles weſt-north-weſt of Coblentz. Lat. 50. 37. N. lon. 24. 2. E. Ferro.

GEMUN'DEN, a town of Germany, in the circle of the Upper Rhine, and county of Leiningen; famous for its fairs: three miles eaſt of Weſterburg.

GEMUN'DEN, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe-Caſſel: ſixteen miles ſouth-weſt of Fritzlar, and twenty-eight ſouth-weſt of Caſſel.

GEMUR'SA, *ſ.* [from *gemo*, Lat. to groan.] An exceſcence growing between the toes; ſo called from the pain it occaſions in walking.

GEN-TSING, a town of China, in the province of Se-tchuen: eighty-ſeven miles north-weſt of Hoei-li.

GENA'DEL, a mountain of Africa, in the country of Nubia, over which the Nile paſſes, and forms a cataract, forty-five miles north of Jalac.

GE'NAP, or GENEPPE, a town of Brabant, ſituated on the Dyle: five miles eaſt of Nivelle.

GENBERA'BA, a town of Perſia, in the province of Irak: one hundred miles eaſt of Amadan.

GENÇAY', a town of France, in the department of the Vienne, and chief place of a canton, in the diſtrict of Civray: four leagues north-north-eaſt of Civray, and four ſouth of Poitiers.

GEND'ARMES, GENS D'ARMES, or *men at arms*, *ſ.* in the French armies, a denomination given to a ſelect body of horſe, on account of their ſucceeding the ancient gendarmes, who were thus called from their being completely clothed in armour.

GEN'DER, *ſ.* [*genus*, Lat. *gendre*, Fr.] A kind; a ſort:

The other motive,
Why to the public court I might not go,
Is the great love the general *gender* bare me. *Shakeſ.*

A ſex.—Things are frequently conſidered with relation to the diſtinction of ſex or *gender*. *Lowth.*—[In grammar.] A denomination given to nouns from their being joined with an adjective in this or that termination.—See the article GRAMMAR, in this volume.

To GEN'DER, *v. a.* [*engendrer*, Fr.] To beget. To produce; to cauſe.—Fooliſh and unlearned queſtions avoid, knowing that they do *gender* ſtrife. 2 *Tim.* ii. 23.

To GEN'DER, *v. n.* To copulate; to breed.—Thou ſhalt not let thy cattle *gender* with a diverſe kind. *Lev.* xix. 19.

GENDRAY', a town of France, in the department of Jura, and chief place of a canton, in the diſtrict of Dole: three leagues and three quarters eaſt of Auxonne.

GEN'DRE (Gilbert-Charles le), marquis de St. Aubin, born in 1688, and made a counſellor in the parliament of Paris, and afterwards a maſter of requeſts. He died at Paris in 1746. He is known by two eſteemed works. Theſe are, *Traité de l'Opinion, ou Mémoires pour ſervir à l'Hiſtoire de l'Eſprit Humain*, 6 vols. 12mo. 1733; ſince twice reprinted with augmentations; and conſiſts of a great variety of hiſtorical examples to elucidate the power of opinion in the ſciences, accompanied with ſuitable reflections. *Antiquités de la Maiſon de France*, 4to. 1739: this is a work of deep and curious reſearch concerning the origin of the regal dynaſties of France; but the new ſyſtem on the ſubject propoſed by the author has not been generally acquieſced in.

GEN'DRE (Louis le), an hiſtorical writer, born of an obſcure family at Rouen in 1659. He received a literary education chiefly through the favour of M. de Harlai, then archbiſhop of Rouen, afterwards of Paris; and being brought up to the church, he was preſented by the ſame patron, in 1690, with a canonry in the cathedral of Paris. Gratitude induced him on the death of De Harlai to publiſh two eulogies upon him in French, and a life more in detail in Latin, the ſtyle of which was much approved. He next eſſayed his talent at hiſtorical panegyric in Eſſays on the Reign of Louis le Grand, 4to. 1697, which he preſented in perſon to the monarch, and which were ſo well received by the public as to paſs through four editions in eighteen months. They have ſince, however, ſunk into the oblivion juſtly attached to temporary adulation. He now aimed at the rank of a proper hiſtorian, and after the ſeparate publication of part of his deſigns, he gave to the world his Hiſtory of France to the Death of Louis XIII. Paris 1718, 3 vols. folio, and 8 vols. 12mo. This is accounted one of the moſt exact abridgments of French hiſtory, and is written with elegant ſimplicity. A treatiſe upon The Manners and Cuſtoms of the French at different Periods of the Monarchy, before publiſhed by him, is added to this work. He alſo compoſed a Life of the Cardinal d'Amboiſe, with a Parallel of the celebrated Cardinals who have governed States, 1724, 4to. and 2 vols. 12mo. This work underwent ſome criticiſm from the *Mém. de Trevoux*, to which the author wrote a reply. His literary merits were rewarded by the abbacy of Notre-Dame de Claire-Fontaine in the dioceſe of Chartres. He died at Paris in 1733, at the age of ſeventy-four. By his will he left bequeſts for various ſingular foundations, ſome of which, after exciting diſputes relative to their fulfilment, were applied by authority to the inſtitution of prizes in the univerſity of Paris. He left five hiſtories of his own life, each compoſed in a different ſtyle and manner, which he directed to be made public.

GENEALO'GICAL, *adj.* Pertaining to deſcents or families; pertaining to the hiſtory of the ſucceſſions of houſes.—Among the reſt was the room in which James I. died, and a portico with a *genealogical* tree of the houſe of Cecil painted on the walls. *Gough's Topog.*

GENEAL'OGIST, *ſ.* [γενεαλογεω, Gr. *genealogiſte*, Fr.] He who traces deſcents.—Conſidering what traſh is thought worthy to be hoarded by *genealogiſts*, the following may not be a deſpicable addition to thoſe repoſitories. *Walpole.*

GENEAL'OGY, *ſ.* [γενεα and λογος, Gr.] Hiſtory of the ſucceſſion of families; enumeration of deſcent in order of ſucceſſion; pedigree.—See the article DESCENT, vol. v. p. 751-757.

GEN'EARCH, *ſ.* [γενεα, a generation, and αρχος, Gr. a chief.] The head of a family, the chief of a tribe or family.

GEN'EATH, *ſ.* [Saxon.] A hind, a farmer. *Cole. Obſolete.*

GEN'EBRARD (Gilbert), a French prelate, and one of the moſt learned men of his time, born at Riom in Auvergne, in 1537. When young he entered into the benedictine order at the abbey of Maufac, in the dioceſe of Clermont, and went to proſecute his ſtudies at Paris, where he learned Greek under Turnebius, philoſophy under Carpentier, and theology under Claude de Saintes. His application was inceſſant, and his progreſs in the different branches of learning and ſcience proportionate, particularly in the learned languages and theology. In 1563 he was admitted to the degree of doctor of divinity by the college of Navarre, and was afterwards appointed regius-profeſſor of the Hebrew language. This poſt he filled for thirteen years with diſtinguiſhed reputation, and had, among other eminent diſciples, the celebrated Francis de Sales, who was accuſtomed to glory in having enjoyed the inſtructions of ſo great a maſter. He was alſo preferred to the priory of St. Denys de la Chartre, at Paris, and to the priory of Semur in Burgundy. In 1576 Peter Danes, biſhop of Lavaur, reſigned his ſee into the king's hands, under the expectation that Genebrard would be nominated his ſucceſſor; but the latter was diſappointed of that dignity by the intrigues of the preſident De Pibrac, who procured the bulls of inſtitution to be iſſued in favour of his own brother. Genebrard was ſo incenſed at loſing this ſee through miniſterial interference, that he became hoſtile to the politics of the court, and joined the army of the League, of which he became a zealous advocate. The numerous writings which he publiſhed againſt thoſe who ſupported the meaſures of the court and the reformed religion, were uncommonly bitter and furious. They were ſo congenial, however, with the ſpirit of the league, that the duke de Mayenne, the head of that body, nominated him to the archbiſhopric of Aix, and he was conſecrated and took poſſeſſion of that ſee in 1593. Here he ſtill continued his hoſtility to the court, and declaimed in his ſermons againſt the king, even when the cauſe of his own party was become hopeleſs. When the league was finally broken, and the whole kingdom had ſubmitted to Henry IV. Genebrard retired to Avignon, where he publiſhed a treatiſe *De Sacrarum Electionum Jure, ad Eccleſiæ Romanæ Reintegrationem*; in which he maintained that the elections of biſhops belong of right to the clergy and people, and argued violently and abuſively againſt the nominations of kings and princes. For publiſhing this book he was proſecuted before the parliament of Aix, who in 1596 decreed that it ſhould be burnt by the hands of the common executioner, and, after depriving the author of his ſee, condemned him to baniſhment from the kingdom, prohibiting his return to it on pain of death. Afterwards they permitted him to retire to his priory at Semur, where he died in 1597, when ſixty years of age. His numerous writings ſhew him to have been a perſon of conſiderable erudition, particularly in biblical and rabbinical literature. He wrote A Sacred Chronology, 8vo. more exact than any which had at that time appeared; Notes upon the Scripture; A Commentary upon the Pſalms, 1577, 8vo. in which the author particularly applies himſelf to reconcile the Hebrew text with the vulgar Latin; A Tranſlation of the Canticles into Iambic Verſe; Three Books concerning the Holy Trinity, 1569, 8vo. Latin

tranſlations

tranſlations from the Hebrew of the *Seder Olam Rabba*, and the *Seder Olam Zuta*, or the Greater and Leſſer Chronology of the Jews; A Diſcourſe againſt Joſeph Abo, David Kimchi, and another Jew, who oppoſed ſome articles of the Chriſtian Religion, 1566; tranſlations of David Kimchi's treatiſe On the Meaſure of Hebrew Verſe, of Commentaries on the Canticles by R. R. Salomon Jarchi, Abraham Aben Ezra, and an anonymous Author, and of Extracts from Maimonides, Elias Levita, Jacob Ben Solomon, &c. An Introduction to the Reading of Hebrew and the other Eaſtern Languages without Points; Notes upon the Hebrew Grammar; tranſlations from the Greek into Latin of ſeveral Liturgies, of A Treatiſe of Zecharias Mitylenenſis againſt the Philoſophers who ſay that the World is eternal, of Origen's *Philocalia*, &c. an edition of Origen's Works, with a Latin verſion, 1578; and a tranſlation into French of The Works of Joſephus, in two vols. 8vo.

GEN'ERABLE, *adj.* [from *genero*, Lat.] That may be produced or begotten.

GENERAC', a town of France, in the department of the Gard: five miles ſouth of Nimes.

GEN'ERAL, *adj.* [*general*, Fr. *generalis*, Lat.] Comprehending many ſpecies or individuals; not ſpecial; not particular.—To conclude from particulars to *generals* is a falſe way of arguing. *Broome.*—Lax in ſignification; not reſtrained to any ſpecial or particular import.—Where the author ſpeaks more ſtrictly and particularly on any theme, it will explain the more looſe and *general* expreſſions. *Watts.*—Not reſtrained by narrow or diſtinctive limitations.—A *general* idea is an idea in the mind, conſidered there as ſeparated from time and place, and ſo capable to repreſent any particular being that is conformable to it. *Locke.*—Relating to a whole claſs or body of men, or a whole kind of any being.—They, becauſe ſome have been admitted without trial, make that fault *general* which is particular. *Whitgifte.*—Public; compriſing the whole:

Nor fail'd they to expreſs how much they prais'd,
That for the *general* ſafety he deſpis'd
His own. *Milton.*

Not directed to any ſingle object.—If the ſame thing be peculiarly evil, that *general* averſion will be turned into a particular hatred againſt it. *Spratt.*—Having relation to all:

The wall of Paradiſe upſprung,
Which to our *general* ſire gave proſpect large
Into his nether empire neighb'ring round. *Milton.*

Extenſive, though not univerſal. Common; uſual:

I've been bold,
For that I knew it the moſt *general* way. *Shakeſpeare.*

General is appended to ſeveral offices: as, *Attorney General, Solicitor General, Vicar General*, &c.

GEN'ERAL, *ſ.* The whole; the totality; the main, without inſiſting on particulars.—In particulars our knowledge begins, and ſo ſpreads itſelf by degrees to *generals*. *Locke.*—An hiſtory painter paints man in *general*; a portrait painter a particular man, and conſequently a defective model. *Reynolds.*—The public; the intereſt of the whole. *Not in uſe*:

Neither my place, nor aught I heard of buſineſs,
Hath rais'd me from my bed; nor doth the *general*
Take hold on me; for my particular grief
Ingluts and ſwallows other ſorrows. *Shakeſpeare.*

The vulgar. *Not in uſe.*—The play, I remember, pleaſed not the million; 'twas caviare to the *general:* but it was, as I received it, and others, whoſe judgment in ſuch matters cried in the top of mine, an excellent play. *Shakeſpeare.*—One that has the command over an army:

The war's whole art each private ſoldier knows,
And with a *gen'ral's* love of conqueſt glows. *Addiſon.*

GEN'ERAL IS'SUE, in law, a plea to the fact of *Not Guilty*, in criminal caſes, in order to trial by the country, or by peers, &c. *H. P. C.* 254. In civil ſuits, there are various pleas, which are general iſſues, according to the ſpecies of the action. See the article PLEADING.

GENERA'LE, *ſ.* The uſual commons in a religious houſe; a flouriſh on the drum to aſſemble the troops.

To GEN'ERALISE, *v. a.* [from *generalis*, Lat.] To reduce to a genus.—Sometimes the name of an individual is given to a general conception, and thereby the individual in a manner *generaliſed. Reid.*

GENERALIS'SIMO, *ſ.* [*generaliſſime*, Fr. from *general.*] The ſupreme commander. It is often rather a title of honour than office.—Pompey had deſerved the name of great; and Alexander, of the ſame cognomination, was *generaliſſimo* of Greece. *Brown.*

GENERAL'ITY, *ſ.* [*generalité*, Fr. from *general.*] The ſtate of being general; the quality of including ſpecies or particulars.—Becauſe the curioſity of man's wit doth with peril wade further in the ſearch of things than were convenient, the ſame is thereby reſtrained unto ſuch *generalities* as, every where offering themſelves, are apparent to men of the weakeſt conceit. *Hooker.*—The main body; the bulk; the common maſs.—By his own principles he excludes from ſalvation the *generality* of his own church; that is, all that do not believe upon his grounds. *Tillotſon.*—The wiſeſt were diſtracted with doubts, while the *generality* wandered without any ruler. *Rogers.*

GEN'ERALLY, *adv.* [from *general.*] In general; without ſpecification or exact limitation.—I am not a woman to be touch'd with ſo many giddy fancies as he hath *generally* taxed their whole ſex withal. *Shakeſpeare.*—Extenſively, though not univerſally. Commonly; frequently. In the main; without minute detail; in the whole taken together.—*Generally* ſpeaking, perſons deſigned for long life, though in their former years they were ſmall eaters, yet find their appetites encreaſe with their age. *Blackmore.*

GEN'ERALNESS, *ſ.* Wide extent; though ſhort of univerſality; frequency; commonneſs.—They had, with a general conſent, rather ſpringing by the *generalneſs* of the cauſe than of any artificial practice, ſet themſelves in arms. *Sidney.*

GEN'ERALSHIP, *ſ.* The office of a general commander, the manœuvres of a general in the command of an army; ſkill; dexterity.

GEN'ERALTY, *ſ.* The office of general. The whole; the totality.—The municipal laws of this kingdom are of a vaſt extent, and include in their *generalty* all thoſe ſeveral laws which are allowed as the rule of juſtice and judicial proceedings. *Hale.*

GEN'ERANT, *adj.* [*genero*, Lat. to produce.] Producing, begetting.

GEN'ERANT, *ſ.* [*generans*, Lat.] The begetting or productive power.—In ſuch pretended generations the *generant* or active principle is ſuppoſed to be the ſun, which, being an inanimate body, cannot act otherwiſe than by his heat. *Ray.*

To GEN'ERATE, *v. a.* [*genero*, Lat.] To beget; to propagate.—Thoſe creatures which being wild *generate* ſeldom, being tame *generate* often. *Bacon.*—To produce to life; to procreate:

God created the great whales, and each
Soul living, each that crept, which plenteouſly
The waters *generated* by their kinds. *Milton.*

To cauſe; to produce.—Sounds are *generated* where there is no air at all. *Bacon.*—Whatever *generates* a quantity of good chyle, muſt likewiſe *generate* milk. *Arbuthnot.*

GENERA'TION, *ſ.* [from *generate*; *generation*, Fr.] The act of begetting or producing.—Seals make excellent impreſſions; and ſo it may be thought of ſounds in their firſt *generation:* but then the dilation of them, without

out any new ſealing, ſhews they cannot be impreſſions. *Bacon.*—A family; a race.—Thy mother's of my *generation:* what's ſhe, if I be a dog? *Shakeſpeare.*—Progeny; offſpring:

The barb'rous Scythian,
Or he that makes his *generation* meſſes
To gorge his appetite, ſhall to my boſom
Be as well neighbour'd. *Shakeſpeare.*

A ſingle ſucceſſion; one gradation in the ſcale of genealogical deſcent.—This *generation* ſhall not paſs 'till all theſe things be fulfilled. *Matt.* xxiv. 34.—An age.—Every where throughout all *generations* and ages of the chriſtian world, no church ever perceived the word of God to be againſt it. *Hooker.*

Dr. Darwin, in the firſt volume of his Zoonomia, has ſuggeſted a new hypotheſis reſpecting the myſterious functions of *generation.* He imagines that the embryo is the produce of the male alone, and that the female only gives it lodgment and nutrition. He does not, however, ſuppoſe its firſt rudiments to be a miniature of the future animal, but merely a ſimple living filament, which receives all its parts by accretion. This fibril, dropping among the nutritive particles prepared by the female, is ſtimulated to action; and, bending into the form of a ring, embraces one of theſe particles, and coaleſces with it. This new organization acquires new irritabilities, chooſes or rejects other particles offered to it, has ſenſation ſuperadded to it, and, in proceſs of time, the powers of aſſociation and volition. The living filament, being a part of the father, has certain propenſities belonging to him, which give the baſis of a ſimilarity of ſtructure; and this is altered or modified by the nutritive particles derived from the mother. Other alterations proceed from the imagination of the father at the inſtant of *generation,*—the extremities of the ſeminal glands imitating the motions of the organs of ſenſe; and thus the ſex of the embryo is produced, which is *male* or *female* according as the image of the one or the other of theſe organs predominated in the father's imagination at the critical period. All augmentations are in conſequence of an irritation or ſenſation of a peculiar kind, which may be termed *animal appetency,* which ſeeks the particles that it wants; and this operates even after birth, and, in the innumerable ſeries of ages, has produced all the diverſities of forms in animals, accommodated to their different modes of life:—for the author ſuppoſes a perpetual progreſs toward perfection in all animated beings, and imagines that none of them are at preſent as they originally exiſted, but have gradually arrived at the ſtate in which we now ſee them, from that of a ſimple and uniform living filament. For the inſufficiency of this hypotheſis, ſee the article CONCEPTION, vol. v. p. 4-12, and the correſpondent engraving.

GENERA'TION, in the mathematics, is applied by many writers to various arithmetical operations; or in geometry to the formation of different magnitudes. Thus 20 is the product generated of 4 and 5; ab that of a and b; 4, 8, 16, &c. the powers generated of or from the root 2; and a^2, a^3, a^4, &c. thoſe from the root a. So alſo, a circle is generated by the revolution of a line about one of its extremities, a cone by the rotation of a right-angled triangle about its perpendicular, a cylinder by the rotation of a rectangle about one of its ſides, or otherwiſe, by the motion of a circle in the direction of a right line, and keeping always parallel to itſelf.—The *generating* line or figure, in geometry, is that which, by any kind of ſuppoſed motion, may generate, or produce, any other figure, plane, or ſolid. Thus a line, according to Euclid, generates a circle; or a right-angled triangle, a cone, &c. and thus alſo Archimedes ſuppoſes his ſpirals to be generated by the motions of generating points and lines; the figure thus generated being called the *generant.*—It is a general theorem in geometry, that the meaſure of any generant, or figure produced by any kind of motion of any other figure, or generating quantity, is equal to the product of this generating quantity drawn into the length of the path deſcribed by its centre of gravity, whatever the kind of motion may be, whether rotatory, or direct, &c. In the modern analyſis, or fluxions, all ſorts of quantities are conſidered as generated by ſome ſuch motion, and the quantity hereby generated is called a *fluent.*—See FLUXIONS and GEOMETRY.

GEN'ERATIVE, *adj.* [*generatif,* Fr. from *genero,* Lat.] Having the power of propagation.—He gave to all, that have life, a power *generative,* thereby to continue their ſpecies and kinds. *Raleigh.*—Prolific; having the power of production; fruitful.—If there hath been ſuch a gradual diminution of the *generative* faculty upon the earth, why was there not the like decay in the production of vegetables? *Bentley.*

GENERA'TOR, *ſ.* [from *genero,* Lat.] The power which begets, cauſes, or produces.—Imagination aſſimilates the idea of the *generator* into the reality in the thing engendered. *Brown.*

GENE'RIC, or GENERICAL, *adj.* [*generique,* Fr. from *genus,* Lat.] That which comprehends the genus, or diſtinguiſhes from another genus, but does not diſtinguiſh the ſpecies.—Though wine differs from other liquids, in that it is the juice of a certain fruit; yet this is but a general or *generic* difference; for it does not diſtinguiſh wine from cyder or perry; the ſpecific difference of wine, therefore, is its preſſure from the grape. *Watts.*

GENE'RICALLY, *adv.* [from *generic.*] With regard to the genus, though not the ſpecies.—Theſe have all the eſſential characters of ſea-ſhells, and ſhew that they are of the very ſame ſpecific gravity with thoſe to which they are ſo *generically* allied. *Woodward.*

GENERO'SITY, *ſ.* [*generoſité,* Fr. *generoſitas,* Lat.] The quality of being generous; magnanimity; liberality.—Can he be better principled in the grounds of true virtue and *generoſity* than his young tutor is? *Locke.*

GEN'EROUS, *adj.* [*generoſus,* Lat. *genereux,* Fr.] Not of mean birth; of good extraction:

Your dinner, and the *generous* iſlanders
By you invited, do attend your perſon. *Shakeſpeare.*

Noble of mind; magnanimous; open of heart.—Pray for others in ſuch forms, with ſuch length, importunity, and earneſtneſs, as you uſe for yourſelf; and you will find all little ill-natured paſſions die away, your heart grow great and *generous,* delighting in the common happineſs of others, as you uſed only to delight in your own. *Law.*

A *generous* virtue of a vigorous kind,
Pure in the laſt receſſes of the mind. *Dryden.*

That *gen'rous* boldneſs to defend
An innocent or abſent friend. *Swift.*

Such was Roſcommon, not more learn'd than good,
With manners *gen'rous,* as his noble blood. *Pope.*

It is uſed of animals. Spritely; daring; courageous:

So the imperial eagle does not ſtay
Till the whole carcaſe he devour.
As if his *gen'rous* hunger underſtood
That he can never want plenty of food,
He only ſucks the taſteful blood. *Cowley.*

Liberal; munificent:

Faſt by the margin of her native flood,
Whoſe wealthy waters are well known to fame,
Fair as the bordering flowers the princes ſtood,
And rich in bounty as the *gen'rous* ſtream. *Heigh.*

Strong; vigorous.—Having in a digeſtive furnace drawn off the ardent ſpirit from ſome good ſack, the phlegm, even in this *generous* wine, was copious. *Boyle.*

Thoſe who in ſouthern climes complain,
From Phœbus' rays they ſuffer pain,

Muſt

Muſt own that pain is well repaid,
By *gen'rous* wines beneath a ſhade. *Swift.*

GEN'EROUSLY, *adv.* [from *generous.*] Not meanly with regard to birth. Magnanimouſly; nobly:

When all the gods our ruin have foretold,
Yet *generouſly* he does his arms withhold. *Dryden.*

Liberally; munificently.

GEN'EROUSNESS, *ſ.* [from *generous.*] The quality of being generous.—Is it poſſible to conceive that the overflowing *generouſneſs* of the divine nature would create immortal beings with mean or envious principles? *Collier.*

GENESAN', a town of Aſiatic Turkey, in the Arabian Irak: ninety miles ſouth of Bagdad.

GEN'ESIS, *ſ.* [from γινομαι, to bring forth, or γενναω, Gr. to beget.] Generation; the firſt book of Moſes, which treats of the production of the world.—See the article BIBLE, vol. iii. p. 8.

GEN'ESIS, in geometry, denotes much the ſame as *generation*, being the formation of a line, ſurface, or ſolid, by the motion or flux of a point, line, or ſurface; as of a globe by the rotation of a ſemi-circle about its diameter, &c.—In the geneſis of figures, the line or ſurface which moves, is called the *deſcribent*; and the line round which, or according to which, the revolution or other motion is made, the *dirigent*.

GENESSEE', a townſhip of the American States, in Ontario county, New-York, having 217 electors.

GENESSEE', a large tract of land in the ſtate of New-York, bounded north and north-weſt by lake Ontario, ſouth by Pennſylvania, eaſt by the weſtern part of the military townſhips, in Onondago county, and weſt by lake Erie and Niagara river. It is a rich tract of country, and well watered by lakes and rivers; one of the latter, Geneſſee river, gives name to this diſtrict. It is generally flat, the river ſluggiſh, the ſoil moiſt, and the lakes numerous.

GENESSEE RIVER. See GHENESSE.

GE'NEST (Charles Claude), a French poet and philoſopher, was born at Paris in 1636. In his youth he reſolved to go to the Indies to ſeek his fortune; but the ſhip in which he ſailed being taken by the Engliſh, he was brought to London, where he ſubſiſted himſelf for ſome time by teaching French. On his return to his own country he obtained the poſt of preceptor to mademoiſelle de Blois, afterwards ducheſs of Orleans. He afterwards became almoner to the ducheſs, ſecretary to the duke of Maine, and was preſented to the abbacy of St. Vilmer, in the dioceſe of Boulogne. He entered the French academy in 1698, and died at Paris in 1719. The abbé Geneſt, though a courtier, was ſincere and ſimple in his manners, and eſtimable in his character. He derived a taſte for natural philoſophy from the lectures of Rohault, the diſciple of Deſcartes, and for metaphyſics from the converſation of Boſſuet. A love for poetry and polite literature was natural to him. He compoſed various works, of which ſome of the principal are: *Principes de Philoſophie*, 1716, 8vo. an elaborate performance in verſe, in which the Carteſian ſyſtem is explained, and proofs are adduced of the exiſtence of a God, and the immortality of the ſoul: its verſification is more praiſed than its poetical ſpirit: Occaſional Pieces of Poetry: A Diſſertation upon Paſtoral, in Proſe: ſeveral tragedies; of theſe, the only one which has kept poſſeſſion of the ſtage is Penelope: the ſentiments of this tragedy are ſo moral, that the rigid Boſſuet did not ſcruple to declare that he ſhould give his approbation to public ſpectacles, were the pieces repreſented always equally pure.

GEN'ET, *ſ.* [French. The word originally ſignified a horſeman, and perhaps a gentleman or knight.] A ſmall-ſized well-proportioned Spaniſh horſe.—You'll have your nephews neigh to you; you'll have courſers for couſins, and *genets* for germanes. *Shakeſpeare.*—It is no more likely that frogs ſhould be engendered in the clouds, than Spaniſh *genets* be begotten by the wind. *Ray.*

He ſhews his ſtatue too, where plac'd on high,
The *genet* underneath him ſeems to fly. *Dryden.*

GEN'ET (Francis), a French prelate and eſteemed caſuiſt, was born at Avignon in the year 1640. He purſued his ſtudies in his native place, and, after going through his claſſical courſe, entered on that of philoſophy, in which for a time he was a diſciple of Scotus, but afterwards relinquiſhed his ſyſtem, and became zealouſly attached to the philoſophy and theology of Aquinas. He alſo applied to the ſtudy of the canon law, and was admitted to the degree of doctor in civil and canon law at Avignon, in 1670; on which occaſion he acquired much reputation by the theſes which he maintained againſt ſimony. The abilities which he diſcovered recommended him to the notice of cardinal Grimaldi, archbiſhop of Aix, who for ſome time made uſe of his talents in the management of the eccleſiaſtical concerns of his metropolitan diſtrict. Afterwards he was employed by M. le Camus, biſhop of Grenoble, in a celebrated viſitation which that prelate appointed to take place through his dioceſe, in which M. Genet's province was to reſolve the caſes of conſcience which ſhould be propoſed. The manner in which he conducted himſelf in this buſineſs, induced M. le Camus to engage him on the compoſition of a ſyſtem of moral theology. To this work M. Genet devoted much time and labour, and produced it, at different periods, in ſix volumes, 12mo. under the title of *Morale de Grenoble*. It has undergone various impreſſions, of which the beſt was publiſhed in the year 1715, in eight volumes, 12mo. A Latin tranſlation of it was publiſhed in the year 1702, by the abbé Genet, the author's brother, and himſelf the author of Caſes of Conſcience relative to the Sacraments. The *Morale de Grenoble* has been condemned by the more relaxed caſuiſts, as much too ſtrict and ſevere; but it met, nevertheleſs, with a very favourable reception in France, where it was read with great approbation, as well as in Italy and other catholic countries. Soon after its publication pope Innocent XI. created the author canon and prebend of the cathedral church at Avignon; and in the year 1685 appointed him biſhop of Vaiſon. His epiſcopal functions he diſcharged with exemplary watchfulneſs and diligence until they were interrupted in the year 1688, in conſequence of his having ventured to receive into his dioceſe the religious belonging to a new convent at Toulouſe, which Louis XIV. had ſuppreſſed. This act expoſed him to the reſentment of the king, by whoſe order he was arreſted, and confined priſoner for fifteen months in the iſle of Rhe; whence he was releaſed at the particular requeſt of the pope. He was accidentally drowned in 1702, when he had juſt completed his ſixty-ſecond year.

GENETE'IL, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the diſtrict of Baugé: two leagues and a quarter north of Baugé, and one and three quarters ſouth-weſt of le Lude.

GENETHLI'ACAL, *adj.* [γενεθλιακος, of γενεθλη, Gr. nativity.] Pertaining to nativities as calculated by aſtronomers; ſhewing the configurations of the ſtars at any birth.—The night immediately before he was ſlighting the art of thoſe fooliſh aſtrologers, and *genethliacal* ephemeriſts, that uſe to pry into the horoſcope of nativities. *Howel's Vocal Foreſt.*

GENETHLI'ACI, *ſ.* in aſtrology, are perſons who erect horoſcopes, or pretend to foretell what ſhall befall a perſon, by means of the ſtars which preſided at his nativity. The ancients called them *chaldæi*, and by the general name *mathematici*: accordingly, the ſeveral civil and canon laws which we find made againſt the mathematicians, only reſpect the Genethliaci, or aſtrolo-

gers. They were expelled Rome by a formal decree of the ſenate; and yet found ſo much protection from the credulity of the people, that they remained in the city unmoleſted. Antipater and Archinapolus have ſhewn that genethliology ſhould rather be founded on the time of the conception, than on that of the birth.

GENETHLIAL'OGY, *ſ.* [*genethlialogia*, Lat. γενεθλιαλογια, Gr.] The ſcience of calculating nativities, or predicting the future events of life from the ſtars predominant at the birth.

GENETHLIAT'IC, *ſ.* [γενεθλη, Gr.] He who calculates nativities.—The truth of aſtrological predictions is not to be referred to the conſtellations: the *genethliatics* conjecture by the diſpoſition, temper, and complexion, of the perſon. *Drummond.*

GENE'VA, *ſ.* [a corruption of *genevre*, French, a juniper-berry.] The ardent ſpirit called *gin*.—We uſed to keep a diſtilled ſpirituous water of juniper in the ſhops. At preſent only a better kind is diſtilled from the juniper-berry: what is commonly ſold is made with no better an ingredient than oil of turpentine, put into the ſtill with a little common ſalt and the coarſeſt ſpirit. *Hill.*

GENE'VA, a free city and republic, many years in alliance with the Swiſs, ſituated on the confines of Savoy, France, and Swiſſerland, at the ſouthern extremity of the lake, called the *lake of Geneva*, or the *Leman-lake*; the Rhône paſſing through it, and dividing it into two unequal parts. Julius Cæſar made it a place of arms. It flouriſhed greatly under the ſucceſſors of Cæſar: the inhabitants became Chriſtians in the third century, and, at leaſt as early as the middle of the fourth, it was made the ſee of a biſhop. The invaſions of the hords of people from the north, the diſorders, ravages, and revolutions, which followed, were not leſs ſenſibly felt at Geneva, than in other parts of the weſtern empire. This city and neighbouring country fell to the Burgundians, afterwards to the Franks. Charlemagne, when he aſſembled his army at Geneva to march againſt the Lombards, augmented the privileges of the citizens, and granted them free fairs. In the diſmemberment of the vaſt eſtates of Charlemagne, Geneva became ſucceſſively annexed to the kingdom of Arles and Burgundy. In the year 1032, it was united to the German empire; but the authority of the emperors, not yet well eſtabliſhed, was hardly at all regarded in the diſtant provinces; the great vaſſals were become independent. Neceſſity had taught the towns to provide for their defence, by uniting and forming a government within themſelves; and the chiefs of the empire, too feeble to maintain their proper authority, protected the aſſociations of the common people, and augmented their liberties, as a balance to the tyranny of the lords and the clergy. In the midſt of this confuſion, which frequent revolutions and profound ignorance had prolonged for ſeveral centuries, the clergy, under one chief, whom the pope had rendered powerful, had begun to join a great portion of temporal juriſdiction to their ſpiritual juriſdiction, already too extenſive. Thus, the biſhops of Geneva, like the biſhops of Lauſanne and Sion, had obtained of the emperors the title of princes and ſovereigns over the city, and a conſiderable ſurrounding country. On the other hand, the counts of the Geneveſe, that is to ſay, the country in the neighbourhood of Geneva, originally only officers of the emperors, though now become vaſſals of the biſhop, aſpired to an excluſive adminiſtration of juſtice both in the town and country. The bulls of the emperors and the popes ſerved rather to keep up theſe diſputes than to decide them. The people, preſſed alternately by theſe two powers, profited by their diſputes to confirm and extend their privileges. They were leſs afraid of the authority of the biſhop, who had a greater intereſt at ſtake. Nevertheleſs, a third power was formed in the neighbourhood, which menaced the liberty of the city. The counts of Savoy became powerful by the ſucceſſive poſſeſſions of ſeveral provinces; and, among the reſt, the Geneveſe adopted the pretenſions of the ancient counts, and aſpired to the ſovereignty of a town at once a frontier and flouriſhing. Several attempts were made by different princes, but nothing very alarming, till, in the beginning of the ſixteenth century, Charles III. a fiery and enterpriſing prince, by conſent of the biſhops, frequently came into the town with a great deal of parade, to gain ſome and intimidate others; and to make a ſhow of his authority, put to death ſome citizens who dared to reſiſt his tyrannic will. A citizen of Geneva, named Berthelier, who had obtained the freedom of Friburg, in Swiſſerland, inſinuated to the chiefs of that republic the benefit of an alliance with Geneva, and that it would be to their intereſt to prevent the latter city from falling into the power of an ambitious neighbour. A treaty was concluded, and two parties aroſe in Geneva, one which remained attached to the intereſt of the duke, and the other on the ſide of liberty. The former were called *Mamelukes*, from the troops of Egypt who were ſo called. The others received the ſurname of *Huguenots*, which was afterwards given to all the proteſtants of France. This latter term is, without doubt, a corruption of the German word *eidgnoſs*, which ſignifies bound or confederate by oath. The duke Charles, irritated by this tranſaction, entered Geneva with a body of troops, by a breach in the wall, and compelled the people to renounce their new alliance, and, by ſolicitations among the Swiſs cantons, perſuaded Friburg to deſiſt from the treaty, promiſing not to injure the liberties of Geneva. Nevertheleſs, Berthelier was ſacrificed to his vengeance, and the biſhop, ſurrounded by a numerous guard, entered into the council general, and depoſed the magiſtrates. Fortunately for Geneva, they quitted the town ſoon after theſe ſudden acts of violence, and gave the citizens time to recover from their terror and conſternation. A new alliance was entered into between the towns of Berne, Friburg, and Geneva, in the year 1526, which the duke of Savoy was not able to prevent, and occaſioned long wars between the republic and Savoy. The biſhop, in his turn, being embroiled with the duke, was reduced to demand the right of the citizenſhip of Geneva, to enjoy the protection of the new alliance, which he confirmed.

At this time the doctrine of the reformation began to be received by the people, fired by the enthuſiaſm of liberty, which invited them to throw off the yoke both eccleſiaſtical and political. The biſhop, whoſe actions had almoſt always been weak or deceitful, was become deſpicable in the eyes of the people and the duke. His imprudent menaces and precipitate retreat, ſerved to ſtrengthen the cauſe of the reformers. Of their two allies, one exhorted the Geneveſe not to ſeparate from the communion of the church of Rome. The other preſſed them to confirm their liberty by ſhaking off the eccleſiaſtical yoke. In 1535, in full council, the doctrines of the reformation were adopted; in conſequence of which the canton of Friburg renounced the alliance. The celebrated John Calvin arriving accidentally at Geneva, towards the cloſe of the following year, was induced to remain and complete the work that was begun. Geneva was now regarded as the centre and aſylum of the reformed religion, both by the French and Italians, and by the retreat of the perſecuted proteſtants, the arts and commerce became daily more flouriſhing, and population increaſed. In 1559, an academy was founded, under the direction of Theodore Beza. In 1536, the cantons of Berne and Friburg, and the Valais, ſeized on ſome of the provinces belonging to the duke of Savoy, near the lake of Geneva, which procured ſome reſpite of hoſtilities to the new republic. In 1584, a perpetual alliance was entered into between Berne, Zurich, and Geneva, which formed the bond of union between Geneva and Swiſſerland. In 1602, an attempt was made

by Charles duke of Savoy, to ſeize on the city by ſurpriſe. Some troops approached the ramparts of Geneva in the night, and a number of ſoldiers had already ſcaled a baſtion, and penetrated into the town. By a fortunate accident the citizens were alarmed time enough to repulſe the enemy, and drive them from their walls. The memory of this deliverance was long preſerved by an anniverſary fête. A war commenced in conſequence of this perfidy, but was followed by a ſolemn peace the following year, ſigned at St. Julien, the 21ſt of July, 1603; at which time the conſtitution of the republic, and the claſſes of the people, were eſtabliſhed and ſettled in the following manner: Thoſe who had obtained permiſſion to eſtabliſh their domicilium in the city, or on its territory, were termed *domiciliés*. This permiſſion was ſolely for one year, and was revocable at will. Their only privilege was to live under the protection of the government. Thoſe who were born in country-places, dependent on the ſtate, and had acquired property, were named *ſubjects*. Thoſe diſtinguiſhed by the title of *inhabitants* were ſuch as were formerly ſimply domiciliated, but to whom the edict of 1782 afterwards granted the right of commerce and labour. The claſs called *natives* were thoſe born of inhabitants. The laſt claſs, ſuperior to all the others, was that of *citizen*; but the ſon of a citizen, when born out of the country, was conſidered as a ſimple *bourgeois*; nor could he be admitted into the ſenate. A citizen was eligible to the firſt employments in the republic, and might become a member of the *petit conſeil*. It was on account of this ſuperiority of title, that Rouſſeau afterwards aſſumed it with ſo much triumph, as a check to the pride of thoſe *noble ſubjects* who were his greateſt antagoniſts. From the general aſſembly of citizens and burgers, the inferior councils, inveſted with the executive power, derived their origin. Theſe formed three colleges. The college or council of *twenty-five*, which regulated the police: the council of *ſixty*, whoſe proper department was ſimilar to that of our privy-council: and the council of *two hundred*, ſuperintendent of the other councils. Four *ſyndics* preſided at theſe councils, whoſe charge was annual. The moſt important, and the moſt ſplendid office was that of *procureur général*, choſen from the council of two hundred. The object of his department was to ſupport the rights of the citizens, and to protect the conſtitution. His commiſſion was uſually for three years, but it might be extended to ſix.

To give even a general idea of the repeated commotions that have diſturbed the repoſe of Geneva, ſince the above period, would greatly exceed the limits of our plan. Suffice it to obſerve, that previous to the revolution of 1782, Geneva had undergone three political changes ſince the commencement of the eighteenth century. In the firſt, in 1707, the citizens had demanded the re-eſtabliſhment of periodical general aſſemblies; and although they had, in a great meaſure, ſucceeded according to their wiſhes, yet the ſenate, taking advantage of the arrival of a body of Swiſs troops, had cauſed ſome of the leaders to be executed: among theſe, fell the illuſtrious Fatio; who, contrary to all forms of juſtice, and, after a general amneſty, pronounced by themſelves, was, by order of the ſenate, ſhot in his priſon. The next cauſe of complaint aroſe from the two councils taking to themſelves the right of impoſing taxes, and of erecting fortifications without the conſent of the general council. This diſpute increaſed; till, in 1738, the parties coming to open hoſtilities, France, Zurich, and Berne, offered their mediation, which was accepted. Their interference, doubtleſs, was friendly, and their deciſion was impartial: but this act, which was then thought to be a benefit, afterward proved the calamitous ſource of the greateſt miſeries to Geneva. Their edict confirmed to the council-general all legiſlative, confederative, and elective, power, as well as the right of making war and peace, of impoſing taxes, and of augmenting the fortifications; and, that no future diſputes might ariſe, the three powers agreed to become joint guarantees to the new law.

The third revolution had its riſe in the unjuſt decree, paſſed in 1762, againſt J. J. Rouſſeau, as noticed above. This decree occaſioned *remonſtrances* on the neglect of the law, which, in the eagerneſs of their zeal, the ſenate had violated. The *remonſtrants* argued, that, as the ſenate would not redreſs the grievances which had been produced by infringing the law, their complaints ought to be ſubmitted to the deciſion of the council-general, whoſe duty it was "to watch over the laws, ſo that no change whatſoever ſhould be made without its conſent." The *recuſants* inſiſted that the ſenate were the proper judges, whether they had infringed the law, or not; and that, as no matter could be brought before the council-general, unleſs propoſed by the ſenate and council of two hundred, the ſenate and council therefore were to determine whether this complaint ſhould be heard: in fact, that they poſſeſſed a *negative power*, by which they could, in their own body, cruſh all remonſtrances, and prevent the propoſal of any queſtion, which they did not wiſh ſhould be inveſtigated. The ſenate thus refuſing to ſuffer any appeal to the council-general, the conſequence was, that, at the election of ſyndics, who were to be choſen by the council-general from the members of the ſenate, the citizens, in turn, rejected the whole liſt. They were obliged by law only to elect ſuch as were *agreeable* to them; and, by the ſame law, they were permitted to refuſe a part, or the whole, of the names which were offered: as, then, none were *agreeable*, they rejected all. The ſenate now had recourſe to the ruinous expedient of ſoliciting foreign aſſiſtance; and, inſtead of liſtening to terms of accommodation with their countrymen, they appealed to the inſidious power of France. The cantons of Zurich and Berne, to which the ſenate likewiſe applied, delayed, for a while, their interference: but, finding that the ſenate perſiſted in its determination, they at length joined in a meaſure which they could not prevent. Their mediation was ſo unpleaſant to the citizens, that, when their propoſals for a reconciliation were offered to the council-general, they were rejected by a large majority. The guaranteeing powers then retired to Soleure, where they pronounced a *decree*, which the duc de Choiſeul, at that time prime-miniſter of France, in vain attempted to compel the Geneveſe to reſpect. Their reſiſtance was unconquerable, and the decree, ſo far from being put in force, was not even ſuffered to be read in the general aſſembly. The ſenate now found the neceſſity of entering into ſome terms of agreement; and, in 1768, a treaty was concluded, by which the council-general, in exchange for its right of refuſal in election of ſyndics, received the privilege of electing one half of the council of two hundred. The citizens obtained, likewiſe, the right of *re-election*, or of annually excluding from the ſenate four of its members, who, after a ſecond excluſion, could not again be choſen. This power was given as a balance to the *droit négatif* of the ſenate, concerning which, nothing was ſtipulated.

During theſe troubles, the contention was between the citizens and the magiſtrates; between two parties, in whom equal power was veſted, ſtruggling for the ſuperiority: but there was another, and a more numerous, claſs of men at Geneva, whoſe liberties ſeem to have been but little regarded. The *citizens*, whoſe anger was ſo vehement againſt the ariſtocracy, appear to have forgotten that *they*, in fact, formed a part of that ariſtocracy; that they were the governors, while the *natives* were the governed and oppreſſed. Though debarred from all power of making or aſſenting to laws by which they were bound, forbidden to engage in the practice of the liberal profeſſions, excluded from the benefit of trial by their equals, and deprived of the fruits of their own induſtry,

duſtry, by reſtrictions on their commerce, the natives, by a curiouſly ſingular expedient of tyranny, were called on to bear the principal burthen of the expences of the ſtate. Men in this ſituation, hearing the word *liberty* ſounded in their ears, would naturally wiſh for a ſhare of that bleſſing, for which others were contending. Accordingly, we find that, in the late revolution, they had aſſerted their right to the privileges of citizens. Their pretenſions, however, had been declared criminal and ſeditious by the ſenate: the citizens, too, diſapproved them; but on what ground ſhould the *natives* be enſlaved, while the *citizens* were free? When the rights of men were in contention, why ſhould not *their* rights be inveſtigated, and, when known, why not aſſerted and eſtabliſhed? The contrary, however, happened; and, in the treaty of 1768, the natives were forgotten by both the other parties, who only thought of ſecuring their own cauſe, while they neglected the liberties of their countrymen.

The deſire of freedom, when once excited, is not eaſily repreſſed. The *natives* ſoon perceived that little attention had been beſtowed on their intereſts; and they openly complained of the hardſhips of their ſubjection. The ſenate anſwered their arguments, in that kind of logic at which tyrants are ſo expert, by baniſhing one of their body for ten years, for having, according to his ſentence, *wiſhed to uſurp the title of citizen, and for having defended his pretenſions by arguments deſtructive of the conſtitution*; and the *citizens*, that they might not be backward in the good work of oppreſſion, complained that the *natives* encroached on their excluſive privilege of trade; and obtained an order, pointing out the narrow limits beyond which they were not to ſtep. Thus, driven to extremes by two parties, they found a tempter in a third. The *recuſants*, who were the chiefs of the ariſtocratic party, ſeeing themſelves fruſtrated in their deſigns on the citizens, ſecretly encouraged the natives, becauſe they were in oppoſition to the citizens; and thus, paradoxical as it may appear, aſſiſted the cauſe of liberty, becauſe they wanted to be tyrants. The miniſter of France, alſo, *appeared* to befriend them. Thus ſituated, is it wonderful that they ſhould ſay, that "they no longer would be the ſlaves of citizens who loved liberty only for themſelves; and that if the walls of Geneva were to incloſe a people who were ſovereign, and another who were ſubject, they would deſert a country to which they had no attachment?"

Under theſe circumſtances, matters were hurried to extremity by the folly of the ſenate, who impriſoned a *native* for ſinging ſome ſatirical verſes, in which he aſſerted that he was a *citizen*. When judgment was to be pronounced on the priſoner, the natives aſſembled, and declared their reſolution to ſuccour him, if any ſevere puniſhment was to be inflicted. The puniſhment was trifling, and the priſoner was carried home crowned with laurels. On that ſame night, contrary to his ſentence, which confined him to his houſe, he appeared in public among his claſs. The ſenate were determined to ſuſtain their decree; and, on this occaſion, forgetting their diſputes with the citizens, applied to them to put themſelves in arms; and the citizens, after conteſting with the ſenate for years, joined them at the inſtant when the oppreſſion was to be removed from themſelves to the natives. So eaſily can we act the tyrant to others, while we are fighting for liberty for ourſelves!

On the next morning, the delinquent was again ſeized; and the natives began to aſſemble. The citizens were immediately called to arms; and, in one ſtreet only, where ſome of the moſt violent of the party had furniſhed themſelves with arms, a ſcuffle enſued, in which three of the natives loſt their lives. Thus ended this inſurrection. The ſenate, that they might revenge their inſulted authority, by adding injuſtice to cruelty, determined to puniſh the natives without the cuſtomary forms of law; and the citizens, that they might ſtrengthen the tyranny which was afterward to oppreſs themſelves, had the infamy to decree the puniſhment in the general aſſembly.

From this period, Geneva remained, for a time, in peace: but peace could not long be expected in a republic thus conſtituted. The ariſtocratic party were daily ſeeking means to increaſe their power; and the *citizens* began to be convinced of the impolicy of their behaviour toward the *natives*. Among other cauſes of complaint, was the want of a regular code of laws, and of a rigid and impartial obſervance of them. This had been decreed by the mediation of 1738; but had been neglected till 1774, when a partial reviſion of the old laws was undertaken by the ſenate. The citizens, finding their remonſtrances on this ſubject to be in vain, had recourſe to their right of re-election, and excluded from the ſenate four of its members. This happened on the 26th of January 1777, when the four ſenators were excluded by 950 votes againſt 550. A reſiſtance ſo determined, gained the citizens their ends; the ſenate liſtened to their propoſals; and a committee, formed equally from the two parties, was entruſted with the important buſineſs of regulating and publiſhing their laws. This committee, however, was of ſhort duration. The ariſtocratic party accuſed their opponents of aiming at the ſubverſion of all law, under the pretence of reviſing the old laws; and the council of two hundred paſſed a decree, by which the committee was diſſolved, and a new one created. The account of theſe diſputes was induſtriouſly magnified at the court of France; where the comte de Vergennes, who had ſucceeded to the duc de Choiſeul, ſeemed determined to ſhew the Geneveſe, that his maſter was reſolved, *in one way or other*, to ſilence their debates. With this view, he applied to the cantons of Berne and Zurich, who had the magnanimity to refuſe their interference in a diſpute which the Geneveſe themſelves were ſufficiently able to ſettle. The ariſtocracy had now again recourſe to the natives; who, irritated by their paſt injuries, and encouraged with hopes of redreſs, entered into their ſchemes. On the night of the 5th of February 1781, the accidental quarrel of two natives collected together a number of ſpectators, who ſoon became actors in the affray. At the ſame time, the arſenal was forced by a party of natives, headed by ſome young men of the ariſtocratic party. This was a ſignal to the citizens to arm themſelves. Their opponents were few, and they ſoon became maſters of the town without bloodſhed.

The citizens had before found the impolicy of ſeparating their intereſts from thoſe of the natives. Inſtead, therefore, of preparing puniſhments for them, they cauſed a decree to be paſſed in their favour: the votes in the council-general, on this occaſion, were one thouſand and ſeven, againſt twenty-nine. Every thing now ſeemed to take a peaceable turn; and a reconciliation was ſpeedily to be effected from the good offices of the cantons of Berne and Zurich: but peace, on ſuch terms, was not the wiſh of the ariſtocracy; and the comte de Vergennes, on their perſuaſion, again came to deſtroy the repoſe of a town, whoſe happineſs he had engaged to promote. The Swiſs deputies had the mortification to find their negociation broken off, and their meetings removed to a diſtance from Geneva. Nor was this all: the French would enter on no terms, unleſs the treaty of 1768 was previouſly ſuſpended. The objection to this treaty was, that it gave to the council-general, the right of electing one half of the council of two hundred; which council, in its preſent ſtate, included all the chiefs of the ariſtocracy. This election was to take place whenever fifty places were vacant in that body; and, at this time, only two were wanting to complete that number. It was of material conſequence, then, to ſuſpend an edict, which enabled the citizens to introduce their

own

own chiefs into this council, which, in fact, conſtituted the ſtrength of their adverſaries: but to this ſuſpenſion, the Swiſs cantons poſitively refuſed to agree; and the French miniſter, experiencing nothing but oppoſition from them, withdrew the name of his maſter from the terms of the guaranteeſhip which he had entered into in 1738. If, however, the *name* of France was withdrawn, its *influence* remained; and the citizens found themſelves threatened with the ſevereſt retaliation, if, according to the edict of 1768, they proceeded to fill up the vacancies in the grand council. His moſt chriſtian majeſty, they were told, was determined to *ſave* them; and, to preſerve them from all miſchief, he had already marched a body of troops into their neighbourhood.

Together with theſe *friendly* proofs of the diſpoſition of France, the citizens had another evil preſſing on them. The edict, which had been paſſed in favour of the natives, had been ſuſpended ſince the interference of the French; and it was well known that, on any attempt to carry it into execution, it would receive an abſolute negative from the ſenate. The natives already began to charge the citizens with having deceived them with promiſes, which, they knew, would never be fulfilled; and called on them to claim, from the ſenate, the performance of an engagement, which, it was evident, would be denied when aſked. The claim was, however, made by a thouſand and ninety-ſix citizens, accompanied by a thouſand and ſeven hundred natives; that is, by more than four-fifths of the heads of families in the republic. The ſenate returned for anſwer, that the law in queſtion could ſubſiſt no longer than the times of anarchy which gave it birth; and that being free, they could not carry it into execution without deſerting the intereſts of their country. The rage of the natives was now ungovernable; nor were the citizens heard in their attempts to calm them: they ran to arms, and while ſome ſeized a part of the garriſon, which oppoſed them with an uſeleſs reſiſtance, others ſurrounded the habitations of the ſenators, againſt whom they vowed immediate vengeance. Thus circumſtanced, the citizens ſaw no method of quelling the tumult, but by joining with the natives, and aſſuring them of the ſucceſs of their demands; and to ſecure this, they determined to compel ſuch a number of the magiſtrates to reſign, as might gain their party a majority in the two councils, and thus enable them to eſtabliſh the treaties of 1768, and of 1781. This was accompliſhed: but the citizens were not contented to ſtop here. Knowing that their actions would call down the vengeance of France, they detained twelve of their magiſtrates as hoſtages for their own ſafety. It was this proceeding which irritated the canton of Berne, and induced it to enter into a league with the courts of Verſailles and Turin; the purpoſe of which was to reduce the Geneveſe by force. To this end, twenty-two companies of grenadiers from Turin, with as many from Berne, and ſix thouſand French troops, began their march to Geneva: while the citizens and natives, being determined to ſtand a ſiege, made ſuch preparations as they could, and named a committee of eleven perſons to conduct their defence. To reſiſt was, however, madneſs;—and, on the evening before the attack was to be made, they entered into the terms of capitulation which were offered to them, and opened their gates.

What were the views of the ariſtocratic party, and how unfavourable their diſpoſitions were toward liberty, became now evident in the precautions which they took to prevent any diſcuſſion in their meaſures. The liberty of the preſs was taken away: all public meetings or aſſemblies were forbidden; and not only their military exerciſes were ſuppreſſed, but the citizens were commanded to keep no fire-arms in their houſes, under pain of baniſhment. The garriſon, too, was newly modelled; a power of increaſing it was given to the grand council; and its officers, which, before, were always Geneveſe, were now *allowed* to be ſtrangers, and the colonel and major even *obliged* to be ſo. It was ordained, too, that every Geneveſe ſhould take an oath of fidelity and ſubmiſſion to the new law. In addition, the people ſaw their defenders forced into exile, for ſupporting their rights: ſome for the ſpace of ten years, and others for life. In return for theſe ſacrifices, they were recompenſed by a magnificent theatre, and a company of comedians, with all the indulgences of luxury and vice. It was in this ſituation, that the citizens entertained ſerious thoughts of emigrating; and turned their views towards Ireland, as affording them a ſituation where they might exert their induſtry, and enjoy that liberty which they had loſt at home. The plan was intereſting: it was the ſtruggle of a manly people almoſt weighed down with their misfortunes; and it was liſtened to with that eagerneſs, with which a free and generous nation gives way to its firſt feelings in favour of the oppreſſed. The obſtacles which prevented its execution, are known to have ariſen from the changes of adminiſtration in Ireland, and from the delay which neceſſarily attended ſuch a ſcheme. Fortunate it was, perhaps, that ſuch obſtacles did exiſt to prevent an emigration, which would have been an act rather of deſpair than of reaſon; and which, however flattering in its appearances, would, as muſt now be evident, have been pernicious in its effects to Ireland, if not to England.

From this ſtate of dejection, the Geneveſe were partly roufed by the death of the comte de Vergennes, and by the ſubſequent elevation of their friend and countryman, M. Necker. The impolicy of the magiſtrates ſerved to diſſipate totally their fears. In the ſevere winter of 1789, the lower claſſes underwent much hardſhip for want of proviſions; and at the time when the diſtreſs was greateſt, the magiſtrates raiſed the price of bread; the profits on the ſale of which conſtitute a part of the revenue. Immediately the ſhops of the bakers were ſtripped; and, the next morning, ſome bread, though eſcorted by ſoldiers, was ſeized. In this tumult, it happened that one of the populace was killed, and the dead body was carried through the ſtreets as a ſignal for inſurrection. The government now prepared to repreſs the diſturbances, by military force; and, accordingly, ſome troops were marched into a part of the city: but, far from being diſperſed, the inhabitants not only attacked them with ſtones from the tops of houſes, but, by means of fire-engines filled with hot water mixed with vinegar and ſoap, totally defeated them. The citizens had hitherto remained inactive, and it was only on the application of the ſenate, that they agreed to interpoſe; not, however, by means of arms, which were unneceſſary; they had only to ſhew the natives that an accommodation was really intended, and the tumults immediately ſubſided. So anxious, indeed, were all parties for peace, that the terms of agreement were ſettled in ſix days. In theſe terms, both parties made great conceſſions. With regard to the natives, particularly, the law which provided for their gradual incorporation with the citizens, was allowed; ſo that from this time, natives of the fourth generation became citizens: the citizens alſo, who had been baniſhed by the edict of 1782, were recalled, and fully reinſtated in their employments.

In 1791, the magiſtrates, anxious to maintain the good underſtanding which had thus prevailed, made further conceſſions in favour of the popular party, and extended their privileges, allowing to every native the freedom of the city at the ſmall price of ſix guineas. This conduct, which it was hoped would have removed all diſcontent, had, however, an oppoſite effect, and ſeemed only to raiſe the tone of the popular party, from the idea it gave them of their own power, which could extort ſuch terms, and emboldened them to demand other privileges with an air of authority. A private application was alſo unfortunately made to the Briſſotin

party, then in power at Paris, requeſting the aſſiſtance of the French in the eſtabliſhment of what they termed *the juſt principles of liberty*. In conſequence of their ſolicitation, general Monteſquieu advanced towards Geneva. On his approach, deputies from the council were immediately diſpatched to enquire into the reaſons of his conduct. The anſwer of the general was, that the French republic had been inſulted by the Geneveſe calling in the troops of Swiſſerland as ſoon as the French forces had entered Sardinia; which circumſtance, he added, plainly evinced that the ariſtocratic party at Geneva were inclined to favour the enemies of France. After ſome time ſpent in fruitleſs negociation, the magiſtrates, perceiving themſelves incapable of defending the ancient conſtitution, paſſed a decree in favour of equal rights, with only ſome ſlight reſtrictions. The popular party, however, would not accept that as a favour which they demanded as a right; and therefore, on the 30th of November, 1792, they appeared in arms, and inſiſted that every department of the government ſhould be filled by individuals of their own party. The ſyndic of the guard, Micheli Ducreſt, being ordered by the magiſtrates to beat to arms, not only refuſed to obey their orders, but delivered the keys of the park of artillery into the hands of the inſurgents. On the 1ſt of December they made themſelves maſters of Geneva, aſſumed the red cap, and adopted the manners of the French revolutioniſts. The members of the former government voluntarily reſigned their functions, and liberty and equality was proclaimed. Proviſional committees, called the committees of ſafety and adminiſtration, were formed, which were confirmed by an aſſembly compoſed of the old and newly-admitted citizens. On the 25th of February, 1793, a convention ſimilar to that of France was formed, conſiſting of 120 members. The firſt acts of this convention were to aboliſh the great council, and to transfer nearly all the power of the little council to the general aſſembly. This conſtitution, with all its faults, was accepted by the people at large, and was even acknowledged by the Swiſs cantons. Order and harmony were in appearance reſtored, when the public tranquillity was again diſturbed by the viſionary doctrines propagated by the circle of equality, which ſtill held its meetings, and perſevered in its deluſive metaphyſical ſcheme of the general equality of rights. The principal members of this club were now citizens Geſnet and the abbé Soulavie, who had acted as their deputies with the Briſſotin party at Paris, and an advocate, of the name of Bouſquet. An aſſeſſment upon property being in agitation by the magiſtrates, the circle of equality ſeized this opportunity of ſpreading the report, that the propoſed aſſeſſment was to be laid principally upon the poor, while the rich were to be almoſt wholly exempted; and at the ſame time ſuggeſted the neceſſity of the people taking the government into their own hands.

In the night of the 18th of July, Bouſquet and Geſnet announced to the aſſembly that a conſpiracy was planned againſt the people by the ariſtocrats. Upon this denunciation the moſt furious of the patriots ran to arms, to puniſh the traitors; while the more moderate contended, that the ſovereign aſſembly ſhould not be diſturbed by ſuch alarms. While, however, the preſident was putting the queſtion, about twenty of the moſt violent of the members, headed by Bouſquet, ran out of the hall, calling upon the people to take up arms. Being joined by vaſt numbers of the loweſt of the people, they ſeized the artillery, plundered the houſes of the citizens, and diſarmed ſuch as they thought hoſtile to their views.

From this moment all the miſeries and horrors of a revolutionary ſtate commenced. The rich were torn from their houſes and thrown into dungeons, where upwards of ſix hundred of the principal inhabitants of the city were crowded together, among whom were moſt of the magiſtrates who had been depoſed in 1792. A revolutionary tribunal was erected, of which Bouſquet was elected preſident, and which held its ſittings in one of the halls of the Hotel de Ville. The firſt ſeven priſoners who were brought before this tribunal were, M. Decombres, lieutenant-colonel of the regiment of Geneva; M. Cayla, the ex-ſyndic; the worthy and patriotic M. Prevoſt, procurator-general; M. Derochment, counſellor; and three others. M. Decombres and the other three were condemned by the tribunal, and the reſt were acquitted; but as they were members of patrician families, and held the firſt places in the ſtate, the aſſembly of the revolutioniſts, intoxicated by the wine that had been plentifully diſtributed on the occaſion, imagined that their acquittal was a ſufficient proof of a plot to ſave the ariſtocrats, who, in the opinion of theſe deluded wretches, all merited the puniſhment of death. While the moderate among the aſſembly were endeavouring to prove the contrary, the enraged part of the mob ran from the aſſembly to the priſon, and, ſeizing the ſeven unfortunate perſons, brought them to the fatal ground. A ſquare battalion was formed, and theſe ſeven victims of the worſt of tyrannies were inſtantly ſhot!—Their next ſtep was to lower the rate of intereſt of money, and to annul all leaſes. In addition to theſe atrocities, the moſt ſacred rites of religion were converted into ridicule, and the moſt horrible blaſphemies were publicly countenanced.

The revolutionary tribunal, not ſatisfied with the innocent blood which had already flowed, ordered three more priſoners to be brought before them; Fatio, ex-ſyndic; Naville, ex-procurator; and Andead, a banker. M. Naville, who was a man of diſtinguiſhed talents, defended himſelf ſo ably, and appealed ſo forcibly to the paſſions and conſciences of the revolutionary tribunal, that one of his judges, on paſſing ſentence, ſaid to him, "I have two conſciences; one of them acquits you, and the other condemns you, in order to ſave the republic." "The republic will loſe then in me a *great citizen*," coolly replied Naville; and this ſingular and bold expreſſion, ſo deſcriptive of his character, was ſtrictly true. When the judgment of the court was paſſed on him, "I will now, (ſaid he,) in my turn, pronounce that ſentence which awaits you and all your accomplices. When enriched by plunder, and become abſolute maſters of the ſtate, expect not to enjoy in peace the fruit of your crimes. All the barriers that you have broken down to arrive at deſpotiſm, will be alſo broken down for you. New factions will ſpring up in the midſt of your faction; you will be engaged in a conſtant ſtruggle with each other for power. Like tigers you united to catch your prey; and like them you will ſpill one another's blood in diſputing which ſhall devour it. You will thus become yourſelves the avengers of the ſhades of your victims: but there will be this difference between you and them—that your victims will have ended their days with the conſolation of having a pure conſcience, which raiſes the ſoul to its Creator; and you will die with hearts burſting with rage; your execution will be preceded by the moſt galling ideas; deſpair will rend your feelings for having imbrued your hands in innocent blood, and torture you with the dread of falling into the abyſs dug with your own hands.—*You will die without daring to raiſe your eyes toward heaven.*"

The judges of this horrid court ſat fourteen days, during which time five hundred and three perſons were tried, of which number thirty-ſeven were condemned; but only eleven ſuffered death, the other twenty-ſix having found means to eſcape. One hundred were ſentenced to be baniſhed; three hundred to be impriſoned, ſome for life and others for various periods; and the remainder obtained their liberty. The ſanguinary ſpirit of Bouſquet and his aſſociates, was happily ſucceeded by a milder ſyſtem. The friends of the revolution of 1792 were too much the friends of their country to conſent

to its incorporation with France; they therefore joined the new revolutioniſts, and at length obtained an aſcendancy. Their firſt attempt was to deprive the French agent of his influence; and the overthrow of Robeſpierre, whoſe creature he was, favoured their deſign. See the article FRANCE, vol. vii. p. 803. After the death of that execrable tyrant, the French government recalled this agent, and accompanied his recal with unequivocal marks of their diſapprobation. The ſucceſſors of Robeſpierre entirely diſavowed his conduct at Geneva; and the convention gave a full and ſolemn acknowledgment of the independence of Geneva, and granted to its miniſter the ſame honours that had been granted to other independent ſtates. And on the 7th of September, the French convention ſolemnly declared that they would take no ſtep which could in the leaſt affect the independence of Geneva. The moderate party, therefore, who had obtained the government of that republic, turned their thoughts to the beſt practicable methods of healing thoſe wounds which the late enormities had occaſioned; and juſtice ſucceeded for a time to the reign of oppreſſion and terror.

In 1795, the government of Geneva enjoined M. Reybaz, their ambaſſador at Paris, to requeſt the guarantee of the independence of their republic, in caſe of any peace between the French and the king of Sardinia, or the German empire. But the conduct of the French directory now clearly evinced their determination to annex Geneva to the republic, as a department; and the remonſtrances of the government of Geneva, breathing a ſpirit of freedom, declared the reſolution of the Geneveſe to emigrate from their native ſoil, rather than ſubmit to an incorporation of their country with that of France.

For a time again the idea of annexing Geneva to France ſeemed to be abandoned by the French; it was however only deferred to a more favourable opportunity, and ſuch a conjuncture occurred in the invaſion of Swiſſerland. The intercourſe which had taken place between France and Geneva from the date of the conqueſt of Savoy, had given a conſiderable aſcendancy to French principles of government. Though the maſs of the Geneveſe remained attached to the idea of territorial independence, a conſiderable number of them began to look with indifference on the forms by which they held their liberties; whether as part of the ſovereign people of Geneva, or as a portion of the ſovereign and powerful people of the French republic. The agents of the French government had ſtudiouſly foſtered this fraterniſing ſpirit, and had made conſiderable progreſs in proſelytiſm, by repreſenting the benefits which would accrue from a more intimate alliance between the two nations. Whatever influence theſe repreſentations might have had, the partiſans of territorial independence remained ſtrenuous in rejecting the proffered fraternity. The partiſans for the incorporation, however, formed a vaſt majority. Of 3197 votes, 2204 gave their ſuffrage for the union; and Geneva was accordingly declared by the ſupreme council to be incorporated with the French republic on the 27th of April, 1798. The treaty of union was ratified on the 17th of May by the French government. The city of Geneva was ſoon after formed into the capital of a department, under the name of "The Department of the Lake of Lemarnus."

Geneva is an irregularly built town, whoſe fortifications are tolerably ſtrong; the houſes are lofty and large, conſtructed like the inns of court at London, and the colleges at Cambridge, where one common ſtaircaſe leads to ſeveral apartments, which are here inhabited by different families. The ſtreets are in general wide; and the loftineſs of the free-ſtone houſes would produce a very ſtately effect, if it were not for the odious deformity produced by the arcades, which are erected before moſt of the houſes, and throw a gloom over the whole ſtreet. Theſe arcades are conſtructed of wood, and ſometimes riſe to a level with the roofs of the houſes: they project very conſiderably, and thus reduce a ſpacious and noble ſtreet into a narrow and mean-looking lane! Their object is to give foot-paſſengers ſhelter from the rain, and ſhade from the ſun, and, at the ſame time, to afford a convenience for drying linen, &c.

The population of Geneva is about 24,000, beſides the new eſtabliſhment of French troops; and notwithſtanding their preſent humiliated condition, Freedom is ſtill the goddeſs they worſhip; and had there been any poſſibility of ſecuring her from violation, they would gladly have bled before her altars. However various has been their ſucceſs, in the different revolutions which have agitated this ſecluded ſtate, the Geneveſe have uniformly evinced a courage which awed their enemies, and a determined bravery in defence of their rights, which, in ſhewing that they prized them highly, gave proof that they were worthy to enjoy them.

The territory of Geneva is now comprehended in the *Departement du Leman*, which contains about ſixteen ſquare leagues of land: its population is eſtimated at 609,000 perſons. It is divided into three cantons or hundreds, the largeſt of which has Geneva for its capital, and contains about 75,000 ſouls, of which 10,000 only are Geneveſe, 20,000 are French, and the remainder are Savoyards. The prefect, as in all the other departments, is appointed *durante bene-placito*. All military appointments are given to Frenchmen: one general commands the town, and another the country. At the firſt moment of the revolution, all the old magiſtrates were diſplaced, and ſince that time the civil officers have been elected by the citizens at large, conſequently ſome are Frenchmen, and ſome Geneveſe.

The revenue of Geneva, ſince it has been annexed to France, ariſes chiefly from the following ſources:—An exciſe duty is laid on all proviſions (wheat excepted); on wine and merchandiſe of every deſcription which is brought into Geneva; the annual produce of this tax is about 120,000 French livres; a land tax; a tax on doors and windows; a tax on the ſale of eſtates; a heavy tax on the collateral inheritance of an eſtate—where the inheritance is lineal and immediate, the tax is moderate. To theſe taxes, or *contributions* as they are called, muſt be added *la contribution mobilière*, which is a ſmall tax on perſonal property, and produces annually about 75,000 livres.

In the republic of letters, Geneva has obtained an honourable eminence. The works of Bonnet, Sauſſure, Mallet, De Luc, &c. have imparted celebrity to the place which gave them birth. Here is a public library of very ancient eſtabliſhment, a Critical Catalogue of which was publiſhed a few years ſince by M. Sennebier, who was then librarian. It has been frequently remarked, not only that Geneva has produced a large proportion of men of letters, but that the bulk of its inhabitants have a more than ordinary ſhare of underſtanding and information. This is perhaps to be accounted for by the eſtabliſhments which abound here of public ſchools. Of theſe there are, in every pariſh, at leaſt two, one for the education of boys, and another for girls: the number of ſchools is proportioned to the ſize and population of the pariſh. Theſe ſchools are ſupported by a private ſociety, nothing more being required from the parents of the children, than that they ſhould ſend them to ſchool clean. The academy, which, together with the college, owes its eſtabliſhment to Calvin, is a ſort of univerſity; it has twelve profeſſors, who give gratuitous lectures to ſtudents, on the following twelve ſubjects:—the belles-lettres, philoſophy, medicine, mathematics, law, education, oriental languages, theology, ſacred hiſtory, natural hiſtory, chemiſtry, and political economy. The expences attached to all theſe inſtitutions are defrayed by a ſociety, denominated *La Societé Economique*, compoſed of many of the old clergy, magiſtrates, and citizens of Geneva, who ſtill

ſtill retain in their hands ſome eſtates and funds which they held under the old government, although a conſiderable portion of thoſe eſtates and other funds has been plundered from them by the French. This ſociety alſo ſupports a ſchool, where ſtudents are gratuitouſly inſtructed in muſic and drawing.

The Geneveſe are celebrated watch-makers, and linen-printers: the few emigrants who had perſeverance enough to ſettle in Bruſſels and Conſtance, after the revolution of 1782, introduced the arts of printing linens and of watch-making into thoſe places. It was, probably, in conſequence of their ſkill in theſe reſpects, that the Iriſh parliament liſtened to the propoſal of eſtabliſhing a colony of Geneveſe emigrants in that country, and voted fifty thouſand pounds towards defraying the expences of their journey, and of their ſettlement in the iſland. Here is alſo a large chocolate manufactory. The police is ſtrictly regulated here: the bridges are drawn up, and all the gates are ſhut, at eight o'clock at night in winter, and at nine in ſummer: after ten, no one is permitted to walk in the town without a light; any one, man, woman, or child, diſregarding this prohibition, is conducted to the guard-room, and takes a lodging there for the night!

Geneva is ſituated ſeventy-two poſts and a quarter ſouth-eaſt from Paris, by Bourg-en-Breſſe and Maçon; and fifty-eight by Dijon and Mount Jura. Lat. 46. 11. N. lon. 5. 55. W. Greenwich.

GENE'VA (Lake of), a large lake, ſituated between Swiſſerland and Savoy, in a valley which ſeparates the Alps from Mount Jura. It is in the ſhape of a creſcent; of which Swiſſerland forms the hollow, and Savoy the convex part; its greateſt breadth is about twelve miles. The country on the ſide of Savoy is full of high and craggy mountains; but from Geneva to the environs of Lauſanne it ſlopes to the margin of the lake, and is both rich and fertile. The banks riſe conſiderably in the neighbourhood of Lauſanne, and form a moſt beautiful terrace, with a rapid deſcent a few miles beyond the town. A plain begins in the neighbourhood of Vevay, which continues for a conſiderable diſtance beyond the end of the lake, but contracts towards the water by the approach of the mountains. The lake at a diſtance appears of a beautiful blue colour, and the water is very clear and tranſparent. Near Geneva the coaſt of the lake abounds with pebbles; between that city and Lauſanne it is ſandy; from thence to Chillon it is bounded by hard calcareous rocks; and the extremity of the ſhore is a marſh formed by mud collected from the Rhone. The greateſt depth of this lake found by M. de Luc, is 160 fathoms. Here the birds called *tippet grebes* make their appearance in multitudes in December, and retire in February to other places where they breed. The lake of Geneva, like all others ſituated between mountains, is ſubject to ſudden ſtorms; but it abounds in fiſh remarkable as well for their excellence as ſize.

GENE'VA, a lake in Upper Canada, which forms the weſtern extremity of lake Ontario; to which it is joined by a ſhort and narrow ſtrait.

GENE'VA, a poſt-town of the American States, in Onondago county, New York, on the great road from Albany to Niagara, ſituated on the bank of the north-weſt corner of Seneca lake, about ſeventy-four miles weſt of Oneida caſtle, and ninety-two weſt of Whiteſtown.

GENEVIE'VE, or MISSIRE, a village in Louiſiana, on the weſtern bank of the Miſſiſſippi, nearly oppoſite to the village of Kaſkaſkias, twelve miles ſoutherly of Fort Chartres.

GENEVIE'VE (religious of), a congregation of regular canons of the order of St. Auguſtine, eſtabliſhed in France; and is a reform of the Auguſtine canons. It was begun by St. Charles Faure, in the abbey of St. Vincent de Senlis, of which he was a member in the year 1618. In 1634, the abbey was made elective. The congregation takes its name from the abbey of St. Genevieve, which is the chief of the order, and whoſe abbot is the general of the whole fraternity. The abbey itſelf took its name from St. Genevieve, the patroneſs of the city of Paris, who died in 512. Five years after her death, Clovis erected the church of St. Genevieve, under the name and invocation of St. Peter, where her relics are ſtill preſerved.

GENEVIL'LIERS, a town of France, in the department of Paris: three quarters of a league weſt of St. Denis.

GENEVOI'S, or DUCHY OF GENEVA, a province of Savoy, bounded on the north by the Swiſs territories, on the eaſt by Faucigny, on the ſouth by Savoy Proper, and on the weſt by France, from which it is ſeparated by the Rhone: Geneva and its territory formerly made a part of it. Annecy is the capital. It is now incorporated with the empire of France.

GENEU'RO, a mountain which divided Piedmont from the ancient Dauphiny, in the road from Briançon to Suſa.

GEN'GENBACH, an imperial town of Germany, in Swabia, ſituated on the Kinzig, in the Ortenau: twenty-two miles north of Friburg, and fifteen ſouth-eaſt of Straſburg. Lat. 48. 24. N. lon. 25. 41. E. Ferro.

GENGISKHAN', JENGHIZ-KHAN, or ZINGIS, a renowned emperor of the Moguls, who, after conquering ſouthern Aſia, and awing China to peace by the terror of his frown, being ſeized with a fever in conſequence of extreme grief for the loſs of his favourite ſon Tuſhi Khan, expired on his march into the latter country, towards the end of the 623d year of the hegira, or A. D. 1226, in the ſeventy-third year of his age, and twenty-fifth of his reign. Thus he, who, without pity or remorſe, had ſlaughtered above two millions of the human race,—had made ſo many children fatherleſs, and ſo many fathers childleſs,—could not ſurvive the loſs of one beloved ſon, though he had three ſons left to cheriſh his declining age!—Aſtoniſhing proof of exquiſite ſenſibility and the moſt ſavage ferocity dwelling in the ſame boſom. For his great exploits, ſee the article HINDOOSTAN.

GE'NIAL, *adj.* [*genialis*, Lat.] That which contributes to propagation:

Creator Venus, *genial* pow'r of love,
The bliſs of men below and gods above! *Dryden.*

That gives cheerfulneſs, or ſupports life:

Nor will the light of life continue long,
But yields to double darkneſs nigh at hand;
So much I feel my *genial* ſpirits droop. *Milton.*

Natural; native.—It chiefly proceedeth from natural incapacity, and *genial* indiſpoſition. *Brown.*

GE'NIALLY, *adv.* By genius; naturally.—Some men are *genially* diſpoſed to ſome opinions, and naturally averſe to others. *Glanville.*—Gaily; cheerfully.

To GENI'CULATE, *v. n.* [*geniculatum*, Lat.] To grow into joints.

GENIC'ULATED, *adj.* [*geniculatus*, Lat.] Knotted; jointed.—A piece of ſome *geniculated* plant ſeeming to be part of a ſugarcane. *Woodward.*

GENICULA'TION, *ſ.* [*geniculatio*, Lat.] Knottineſs; the quality in plants of having knots or joints.

GE'NII, *ſ.* ſpirits or dæmons, which, in fabulous hiſtory, are ſaid to preſide over the affairs of men. See the articles DÆMON, DÆMONIAC, and DEMONOLOGY, in our fifth volume.

GENILLE', a town of France, in the department of the Indre and Loire: one league north of Loches.

GE'NIO, *ſ.* [Italian; *genius*, Lat.] A man of a particular turn of mind.—Some *genios* are not capable of pure affection; and a man is born with talents for it as much as for poetry, or any other ſcience. *Tatler.*

GENIOGLOS'SUS, *ſ.* [from γενειον, the chin, and γλωσσα, Gr. the tongue.] A muſcle ſo named from its origin

origin in the chin and its inſertion in the tongue. See the article ANATOMY.

GENIOHYOIDÆ'US, *ſ.* [from γενειον, the chin, and υοειδης, Gr. the os hyoides.] A muſcle ſo called from its origin in the chin and its inſertion in the os hyoides.

GENIOPHARYNGÆ'US, *ſ.* [from γενειον, the chin, and φαρυγξ, Gr. the pharynx.] A muſcle ſo called from having its origin in the chin and its inſertion in the pharynx. See ANATOMY, vol. i.

GENIOS'TOMA, *ſ.* [from γενειον, a beard, and στομα, Gr. a mouth; the mouth of the corolla being villoſe or bearded.] In botany, a genus of the claſs pentandria, order monogynia. The generic characters are—Calyx: perianthium inferior, turbinate, five-cleft, permanent: diviſions ſhort, ſharp. Corolla: one-petalled, funnel-form; tube widened, longer than the calyx; throat villoſe-bearded; border five-parted, ſpreading; diviſions ovate, ſharpiſh, the length of the tube. Stamina: filaments five, ſhort, in the throat of the corolla; antheræ oblong, ſtanding out. Piſtillum: germ ovate; ſtyle filiform, longer than the tube; ſtigma cylindric, blunt, grooved. Pericarpium: capſule? oblong, two-celled. Seeds: very many, ſubangular, placed on a filiform receptacle.—*Eſſential Character.* Calyx turbinate, five-cleft; corolla one-petalled, with a villoſe throat, and a five-parted border; capſule oblong, two-celled, many-ſeeded.

Genioſtoma rupeſtris, a ſingle ſpecies; native of the iſle of Tanna in the South Seas.

GENI'PA, *ſ.* in botany. See GARDENIA.

GENIS'TA, *ſ.* [from *genu*, Lat. the knee; either becauſe it is flexible, like that joint, or becauſe it is ſuppoſed to be good for pains there.] In botany, a genus of the claſs diadelphia, order decandria, natural order papilionaceæ or leguminoſæ. The generic characters are—Calyx: perianthium one-leafed, ſmall, tubular, two-lipped; upper lip two-toothed, more deeply divided; lower three-toothed, nearly equal. Corolla: papilionaceous; banner oblong, remote from the keel, the whole reflex; wings oblong, looſe, ſhorter than the others; keel ſtraight, emarginate, longer than the banner. Stamina: filaments ten, connate, emerging from the keel; antheræ ſimple. Piſtillum: germ oblong; ſtyle ſimple, riſing; ſtigma ſharp, rolled in. Pericarpium: legume roundiſh, turgid, one-celled, two-valved. Seeds: ſolitary, uſually kidney-form.—*Eſſential Character.* Calyx two-lipped, two and three-toothed; banner oblong, reflex downwards from the piſtil and ſtamens.

Species. I. Unarmed, or without thorns. 1. Geniſta Canarienſis, Canary geniſta or cytiſus: leaves ternate, pubeſcent on both ſides; branches angular. Leaves obovate, ſomewhat mucronate; but the floral leaves ſubſeſſile, minute; flowers in corymbs, five or ſix together, ſweet. Native of Spain and the Canaries. Cultivated in 1656, by John Tradeſcant, jun. It flowers from May to September.

2. Geniſta candicans, hoary geniſta, or Montpelier cytiſus: leaves ternate, villoſe underneath; peduncles lateral, leafed, ſuſtaining about five flowers; legumes hirſute. Riſes to the height of ſeven or eight feet, ſending out many ſlender branches, the upper parts of which, for more than a foot in length, ſend out ſmall flowering-branches on their ſides, ſupporting five yellow flowers, which appear in June and July: the ſeeds ripen in autumn. This reſembles the foregoing ſpecies, but the leaflets are larger, oval, pubeſcent underneath only, ſharp at both ends; the lateral ſhoots are ſhort; flowers without ſcent; floral leaves petioled, ſcarcely ſmaller than the others; ſeeds four or ſix, ſomewhat kidney-ſhaped, black, ſmooth, ſublucid, with a glandular, prominent, permanent rim, ſhaped like a creſcent, and of a white or yellow colour, round the umbilicus. Native of Spain, Italy, and France. Cultivated in 1748, by Mr. Miller.

3. Geniſta linifolia, flax-leaved geniſta, or broom: leaves ternate, ſeſſile, linear, ſilky underneath. This is a ſmall ſhrub, with branches that are knotty from indentations left by the fallen leaves; the branchlets or ſhoots are leafy, angular, upright, ſilky; leaves crowded, alternate; leaflets nearly equal, ſharp, rolled back at the edge; flowers in racemes at the ends of the branches. Native of the Levant and Spain.

4. Geniſta triquetra, triangular geniſta or broom: leaves ternate, the upper ones ſimple; branches three-ſided procumbent. Native of Spain, Italy, and France; flowers from April to June. It is a hardy evergreen trailing ſhrub, producing a vaſt profuſion of bloom, which renders it eminently conſpicuous in May and June: it rarely produces ſeed. When tied up properly, and trained to a ſtake, it may vie with moſt of our ornamental ſhrubs.

5. Geniſta ſagittalis, jointed geniſta or broom; branches ancipital, membranaceous, jointed; leaves ovate-lanceolate. This ſends out ſeveral ſtalks, which ſpread flat on the ground, and divide into many flat branches, which are jointed, and their two ſides are edged like a broad-ſword; they are herbaceous, but perennial. At each of the joints is placed one ſmall ſeſſile ſpear-ſhaped leaf, ending in a point, of a deep-green colour, and ſmooth; the ſtalks above the leaves have three wings, under them two. Native of France, Germany, Switzerland, Savoy, Auſtria, Carniola, Italy, and Spain. It flowers in June, ſometimes in May, and ripens the ſeeds in September.

6. Geniſta tridentata, or three-toothed geniſta: branches three-ſided, membranaceous, ſomewhat jointed; leaves three-cuſped. Very nearly allied to the foregoing, but all the parts are larger. Native of Portugal. Neither Miller's No. 6, nor that which he has figured in Pl. 138, can be this ſort.

7. Geniſta tinctoria, common dyer's geniſta, or broom: leaves lanceolate, ſmooth; branches ſtreaked round, upright. The roots creep far and wide; ſtems many, angular, tough, from a foot to eighteen inches or two feet in height, ſometimes more; branches ſubdivided, ending in ſhort ſpikes of yellow flowers, with ſtipules between them. Native of moſt parts of Europe, in paſtures and the borders of fields, particularly in dry gravelly or ſandy ſoils; flowering in July. In the old writers it is called baſe broom, green weed, or green wood, dyer's-weed, and wood-waxen. When cows feed on it, their milk, and the butter or cheeſe made from it, are ſaid to be very bitter. A bright yellow colour may be prepared from the flowers; and for wool that is to be dyed green with woad, the dyers prefer it to all others. A dram and half of the powdered ſeeds operates as a mild purgative. A decoction of the plant is ſometimes diuretic, and therefore has proved ſerviceable in dropſical caſes. A ſalt prepared from the aſhes is recommended in the ſame diſorder.

8. Geniſta Sibirica, or Siberian geniſta: leaves lanceolate, ſmooth; branches equal, round, upright. This reſembles the foregoing, but the ſtalks are neither ſtreaked nor angular; and the leaves are ſomething narrower. Native of Siberia.

9. Geniſta florida, Spaniſh dyer's geniſta, or broom: leaves lanceolate, ſilky; branches ſtreaked round; flowers in bundles, directed one way. This riſes with woody ſtalks two or three feet high, ſending out many taper channelled branches, which grow erect; leaves ſmall, alternate; ſpikes of flowers terminating, ſucceeded by ſhort pods, which turn black when ripe, and contain four or five kidney-ſhaped ſeeds; the calyxes as well as the leaves are ſilky and ſhining. Native of Spain; Mr. Ray found it near Naples, by the Camaldules. It flowers in June and July, and the ſeeds ripen in autumn.

10. Geniſta piloſa, hairy geniſta or broom: leaves ſolitary, lanceolate, obtuſe, ſomewhat hairy; peduncles the length of the calyx; ſtandard hairy on the outſide;

branches diffuſed. This differs from the common dyer's weed, No. 7, in having the branches depreſſed on every ſide and procumbent; whereas that is upright. Native of Sweden, Germany, Auſtria, Carniola, Hungary, Swiſſerland, France, Italy, and Spain; not known to grow wild in England till it was diſcovered about Lachford, four or five miles from St. Edmund's Bury in Suffolk, by the late ſir John Cullum, bart. and Mr. Dickſon. Mr. Woodward obſerves that Cavenham and other heaths near Bury appear yellow with the great plenty of theſe flowers; the flowering branches ſtanding up: at other times it is difficult to find this ſhrub, the ſtem and branches being ſo cloſely procumbent, that they are often found even beneath the moſs. It flowers in May.

11. Geniſta humifuſa: leaves lanceolate, ciliate; branches proſtrate, ſtreaked, villoſe. Native of the Levant.

II. Thorny. 12. Geniſta Anglica, Engliſh geniſta, petty whin, or needle furze: thorns ſimple, awl-ſhaped; flowering-branches abbreviated, unarmed; leaves lanceolate, acute; legumes ſtraightiſh. Stem much branched; branches tough, without leaves, furniſhed with extremely ſharp ſlender thorns, from a quarter to half an inch in length; the ſhoots of the year grow in bundles on the ſummits of the old ones, and ſparingly from the ſides, bearing numerous, ſmall, bright green, (glaucous on the young ſhoots, *Ray*,) oval or lanceolate, (narrower and ſharper on the older branches, *Ray*,) ſmooth, entire leaves, intermixed with ſoft ſpines, (ſcattered; but ſometimes there are none, *Relh.*) flowers ſmall, pale, yellow, few; legumes ſhort and broad. Native of Dauphiné, Denmark, and Britain, on heaths, uſually in moiſt ſpongy ground. It flowers from the end of May to July.

13. Geniſta Germanica, German geniſta or broom: thorns compound; flowering-branches elongated, unarmed; leaves lanceolate, hairy; legumes oblong, ſtraightiſh. Stems about a foot and half in height, very much branched; the old branches have no leaves, but ſtrong branched thorns; the younger ones are full of green hairy leaves, of an ovate-lanceolate form, the lower ones broader and rather ovate; they come out either in threes, or ſingly alternate: theſe alſo frequently have ſoft, tender, ſimple, thorns. Native of Germany; Swiſſerland, as about Lauſanne, Baſil, &c. Savoy, on Mont Saleve, near Geneva, obſerved by Ray; Dauphiné, Piedmont, Carniola, and Arragon, in dry woody places. It flowers the end of May or the beginning of June, and ripens its ſeeds in September. Introduced in 1773, by the earl of Bute.

14. Geniſta Hiſpanica, dwarf prickly geniſta or broom: ſpines decompound; flowering branches unarmed; leaves linear-lanceolate, hairy; legumes ovate, ſtraight. This riſes with woody ſtalks, two or three feet high, ſending out many taper-channelled branches, which grow erect; flowers yellow, in terminating ſpikes, ſucceeded by ſhort pods, which turn black when ripe, and contain four or five kidney-ſhaped ſeeds. Native of Spain, South of France, and Carniola; flowers in June and July, and the ſeeds ripen in autumn.

15. Geniſta Luſitanica, Portugal geniſta or broom: ſtem leafleſs; thorns decuſſated. The woody ſtems are leafleſs; the younger ſtems leafy, and covered with decuſſated ſpines. Native of Portugal. Introduced in 1771, by Mrs. Primmet. It flowers from March to May.

16. Geniſta ſcandens, climbing geniſta or broom: ſpines ſimple; ſtem climbing; leaves bipinnate. This is a large ſhrub, with a very long, round, climbing, branched, ſtem, having many ſhort recurved ſpines ſcattered over it. Native of Cochin-china, near rivers, mounting to the top of large trees, and covering them with its golden flowers.

17. Geniſta hirſuta, or hirſute geniſta: ſpines ternate, decuſſated; leaves ſimple, lanceolate; ſpikes terminating, hirſute. This is a very thorny rigid ſhrub, with round branches, leafleſs below, extremely hirſute at the top. Native of Old Caſtile.

Propagation and Culture. All theſe ſhrubs are propagated by ſeeds, which, if ſown in the autumn, will ſucceed much better than if ſown in the ſpring, and a year will be thereby ſaved; as theſe plants ſend out long, ſtringy, tough, roots, which run deep into the ground, they do not bear tranſplanting well, eſpecially if they are not removed young; therefore the beſt way is to ſow a few ſeeds in thoſe places where the plants are deſigned to remain, and to pull up all except the moſt promiſing plants as ſoon as they are paſt danger; after this the plants will require no other culture, but to keep them clean from weeds: but where this cannot be practiſed, the ſeeds may be ſown thin upon a bed of light earth, and when the plants come up, they muſt be kept clean from weeds till the following autumn, when the plants ſhould be carefully taken up and tranſplanted where they are deſigned to remain. Some of the ſorts are very hardy, and will grow in almoſt any ſoil or ſituation; but moſt of them (1, 2, 3, 4, 6, 9, 11, 14, 15, 17,) muſt have a ſheltered ſituation and dry ſoil, to carry them through our winters. The firſt, third, and ſixteenth, require the protection of a green-houſe. The ſorts which do not produce ſeeds here may be increaſed by layers. See Aspalathus, Crotalaria, Hedysarum, Indigofera, Sophora, and Spartium.

GENIS'TA AFRICANA. See Aspalathus, Borbonia, Liparia, Sophora, and Spartium.

GENIS'TA SPARTIUM. See Anthyllis, Genista, Hedysarum, Psoralea, and Ulex.

GENIS'TA SPINOSA. See Hedysarum and Ulex.

GENIS'TÆ AFFINIS. See Psoralea.

GENISTEL'LA. See Aspalathus and Genista.

GEN'ITAL, *adj.* [*genitalis*, Lat.] Generative; ſerving to generation.

GEN'ITAL, *ſ.* the organ of procreation. See Anatomy, vol. i. p. 618–621.

GEN'ITALS, *ſ.* [*genitalis*, Lat. from *geno*, or *gigno*, to beget.] Parts belonging to generation.—Ham is conceived to be Jupiter, who was the youngeſt ſon who is ſaid to have cut off the *genitals* of his father. *Brown.*

GENI'TE, a town of France, in the department of the Correze: eighteen miles weſt of Brive.

GE'NITES, *ſ.* among the Hebrews, thoſe deſcended from Abraham, without any mixture of foreign blood. The Greeks diſtinguiſhed by the name of *genites* ſuch of the Jews as were iſſued from parents, who, during the Babyloniſh captivity, had not allied with any gentile family.

GEN'ITING, *ſ.* [A corruption of *Janeton*, French, ſignifying *Jane* or *Janet*, having been ſo called in honour of ſome lady of that name; and the Scottiſh dialect calls them *Janet*-apples, which is the ſame with *Janeton*; otherwiſe ſuppoſed to be corrupted from *Juneting*.] An early apple gathered in June.—In July come early pears, and plumbs in fruit, *genitings* and codlins. *Bacon.*

GEN'ITIVE, *ſ.* & *adj.* [*genitivus*, Lat.] In grammar, the name of a caſe, which, among other relations, ſignifies one begotten, as, the father *of a ſon*; or one begetting, as, ſon *of a father*.—See the article Grammar.

GE'NIUS, *ſ.* [Latin; *genie*, Fr.] The protecting or ruling power of men, places, or things:

The *genius* and the mortal inſtruments
Are then in council; and the ſtate of man,
Like to a little kingdom, ſuffers then. *Shakeſpeare.*

And as I awake, ſweet muſic breathe,
Sent by ſome ſpirit to mortals good,
Or th' unſeen *genius* of the wood. *Milton.*

A man endowed with ſuperior faculties.—There is no little writer of Pindaric who is not mentioned as a prodigious *genius*. *Addiſon.*—Mental power or faculties:

The ſtate and order does proclaim
The *genius* of that royal dame. *Waller.*

Diſpoſition

Diſpoſition of nature by which any one is qualified for ſome peculiar employment.—A happy *genius* is the gift of nature. *Dryden.*

One ſcience only will one *genius* fit;
So vaſt is art, ſo narrow human wit. *Pope.*

Nature; diſpoſition.—Another *genius* and diſpoſition improper for philoſophical contemplations, is not ſo much from the narrowneſs of their underſtanding, as becauſe they will not take time to extend them. *Burnet.*

Studious to pleaſe the *genius* of the times,
With periods, points, and tropes, he ſtuns his crimes.
Dryden.

The two great ornaments of the human character, *taſte* and *genius*, are correctly drawn, and happily contraſted, by Dr. Blair, in his "Lectures on Rhetoric and the Belles Lettres." His remarks are as follow: "Taſte and genius are two words frequently joined together; and therefore, by inaccurate thinkers, confounded. They ſignify however two quite different things. The difference between them can be clearly pointed out; and it is of importance to remember it. *Taſte* conſiſts in the power of judging: *genius*, in the power of executing. One may have a conſiderable degree of taſte in poetry, eloquence, or any of the fine arts, who has little or hardly any genius for compoſition or execution in any of theſe arts; but genius cannot be found without including taſte alſo. Genius, therefore, deſerves to be conſidered as a higher power of the mind than taſte. Genius always imports ſomething inventive or creative; which does not reſt in mere ſenſibility to beauty where it is perceived, but which can, moreover, produce new beauties, and exhibit them in ſuch a manner as ſtrongly to impreſs the minds of others. Refined taſte forms a good critic; but genius is farther neceſſary to form the poet, or the orator.

"It is proper alſo to obſerve, that genius is a word, which, in common acceptation, extends much farther than to the objects of taſte. It is uſed to ſignify that talent or aptitude which we receive from nature, for excelling in any one thing whatever. Thus we ſpeak of a genius for mathematics, as well as a genius for poetry; of a genius for war, for politics, or for any mechanical employment. This talent or aptitude for excelling in ſome one particular, is, what we receive from nature. By art and ſtudy, no doubt, it may be greatly improved; but by them alone it can never be acquired. As genius is a higher faculty than taſte, it is, according to the frugality of nature, more limited in the ſphere of its operations. It is not uncommon to meet with perſons who have an excellent taſte in ſeveral of the polite arts, ſuch as muſic, poetry, painting, and eloquence, all together: but, to find one who is an excellent performer in *all* theſe arts, is much more rare; or rather, indeed, ſuch an one is not to be looked for. A ſort of univerſal genius, or one who is equally and indifferently turned towards ſeveral different profeſſions and arts, is not likely to excel in any. Although there may be ſome few exceptions, yet in general it holds, that when the bent of the mind is wholly directed towards ſome one object, excluſive, in a manner, of others, there is the faireſt proſpect of eminence in that, whatever it be. The rays muſt converge to a point, in order to glow intenſely. This remark is of great importance to young people; in leading them to examine with care, and to purſue with ardour, the current and pointing of nature towards thoſe exertions of genius in which they are moſt likely to excel.

"A genius for any of the fine arts, always infers or ſuppoſes taſte; and it is clear, that the improvement of taſte will ſerve both to forward and to correct the operations of genius. In proportion as the taſte of a poet, or orator, becomes more refined with reſpect to the beauties of compoſition, it will certainly aſſiſt him to produce the more finiſhed beauties in his work. Genius, however, in a poet or orator, may ſometimes exiſt in a higher degree than taſte; that is, genius may be bold and ſtrong, when taſte is neither very delicate nor very correct. This is often the caſe in the infancy of arts; a period when genius frequently exerts itſelf with great vigour, and executes with much warmth; while taſte, which requires experience, and improves by ſlower degrees, hath not yet attained to its full growth. Homer and Shakeſpeare are proofs of this fact, in whoſe admirable writings are found inſtances of rudeneſs and indelicacy, which the more refined taſte of later writers, who had far inferior genius to them, would have taught them to avoid. As all human perfection is limited, this may very probably be the law of our nature, that it is not given to one man to execute with vigour and fire, and, at the ſame time, to attend to all the refined graces that belong to the exact perfection of his work: while, on the other hand, a thorough taſte for thoſe inferior graces, is, for the moſt part, accompanied with a diminution of ſublimity and mental power."

The manners and literary character of thoſe who are uſually termed *men of genius*, cannot be more forcibly depicted than in the "Eſſays" recently publiſhed by J. D'Iſraeli. He juſtly obſerves that 'the modes of life of a man of *genius* are often tinctured with eccentricity and enthuſiaſm. Theſe are in an eternal conflict with the uſages of common life. His occupations, his amuſements, and his ardour, are diſcordant to daily purſuits, and prudential habits. It is the characteriſtic of genius to diſplay no talent to ordinary men; and it is unjuſt to cenſure the latter when they conſider him as born for no human purpoſe. Their pleaſures and their ſorrows are not his pleaſures and his ſorrows. He often appears to ſlumber in diſhonourable eaſe, while his days are paſſed in labours, more conſtant and more painful than thoſe of the manufacturer. The world is not always aware that to meditate, to compoſe, and even to converſe with ſome, are great labours: and as Hawkeſworth obſerves, "that wearineſs may be contracted in an arm chair."

'Such men are alſo often cenſured for an irritability of diſpoſition. Many reaſons might apologize for theſe unhappy variations of humour. The occupation of making a great name, is, perhaps, more anxious and precarious than that of making a great fortune. We ſympathiſe with the merchant when he communicates melancholy to the ſocial circle in conſequence of a bankruptcy, or when he feels the elation of proſperity at the ſucceſs of a vaſt ſpeculation. The author, how great ſoever his genius, is not leſs immerſed in cares, or agitated by ſucceſs; for literature has its bankruptcies and its ſpeculations. The anxieties and diſappointments of an author, even of the moſt ſucceſsful, are incalculable. If he is learned, learning is the torment of unquenchable thirſt, and his elaborate work is expoſed to the accidental recollection of an inferior mind, as well as the fatal omiſſions of wearied vigilance. If he excels in the magic of diction, and the graces of fancy, his path is ſtrewed with roſes, but his feet bleed on inviſible yet piercing thorns. Rouſſeau has given a glowing deſcription of the ceaſeleſs inquietudes by which he acquired ſkill in the arts of compoſition; and has ſaid, that with whatever talent a man may be born, the art of writing is not eaſily obtained.'—

'It is obſerved by M. La Harpe, that as it has been proved there are ſome maladies peculiar to artiſts, there are alſo ſorrows which are peculiar to them; and which the world can neither pity nor ſoften, becauſe it cannot have their conceptions. We read not without a melancholy emotion, the querulous expreſſions of men of genius. We have a little catalogue *de calamitate litteratorum*; we might add a volume by the addition of moſt of our own authors.—The votaries of the arts and ſciences are called by Cicero, Heroes of Peace; their labours, their dangers, and their intrepidity, make them heroes;

heroes; but peace is rarely the ornament of their feverish exiſtence.'

'Men of genius are often reverenced only where they are known by their writings. In the romance of life they are divinities, in its hiſtory they are men. From errors of the mind, and derelictions of the heart, they may not be exempt; theſe are perceived by their acquaintance, who can often diſcern only theſe qualities. The defects of great men are often the conſolation of dunces. For their foibles it appears more difficult to account than for their vices; for a violent paſſion depends on its direction to become either excellence or depravity; but why their exalted mind ſhould not preſerve them from the imbecilities of fools, appears a mere caprice of nature. A curious liſt may be formed of

"Fears of the brave and follies of the wiſe." *Johnſon.*

'But it is alſo neceſſary to acknowledge, that men of genius are often unjuſtly reproached with foibles. The ſports of a vacant mind are miſunderſtood as follies. The ſimplicity of truth may appear vanity, and the conſciouſneſs of ſuperiority, envy. Nothing is more uſual than our ſurpriſe at ſome great writer or artiſt contemning the labours of another, whom the public cheriſh with equal approbation. We place it to the account of his envy; but perhaps this opinion is erroneous, and claims a conciſe inveſtigation. Every ſuperior writer has a manner of his own, with which he has been long converſant, and too often inclines to judge of the merit of a performance by the degree it attains of his favourite manner. He errs, becauſe impartial men of taſte are addicted to no manner, but love whatever is exquiſite. We often ſee readers draw their degree of comparative merit from the manner of their favourite author; an author does the ſame; that is, he draws it from himſelf. Such a partial ſtandard of taſte is erroneous; but it is more excuſable in the author than in the reader.

'This obſervation will ſerve to explain ſeveral curious phenomena in literature. The witty Cowley deſpiſed the natural Chaucer; the claſſical Boileau, the rough ſublimity of Crebillon; the forcible Corneille, the tender Racine; the affected Marivaux, the familiar Moliere; the artificial Gray, the ſimple Shenſtone. Each judged alike of the genius of his competitor by that peculiar manner he had long formed for himſelf. In a free converſation they might have contemned each other; and a dunce, who had liſtened without taſte or underſtanding, if he had been a haberdaſher in anecdotes, would have haſtened to repoſit in his warehouſe of literary falſities, a long declamation on the vanity and envy of theſe great men.'—

'It has long been acknowledged that every work of merit, the more it is examined, the greater the merit will appear. The moſt maſterly touches, and the reſerved graces, which form the pride of the artiſt, are not obſervable till after a familiar and conſtant meditation. What is moſt refined is leaſt obvious; and to ſome muſt remain unperceived for ever.—But aſcending from theſe elaborate ſtrokes in compoſition, to the views and deſigns of an author, the more profound and extenſive theſe are, the more they elude the reader's apprehenſion. The happieſt writers are compelled to ſee ſome of their moſt magnificent ideas float along the immenſity of mind, beyond the feeble graſp of expreſſion. Compare the genius of the author with that of the reader; how copious and overflowing is the mind of the one to the other; how more ſenſibly alive to a variety of exquiſite ſtrokes which the other has not yet perceived; the author is familiar with every part, and the reader has but a vague notion of the whole. How many noble conceptions of Rouſſeau are not yet maſtered! How many profound reflections of Monteſquieu are not yet underſtood! How many ſubtile leſſons are yet in Locke, which no preceptor can teach!

'Conſciouſneſs of merit characteriſes men of genius; but it is to be lamented that the illuſions of ſelf-love are not diſtinguiſhable from the realities of conſciouſneſs. If we were to take from ſome men their pride of exultation, we annihilate the germ of their excellence. The perſuaſion of a juſt poſterity ſmoothed the ſleepleſs pillow, and ſpread a ſunſhine in the ſolitude, of Bacon, Monteſquieu, and Newton; of Cervantes, Gray, and Milton. Men of genius anticipate their contemporaries, and know they are ſuch, long before the tardy conſent of the public.'—Yet, after all, we muſt conclude with Hermogenes, that "genius is like a comet; neither its periods nor its effects are known."

GEN'LIS, a town of France, in the department of the Aiſne, and chief place of a canton, in the diſtrict of Chauny: three miles north of Chauny, and twelve ſouth of St. Quintin.

GENNA'DIUS, patriarch of Conſtantinople in the fifth century. He was firſt ordained a preſbyter of the Conſtantinopolitan church, from which ſituation he was elected to the patriarchal dignity in 458, on the death of Anatolius. He employed himſelf with great zeal and diſintereſtedneſs in correcting the relaxed ſtate of diſcipline which prevailed in his dioceſe. In a council of ſeventy-three biſhops which he held in the year 459, he procured the paſſing of a canon againſt ſimoniacal ordinations; and by means of Marcian, whom he appointed ſteward of his dioceſe, eſtabliſhed the diſintereſted regulation, that the oblations made in the reſpective churches, which it had been cuſtomary to claim for the patriarch's treaſury, ſhould thenceforward belong to the officiating clergy. He died in 471. Gennadius, the prieſt of Marſeilles, places him among the celebrated eccleſiaſtical writers, and paſſes encomiums on the quickneſs of his parts, the extent of his learning, and the elegance of his ſtyle. He was the author of A Commentary upon the Book of Daniel; and of ſeveral Homilies, and other works. Theſe writings, however, are no longer extant; and no remains of them have reached modern times, excepting A Synodal Epiſtle againſt Simony, inſerted in the fourth volume of the Collect. Concil. and two fragments, one from a letter or treatiſe againſt the anathemas of Cyril of Alexandria, quoted by Facundus biſhop of Hermiana, lib. ii. cap. 4. and the other from a treatiſe addreſſed to Parthenius, and quoted by Leontius in his common-places concerning the origin of the ſoul.

GENNA'DIUS, patriarch of Conſtantinople in the fifteenth century, whoſe original name was George Scolarius, which he changed upon embracing the eccleſiaſtical life. His abilities recommended him to employment at court, where he roſe to the office of ſecretary to the emperor John Palæologus, and was afterwards appointed chief judge of the Greeks. In 1438 he accompanied the emperor into Italy, to meet the council of Florence, for the purpoſe of bringing about an union between the Greek and Latin churches. After the return of Scholarius to Conſtantinople, he united with Mark of Epheſus in ſtrongly oppoſing the reception of thoſe terms of union to which the emperor had acceded, both by his perſonal influence and by his writings. He died about the year 1460; and was the author of An Explanation of the Chriſtian Faith, delivered before the Turkiſh Emperor Mahomet, inſerted in Greek, Latin, and Turkiſh, in Cruſius's *Turco-Græcia*, lib. ii. and in Greek and Latin in David Chytræus's *De Statu Eccleſiarum in Græcia*. A book containing Articles of Faith, addreſſed to the ſame emperor, in the form of a dialogue between a Turk and the patriarch, which is inſerted in the Hæreſiologia, publiſhed at Baſil 1556, and ſeparately edited at Helmſtadt, 1611, 8vo. A Treatiſe concerning Predeſtination, firſt edited in Greek by David Hæchelius, 1593, 4to. and afterwards in Greek and Latin by Frederic Morell, and ſubjoined to the Appendix to the Works of St. Baſil, Paris, 1618, &c. A Treatiſe on the Doctrine of the Trinity, publiſhed in Greek and Latin by Aldus Manutius, 1501, 4to. and a vaſt number of letters,

letters, orations, homilies, theological diſſertations, controverſial tracts, &c. which ſtill remain in manuſcript in different public libraries.

GENNA'DIUS, an eccleſiaſtical writer who flouriſhed towards the cloſe of the fifth century, was a native of Gaul, and became a prieſt of Marſeilles, and not biſhop of that city as ſome writers have maintained. Both ancients and moderns have differed widely in their judgments concerning his doctrines. This, at leaſt, is certain, that he controverted the opinions of St. Auguſtine on the ſubjects of grace and predeſtination, in which he concurred with the learned Fauſtus biſhop of Riez. From a catalogue given of his works, it appears, that he had written eight books againſt all the hereſies, ſix books againſt Neſtorius, three books againſt Pelagius, and a treatiſe concerning the Millennium and the book of Revelation, which are no longer extant. The only remains of this author which have reached our times are, a treatiſe *De Viris illuſtribus*, which is a continuation of St. Jerome's Catalogue of Eccleſiaſtical Writers, from 392 to 395, and has been printed with it at different times; and a treatiſe *De Fide, ſeu de Dogmatibus Eccleſiaſticis Liber ad Gelaſium Papam miſſus*. The laſt-mentioned work was for a long time attributed to St. Auguſtine, and was generally inſerted in the editions of his works. It was ſeparately printed with the learned notes of Elmonhorſtius at Hamburgh, in 1614, 4to. Of the time of the author's death nothing is known with any certainty, excepting that it did not take place before the year 395. His learning appears to have been very reſpectable, and the ſtyle of his writings is ſimple, perſpicuous, and elegant. There is a Life of St. Jerome, in the fourth volume of Mabillon's *Vetera Analecta*, which that father aſcribes to this author.

GEN'NE, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the diſtrict of Saumur, near the Loire: three leagues north-weſt of Saumur.

GEN'NEP, a town of Germany, in the circle of Weſtphalia, and duchy of Cleves, ſituated on the Niers, near the Meuſe. It contains a church for Roman Catholics, and another for Proteſtants: nine miles ſouth-ſouth-weſt of Cleves. Lat. 51. 43. N. lon. 23. 28. E. Ferro.

GEN'NEPER-HUYS, a town of Germany, in the circle of Weſtphalia, and duchy of Cleves: nine miles ſouth-ſouth-weſt of Cleves.

GEN'NES, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of La Guerche: five miles north-eaſt of La Guerche.

GENNES'ARET, land of. See GADARENES.

GENNES'ARETH, lake of, or GENASSAR water. See GALILEE, ſea of.

GEN'OA, an ancient and reſpectable ſtate or province of Italy; bounded on the north by Piedmont, the Mileneſe, and the Parmeſan, on the eaſt by Tuſcany, on the ſouth by the Mediterranean ſea, and on the weſt by the county of Nice; about 120 miles in length, but ſcarcely in any part more than twenty in breadth. The country is mountainous, and part of it covered with barren rocks, which ſerve for its defence. Some of the mountains are covered with wood, and ſome yield good paſture. There is not an adequate portion of arable land, ſo that the inhabitants are obliged to purchaſe great part of their corn from Naples, Sicily, and other places; however, they carefully cultivate every place they can, and throughout the year they are ſupplied with excellent legumes and vegetables for the table. They make a conſiderable quantity of wine, and have abundance of excellent fruit, eſpecially citrons, oranges, pomegranates, almonds, and figs. A great number of mulberry trees are raiſed to feed ſilk-worms, and olives grow in great plenty, eſpecially round the Gulf of Spezzia. Salt is produced ſufficient for exportation. A great number of ſmall rivers run from the mountains, but none worthy of any other name than brooks. The inhabitants are Roman catholics, and ſubmit to the tribunal of inquiſition. The proteſtants, who dwell in the towns, are not beloved, but are ſuffered by the magiſtrates to live in peace. The manufactures are not ſo flouriſhing as they formerly were; the moſt conſiderable are velvet, pluſh, damaſk, different kinds of ſilk, for which they purchaſe a great deal of raw ſilk from Meſſina and other places; gold and ſilver ſtuffs, lace, gloves, ſtockings, ribbons, ſoap, paper to imitate the Indian, &c. Other articles of commerce are oil, fruit, macaroni, confectionary, Parmeſan cheeſe, anchovies, &c. The manufactures of the Genoeſe are greatly reduced: too great a price being paid for the articles which they manufacture, and the inſecurity of their ports, contribute greatly to enfeeble their commerce. Genoa has been for ages paſt declared a free port; but then Leghorn is likewiſe a free port with ſtill greater liberty. The banking buſineſs in Genoa is very conſiderable, and the bankers are eſteemed the richeſt in Europe.

The city of Genoa was formerly the capital of Liguria; whence its ſubſequent temporary title of *Ligurian Republic*. It was deſtroyed by the Carthaginians, and rebuilt by the Romans, whoſe ally it became, and whoſe fortune it followed. It fell under the power of the Oſtrogoths, from whom it was taken by Beliſarius. In 670, it was ſacked by the Lombards, under whoſe power it remained till they were expelled from Italy by Charlemagne. It was for ſome time under the German empire, but by degrees erected itſelf into an independent ſtate: Its power ſoon after ſo increaſed by its flouriſhing trade, that, in 806, it reduced the iſland of Corſica, and, in the 11th and 12th centuries, diſtinguiſhed itſelf in the cruſades.

The Genoeſe, in the 12th century, ſubjected the half of Sardinia and the city of Syracuſe, with its dependencies, to their dominion, and even made themſelves maſters of the Black Sea and all its ports, and ſettled themſelves in the Crimea. In the 13th century, they added to their conqueſts the towns of Albengo, Savona, Vintimiglia, and others in their neighbourhood; and for the ſuperiority of the ſea, engaged in a long and troubleſome war with Venice, which laſted till the year 1381. By it they were extremely weakened, and rendered unable to maintain their poſſeſſion of the Crimea, from which they were entirely driven in 1471. In the ſixteenth century, their republic and liberty ſuffered many rude ſhocks; and the inteſtine diſſenſions about the form of government ſo debilitated the ſtate, that they were obliged to put themſelves ſometimes under the protection of the dukes of Milan, and ſometimes under the kings of France: but the latter treating them with intolerable haughtineſs and rigour, they ſtruggled hard, but unſucceſsfully, for liberty, till that naval hero, Andrew Doria, in 1528, reſcued his country out of the hands of their tyrannical maſters, ſettled it in perfect freedom, and eſtabliſhed its independent conſtitution. See the biographical account of DORIA, vol. vi. p. 25. —After that period Genoa generally ſided with Spain, which frequently involved it in quarrels with France: and it alſo had a dangerous neighbour in the dukes of Savoy. In 1684, it was cruelly bombarded by the French, and to ſave itſelf from total deſtruction, was obliged to ſubmit to very hard terms; two of which were, that the doge or duke, with four of the counſellors, ſhould appear in perſon at Verſailles, and aſk pardon; and that the ſtate ſhould diſarm all their gallies to ſix, with a promiſe not to fit out more without the knowledge and conſent of the French king.

In the year 1713, Charles VI. ſold the marquiſate of Finale to the republic of Genoa for a conſiderable ſum of money. In 1743, the queen of Hungary having, at the treaty of Worms, ceded to the king of Sardinia all her rights to the town and marquiſate of Finale, and

demanding that the Genoeſe ſhould deliver up the marquiſate, they entered into a defenſive alliance with France, Spain, and Naples; and, in 1745, declared war againſt the king of Sardinia. The king of Sardinia made himſelf maſter of great part of the ſtate; ſeveral Genoeſe ports were bombarded by an Engliſh fleet; and, by their aſſiſtance, the imperialiſts became maſters of Genoa.—After the city had been thus conquered by the Auſtrians, Botta, the general of the empreſs queen's forces, had, by his inſolent menaces, ſo terrified the ſenate and nobles, that theſe daſtardly grandees reſolved to reſign the whole republic into his hands, and to throw themſelves on his mercy. Adorno alone, who commanded the Genoeſe troops in Savona, behaved with becoming ſpirit: he declared that he was determined to defend the place to the laſt extremity; and that he had made a will, by which he had deſtined all his fortune to the relief of the widows and children of thoſe of his countrymen who might be ſlain during the ſiege. To the meſſengers ſent by the affrighted ſenate to command him to reſign the town to the Auſtrians, he anſwered, "that he had been entruſted with the defence of it by a *free* republic, and would not obey the orders of an *enſlaved* republic to reſign it." Accordingly he ſuſtained a ſiege and blockade of three months. The rapacity of the Auſtrians in the mean time was inſatiable, and they added the moſt intolerable cruelty to their exceſſive extortions. There were, however, in Genoa forty thouſand men, who were neither nobles nor ſenators: but whoſe conduct deſerved a more honourable title than any which kings and ſenates can excluſively beſtow. The Auſtrians were about to carry off the cannon, in order to employ them againſt the allies of the republic; which excited the utmoſt indignation:—during this operation, an officer happened to ſtrike a Genoeſe, who did not obey his orders with ſufficient alacrity; the Genoeſe inſtantly ſtabbed him to the heart: this was the ſignal for a general onſet; the people attacked the Auſtrians with ſtones, which were the only weapons they then had: but they ſoon procured other arms, notwithſtanding the attempt of the doge and ſenate to prevent them. Botta, the imperial general, was mad with rage: "Shall the Auſtrians, (he cried,) who drove the French out of Italy, tremble before a Genoeſe mob?" Yet this Genoeſe mob in 1747, defeated them repeatedly, ſlew ſeveral thouſands of them, made four thouſand priſoners, and at length drove them entirely out of the city. Its tranquillity, after this warfare, was permanently reſtored by the treaty of Aix-la-Chapelle, in 1748.

The ancient nobility conſiſted of twenty-eight families, and were thoſe whom Andrew Doria, in 1528, ſeparated from all the reſt, and declared only capable of holding the chief offices and dignity of doge or duke; all the other inhabitants of Genoa being reduced by him to the claſs of commoners. After that time it was found neceſſary to create other nobility. The nobility of Genoa as a commercial republic, were always allowed to keep manufactures of velvet, ſilk, and cloth; to farm the duties, and to have ſhares in merchant veſſels; but all other buſineſs and handy-crafts were forbidden. The form of government in this republic has always been ariſtocratic. The chief was called doge, or duke, to which dignity no perſon was promoted till he was fifty years of age, and had for fifteen years left off all trade or occupation not conſiſtent with nobility. Every two years a new doge was choſen; and the former incapacitated during five years to hold again the ſame poſt. However, he had a procurator's office aſſigned him, and a penſion of five hundred ſcudi for life. The fleet of this republic, anciently ſo celebrated for its victories over the Saracens, Piſaneſe, Venetians, Spaniards, and Turks, and for continuing a conſiderable time maſters of Sardinia, Malta, Majorca, Minorca, Candia, Cyprus, and many other places in and near the Mediterranean and Archipelago, and even of the Black ſea, the Crimea, and other parts, has for a number of years paſt been reduced to only ſix gallies.

In the ſubſequent hiſtory of this republic, nothing particular occurs till the commencement of the French revolution, and the invaſion of Italy by the armies of that republic. Upon this occaſion, the French made the ſtricteſt promiſes to obſerve the reſpect due to the ſovereignty of Genoa, on its own territory; and they were kept, accordingly, on this occaſion, to the particular ſatisfaction of the Genoeſe, who were exceedingly ſolicitous to preſerve their neutrality in the midſt of hoſtilities which it was not in their power to remove from their neighbourhood. The maſs of the inhabitants of Genoa, however, was, in 1794, inclined to the French ſyſtem, but the nobles continued inveterate to democratical principles. In the diſtricts ſituated along the mountainous country, bordering upon the territories of Genoa, numbers of banditti infeſted the roads; and were privately encouraged by the Auſtrian emiſſaries at Genoa, whoſe reſidence in that city was ſtrongly ſuſpected to be connived at by ſome leading men in the Genoeſe government. Theſe ſuſpicions, and the repugnance of the nobles to favour popular notions, prevented a cordial correſpondence from ſubſiſting between this ſtate and the French republic.

As the nobility of Genoa exerciſed the ſupreme ſway, they were juſtly apprehenſive that the French, if ſucceſsful, would deſtroy the ariſtocracy, and erect a government entirely democratical. From that motive, they oppoſed the projects of the French, by every impediment they could poſſibly throw in their way; but the torrent of that irreſiſtible fortune, which attended the triumphant arms of France, overwhelmed Genoa in common with the reſt of Italy. The majority of the people were deſirous of a popular government. Feuds had, of courſe, ariſen amongſt them and the dependents of the nobility. A deſperate fray took place betwixt both parties, ſhortly after the ſigning of the preliminaries of peace between the emperor and the French. Elated by that event, the republican party raiſed a violent commotion in the city, and proceeded to open force, in ſupport of their pretenſions: but many of them were killed, and the inſurrection was ſuppreſſed. As their principal leaders had fallen, their projects were conſidered as at an end, and they were treated with exceſſive ſeverity. Determined, however, not to yield, they applied to Bonaparte for protection. This was readily granted, and the French having taken poſſeſſion of the city, the enemies to the ariſtocracy could no longer, with ſafety, be oppoſed. Their opponents yielded, and, in 1797, agreed to the eſtabliſhment of a commonwealth, under the name of the *Ligurian republic*, on the principle of a perfect equality of rank and privileges among all the claſſes of ſociety. The French ſyſtem of legiſlation took place in every reſpect; and the territory of Genoa was divided into communes and municipalities, in imitation of France.

Owing to the ſucceſſes of the Auſtro-Ruſſians, Genoa and its ſmall territory were the only poſſeſſions remaining to France, in Italy, at the cloſe of the year 1799. In the following year, Genoa was the head quarters of the French, commanded by Maſſena, who, on the 5th of April, was ſuddenly ſurpriſed by the appearance of an Engliſh fleet, under lord Keith, in the gulf, off the city, which was ſoon blockaded in form; while, on the other hand, the army of the imperial general Melas, approached cloſely to it by land. The Auſtrians immediately made a general attack on the French army. The French were driven as far back as Ruha, which they entered in the evening.

Though forced to retire, the French, with much bravery, defended the city till the 15th of May, when the Engliſh fleet began to bombard Genoa every night. The populace, particularly the women, ran about the ſtreets,

ſtreets, ſetting up frightful cries for peace; and a general inſurrection againſt the French would have enſued, if the efforts of the French ſoldiers to reſtrain it had not been ſeconded by a number of individuals among the inhabitants. But the illuſions of hope, at laſt, vaniſhed. Proviſions were entirely exhauſted, even the laſt horſes and dogs were conſumed, when Maſſena received a letter from general Melas, inviting him to an interview with lord Keith, and the generals Otto and St. Julian, who offered him a capitulation on the moſt honourable terms. To this firſt overture, he replied, that he would conſider of it; though, in reality, he had nothing to conſider. The day after, he received another meſſage with the ſame terms. He then ſent the adjutant-general Andreaux, under pretence of ſome buſineſs relating to the priſoners, to Rivolo, in order that he might receive the propoſals of the allies, and enter, without any further delay, into a negociation for peace.

The firſt article of capitulation propoſed by the allies, was, that the army ſhould return to France, but that the general ſhould remain a priſoner of war. "You, ſir, (ſaid lord Keith to Maſſena,) are worth twenty thouſand men." But Maſſena ſaid, "that no negociation would be gone into, if the word capitulation was to be made uſe of." On the 4th of June, the allied generals, having given up their firſt propoſal, reſumed the negociation. In the mean time, the city of Genoa, containing a population of one hundred and ſixty thouſand ſouls, though a prey to all the horrors of famine, remained quiet. A great number of old people, women, and children, reduced to the neceſſity of attempting to ſuſtain nature by herbs, roots, and impure animals, died of diſeaſes or inanition. This melancholy picture was daily exhibited to view by the riſing ſun. Mothers were found dead with hunger, and children, at the breaſt, alſo dead, or dying.

On the 4th of June, 1800, the principal articles for the evacuation of Genoa were agreed upon between the French adjutant-general Andreaux, on the one part, and major-general Reſt, a ſtaff officer in the imperial ſervice, with the Engliſh captain Rivers, on the other. On the 5th, lord Keith, commander of the combined naval forces in the Mediterranean, general Otto, commander of the blockade of Genoa, with general St. Julian, who was charged with the political part of the negociation, were met by general Maſſena, commander in chief of the French army in Italy. Each of theſe parties was accompanied by only two or three gentlemen. In this conference, Maſſena diſplayed much French fineſſe under the cloak of an apparent gaiety, which formed a complete contraſt with the gravity of the other contracting party, and was attended with this advantage, that it did not look as if he was greatly alarmed for the ſituation of his army. And it was, perhaps, owing to that eaſe and gaiety of manner that he obtained, in the end, all that he had demanded. In the whole of the conference, lord Keith treated Maſſena, as the general himſelf acknowledged, in a very civil and liberal manner. His lordſhip diſclaimed all hard conditions, and ſaid, "General, the defence you have made has been ſo heroic, that it is impoſſible to refuſe you any thing you aſk." At length, Maſſena ſigned the treaty for the evacuation of Genoa, and the contracting parties mutually gave hoſtages. The Auſtrians took poſſeſſion of the gates of the city, and the Engliſh of the entrance into the harbour. The battle of Marengo, however, ſoon after, changed the fate of Genoa; it was again ſurrendered by general Melas to the French, and again the *Ligurian republic* was for a ſhort period eſtabliſhed. Bonaparte was crowned king of Italy on the 26th of May, 1805; and it was expected that Genoa would ſoon be made an appendage to that newly-created kingdom. He however thought fit to unite it, not to his kingdom of Italy, which was to paſs into the hands of another perſon, but to the *French empire*. This took place on the 2d of June following. The reaſon aſſigned for incorporating this territory with France, was the refuſal of Great Britain to acknowledge the Ligurian republic. The ancient Liguria is now divided into three department, of which Genoa, Savona, and Chiavari, are the chief cities.

The city of Genoa is about ten miles in circumference, and defended towards the land by a double wall. Several baſtions are erected along the ſea-ſhore, on rocks which riſe above the water. The ſtreets are in general narrow, but clean and well-paved; two, called the *Strada Nuova* and *Strada Balbi*, are filled with magnificent palaces, built with marble. It is the ſee of an archbiſhop. The cathedral is built in the Gothic ſtyle, and paved with black and white marble, in the treaſury of which is preſerved a curious hexagon diſh, ſaid to be of a ſingle emerald, found at Ceſarea in the time of the cruſades, which the Genoeſe received as their ſhare of the plunder. This precious mineral is now diſcovered to be nothing more than coloured glaſs, as noticed under the article GEM, p. 301 of this volume. Beſides the cathedral, it contains thirty-two pariſh churches, many of which are magnificent, and adorned with ſculptures and pictures by the beſt maſters. The doge's palace is large, without decoration, except two ſtatues of John Andrew Doria and Andrew Doria, larger than the life, at the entrance. The arſenal contains curious arms and military machines, models for bridges, the armour worn by a number of Genoeſe women in the cruſades, a ſhield containing 120 piſtols, made by Julius Ceſar Vecche, for the purpoſe of aſſaſſinating the doge and ſenate at one time. Other public buildings, entirely of marble, are the Albergo, which ſerves as a poor houſe and houſe of correction, where is a beautiful relievo, the Virgin ſupporting a dead Chriſt, by Michael Angelo; and the Aſſumption of the Virgin, in white marble, by Puget, an inimitable piece of ſculpture; a large hoſpital for the ſick of all nations and religions; the Conſervatory, for educating and portioning 300 poor girls; and a great number of palaces belonging to the nobility. They reckon at Genoa ſixty-nine convents of men and women. The buildings are in general of marble. Yet it is not extravagance, but neceſſity, which compels the uſe of this material; the ſurrounding mountains abounding with nothing elſe but quarries of that beautiful ſtone. The number of inhabitants is eſtimated at 160,000: ſixty-three miles ſouth of Milan. Lat. 44. 25. N. lon. 26. 35. E. Ferro.

GEN'OLHAC, or GENOUILLAC, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Alais: five leagues north-weſt of Alais, and ten weſt of Pont St. Eſprit.

GENO'SA, a town of Italy, in the kingdom of Naples, and province of Otranto: ten miles ſouth-eaſt of Otranto.

GENOVE'SI (Anthony), a celebrated Neapolitan philoſopher, born in 1712, at Caſtiglione, in the diſtrict of Salerno. His father deſtined him from his earlieſt years to the church; and with this view had him inſtructed in the Latin language and the peripatetic philoſophy, which was then prevalent in all the ſchools. In his ſixteenth year he poſſeſſed ſo much readineſs in diſputation, that he was able to reduce to a dilemma the moſt experienced monks in the convents of the place, though he could not form a clear idea either of the ſubject of the diſpute, or of the common terms of the art by which he bewildered his antagoniſt. His penetration and boldneſs in doubting every thing that appeared not founded on reaſon, excited, at an early period, his ſuſpicion of a philoſophy which preſented nothing but obſcurity, and an ardent deſire to obtain a ray of light which might conduct him to the paths of truth. His progreſs in theology and juriſprudence, and particularly the ſciences, civil and canon law, excited general aſtoniſhment, inſomuch that the archbiſhop of Conza, conceiving

ceiving a high opinion of his talents, admitted him as teacher of rhetoric into his ſeminary. After the death of his patron, who conſecrated him a prieſt in 1736, he left the ſeminary of Salerno, and repaired to Naples to follow the practice of the law. But his turn for ſolitary meditation being ill ſuited to the declamation of a court of juſtice, he reſolved to devote himſelf to philoſophy. After preparing himſelf at Naples by reading and ſtudying the ancient and modern philoſophers, he obtained the place of extraordinary-profeſſor of metaphyſics. He commenced a courſe of lectures in November 1741, and the boldneſs of his manner, and the clearneſs with which he explained and illuſtrated the principles of his ſyſtem, brought him an uncommon concourſe of ſcholars. The general principles on which he founded his philoſophy were as follows:—Every thing that has no relation to the well-being of man, and for which reaſon can aſſign no grounds, ought to be entirely baniſhed from philoſophy. The greater part of the peripatetic ontology he conſidered as uſeleſs. In regard to the doctrine of the exiſtence of matter, extenſion, the nature of ſpace, motion, eternity, and the like, he candidly acknowledged his ignorance, and aſſerted that no philoſopher had ever yet comprehended it. A ſyſtem of metaphyſics which conducted back the mind to the ſtraight road to truth, could not fail to ſtir up againſt the author the ſlaves of the old empire of darkneſs and ignorance, who confounded reaſon and infidelity. Scarcely had the firſt part of his Metaphyſics made its appearance in 1743, when a hoſt of foes ſtarted up againſt him from all quarters. In every page they found traces or proofs of ſcepticiſm and unbelief; and he was even accuſed of opening a door to freethinking in Italy, becauſe he recommended the works of Galileo, Grotius, and Newton. But Galiani, the director of the Neapolitan univerſities, ſincerely rejoiced to ſee ſuch a light kindled up in his native country; and he had nothing ſo much at heart as to give the exalted genius of Genoveſi every poſſible opportunity to ſpread inſtruction among the people. He therefore perſuaded the king to beſtow on him the vacant place of profeſſor of ethics, and thus opened to him a new field for combating the ignorance and prejudice of the ſchools. Genoveſi taught this ſcience according to a plan which was totally unknown in the ſeminaries of Naples. He interwove in his lectures the hiſtory of the human paſſions; and enlivened them by a boldneſs and ſpirit which were peculiarly his own. At this time there were a great many works on logic uſed in the ſchools of Italy, but none of them gave rules for thinking and judging of objects in a rational manner. To remedy this deficiency, Genoveſi compoſed a new ſyſtem of logic, which he dictated in his private lectures, and which was publiſhed in 1745, under the title of *Elementorum Artis Logico-criticæ, Libri quinque.* Such a ſyſtem of logic, in a public ſchool of Italy, was a phenomenon of the happieſt influence. It put into the hands of young perſons the key of truth, and enabled the author to bring out, with more advantage, the ſecond and third part of his Metaphyſics, in which he treated on the doctrine of the ſoul and on natural theology. This he did in the years 1747 and 1751. The ſame ſpirit of love, truth, and forbearance, prevails in his Chriſtian theology, which he taught in private lectures, under the title of *Omnigenæ Theologiæ Elementa, Hiſtorico-critico-dogmatica.* He alſo publiſhed Eſſays on Agriculture, with Conſiderations on the true Object of the Sciences, printed in 1753. In 1754, Genoveſi opened, in the univerſity of Naples, his new profeſſorſhip in domeſtic economy, with an introductory lecture. His chief object was, while he taught the principles of political economy, to inſpire the Neapolitan youth with the ſocial and civil virtues, and above all a public ſpirit of patriotiſm, without which no nation can attain to that height of proſperity of which it is ſuſceptible. With this view, he cauſed Carey's Hiſtory of the Engliſh Trade to be tranſlated into Italian, under his own inſpection, and publiſhed at Naples in 1757, with many uſeful notes. He alſo cauſed to be republiſhed at Naples the excellent Treatiſe on Agriculture by Coſino Trinci of Piſtoia, accompanied with an eſſay, in which he explained the cauſes of the decline and neglect of agriculture in the kingdom of Naples. In 1765, he publiſhed another no leſs important treatiſe, in which he examined the queſtion, Why countries, the moſt fruitful by nature, are often expoſed to the miſeries of ſcarcity and famine? While employed in publicly teaching political economy, he had the pleaſure of ſeeing his Logic and Metaphyſics introduced, not only into different univerſities, but alſo into various convents and monaſteries. This encouraged him to turn his attention, during his leiſure hours, to the other departments of philoſophy, the object of which is to improve the underſtanding; and in 1758 he publiſhed, with general approbation, *Meditazioni filoſophiche ſulla Religione e ſulla Morale,* in which he ſhews the connection between natural religion and morality. His humorous letters, which appeared in 1759, under the title of *Lettere all Amico Provinciale,* in oppoſition to the *Diſſertazini Filoſophiche* of Paſquale Magli, were read with much pleaſure. In 1764, he gave to the public a treatiſe *De Jure & Officiis,* which he had dictated to his pupils at private hours, and in which he deduced the duties and rights of man from nature. His *Lettere Academiche,* in which he examined the celebrated queſtion, Whether the ſciences have been of more hurt than benefit to mankind? appeared alſo in 1764. He was induced to undertake this work in conſequence of the writings of Rouſſeau, who at that time made a great noiſe in the world, and by the inſtigation of his literary friends. Some dialogues, added at the end, are a concealed ſatire on the Neapolitan laws. The *Conſiderazioni ſulle Scienze,* added to his Logic, abounds with new and ingenious ideas. In the Italian metaphyſics he diſpenſes with the dark ſubject of ontology, and begins with coſmology. But his maſter-piece was the Italian Syſtem of Morality, the firſt part of which appeared in 1767, under the title of *Dicoſyna*: the total derangement of his health, however, prevented him from completing his labour. The ſeeds of a mortal diſeaſe had been long lurking in the conſtitution of this eminent man. In 1768 his complaints increaſed ſo much, that he was incapable of continuing his lectures. That he might not have to ſtruggle at the ſame time with poverty, the king made an addition to his ſalary; but he died on the 22d of September, 1769, of the dropſy in the breaſt, in the fifty-ſeventh year of his age, lamented by all thoſe who had at heart the improvement of their country, and particularly by the Neapolitan youth, for the ſake of whoſe inſtruction he had renounced all ſocial enjoyment, and even ſacrificed his life. His principal works were reprinted in 1764, in 5 vols. 4to.

GENOUILLA'T, a town of France, in the department of the Creuſe, and chief place of a canton, in the diſtrict of Bouſſac; three leagues weſt of Bouſſac.

GENOUILLE', a town of France, in the department of the Charente: ten miles weſt of St. Jean d'Angely.

GENOUILLE', a town of France, in the department of the Vienne: one league ſouth of Civray.

GEN'SAC, a town of France, in the department of Gironde, and chief place of a canton, in the diſtrict of Libourne: three leagues ſouth-eaſt of Libourne, and three north of Caſtelmoron d'Albert.

GEN'SERIC, or GIZERIC, a renowned king of the Goths or Vandals. See the article GOTHS, in this volume.

GENT, *adj.* [old French.] Elegant; ſoft; gentle; polite. *A word now diſuſed:*

She, that was noble, wiſe, as fair and *gent,*
Caſt how ſhe might their harmleſs lives preſerve. *Fairfax.*

GENTEEL', *adj.* [*gentil,* Fr.] Polite; elegant in behaviour;

behaviour; civil.—He had a *genteeler* manner of binding the chains of this kingdom than moſt of his predeceſſors. *Swift.*—Graceful in mien.—So ſpruce that he can never be *genteel*. *Tatler.*—Elegantly dreſſed.—Several ladies that have twice her fortune, are not able to be always ſo *genteel*, and ſo conſtant at all places of pleaſure and expence. *Law.*

GENTEEL'NESS, *ſ.* Elegance; gracefulneſs; politeneſs.—Parmegiano has dignified the *genteelneſs* of modern effeminacy, by uniting it with the ſimplicity of the ancients, and the grandeur and ſeverity of Michael Angelo. *Reynolds.*—Qualities befitting a man of rank.

GENTEEL'Y, *adv.* Elegantly; politely.—After a long fatigue of eating and drinking, and babbling, he concludes the great work of dining *genteelly*. *South.*—Gracefully; handſomely.

GEN'TIAH, a town of Aſia, in the country of Aſſam: 370 miles eaſt of Patna. Lat. 25. 10. N. lon. 92. 10. E. Greenwich.

GEN'SING, *ſ.* [Chineſe.] A reſtorative root brought from China. See the article PANAX.

GENTIA'NA, *ſ.* [from Gentius, king of Illyria.] GENTIAN; in botany, a genus of the claſs pentandria, order digynia, natural order rotaceæ, (Gentianæ, *Juſſ.*) The generic characters are—Calyx: perianthium five-parted, ſharp; diviſions oblong, permanent. Corolla: petal one, tubular at the bottom, imperforate, at the top five-cleft, flat, withering, various in form. Stamina: filaments five, ſubulate, ſhorter than the corolla; anther ſimple. Piſtillum: germ oblong, cylindric, length of the ſtamens; ſtyles none; ſtigmas two, ovate; (germ ſuperior; ſtyle ſimple, or two ſeſſile ſtigmas, *Gærtner.*) Pericarpium: capſule oblong, columnar, acuminate; ſlightly bifid at the tip, one-celled, two-valved. Seeds: numerous, ſmall, (fixed all round to the walls of the capſule, *G.*) receptacles two, each faſtened longitudinally to a valve.—*Eſſential Character.* Corolla monopetalous; capſule ſuperior, two-valved, one-celled; with two longitudinal receptacles.

Deſcription. The numerous ſpecies of this genus have very few characters in common; ſome of them indeed differ ſo much from others, that they have been ranged under ſeparate genera, and ſome are yet of opinion that the genus ſhould be divided. They are all herbaceous plants; the gentians properly ſo called are perennial; moſt of the gentianellas and the centauries are annual; the leaves are ſimple, ovate, lanceolate, or linear, or between theſe figures, oppoſite on the ſtem, and entire; commonly marked with five or three ſtrong nerves; flowers either axillary or terminating, ſolitary or elſe in bunches or whorls; antheræ coaleſcing in ſeveral of the ſpecies, as in ſyngeneſia monogamia. The figure of the fruit is conſtant: but both that and the number in the flower varies much in the different ſpecies. Some ſpecies exclude a fifth part of the number in the flower. One adds three parts of the number in the flower. One ſpecies has the neck of the corolla ſpreading: a ſecond has the neck cloſed with hairs: a third has the ſegments of the corolla ciliate: a fourth has a bell-ſhaped, upright, plaited border: in a fifth it is ſtarred, with ſmall ſegments interpoſed between the larger ones: ſome have a bell-ſhaped, and others have a funnel-ſhaped corolla, &c.

Species. I. Corollas five-cleft or thereabouts, and ſomewhat bell-ſhaped. 1. Gentiana viſcoſa, or clammy gentian: corollas five-cleft, one-ſtyled; panicles trichotomous; bractes perfoliate; leaves oblong, three-nerved. See EXACUM *viſcoſum*, vol. vii. p. 92.

2. Gentiana lutea, or yellow gentian: corollas uſually five-cleft, wheel-ſhaped in whorls; calyxes ſpathaceous. Root thick, of a yellowiſh brown colour, and very bitter taſte; lower leaves petioled, oblong-ovate, a little pointed, ſtiff, yellowiſh green, having five large veins on the back, and plaited; ſtem three or four feet high and more, with a pair of leaves at each joint, ſeſſile or almoſt embracing, of the ſame form with the lower ones, but diminiſhing gradually to the top; flowers in whorls at the upper joints; when the flower opens the calyx burſts on the ſide; fruit ſhort, ſwelling in the middle; ſeeds often barren. Native of Lapland, Sweden, Germany, Swiſſerland, France, Italy, and North America. Haller obſerves that it occupies large tracts of country, untouched by any cattle. It flowers in June and July.

Our old authors call it *felwort* and *bitterwort*. Before hops had eſtabliſhed their reputation, this with many other bitter herbs was occaſionally uſed in brewing. Mr. Houghton (at the end of the 17th century) affirms, that he has divers times ſold it for that purpoſe. The root of this ſpecies of gentian, imported from Swiſſerland, Germany, &c. is the principal bitter now employed in medicine, though the roots of ſeveral other ſorts are ſaid to be equally efficacious, and are even preferred by ſome. As the intenſe bitters are generally admitted to be not only tonic and ſtomachic, but alſo anthelmintic, antiſeptic, emmenagogue, antiarthritic, and febrifuge, this root has a better claim to the poſſeſſion of theſe powers than moſt of the kind. Many dyſpeptic complaints, though ariſing from the debility of the ſtomach, are more effectually relieved by theſe bitters than by Peruvian bark: and gentian, joined with equal parts of tormentil or galls, has conſtantly ſucceeded, as we are told by Dr. Cullen, in curing intermittents, if given in ſufficient quantity. As a ſimple bitter, gentian is rendered more grateful to the ſtomach by the addition of an aromatic, and for this purpoſe orange-peel is commonly uſed. Gerarde informs us, that "maſter Iſaac de Laune, a learned phiſition, ſent him plants of this for the encreaſe of his garden from Burgundie: and that it is named in Engliſh *felwoort gentian*, *bitterwoort*, *baldmoyne*, and *baldmoney*."

3. Gentiana purpurea, or purple gentian: corollas uſually five-cleft, bell-ſhaped in whorls; calyxes truncate. Root as thick as a man's arm, and two feet long, white within and ſtriated on the outſide, extremely bitter, and uſed medicinally in ſome countries, inſtead of G. lutea, with equal ſucceſs; ſtem ſmaller, a foot or eighteen inches in height; leaves ſomewhat broader. Haller is of opinion that it can ſcarcely be ſeparated from the ſixth ſpecies. Native of Denmark, Swiſſerland, and Sileſia.

4. Gentiana macrophylla, or long-leaved gentian: flowers five-cleft, ſeſſile, in whorls; root-leaves equal to the ſtem, which is almoſt naked. Root creeping, with a tranſverſe ſtock, and abundance of whitiſh fibres; root-leaves often a ſpan in length, ſtanding up above the ſtem, broad-lanceolate, five-nerved, ſheathing at the baſe; flowering-ſtem coming out on the ſide of theſe, procumbent at the bottom but gradually riſing, having only one or two pairs of leaves, beſides the floral ones on the top. In its habit this is between the purpurea and cruciata, as decumbens and algida are between this and pneumonanthe. The herbaceous part is hardly bitter. Native of all Siberia, eſpecially the eaſtern part, where the cruciata is not found; flowering in July and Auguſt.

5. Gentiana campanulata, or bell-ſhaped gentian: corollas bell-ſhaped, ſeven-cleft, ſtreaked, unſpotted; calyxes ſeven-cleft. Root yellow on the outſide, very bitter, fuſiform, branched. Native of Carinthia, on Mount Garten in Reichenau; flowering in July. Diſcovered originally by Burſer.

6. Gentiana punctata, or ſpotted-flowered gentian: corollas bell-ſhaped, five-cleft or thereabouts, dotted; calyxes five-toothed. This agrees in many reſpects with G. pannonica, but the leaves are more ovate, leſs elongated, and more ſtrict. Native of Auſtria, Sileſia, Italy, &c.

7. Gentiana pannonica, or rough gentian: corollas bell-ſhaped, ſix or ſeven-cleft, dotted; calyxes uſually ſix-cleft; ſtem-leaves lanceolate, acuminate. Root yel-

lowiſh on the outſide, whitiſh within, intenſely bitter: the whole plant is ſmooth and ſhining; ſtem from half a foot to two feet in height, round or ſlightly angular, erect, a finger thick at the baſe, which is covered with ſheathing ſcales, having a bifid or trifid mouth; leaves oppoſite, broad ovate or lanceolate, acute, quite entire, bright green, ſomewhat plaited, having five prominent pale nerves on the back, attenuated into connate petioles; the upper ones more ſeſſile. Although this reſembles G. purpurea, yet it has a much ſmaller flower, of a different colour from that; the ſtem-leaves alſo are ovate and ſharpiſh, but never produced into a point. Native of Swiſſerland, the Tyrol, Sileſia, and the Carpathian mountains.

8. Gentiana ſeptemfida, or ſeven-cleft gentian: corollas ſeven and five cleft, with ciliate ſegments interpoſed; leaves ovate-acuminate, ſomewhat ſtem-claſping. Stem a foot or eighteen inches in height, having the air of G. aſclepiadea, round, ſmooth, quite ſimple; the whole plant is ſmooth; both root and herb are very bitter. Native of the mountains of Perſia near the Caſpian ſea, and of the Cherſoneſus Taurica.

9. Gentiana aſclepiadea, or ſwallow-wort leaved gentian: corollas five-cleft, bell-ſhaped, oppoſite, ſeſſile; leaves ſtem-claſping. Stem upright, near a foot high; leaves ſmooth, about two inches long, and three quarters of an inch broad at the baſe, embracing there, and ending in an acute point; they are of a fine green, have five longitudinal veins, joining at both ends, but diverging in the middle, and reſembling thoſe of aſclepias, whence it has the trivial name. This is the moſt taſteleſs and leaſt bitter of the genus. Ray ſays that the root is very bitter. Native of Swiſſerland, Hungary, Stiria, Auſtria, Sileſia, Piedmont, Barbary, mount Caucaſus, &c. It flowers with us in July and Auguſt. Cultivated in 1629, as appears from Parkinſon.

10. Gentiana triflora, or three-flowered gentian: corollas bell-ſhaped, five-cleft, aggregate-ſeſſile; leaves linear; floral leaves four, two longer and two ſhorter. Root fibrous; root-leaves none; ſtem upright, very ſtraight, a ſpan high, round, furniſhed with very ſmall leaves at the bottom, becoming gradually longer higher up, decuſſately oppoſite; they are ſtiff and ſomewhat rigid, blunt at the end, and turned back at the edge; the largeſt are near three inches in length. It is really different from G. pneumonanthe, with which it may eaſily be confounded, from having a flower of the ſame colour, by its being ſo ſtiffly upright, and bitter. It flowers in July and Auguſt. Native of Eaſtern Siberia.

11. Gentiana pneumonanthe, marſh gentian, or calathian violet: corollas five-cleft, bell-ſhaped; flowers peduncled; leaves linear. Stem upright, about a foot high; leaves ſmooth, an inch and half long, and leſs than a quarter of an inch broad; flowers on the top of the ſtalk, three or four in number, on peduncles alternately above each other; they are large, and, being of a deep blue colour, make a fine appearance. The flowers, according to Haller, are ſolitary and almoſt ſeſſile in the axils or boſoms of the leaves. Pollich ſays, that one terminates the ſtem, and the reſt are axillary, ſolitary, and ſubſeſſile; Scopoli, that the lower corollas are peduncled and from the axils. Krocker deſcribes them as terminating and axillary, peduncled, ſolitary or in pairs, ſix, eight, or ten, in the whole, with two or four ſtipules under the peduncles. Theſe variations occur in different ſoils and ſituations: with us certainly the plant ſeldom bears more than one or two flowers; but after a wet ſpring it is found much more luxuriant, bearing five, ſix, or ſeven, flowers.

Pallas diſtinguiſhes this from his triflora, by its having a more ſlender ſtalk, and the leaves more lanceolate and acute; one flower at the end, the reſt axillary, all peduncled when there are ſeveral; for ſometimes there is no more than one; calyx deeply five-cleft, the ſegments linear, two alternate ones larger than the reſt; corolla larger, more dilated at the throat, plaited, the ſegments ſharper and ſubſerrate, with a tooth of the plait between each. The ſtructure of the flower therefore is very different from the foregoing.

Native of Sweden, Denmark, England, Swiſſerland, Carniola, the Palatinate, Sileſia, Piedmont, in the temperate parts of Ruſſia and all Siberia, in moiſt meadows and marſhes; Ray found it near Lindau in Germany. It flowers in Auguſt and September; or, as Linnæus obſerves, with the colchicum. With us it is not very common in the ſouth, but in the north much more ſo; in Lincolnſhire and Yorkſhire abundant, in the boggy parts of heaths, as in Tatterſhal park; found by Mr. Newton between Clapham and Engleton; near Doncaſter by Mr. Tofield; near Milthorp in Weſtmoreland, and in Lancaſhire common; near Tunbridge in Kent, by Dr. Wilmer; on Longfield downs near Graveſend, near Greenhithe, Cobham, &c. in Kent, and near Bath, by Gerarde; at Lellingſtone, and near Dartford in Kent, and in the weſt country in divers places, by Parkinſon. Johnſon (Ger. emac.) is of opinion that Gerarde did not know the plant, and ſays that he never found it but once, and that was on a wet mooriſh ground in Lincolnſhire, called Netleton moor, two or three miles on this ſide Caſter. Johnſon was ſo well acquainted with Kent, that he cannot well be deceived. On Stratton Strawleſs heath, near Norwich, by Stillingfleet.

12. Gentiana ſaponaria, or ſoapwort-leaved gentian: corollas five-cleft, bell-ſhaped, ventricoſe in whorls; leaves three-nerved. This riſes uſually ſixteen inches high, with upright ſtraight ſtems, having long ſharp-pointed oppoſite leaves, ſpreading horizontally; from the axils of theſe come out four or five blue flowers. Native of North America. Introduced in 1776, by Mr. William Young; it flowers in Auguſt and September.

13. Gentiana villoſa, or hairy gentian: corollas five-cleft, bell-ſhaped, ventricoſe; leaves villoſe. Native of Virginia.

14. Gentiana acaulis, dwarf gentiana, or gentianella: corolla five-cleft, bell-ſhaped, higher than the ſtalk. Root large, woody, branched; ſtem from only one to three inches in height, with one or two pairs of leaves on it, and terminated by one very large, upright, handſome flower; in a garden, when the plants are ſtrong, there are ſometimes more. This plant, in its natural alpine ſituation, has little or no ſtem, whence its trivial name; but it acquires one in a ſtate of cultivation. Native of Swiſſerland, Auſtria, Carniola, and Sileſia; Ray remarked it on the higheſt parts of mount Jura; it flowers in our gardens in April and May, and ſometimes a ſecond time in the autumn; in the Alps the time of flowering is June, July, and Auguſt; it was cultivated in 1629, according to Parkinſon; and in 1636, it was to be found in moſt of our choice gardens, as with Mr. Parkinſon, Tradeſcant, Tuggye, &c.

15. Gentiana nana, or tufted dwarf gentian: corolla five-cleft, bell-ſhaped, bearded on the throat, ſtem-leaves ovate. Root ſmall, annual, very ſlender, bitteriſh; ſtems in tufts, from an inch to a ſpan in height, ſeldom branched, decumbent at bottom, then upright, jointed, leafy, terminated by one flower; it flowers at the end of Auguſt. Native of Dauphiné, Savoy, Piedmont, Sileſia; diſtinguiſhed from G. nivalis, to which it is very nearly allied, by its tender ovate leaves without veins, its ſlender ſtalks bearing uſually one flower only, the ſegments of the flower nearly erect, and the calyx by no means long, and tubular.

16. Gentiana exaltata, or crowned gentian: corollas five-cleft, crowned notched, peduncle very long, dichotomous, terminating. This riſes with an upright branching ſtalk, near two feet high; the upper part divides into ſeveral forks, between which are ſix or ſeven long naked peduncles, each ſuſtaining one large blue flower. Native of the Weſt Indies, diſcovered by Plumier; and found afterwards by Houſtoun plentifully at

Vera

Vera Cruz, in low moiſt places, where the water ſtagnates, remote from the coaſt.

17. Gentiana decumbens, or creeping gentian: corollas five-cleft, bell-ſhaped, root-leaves lanceolate, very long; ſtalk decumbent. Root perennial; ſtems one or two, coming out on the ſide of the bunch of leaves, decumbent at bottom, then riſing, a ſpan or a foot in height, naked at bottom, a pair of leaves in the middle, bearing leaves and flowers at the end. Native of the farther Siberia, flowering from July till ſtopped by the froſt; it is gently bitter and aromatic, hence it is uſed medicinally in Thibet.

18. Gentiana algida, or cold gentian: corollas five-toothed, bell-ſhaped, ſeſſile dotted, root-leaves in bunches. Root perennial; ſtem very ſtraight, round, from a finger's length to a ſpan in height, with two or three pairs of broad-lanceolate three-nerved leaves on it, ſlightly ſheathing it at the baſe; it reſembles the foregoing ſpecies, and is very nearly allied to it, but differs in ſome eſſential characters; Gmelin therefore makes it a variety of G. pneumonanthe, and Linnæus of G. punctata, without reaſon. Found on the ſnowy alpine tops of eaſtern Siberia, and other parts of the Ruſſian empire; flowering in Auguſt; intenſely bitter, and proper to be uſed medicinally.

19. Gentiana ſaxoſa, or ſtony gentian: corollas five-cleft, bell-ſhaped, leaves ſpatulate. Stem herbaceous, ſingle, ſlender, round, grooved, erect, ſmooth and even, a hand or a ſpan in height; leaves yelloviſh green, two inches long; root-leaves approximating, on ſubimbricate channelled petioles. Flowers white, upright. Native of New Zealand; found in Duſky-bay, March 7, 1773.

20. Gentiana montana, or mountain gentian: corollas five-cleft, bell-ſhaped, leaves heart-ſhaped ſeſſile. Native of New Zealand; found alſo in Duſky-bay.

21. Gentiana glauca, or blue gentian: corolla five-cleft, bell-ſhaped; flowers ſeſſile; leaves ovate-rounded. Stem ſimple, round, upright, from two to four inches in height, having three or four pairs of ſeſſile leaves on it, which are ſomewhat fleſhy, and ſmaller than the root-leaves; flowers uſually three, ſeldom one only at the end, together with an acceſſory pair from the uppermoſt axils. Native of the higheſt mountains of Kamtſchatka; flowering from June to Auguſt, and ripening its ſeeds in September. There is a variety, in high, expoſed, rocky ſituations, with two or three flowers ſitting cloſe to the root-leaves, without any ſtalk.

II. Corollas five-cleft, or thereabouts, and funnel-ſhaped. 22. Gentiana verna, or green gentian: corolla five-cleft, longer than the ſtalk; root-leaves crowded, larger than the others. This is a little plant, hardly two inches high; a perennial yellow branched root puts up ſeveral ſimple ſtalks, each ſupporting one flower; it differs from G. pumila, in the leaves being channelled, more rigid, and half-ſtem-claſping; the plaits of the calyx, terminating it in ſo many teeth, elevated; the little ears or proceſſes emarginate; the ſtigmas finely ſerrate, and reſembling a little drinking glaſs. Native of Swiſſerland, Savoy, Piedmont, Auſtria, Carniola, Sileſia; flowering early in the ſpring; both in moiſt meadows and in alpine ſituations: on the high Alps it flowers later; it varies with a white flower; a beautiful blue colour may be extracted from the flowers as they are more commonly found.

23. Gentiana pyrenaica, or pyrenean gentian: corolla ten cleft, equal, the outer diviſions ruder than the others. This is very like the foregoing, but the corolla is regularly ten-cleft, the ſegments blunt, the alternate or outer ones green on the outſide, within all are blue; leaves linear or linear-lanceolate; ſtalk perennial, procumbent, with upright branches, bearing one flower the length of the branch. Native of the Pyrenees.

24. Gentiana altaica, or altaic gentian: corolla ten-cleft, the clefts alternately ſmaller and ſerrulate; ſtalk ſhorter than the flowers. Root ſlender, two or three inches long; both root-leaves and ſtem-leaves cloſely imbricate, ſubulate-linear, ſharp; ſtem uſually ſingle, but ſometimes two or three, about an inch in length, ſomewhat naked under the flower, with one pair of leaves near it: it is very nearly allied to G. pyrenaica, and like that is almoſt void of bitterneſs; it may therefore only be a variety ariſing from ſituation; the principal difference conſiſts in the ſuperior ſize of the flower, the ſtrength of the whole plant, and the ſhortneſs of the ſtalk; G. pumila of Linnæus and Jacquin, ſeems to be the ſame plant with the pyrenaica. Native of the ſnowy cliffs of the Altaic Alps.

25. Gentiana pumila, or ſmall gentian: corolla five-cleft, ſubſerrate, leaves lanceolate-linear. Stem one-flowered, about an inch in height, with two pairs of leaves, one near the calyx, which is cloven half-way down, and is angular with five raiſed lines. Haller is of opinion that this does not differ from G. verna: and Pallas cannot ſee any difference between the ſpecimens which he received of this from Jacquin, and the pyrenaica. Native of the mountains of Dauphiné, Auſtria, and Carniola.

26. Gentiana Bavarica, or Bavarian gentian: corolla five-cleft, ſerrate, leaves ovate, obtuſe. Leaves blunt, not ſharp, as in G. verna; ſtem often proſtrate, three inches or more in height, with eight or ten pairs of ovate leaves on many; flower ſolitary, large, blue; but it varies with a white flower, like moſt of the others. Native of Swiſſerland and Germany; about the lake Baikal, and on the Carpathian mountains in the Ruſſian empire, flowering early in the ſpring; the Siberian plant is taller, and larger in all the parts, than the German.

27. Gentiana aurea, or golden gentian: corollas five-cleft, extremely acuminate; throat beardleſs and awnleſs, branches oppoſite. Root, annual; ſtem, erect, a ſpan high. Native of the mountains about Bourdeaux, and of Norwegian Lapland.

28. Gentiana nivalis, or winter gentian: corollas five-cleft, branches one-flowered alternate. Stem ſometimes one-flowered, but frequently branched, having one flower coming out from each axil regularly one above another, often alternately, but ſometimes in pairs: found in the mountains of Lapland; in the Alps of Swiſſerland, where as Haller obſerves it is a genuine alpine plant; and between Savoy and Piedmont, as Mont Cenis, &c. and on the Pyrenees, adorning them, as Linnæus ſpeaks, with the ſplendour of its deep vivid blue flowers; it has alſo been found by Mr. Dickſon on Ben Lawers in Scotland. It varies, like moſt of the others, with a white corolla; the fading from blue to white is indeed very common in flowers.

29. Gentiana aquatica, or water gentian: corollas five-cleft, terminating ſeſſile, leaves membranaceous at the edge. Stems from two to twenty, uſually ſimple, but ſometimes branched dichotomouſly, in the flowering plant very ſhort, but in the fruiting plant lengthened out, the leaves becoming more remote and produced into an oblong form; flowers ſmall, blue, varying to green and white; it approaches very near to G. nivalis; and is larger in cold ſituations, than in more ſouthern ones; being very bitter, it is uſed medicinally in Dauria. It flowers in the middle of May, and is found from the river Jeniſea, to the eaſtern ocean, in ſandy wet meadows, and eſpecially by lakes and rivers; it is found alſo in China and Japan.

30. Gentiana utriculoſa, or bottle gentian: corollas five-cleft, ſalver-ſhaped, calyxes plaited and keeled. Root ſlender, fuſiform, fibrous, yellow, annual, (perennial, *Allioni*;) ſtem upright, a finger's length or a hand in height, ſometimes higher, ſlightly angular, ſmooth; branches oppoſite, each with the ſtem terminated by one flower. Ray remarks, that this ſpecies differs from all the gentianellas which he has obſerved, in having the

tube of the corolla no longer than the calyx, but the ſegments of the former ſpreading immediately over the top of the latter, as in the pink. Mr. Miller obſerves, that after the top flower decays, there are frequently two ſmaller flowers come out from the ſide of the ſtalk, at the two upper joints; theſe flowering after each other, there is a ſucceſſion of flowers till autumn. Native of the mountains of Swiſſerland, Germany, Auſtria, Idria, and Italy; flowering in June. Ray relates that he found it abundantly in going from Munich to Augſbourg.—This alſo varies with a white flower.

31. Gentiana exacoides, or healing gentian: corollas five-cleft, ſalver-ſhaped, calyxes membranaceous and keeled, ſtalk dichotomous, leaves cordate. The whole plant is only about a finger's length. Native of the Cape of Good Hope. It ſeems to belong to a different genus.

32. Gentiana centaurium, centaury gentian, or ſmaller centaury: corollas five-cleft, ſtem dichotomous, piſtil ſimple. Smooth and glaucous; ſtalk from four inches to a foot in height, upright, hexangular, or quadrangular, generally ſimple, but frequently putting out upright ſimple branches ſome way above the root, and ſometimes branching all the way to the top; ſeeds roundiſh, yellow. Our Gerarde, remarked (1597), that "the flowers, (which he deſcribes as growing at the top of the ſtalk in a ſpokie buſh or rundell, of a red colour tending to purple,) in the day time, and after the ſun is up, do open themſelves, and towards evening do ſhut up again." Native of moſt parts of Europe from Sweden and Denmark, ſouthwards to Italy; and in all the temperate parts of Ruſſia, in dry paſtures; flowering from June to Auguſt.

This ſpecies is extremely bitter, with a diſagreeable flavour, whence Haller obſerves that it was called *fel terræ*, or gall of the earth, by the ancients; he alſo determines it to be the *graveolentia centaurea* of Virgil, to which Lucretius gives a more ſignificant epithet of *triſtia*, expreſſive of its extreme bitterneſs. It is the baſis of the famous Portland powder, which prevents fits of the gout, when taken in a large quantity, and a long time together; but is ſaid to bring on hardneſs of the liver, palſy, and apoplexy; a tincture of the leaves, and the upper part of the root, is a good medicine to weak ſtomachs and cachectic habits; a decoction of the whole plant deſtroys lice, and cures the itch. It is not uncommon with a white corolla; this alſo is ſometimes only four-cleft; in boggy places it is found with a very ſhort ſtem, remarkably branched. Although good reaſons be given by Mr. Curtis and Dr. Stokes, why this ſpecies ſhould be removed into the genus Chironia, yet averſe from change we have left it where Linnæus placed it, and other botaniſts ſtill continue it.

33. Gentiana pulchella, or neat gentian: corolla five-cleft, tube elongated, ſtyle ſimple, ſtalk quite ſo. Stem ſcarcely an inch high. Native of Sweden.

34. Gentiana verticillata, or whorled gentian: corollas quinquefid, in whorls eight together. Stem about a hand high, round, and ſomewhat woody. Native of the Eaſt Indies. Linnæus ſuppoſes the South American plant to be the ſame with this; it has however a more tender branched ſtalk than the American; the leaves are ſhorter snd narrower; the corollas narrower, with a longer tube, and ſharp but not mucronate ſegments; the calyxes ovate-acute, with ſegments ſhorter than the capſule; in the American plant the ſtem is more ſtiff and robuſt, with the angles ſomewhat rugged, not ſmooth and even; the ſegments of the calyx narrower and reflex. See No. 37.

35. Gentiana maritima, or procumbent ſea gentian: corollas five-cleft, ſtyles twin, ſtem dichotomous few-flowered. This reſembles G. centaurium, but the flowers are peduncled and yellow; the leaves have not three nerves, but one only. Gerard adds, that the tube of the corolla is longer, the flowers fewer in number, and the ſtyle double. And Pallas, that the ſegments of the calyx are almoſt capillary; the tube of the corolla very narrow, dilated at the throat, the ſegments of the border nearly linear; ſtem ſeldom more than a hand high, ſharply four-cornered, dichotomous at top; leaves uſually oval, not ovate-lanceolate as in G. centaurium. Native of the ſea coaſts in the ſouth of France, and Italy; about Naples, &c. alſo about Tiflis, and every where on the ſhore of the Euxine, where it has uſually white corollas; likewiſe in the Azores; it is annual, and flowers in May; with us in July and Auguſt.

36. Gentiana ſpicata, or ſpiked gentian: flowers alternate, ſeſſile, corollas five-cleft. This is an annual plant, with an upright ſtalk, about a foot high, ſending out ſeveral branches towards the top; the flowers are produced from the ſide and at the top of the ſtalk, in looſe irregular umbels; they are white, and about the ſize of thoſe of common centaury. Native of the ſouth of France and Italy.—This has frequently purple corollas.

37. Gentiana verticillaris, or rounded gentian: flowers in whorls, corollas five-cleft, ſtalk extremely ſimple. Native of America.—The Eaſt-Indian plant, No. 34, is ſcarcely different. Koenig ſent two plants from the Eaſt Indies, both agreeing with the Linnæan character, but very diſtinct from each other; with the ſtalk angular at the baſe, but the upper part round, branched and ſtreaked; the leaves lanceolate and three-nerved, the flowers in whorls from the upper axils; this is the ſame with that which is deſcribed above. With the ſtalk regularly four-cornered, and perfectly ſimple; the leaves linear-lanceolate, fleſhy, and nerveleſs; flowers from every axil, of the ſame form and ſize as the others; this is the plant which is figured by Burman.

38. Gentiana quinqueflora, or five-flowered gentian: corollas five-cleft, ſtalk acute-angled, leaves ovate, ſtem-claſping. Size and ſtature of G. amarella; ſtem undivided, four-cornered with the corners membranaceous. Found in Pennſylvania by Kalm.

39. Gentiana ſcilloides, or ſquill-like gentian: corollas five-cleft, bractes in pairs, ſtalk one-flowered, proſtrate branched, leaves obovate obtuſe, three-nerved. A foot in height, tender and very ſmooth, with but few branches. Found in the Azores by Maſſon. See No. 35.

40. Gentiana aphylla, or leafleſs gentian: corolla five-cleft, ſalver-ſhaped, ſtalk leafleſs. A very ſmall, filiform, annual plant, ſcarcely branched, native of the mountainous woods of Martinico; in the hollows of trees, ſcarcely previous to the light; ſtem upright, ſimple, four inches high, tender, ſhining, ſtraw-coloured, with oppoſite, very ſhort, remote, ſtipules, at the joints; flower terminating, ſolitary, erect, yellowiſh, inodorous.

41. Gentiana amarella, or autumnal gentian: corolla ſalver-ſhaped, five-cleft (ſometimes four or even three), bearded at the throat, ſegments of the calyx five, equal. So nearly allied, ſays Linnæus, to G. campeſtris, as to be ſcarcely diſtinguiſhable, except by the calyx; ſtem ſomewhat angular, branched, erect, bearing ſeveral pairs of ſeſſile, ovate, three-nerved, dark-green leaves, and clothed from top to bottom with flowers, on ſhort, axillary, forked, ſide-branches, one being terminal. Found in dry paſtures, through moſt parts of Europe, with us not uncommon, eſpecially in calcareous ſoils; flowering from July to September; Linnæus ſays, in the autumn, with Colchicum or meadow ſaffron, later than Campeſtris; according to Ray, at the end of Auguſt, or ſomewhat earlier. A variety under the name of "the taller autumnal gentian, with centaury-like leaves," is ſaid, in Ray's Synopſis, to have been found near Welwyn in Hertfordſhire, and Belchamp St. Paul in Eſſex; but it does not differ in any thing eſſential from the other. Another variety is mentioned

mentioned by Ray under the name of G. fugax verna ſ. præcox, differing in no reſpect from amarella except in the time of flowering; this earlineſs may perhaps be owing to the plants having ſprung up in autumn, and ſtood the winter.

42. Gentiana auriculata, or eared gentian: corollas four and five cleft, bell-ſhaped, villoſe within, the alternate ſegments cordate. Upright, almoſt ſimple, a foot or leſs in height; found throughout all Kamtſchatka, the iſlands towards Japan and America, and on the ſhore of America itſelf; the herb, both freſh and dry, is uſed by the natives as a ſtomachic and antiſcorbutic, and againſt vernal diarrhœas cauſed by feeding on fiſh; it is not however ſo bitter as ſome of the other ſpecies; it flowers the beginning of Auguſt, and perfects its ſeeds in September.

III. Corollas not five-cleft. 43. Gentiana campeſtris, or field gentian: corollas four-cleft, bearded at the throat; calyx four-leaved, the two outer ſegments very large. Linnæus can hardly be perſuaded that this is diſtinct from amarella, No. 41. He thinks it may be a variety, or perhaps a hybridous or mule plant! Scopoli boldly makes them one, becauſe the flowers cloſe at the approach of wet, in both; the ears of the corolla are finely jagged and upright; the edges of the calycine teeth are reflex; the baſe of the corolla adheres ſo cloſe to the calyx, that when torn away it carries off the inner ſkin along with it; and the ſtigmas are alike in form and poſition. Others have no doubt of their being perfectly diſtinct. The calyx in this conſiſts of four ſeparate leaflets; the two outer oval-lanceolate, very large; the inner lanceolate, ſomething membranaceous, but one-fourth the breadth of the outer; ſtem more angular, approaching to ſquare, and branched; the branches longer than the leaves, with the flowers more ſcattered; leaves ſhorter, and not ſo ſharply pointed; the flowers alſo are larger than thoſe of amarella, though the plant is uſually ſmaller. Haller deſcribes it as extremely branched, and there are ſpecimens in England branched from the root to near the top; the branches long, with leaves and flowers ſcattered the whole length; but amarella has the branches ſhort, even the lower ones not exceeding the length of the leaves from which they ſprang; the upper ones in general much ſhorter. Native of moſt part of Europe from Lapland to Italy; frequent in Ruſſia and Siberia to the lake Baikal; whereas Pallas has not obſerved amarella in Siberia, nor in Ruſſia, except on mount Caucaſus. With us it is not ſo common as amarella: but it has been obſerved about Kendal and other places in the north, in Wales, Cheſhire, Cornwall, Stratton-heath in Norfolk, Bury in Suffolk, &c. In Engliſh Botany it is obſerved, that it grows in paſtures, more particulary towards the ſea; and that it is not ſo much confined to a calcareous ſoil as the amarella: Linnæus ſays that it flowers in ſummer, after the ſolſtice; with us in September and October; various months are ſet down by others, as April to June, and Auguſt; Dr. Withering ſays that he has ſeen it flowering in a garden in October. This, as well as the two former, is annual. According to Linnæus, poor people uſe it inſtead of hops in beer; and according to Pallas, as a medicine, in common with many other ſpecies.

44. Gentiana ciliata, or fringed-flowered gentian: corollas four-cleft, ciliate at the edge. Root ſmall, round, ſtraight, not annual; (biennial, *Pallas.*) Stalk from two to eight inches long, (a foot, *Haller,*) reddiſh, angular, ſmooth, leafy; ſometimes ſimple and one flowered, ſometimes with oppoſite branches, terminated by upright, ſeſſile, ſolitary flowers; the corolla varies in different countries; in America it is much ciliated; in Italy but little; in Iceland and Norway it is only ſerrate. Pallas remarks, that this ſpecies is the connecting link between this genus and the Swertias; that it is very upright, with ſtiff branches, ſometimes exceedingly branched, much higher in Siberia and mount Caucaſus than the European plant, but with ſmaller flowers; Pallas has figured them both. Native of Swiſſerland, Norway, Denmark, Germany, Auſtria, Carniola, Italy, Siberia, Caucaſus, Canada; flowering in Auguſt and September; in Italy in October, and even till winter: it is uſed officinally, by the natives; and deſerves a place in gardens from the beauty of the flowers.

45. Gentiana cruciata, or croſſwort gentian: corollas four-cleft, beardleſs, flowers in whorls ſeſſile. The root is perennial; and it puts up ſeveral ſtalks, from a ſpan to a foot high and more. The leaves being in pairs, and each pair croſſing the next at right angles, has given occaſion to the trivial name *cruciata*, and the Engliſh name *croſſwort gentian.* Native of Switzerland, Germany, Auſtria, Carniola, Hungary, the Apennines, Ruſſia, and Siberia; flowering in July and Auguſt: in our gardens it flowers in June, and ſometimes in May. Cultivated in 1596, by Gerarde.

46. Gentiana ſeſſilis, or ſeſſile gentian: corollas four-cleft, flowers ſtemleſs, leaves ovate. Native of Chili.

47. Gentiana filiformis; leaſt gentian, or marſh centaury: corollas four-cleft beardleſs, ſtalk dichotomous filiform. Root white, woody, ſimple or with large fibres; root-leaves ſmall, narrow, oblong; ſtalk about three inches high, ſimple or branched, at each joint a pair of ſmall, narrow, ſharp leaves; flowers at the ends of the branches on long pedicels, yellow, ſmall, almoſt always cloſed, ſeeming as far as could be diſcerned, to have five petals. Every part of the herb is ſmooth; the flowers expanding only in bright ſunſhine. Annual, growing in bogs, in Denmark, France, and England; Mr. Ray firſt remarked it towards the end of Cornwall (near St. Ives) in rotten marſhy ground; Dr. Pulteney ſent it out of Dorſetſhire; it is alſo found in Hampſhire and Devonſhire. The time of flowering is July.

48. Gentiana heteroclita, or irregular gentian: flowers four-cleft, irregular; ſtalk brachiate. Root annual, fibrous; the plant has the appearance of G. centaurium; ſtalk erect, a ſpan high, dichotomous, quadrangular; Flowers ſeſſile, ſolitary in the diviſions of the ſtem, of a purple colour. Native of Malabar, in cultivated fields; diſcovered by Koenig.

49. Gentiana ſcandens, or climbing gentian: ſtem ſhrubby climbing, corollas bell-ſhaped five-cleft, in elongated pendulous panicles. Stem large, woody, round, with many very long climbing branches, without ſpines or tendrils. Native both of China and Cochin-china, climbing trees and hedges; it has an unpleaſant fetid ſmell, which is loſt in drying; and a very bitter flavour. In the Chineſe plant the leaves are often cordate, ſlightly emarginate at the baſe. It is tonic and ſtomachic.

50. Gentiana fimbriata, or fringed gentian: corollas bell-ſhaped, ten-cleft, alternate ſegments fringed and ſmaller, leaves lanceolate. Stem round, erect, ſimple. Native of Virginia.

51. Gentiana diffuſa, or branched gentian: ſtem branched dichotomous divaricate, leaves ovate-oblong, peduncles capillary one or two-flowered. Native of the Eaſt Indies.

52. Gentiana albens, or white gentian: leaves ovate ſtem-claſping, calyxes ovate, ſtem trichotomous. 53. Gentiana dubia, or doubtful gentian: corollas four-cleft, calyx lanceolate, panicle terminating trichotomous ſuperdecompound. Natives of the Cape of Good Hope; obſerved by Thunberg.

Propagation and Culture. Of this numerous genus not above ſixteen are cultivated in our gardens; and five only are wild in this country. The greater part are natives of the European Alps. Several of theſe have been lately introduced from thence by Drs. Pitcairn and Fothergill, but it is difficult to preſerve ſome of them long in a ſituation ſo different from their proper one. Cluſius affirms, that he could not by any art make the ſecond or third ſpecies continue, or bear flowers in a garden; the perennial ſorts in general may be propagated both from ſeed, and by offsets, taken off in autumn,

which is the beſt ſeaſon for removing all theſe plants; but they ſhould not be removed or parted oftener than every third year, if they are expected to produce ſtrong flowers.

The 1ſt, 34th, and 35th, with a few others not in cultivation at preſent, require the protection of the greenhouſe: the 16th and two or three others, little known, muſt be raiſed in a hot-bed, and kept in a ſtove; the reſt are hardy, and, were they not difficult to preſerve, many of them would be very acceptable in borders of flowers. The ſecond delights in a light loamy ſoil and a ſhady ſituation, where it will thrive much better than in a light dry ſoil, or an open expoſure; it is propagated by ſeed, which ſhould be ſown in pots ſoon after it is ripe, for if it is kept till the ſpring, it will not ſucceed; theſe pots ſhould be placed in a ſhady ſituation, and kept clean from weeds; in the ſpring the plants will appear, when they muſt be duly watered in dry weather, and kept clean from weeds till the following autumn; then they ſhould be carefully ſhaken out of the pots, ſo as not to break or injure their roots; and a ſhady border of loamy earth ſhould be well dug and prepared to receive them, into which the plants ſhould be put at about ſix inches diſtance each way, obſerving to let the top of the roots be a little below the ſurface of the ground, then preſs the earth cloſe to the roots; after this they will require no farther care, but to keep them conſtantly clean from weeds; and if the following ſpring ſhould prove dry, they ſhould be duly watered, which will greatly forward their growth. In this border the plants may ſtand two years, by which time they will be fit to tranſplant where they are deſigned to remain; therefore in autumn, ſo ſoon as their leaves decay, they may be removed; but as the roots of theſe plants run deep into the ground, like carrots, there muſt be great care taken in digging them up, not to cut or break their roots, for that will greatly weaken, if it does not kill them. After the plants are well fixed in their places, they require no other culture, but to dig the ground about them early in the ſpring before they begin to ſhoot, and in the ſummer to keep them clean from weeds; the roots of theſe plants will continue many years, but the ſtalks decay every autumn; the ſame roots do not flower two years together, nor ſeldom oftener than every third year; but when they flower ſtrong, they make a fine appearance; and as theſe delight in ſhady moiſt ground, where but few ornamental plants will thrive, they ſhould not be wanting in good gardens. 3 to 13. may be propagated and cultivated in the ſame manner. Pallas ſays, that the 4th is eaſily raiſed from ſeed in the Ruſſian gardens.

The 9th and ſome of the others muſt have a moiſt loamy ſoil, otherwiſe they will not thrive. Cluſius relates, that he made the 9th flower in a garden, but that it drooped, and loſt much of its native vigour and elegance. The 11th, not ſtriking its root ſo deep into the ground as the officinal yellow gentian, may be tranſplanted with leſs hazard, eſpecially if it be removed with a good ball of earth to the roots; in a ſtrong moiſt ſoil this will flower annually. The fourteenth is commonly propagated by parting the roots, but it muſt not be often tranſplanted or parted, in order to have it flower ſtrong; it ſhould have a loamy ſoil and a ſhady ſituation; it may alſo be increaſed by ſeeds ſown in autumn; in a good ſoil the plants will be ſtrong enough to flower the ſecond year, and theſe ſeedling plants will flower much ſtronger than thoſe which are propagated from offsets. This is one of the ſpecies beſt known, and much eſteemed for the brilliant azure of its flower, ſo large in proportion to the ſize of the plant. Ray obſerves, that although it be a native of the higheſt Alps, yet it readily admits cultivation; and that it was much ſought after in his time by gardeners and floriſts for the beauty of the flower. 44 and 45 may be increaſed and treated as 14.

The other alpine gentianellas may be alſo increaſed and treated in the ſame manner: in common with other alpine plants, theſe love a pure air, an elevated ſituation, and a loamy ſoil, moderately moiſt; they do not proſper therefore very near London. Cluſius affirms, in particular, that G. verna, No. 22, rejects all culture.

Several ſpecies, as 28, 29, 30, growing on ſpongy ground, it is difficult to cultivate them in gardens; the ſeeds muſt be ſown in pots, or upon a moiſt boggy ground in autumn, in the ſhade; when the plants come up, the ſurface of the ground ſhould be covered with moſs, which ſhould be conſtantly kept moiſt. See OROBANCHE, SAPONARIA, SAROTHRA, and SWERTIA.

GENTIANOI'DES. See GENTIANA.

GEN'TILE, *ſ.* [*gentilis*, Lat.] One of an uncovenanted nation; one who knows not the true God.—Tribulation and anguiſh upon every ſoul that doeth evil, of the Jew firſt, and alſo of the *Gentile*. *Rom.* ii. 9.—A perſon of rank. *Obſolete:*

Fine baſil deſireth it may be her lot
To grow, as a gilliflower, trim in her pot;
That ladies and *gentiles*, for whom we do ſerve,
May help him as needeth, poor life to preſerve. *Tuſſer.*

The origin of the *Gentiles* is deduced from the Jews, who called all thoſe who were not of their name גוים *goijm*, i. e. *gentes*, which in the Greek tranſlations of the Old Teſtament is rendered τα εθνη; in which ſenſe it frequently occurs in the New Teſtament; as in Matthew vi. 32. "All theſe things the nations or Gentiles ſeek." Whence the Latin church alſo uſed *gentes* in the ſame ſenſe as *Gentiles*, eſpecially in the New Teſtament. But the word *gentes* ſoon obtained another ſignification, and no longer meant all ſuch as were not Jews; but thoſe only who were neither Jews nor Chriſtians, but followed the ſuperſtitions of the Greeks and Romans, &c. In this ſenſe it continued among the chriſtians writers, till their manner of ſpeech, together with their religion, was publicly and by authority received in the empire; when *gentiles*, from *gentes*, came into uſe: and then both words had two ſignifications, viz. in treatiſes or laws concerning religion, they ſignified Pagans, neither Jews nor Chriſtians; and in civil affairs, they were uſed for all ſuch as were not Romans.

Mr. Bryant ſays, that all the myſteries of the *gentile* world appear to have been memorials of the deluge, and of the events which immediately ſucceeded. They conſiſted for the moſt part of a melancholy proceſs; and were celebrated by night with torches, in commemoration of the ſtate of darkneſs in which Noah and his family had been involved. The firſt thing at theſe awful meetings was to offer an oath of ſecreſy to all who were to be initiated; after which they proceeded to the ceremonies. Theſe began with a deſcription of *Chaos*; by which was ſignified ſome memorial of the deluge. Chaos was certainly the ſame as Βυθος, the great abyſs. Of the rites above-mentioned we have an account in the Orphic Argonautica. V. 11, &c.

————Μετα δ' ορκια Μυσταις
Αρχαιου μεν πρωτα Χαους αμεγαρτον αναγκην,
Και Κρονον, ος ελοχευσεν απειρεσιοισιν υφ' ολκοις
Αιθερα, και διφυη περιωπεα κυδρον Ερωτα.

The poet adds afterwards, that Eros had the name of Phanes, becauſe he was the firſt remarkable object which appeared to the eye of man, in conſequence of this great event. Noah is ſpoken of as a man of juſtice; and this part of his character is continually alluded to by the mythologiſts, whenever they treat of his hiſtory. The author of the above-mentioned poem, among many ſacred rites to which he had been witneſs, mentions the orgies of Juſtice, or the *juſt* perſon; and thoſe of Arkite Athene, which were celebrated by night:

Οργια Πραξιδικης και Αρειης νυκλος Αθηνης. v. 31.

By

By Αρειην Αθηνη was meant arkite providence; in other words, *divine wiſdom*, by which the world was preſerved. In theſe myſteries, after the people had for a long time bewailed the loſs of a particular perſon, he was at laſt ſuppoſed to be reſtored to life. Upon this the prieſt uſed to addreſs the people in theſe memorable terms: "Comfort yourſelves, all ye who have been partakers of the myſteries of the deity thus preſerved: for we ſhall now enjoy ſome reſpite from our labours." To theſe were added the following remarkable words: "I have eſcaped a ſad calamity; and my lot is greatly mended." At ſuch times there ſeems to have been an invocation made by the people to the Dove, Ionah; which was probably introduced to their view; Ιω Μακαιρα, Λαμπαδηφορος; "Hail to the dove, the reſtorer of light."

GENTILES'CHI (Horatio), an Italian painter, born at Piſa in 1563. After having made himſelf famous at Florence, Rome, Genoa, and other parts of Italy, he removed to Savoy; from whence he went to France, and upon the invitation of Charles I. came over to England. He was well received by that king, who employed him in his palace at Greenwich, and other public places. The moſt remarkable of his performances in England, were the ceilings of Greenwich and York-houſe. He painted alſo a Madona, a Magdalen, and Lot with his two daughters, for king Charles; which he performed admirably well. His moſt eſteemed piece abroad was the portico of cardinal Bentivoglio's palace at Rome. He was much in favour with the duke of Buckingham, and many others of the nobility. After twelve years continuance in England, he died here at 84 years of age, and was buried in the queen's chapel at Somerſet-houſe. His portrait is among the heads of Vandyke, he having been drawn by that great maſter.—He left behind him a daughter, *Artemiſia Gentileſchi*, who was but little inferior to her father in hiſtory-painting, and excelled him in portraits.

GEN'TILESSE, *ſ.* [French.] Complaiſance; civility. *Not uſed.*

She with her wedding-cloaths undreſſes
Her complaiſance and *gentileſſes*. *Hudibras.*

GEN'TILI (Alberico), an eminent juriſt, born in 1550, at Caſtel St. Geneſio in the marche of Ancona, where his father Matteo practiſed as a phyſician. He graduated in law at the univerſity of Perugia, and was prætor or judge at Aſcoli, when his father, becoming a convert to the reformed religion, reſolved to leave Italy, and take with him his eldeſt ſon Alberico, and his youngeſt, Scipio. Alberico came to England, and in 1582 obtained the chair of juriſprudence in the univerſity of Oxford, which he held with reputation till his death, in 1608. He was a man of vaſt and comprehenſive erudition, and publiſhed various works, moſt of them in his own profeſſion. From his Six Dialogues on the Interpreters of Law, dedicated to his patron the earl of Leiceſter, it might be ſuppoſed that he was the idolater of the juriſts of the preceding ages, and their barbariſm, which he defends againſt the politer and more liberal method of Alciatus, but in a ſtyle and manner obviouſly imitating that of Alciatus himſelf; ſo that ſome have ſuppoſed that the dialogues were meant as an ironical ſatire upon the ignorance and vulgarity of the juriſts of his time. He was the firſt who carried his reſearches into the law of nature and of nations; and his three books *De Jure Belli* are much praiſed by Grotius, who confeſſes his obligations to them in the larger work which he compoſed on the ſame ſubject. His political doctrines were well ſuited to the reigns of Elizabeth and James, as appears from his diſputation, *De Vi Civium in Regem ſemper injuſta*, and other pieces. He wrote three books *De Legationibus*, and ſeveral tracts relative to antiquities. He alſo cultivated polite literature; of which he gave an eſſay in his *Lectiones Virgilianæ*.

GEN'TILI (Scipio), brother of the preceding, born in 1563, and ſent to ſtudy at Tubingen. He there greatly diſtinguiſhed himſelf in Latin poetry, and alſo purſued the ſtudy of Greek and of juriſprudence, which he afterwards cultivated with increaſing ſucceſs at the univerſities of Wittemberg and Leyden. He received the degree of doctor at Baſil in 1589, and then went to Heidelberg as a public expounder of law. After a ſhort abode in that city, he removed to Altdorf, where he was firſt colleague to Donellus in the profeſſorſhip, and afterwards principal profeſſor of law. He was made a counſellor to the city of Nuremberg; and ſuch was his reputation that he was invited to ſeveral univerſities, and even is ſaid to have received liberal offers from pope Clement VIII. to ſettle at Bologna, all which he declined. He died at Altdorf in 1616. He wrote ſeveral works, of which the principal are, 1. *De Jure publico Populi Romani*; 2. *De Conjurationibus*; 3. *De Donationibus inter Virum & Uxorem*; 4. *De Bonis maternis & ſecundis Nuptiis*; 5. *In Apulei Apologiam Comment*; 6. *De Juriſdictione*; 7. *De Erroribus Teſtamentorum*; 8. *Comment in Pauli Epiſt. ad Philemonem.* He alſo wrote ſeveral elegant Latin poems, among which were Paraphraſes of various Pſalms, and a Tranſlation of the two firſt cantos of Taſſo's Jeruſalem. All his works have been lately reprinted at Naples, in 8 vols. 4to.

GEN'TILISM, *ſ.* [*gentiliſme*, Fr. from *gentile.*] Heatheniſm; paganiſm.—If invocation of ſaints had been produced in the apoſtolical times, it would have looked like the introducing of *gentiliſm* again. *Stillingfleet.*

GENTILI'TIOUS, *adj.* [*gentilitius*, Lat.] Endemial; peculiar to a nation.—That an unſavory odour is *gentilitious*, or national, unto the Jews, reaſon or ſenſe will not induce. *Brown.*—Hereditary; entailed on a family.—The common cauſe of this diſtemper is a particular and perhaps a *gentilitious* diſpoſition of body. *Arbuthnot.*

GENTIL'ITY, *ſ.* [*gentilité*, Fr. from *gentil*, Fr. *gentilis*, Lat.] Good extraction; dignity of birth. Elegance of behaviour; gracefulneſs of mien; nicety of taſte. Gentry; the claſs of perſons well born.—Gavelkind muſt needs, in the end, make a poor *gentility*. *Davies.*—Paganiſm; heatheniſm.—When people began to eſpy the falſhood of oracles, whereupon all *gentility* was built, their hearts were utterly averted from it. *Hooker.*

GEN'TILLET (Valentine), a learned French writer in defence of the proteſtant cauſe, a native of Vienne in Dauphiné, who flouriſhed in the ſixteenth century; but we are ignorant when he was born, or died. He was a civilian by profeſſion, and according to ſome writers was at firſt an advocate in the parliament of Toulouſe, and afterwards ſyndic of the republic of Geneva. He diſtinguiſhed himſelf by his writings, which rendered him a favourite author with the proteſtants, for the zeal which they diſplayed againſt popery, and the learning and abilities with which they maintained the principles of the reformation. By the edicts that were publiſhed in France againſt thoſe of the reformed religion, he was driven into exile. In 1578 he publiſhed An Apology for the Proteſtants, which paſſed through ſeveral editions, and appeared ten years afterwards in an enlarged form, in French, and alſo in Latin, under the title of *Apologia pro Chriſtianis Gallis Religionis Evangelicæ ſeu Reformatæ, qua docetur hujus Religionis Fundamenta in Sacra Scriptura jacta eſſe*, &c. 8vo. In 1586 he publiſhed a work entitled *Le Bureau du Concile de Trente*, &c. and in the ſame year a Latin edition of the ſame, entitled *Examen Concilii Tridentini*, &c. of which there afterwards appeared ſeveral impreſſions at different places. He was alſo the author of the Anti-Machiavel, or Diſcourſes on the Means of well governing a Kingdom, 1547, 12mo. and the Anti-Socinus, 1612, 4to.

GEN'TILLY, a town of France, in the department of Paris; the reſidence of the kings of France of the firſt and ſecond race: three quarters of a league ſouth of Paris.

GEN'TIOUX, a town of France, in the department

of the Creuſe, and chief place of a canton, in the diſtrict of Felletin: three leagues ſouth-weſt of Felletin.

GEN'TLE, *adj.* [*gentilis*, Lat.] Well born; well deſcended; ancient, though not noble.—Theſe are the ſtudies wherein our noble and *gentle* youth ought to beſtow their time. *Milton.*

Of *gentle* blood, part ſhed in honour's cauſe,
Each parent ſprung. *Pope.*

Soft; bland; mild; tame; meek; peaceable.—A virtuous and a good man, reverend in converſation, and *gentle* in condition. 2 *Mac.* xv. 12.

Her voice was ever ſoft,
Gentle and low; an excellent thing in woman. *Shakeſ.*

Soothing; pacific:

And though this ſenſe firſt *gentle* muſic found,
Her proper object is the ſpeech of men. *Davies.*

GEN'TLE, *ſ.* a gentleman; a man of birth. *Now out of uſe:*

Gentles, do not reprehend;
If you pardon, we will mend. *Shakeſpeare.*

A particular kind of earth-worm. See the article FISHING, vol. vii. p. 420.—He will in three hot months bite at a flagworm, or at a green *gentle*. *Walton.*

To GEN'TLE, *v. a.* To make gentle; to raiſe from the vulgar. *Obſolete:*

He to-day that ſheds his blood with me,
Shall be my brother: be he ne'er ſo vile,
This day ſhall *gentle* his condition. *Shakeſ. Henry V.*

GEN'TLEFOLK, *ſ.* Perſons diſtinguiſhed by their birth from the vulgar.—The queen's kindred are made *gentlefolk*. *Shakeſpeare.*—Sometimes with a plural.—*Gentlefolks* will not care for the remainder of a bottle of wine; therefore ſet a freſh one before them. *Swift.*

GEN'TLEMAN, *ſ.* [*gentilhomme*, Fr. *gentilhuomo*, Ital. that is, *homo gentilis*, a man of anceſtry. All other derivations ſeem to be whimſical.] A man of birth; a man of extraction, though not noble:

I freely told you all the wealth I had
Ran in my veins: I was a *gentleman*. *Shakeſpeare.*

A man raiſed above the vulgar by his character or poſt.—He is ſo far from deſiring to be uſed as a *gentleman*, that he deſires to be uſed as the ſervant of all. *Law.*

Inquire me out ſome mean-born *gentleman*,
Whom I will marry ſtrait to Clarence' daughter. *Shakeſ.*

A term of complaiſance; ſometimes ironical.—The ſame *gentlemen* who have fixed this piece of morality on the three naked ſiſters dancing hand in hand, would have found out as good a one had there been four of them ſitting at a diſtance, and covered from head to foot. *Addiſon.*—The ſervant that waits about the perſon of a man of rank.—Sir Thomas More, the Sunday after he gave up his chancellorſhip, came to his wife's pew, and uſed the uſual words of his *gentleman* uſher, Madam, my lord is gone. *Camden.*—It is uſed of any man however high.—The king is a noble *gentleman*, and my familiar. *Shakeſpeare.*

Under the denomination of *gentlemen*, in the Engliſh precedence and juriſprudence, are compriſed all perſons above yeomen: whereby noblemen are truly called gentlemen. *Smith de Rep. Ang. lib.* 1. *cc.* 20, 21. A gentleman, in heraldry, is defined to be one, who, without any title, bears a *coat of arms*, and whoſe anceſtors have been freemen; and by the armorial bearings, that a gentleman retains, he is known to be, or not to be, deſcended from thoſe of his name, that perhaps lived many centuries before him: thus a family coat of arms is ever conſidered as the criterion of an honourable anceſtry, and is a mark of diſtinction or warranty of a gentleman over and above the yeomen and commonalty. There is ſaid to be a gentleman by virtue of office, and in reputation, as well as thoſe that are born ſuch. 2 *Inſt.* 668. And we read that J. Kingſton was *made* a gentleman by *Rich.* II. *Pat.* 13. *Rich.* II. *par.* 1. *Gentilis homo* for a gentleman, was adjudged a good addition. *Hil.* 27. *Edw.* III. But the addition of eſquire, or gentleman, was rare before 1 Hen. V. though that of knight is very ancient. 2 *Inſt.* 595, 667.

For the gratification of the curious reader, we ſhall add the narrative "*of the origin of gentlemen*," from Leyden's "Complaynt of Scotland," republiſhed in 1801, from an original in the Britiſh Muſeum, and of which only four copies are in exiſtence, written in the year 1548.

"And nou ſen this purpos hes occurrit to ſpeik of gentreis ande nobilnes, i vil fyrſt diſcriue the origine of gentil men, be the quhilk ze may knau, quha is ane vilaine. Bot fyrſt i man reherſe the ſtait of the pepil that var in the gude anciant dais, quhilk ſum men callit the goldin varld. there vas na defferens of ſtaitis at that tyme amang men, nothir in preeminens, dignite, ſuperiorite, nor honour, for at that tyme al men var egal, & nocht partial nor deuidit, for the pepil lyuit al to gydthir in ane tranquil & louabil cōmunite, ande thai left no thing to there poſterite bot regrettis for the alteratione of that gude varld. in thai dais, the pepil eit nor drank nocht bot quhen hungir conſtrenzet them, & than there maiſt delegat refectiōe vas acquorns, vyild berreis, green futis, rutis & eirbis, ande thai drank the freſche vattir. at ſum tyme thay paſt in the forreſtis to the courſe and hunting, and ſleu vyild beyſtis, ſyne dryit the flaſche at the ſune or thai eit it. and thai that var of maiſt tendir complexione couurit thē vith the ſkynnis of tha vyild beyſtis to keip them fra cald. At that tyme ther vas no ceremonial reuerens nor ſtait, quha ſuld pas befor or behynd, furtht or in at the dur, nor zit quha ſuld haue the dignite to vaſche ther hādis fyrſt in the baſſine, nor zit quha ſuld ſit doune fyrſt at the tabil. at that tyme the pepil var as reddy to drynk vattir in ther bonet, or in the palmis of ther handis, as in ane glas, or in ane taſſe of ſiluyr. At that tyme thai lay al to gydthir in ane cauerne, as dois preſently the ſophiſtic egiptiens. thai purgit ther belleis, ande exercit the verkis of nature, ilk ane in vthirs preſents vithout ſchame, reproche, or offens. than ane lang tyme there eftir, nature prouokit thē to begyn ſum little police. for ſum of them began to plant treis, ſum to dāt beyſtis, ſum gadthird the frutis, ande kepit them quhil on to the tyme of neceſſite, ande ſum neuriſt there childis. at that tyme the pepil drank nothir vyne nor beir, nor na vthir confekkit drynkis. at that tyme ſtraynge cūtries var nocht focht to get ſpicis, eirbs, drogis, gūmis, & ſuccur for to mak exquiſit electuars to prouoke the pepil til ane diſordinat appetit. At that tyme, there vas no ſumpteous clethyng of fine claytht and of gold & ſilk of diuerſe faſſons. at that tyme i the begynnyng of ther police, coppir, bras, and yrn and vthir mettellis, var meltit to mak vtēſel veſchel neceſſair to ſerue ane houſhald, and var nocht meltit to be gunnis ande cannons to ſla doune the pepil. Ande nou ſen that goldin varld is paſt, ther hes ſuccedit ane yrn varld, quhilk hes altrit euerye gude thing in infelicite and myſcheif, for meikens is changit i maleis, trauail in ydilnes, reſt in exceſſe, pace in veyr, eyſe in pane, loue in hatrent, cherite in cruelte, iuſtice in extorſions, almis in thyft, kyndnes in perſecutione, ſupporting of ignorance in detractione, pitie in rigor, ande faytht in ypocryſie, and ſa euyrie thing is altrit fra ane gude ſtait in ane abhominabil qualite. The cauſe of this alteratione hes procedit fra the euyl cōditiōs of men that began tyl oppreſſe there nychtbours. ande til eſchaip ſic oppreſſione, the pepil chēſit ane certain of gouuernours of the maiſt robuſt & maiſt prudent to be there deffendours, ande alſe thai randrit thē tributaris ande ſubiectis to there ſaid gouuernours, ande there gouuernours gat for their panis and laubyr, the butin and ſpulzé that thai cōqueiſt fra the tirran oppreſſours. Thai gouuernours

var

var ſa nobil in there auen curage, that thai diſtribut the maiſt part of the butine ande ſpulze amāg the pepil that hed vſit them maiſt vailzeantly contrar there enemeis, ande thai that var laſche couuardis gat nothing. Of this ſort began the fyrſt nobilnes ande gentreis in the varld, for thai that var vailzeant, thai var reput for nobilis, ande gentil men, ande thai that var vicius & couuardis, var reput for vilainis and carlis."

"When Adam dug and Eve ſpan,
Where was then the GENTLEMAN?"

Lat. *Primus majorum quis quis fuit ille tuorum,*
Aut paſtor fuit, aut illud quod dicere nolo.

This proverb inculcates that merit, and not birth, makes the gentleman; and that though our fathers might have inherited that claim from a noble anceſtry, yet if we degenerate, we can have no real right or pretenſion to it, whatever law or cuſtom may determine in our favour.

"Jack will never make a GENTLEMAN."—This proverb is intended to ſhew that every one will not make a gentleman, though commonly called ſo; ſince from the preceding proverb, it is apparent that there is ſomething more required of a gentle and philanthropic quality or diſpoſition, than is always found either in high or low life, in noble anceſtry, or mean original:—"You cannot make a ſilken purſe of a ſow's ear." *Ex quovis ligno Mercurius non fit,* ſay the Latins.

GENTLEMAN-USH'ER, *ſ.* One who holds a poſt at court to uſher others to the preſence.—His tongue goes always before his wit, like *gentleman-uſher,* but ſomewhat faſter. *Overbury.*

GEN'TLEMANLIKE, or GEN'TLEMANLY, *adj.* Becoming a man of birth.—He holdeth himſelf a gentleman, and ſcorneth to work, which, he ſaith, is the life of a peaſant or churl; but enureth himſelf to his weapon, and to the *gentlemanly* trade of ſtealing. *Spenſer.*—You have trained me up like a peaſant, hiding from me all *gentlemanlike* qualities. *Shakeſpeare.*

GEN'TLEMANSHIP, *ſ.* Elegance of manners.—His fine *gentlemanſhip* did him no good. *Marquis of Halifax.*

GEN'TLENESS, *ſ.* Dignity of birth; goodneſs of extraction. Softneſs of manners, ſweetneſs of diſpoſition; meekneſs; tenderneſs.—Maſters muſt correct their ſervants with *gentleneſs,* prudence, and mercy. *Rogers.*—Women ought not to think *gentleneſs* of heart deſpicable in a man. *Clariſſa.*

Still ſhe retains
Her maiden *gentleneſs,* and oft at eve
Viſits the herds. *Milton.*

Kindneſs; benevolence. *Obſolete.*—The *gentleneſs* of all the gods go with thee. *Shakeſpeare.*

The moral quality of *gentleneſs* is forcibly inculcated in the following paſſage from Holland's Diſcourſes:—"Gentleneſs is the expreſſion of humility and meekneſs in our converſe with mankind. This virtue is viſible in the diſcourſe of thoſe who poſſeſs it. It preſerves them from all harſh and ſevere expreſſions, and from every degree of cenſoriouſneſs and uncharitableneſs. A man of gentle ſpirit will always ſpeak to his neighbour, and of him, with the utmoſt candour. He will never mention the faults of any one but when it is neceſſary. Even then, whether the perſon in fault be preſent or abſent, he will treat him with ſuch tenderneſs, as to give no real cauſe of offence. He is always deſirous to pleaſe, when he can do it conſiſtently with integrity, and with the general good of mankind. He is always willing to be pleaſed, and to put the beſt conſtruction upon the endeavours which are uſed for this purpoſe. Hence, thoſe who wiſh to ſerve him, however unſucceſsful their endeavours may be, or however unhappily they be expreſſed, in his opinion, confer an obligation upon him. Thoſe, alſo, who deſire and deſign to hurt or diſoblige him, will find that even his anger, or reſentment, is tempered with *gentleneſs,* and that he will proceed to no greater extremities than reaſon and benevolence will juſtify. In ſome, this gentleneſs appears to be a kind of natural gift, ſo as to render them almoſt incapable of any behaviour, or any language, inconſiſtent with it. In others, it is acquired by reflection and exerciſe. The former is generally more graceful and amiable, the latter is, at leaſt, equally meritorious; the former will find a ſurer way to the hearts of men, the latter will bring the underſtanding and judgment over to its ſide, and cauſe them to applaud the victory which a man has gained over himſelf. The ſincere expreſſions of it, whether from nature or habit, deſerve approbation and love; but the counterfeit is not of the leaſt value. There is no condition of life, in which this amiable diſpoſition may not be exerciſed. Where is the man who has it not in his power to hurt any of his fellow-men? He may, therefore, expreſs the gentleneſs of his heart, by ſteadily and uniformly abſtaining from that conduct which will have this effect. But he may diſcover the goodneſs of his heart towards thoſe, alſo, whom he is not capable of hurting, by his care not to diſpleaſe or grieve them unneceſſarily, and by his conſtant attention to that line of behaviour by which he may pleaſe and gratify them. In this way, may a child, a ſervant, or a ſubject, ſhow himſelf gentle towards a father, a maſter, or a governor; and, in like manner, any other inferior towards his ſuperior.

"But the higher ſituations of life afford the moſt ample field for the cultivation and exerciſe of this branch of benevolence. It is one of the offices of charity which appears with the greateſt beauty in thoſe who have it moſt in their power to act contrary to it. The father of a family, whoſe heart is poſſeſſed with this virtue, will exerciſe his authority ſteadily, but with tenderneſs. He will not fail to notice the faults of his children, and will take every method, which his prudence can ſuggeſt, to prevent the repetition of them; but he will very carefully obſerve the apoſtolic injunction, not to provoke his children to wrath, or to diſcover any bitterneſs to them. If he ever treat them with any ſeverity, as ſoon as they ſhall appear to be humbled by it, he will encourage them by his returning kindneſs, and convince them that he does a violence to his own heart, when he uſes any other language, or adopts any other behaviour, to them, than what is moſt kind and affectionate. The gentleneſs of a maſter to his ſervants will, in like manner, direct to that behaviour which will make a ſtate of ſubjection the eaſieſt to them, and the remembrance of their dependance the leaſt irkſome to their minds. To make them a juſt return for their ſervices, according to mutual agreement, and to add a proper acknowledgment for any extraordinary labour, is no more than common equity. Nor will a gentle nature fail to pay a certain attention which, particularly in ſickneſs, domeſtics have a right to require. Their faults ſhould be blamed in a manner fitted to encourage their return to their duty, and to make their ſubjection ſit as eaſy upon their minds as is conſiſtent with the nature and deſign of the relation between maſters and ſervants. The effect of gentleneſs in higher governors is eaſily conceived, and, after what has been obſerved, needs not to be deſcribed. Its influence on the intercourſe between equals and friends, and the pleaſing direction which it will give to all their endeavours to ſerve and pleaſe one another, are ſufficiently obvious."

GEN'TLESHIP, *ſ.* Carriage of a gentleman. *Obſolete.*—Some in France, which will needs be gentlemen, have more *gentleſhip* in their hat than in their head. *Aſcham.*

GEN'TLEWOMAN, *ſ.* A woman of birth above the vulgar; a woman well deſcended.—The *gentlewomen* of Rome did not ſuffer their infants to be ſo long ſwathed as poorer people. *Abbot.*—A woman who waits about the perſon of one of high rank:

The late queen's *gentlewoman,* a knight's daughter,
To be her miſtreſs' miſtreſs! *Shakeſpeare.*

A word of civility or irony.—Now, *gentlewoman*, you are confeſſing your enormities; I know it by that hypocritical down-caſt look. *Dryden.*

GENT'LESSE, *ſ.* Courteſy:

The ſalvage man, that never till this houre
Did taſte of pittie, neither *gentleſſe* knew,
Seeing his ſharp aſſault, and cruel ſtoure,
Was much emmoved at his peril's vew. *Spenſer.*

GENT'LIN, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg: thirty miles north-eaſt of Magdeburg.

GENT'LY, *adv.* Softly; meekly; tenderly; inoffenſively; kindly.—The miſchiefs that come by inadvertency, or ignorance, are but very *gently* to be taken notice of. *Locke.*—Softly; without violence.—A ſort of great bat, as men lay aſleep with their legs naked, will ſuck their blood at a wound ſo *gently* made as not to awake them. *Crew.*

Fortune's blows,
When moſt ſtruck home, being *gently* warded, craves
A noble cunning. *Shakeſpeare.*

GENTOO'S, a name given to the profeſſors of the religion of the bramins. See the article HINDOOSTAN.

GEN'TRY, *ſ.* [*gentlery*, *gentry*, from *gentle.*] Birth; condition; rank derived from inheritance:

You are certainly a gentleman,
Clerk-like experienc'd, which no leſs adorns
Our *gentry* than our parent's noble name,
In whoſe ſucceſs we are gentle. *Shakeſpeare.*

Claſs of people above the vulgar; thoſe between the vulgar and the nobility.—Let ſtates, that aim at greatneſs, take heed how their nobility and *gentry* multiply too faſt. *Bacon.*

How cheerfully the hawkers cry
A ſatyr, and the *gentry* buy. *Swift.*

A term of civility, real or ironical:

The many-coloured *gentry* there above,
By turns are rul'd by tumult and by love. *Prior.*

Civility; complaiſance. *Obſolete:*

Shew us ſo much *gentry* and good-will,
As to extend your time with us awhile. *Shakeſpeare.*

GE'NU, *ſ.* [from γονυ, Gr. παρα το εις γην νευειν, becauſe by it the body is bent towards the earth.] The knee.

GEN'UA, in ancient geography, a famous city of Liguria, deſtroyed by Hannibal, and rebuilt by the Romans: now *Genoa.*

GEN'UBATH, [Heb. ſignifying *theft.*] The name of a man.

GENUFLEX'ION, *ſ.* [*genuflection*, Fr. *genu*, knee, and *flecto*, Lat. to bend.] The act of bending the knee; adoration expreſſed by bending the knee.—Here uſe all the rites of adoration, *genuflexions*, wax-candles, incenſe, oblations, prayers only excepted. *Stillingfleet.*

The jeſuit Roſweyd, in his Onomaſticon, ſhows, that genuflexion, or kneeling, has been a very ancient rite in the church, and even under the Old Teſtament diſpenſation; and that this practice was obſerved throughout all the year, excepting on Sundays, and during the time from Eaſter to Whitſuntide, when kneeling was forbid by the council of Nice. Others have ſhown, that the cuſtom of *not* kneeling on Sundays had obtained from the time of the apoſtles, as appears from St. Irenæus, and Tertullian; and the Ethiopic church, ſcrupulouſly attached to the ancient ceremonies, ſtill retains that of not kneeling at divine ſervice. The Ruſſians deem it an indecent poſture to worſhip God on the knees. The Jews alſo uſually pray ſtanding. Roſweyd gives the reaſons of the prohibition of genuflexion on Sundays, &c. from St. Baſil, Anaſtaſius, St. Juſtin, &c. Baronius is however of opinion, that genuflexion was not eſtabliſhed in the year of Chriſt 58, from that paſſage in Acts xx. 36, where St. Paul is expreſsly mentioned to kneel down at prayer; but Saurin ſhows, that nothing can be thence ſatisfactorily concluded. The ſame author remarks, alſo, that the primitive Chriſtians carried the practice of genuflexion ſo far, that ſome of them had worn cavities in the floor where they prayed: and St. Jerome relates of St. James, that he had contracted a hardneſs on his knees equal to that of camels.

GENU'GRA, *ſ.* [from γονυ, the knee, and αγρα, Gr. a ſeizure.] The diſeaſe commonly called the gout in the knee.

GEN'UINE, *adj.* [*genuinus*, Lat.] Not ſpurious; not counterfeit; real; natural; true.—The belief and remembrance, and love and fear, of God, have ſo great influence to make men religious, that where any of theſe is, the reſt, together with the true and *genuine* effects of them, are ſuppoſed to be. *Tillotſon.*

A ſudden darkneſs covers all;
True *genuine* night: night added to the groves. *Dryden.*

GEN'UINELY, *adv.* Without adulteration, without foreign admixtures; naturally.—There is another agent able to analize compound bodies leſs violently, more *genuinely*, and more univerſally, than the fire. *Boyle.*

GEN'UINENESS, *ſ.* Freedom from any thing counterfeit; freedom from adulteration; purity; natural ſtate.—It is not eſſential to the *genuineneſs* of colours to be durable. *Boyle.*

GE'NUS, *ſ.* [Latin.] Kindred, ſtock, or lineage. Manner, ſort, faſhion. With grammarians, it ſignifies the kind of noun, maſculine, feminine, or neuter. Among logicians, it is the firſt of the univerſal ideas; and is when the idea is ſo common, that it extends to other ideas, which are alſo univerſal; as, the quadrilater is *genus* with reſpect to the parallelogram and trapezia; ſubſtance is *genus* with reſpect to body and mind. So *genus ſummum* is that which holds the uppermoſt claſs in in its predicament; or it is that which may be divided into ſeveral ſpecies, each whereof is a genus in reſpect to other ſpecies placed below. *Genus ſubaltern*, is that, which being a medium between the higheſt genus and the loweſt ſpecies, is ſometimes conſidered as a genus and ſometimes as a ſpecies. *Genus remotum*, is where there is another genus between it and its ſpecies. In logic, *genus proximum* is the next or neareſt genus where the ſpecies is immediately under it; as man under animal. In botany, and natural hiſtory, a ſyſtem or aſſemblage of plants, or animals, or minerals, agreeing in ſome one common character, in reſpect to the ſtructure of certain parts, whereby they are diſtinguiſhed from all other claſſes. In muſic, a certain manner of ſub-dividing the principles of melody, *i. e.* the conſonant intervals into their concinnous parts. With rhetoricians, *genus* is diſtributed into demonſtrative, deliberative, and judiciary. Algebra, by the ancients, was diſtributed into two genera, logiſtic and ſpecious. With anatomiſts, an aſſemblage or ſyſtem of ſimilar parts, diſtributed throughout the body; as, the *genus nervoſum*, the nerves ſo conſidered.

GENU'SUS, in ancient geography, a river of Macedonia, falling into the Adriatic, above Apollonia: now the *Semno.*

GENZA'NO, a town of Italy, in the kingdom of Naples, and province of Baſilicata: twelve miles eaſt-ſouth-eaſt of Venoſa.

GEOCEN'TRIC, *adj.* [of γη, the earth, and κεντρον, Gr. a centre.] In aſtronomy, is ſaid of a planet or its orbit, to denote its having the earth for its centre. The moon alone is properly geocentric. And yet the motions of all the planets may be conſidered in reſpect of the earth, or as they appear from the earth, and thence called their *geocentric motions.* Hence the *geocentric place* of a planet, is the place where it appears to us, from the earth; or it is a point in the ecliptic, to which a planet,

ſeen from the earth, is referred. The *geocentric latitude* of a planet, is its latitude as ſeen from the earth; or the inclination of a line, connecting the planet and the earth, to the plane of the earth's ecliptic. Orbit is the angle which the line (connecting the planet and the earth) makes with a line drawn to meet a perpendicular let fall from the planet to the plane of the ecliptic. The *geocentric longitude* of a planet, is the diſtance meaſured on the ecliptic, in the order of the ſigns, between the geocentric place and the firſt point of Aries.

GEOCEN'TRICALLY, *adv.* In a geocentric manner, in a manner which ſuppoſes the earth to be the centre.

GEODÆ'SIA, *ſ.* [of γη, and δαιω, Gr. to divide or diſtribute.] That part of geometry which contains the doctrine or art of meaſuring ſurfaces, and finding the contents of all plane figures.

GEODÆT'ICAL, *adj.* [from *geodæſia.*] Relating to the art of meaſuring ſurfaces; comprehending or ſhowing the art of meaſuring land.

GEODÆT'ICALLY, *adv.* According to the manner in which ſurfaces are meaſured.

GEOF'FREY of MONMOUTH, a writer of early Britiſh hiſtory, flouriſhed under king Stephen, about the year 1150, and was firſt archdeacon of Monmouth, and then biſhop of St. Aſaph. On account of ſome tumults in Wales, he quitted his dioceſe, and appealed to king Henry II. who gave him the abbacy of Abingdon in commendam. Upon an application from the clergy of St. Aſaph to return to his ſee, he refuſed it, thinking to keep his abbacy; but this was beſtowed upon another perſon, ſo that he was left without a title. He wrote various works, of which the moſt noted was his *Chronicon ſive Hiſtoria Britonum*, ſuppoſed to be tranſlated from an ancient hiſtory in the Welſh language, brought from Brittany. It contains a pretended genealogy of the kings of Britain from the time of the fabled Brutus the Trojan, and enumerates above ſeventy illuſtrious monarchs before the invaſion of Julius Cæſar. The marvellous relations concerning prince Arthur are chiefly taken from this author. Notwithſtanding the manifeſtly fabulous nature of Geoffrey's work, nationality, and the love of wonder, have given it popularity, ſo that it has paſſed through ſeveral impreſſions, and has been epitomiſed by Ponticus Virunnius, an Italian. It is the opinion of judicious critics that a foundation of truth in it is buried under a ſuperſtructure of monkiſh forgeries.

GEOFFROY' (Stephen-Francis), a phyſician eminent for chemical and botanical knowledge, born in 1672, at Paris, where his father was an apothecary, and had paſſed through the principal offices of magiſtracy. At the age of twenty, Geoffroy was ſent to an eminent ſurgeon at Montpellier, and there attended upon the lectures of the celebrated profeſſors of that ſchool of medicine. He then travelled into the ſouthern provinces of France, and viewed every object worthy of curioſity. In 1698 he accompanied the count de Tallard in his embaſſy to England, where he became known to the principal men of ſcience, and obtained admiſſion into the royal ſociety. Thence he paſſed into Holland; and in 1700 he attended the abbé de Louvois in a tour in Italy. Upon his return he quitted his original deſtination, which was that of pharmacy, and entered upon the higher order of the profeſſion, for which his education had ſo well qualified him. He was created bachelor of phyſic in 1702, and doctor in 1704. The ſubjects of his theſes were all curious: one of them, *An Hominis Primordia Vermis?* was thought ſo intereſting by ſome ladies of high rank, that it was neceſſary to tranſlate it into French. In this, he aſſerts the ſexes of plants, and ſuppoſes the ſtamina to be the male organs.

Geoffroy was in no haſte to commence practice. He continued his ſtudies in retirement for ſome years, and ſeems never to have puſhed himſelf forwards, though his merit cauſed him to be conſulted by his brethren in important caſes. His extreme anxiety for his patients gave him a melancholy air, which at firſt alarmed them, till they were able to make due allowances for temper. In 1709 the king nominated him to the poſt of profeſſor of phyſic in the college royal, vacant by the death of the celebrated Tournefort. He began his functions by a courſe of Materia Medica, for which he had long been collecting materials. M. Fagon, in 1712, reſigned to him his office of profeſſor of chemiſtry in the royal garden, which he had for ſome time filled as his ſubſtitute. The faculty of Paris choſe him twice to the office of dean, which was at that time particularly laborious on account of their diſputes with the company of ſurgeons. He alſo occupied a place in the royal academy of ſciences from 1699, and was aſſiduous in his attendance upon their meetings. His health at length gave way under his toils, and he died in January 1721. As a chemiſt, Geoffroy is known by the Table of Affinities which in 1718 he gave to the public, and which was the firſt of the kind. His principal work in medicine was a Hiſtory of the Materia Medica, publiſhed after his death in three volumes 8vo. 1741, in Latin, and ſince tranſlated into French, Engliſh, and German. Though an unfiniſhed work, it was the moſt complete, as far as it went, that had hitherto appeared. The firſt volume contains all the mineral part; the ſecond, the exotic vegetables; the third, the indigenous. He alſo wrote ſeveral papers, chemical and botanical, in the Memoirs of the Academy of Sciences.

GEOFFROY'A, *ſ.* [ſo named by Jacquin, in honour of Monſ. *Geoffroy*, the ſubject of the preceding article.] In botany, a genus of the claſs diadelphia, order decandria, natural order of papilionaceæ or leguminoſæ. The generic characters are—Calyx: perianthium one-leafed, bell-ſhaped, half five-cleft; the upper diviſions diverging, ſpreading. Corolla: papilionaceous; banner roundiſh, emarginate, flat, reflex; wings the ſame length with the banner, blunt, concave; keel compreſſed, the ſame length and figure with the wings. Stamina: filaments diadelphous (ſimple and nine-cleft), the length of the keel; antheræ roundiſh. Piſtillum: germ roundiſh; ſtyle ſubulate; ſtigma obtuſe. Pericarpium: drupe ovate, large, with a longitudinal groove on each ſide. Seed: nut ſubovate, woody, rather flatted, with a longitudinal groove on each ſide, acute, two-valved.—*Eſſential Character.* Calyx five-cleft; drupe ovate; nut flatted.

Species. 1. Geoffroya ſpinoſa, or thorny Geoffroya: thorny; leaflets oblong. This is a thorny tree, ſays Linnæus, with pinnate leaves, and a drupaceous fruit, reſembling the peach. It is deſcribed by Jacquin, as an inelegant tree, twelve feet high, upright, branched. Thorns few, awl-ſhaped, frequently an inch long, thick on the trunk and branches. Flowers on very ſhort peduncles, with corollas of a dirty fulvous colour, diffuſing widely a moſt fetid odour; the drupe does not ill repreſent the freſh fruit of an almond, the rind is very ſlightly tomentoſe, and of a greeniſh yellow colour; the pulp is ſoft, ſweet, yellowiſh, has a nauſeous ſmell, and ſtains the hands with ruſt-colour not eaſily waſhed out; the nut or ſtone is whitiſh, adheres cloſe to the pulp, and contains a white kernel, that has a farinaceous aſtringent taſte. A plant with papilionaceous flowers, and a drupe for a fruit, is a great ſingularity. Native of Carthagena in New Spain.

2. Geoffroya inermis, or ſmooth Geoffroya: without thorns; leaflets lanceolate. This tree riſes to a conſiderable height, and towards the top ſends off ſeveral branches; the wood is hard enough to admit of being poliſhed; the external bark is ſmooth and grey; internally it is black and furrowed. The fruit is a large ſubovate drupe, incloſing a woody nut. Native of Jamaica. Introduced in 1778, by Meſſrs. Kennedy and Lee. In Jamaica it has the name of *cabbage-bark*, or *worm-bark-tree.* The bark, which has a mucilaginous ſweetiſh taſte, and a diſagreeable ſmell, was firſt noticed

as

as a vermifuge by Mr. Peter Duguid; but Dr. Wright, who reſided a long time at Jamaica, has communicated the fulleſt information concerning this tree: according to him, the bark is powerfully medicinal, and its anthelmintic effects have been eſtabliſhed at Jamaica by long experience. It may be given in decoction, ſyrup, powder, or extract; but muſt be uſed with caution, in ſmall doſes, at firſt.

GEOG'RAPHER, *ſ.* [γη and γραφω, Gr. *geographe*, Fr.] One who deſcribes the earth according to the poſition of its different parts.—A greater part of the earth hath ever been peopled than hath been known or deſcribed by *geographers*. *Brown.*

From ſea to ſea, from realm to realm, I rove,
And grow a mere *geographer* by love. *Tickel.*

GEOGRAPH'ICAL, *adj.* [*geographique*, Fr. from *geography*.] Relating to geography; belonging to geography.—I ſend you an hiſtorical, chronological, and *geographical*, dictionary. As *geographical*, it deſcribes the ſituation of countries and cities. *Cheſterfield.*

GEOGRAPH'ICAL MILE, the ſea-mile or minute, being the 60th part of a degree of a great circle.

GEOGRAPH'ICALLY, *adv.* In a geographical manner; according to the rules of geography.—Minerva lets Ulyſſes into the knowledge of his country; ſhe *geographically* deſcribes it to him. *Broome.*

GEOG'RAPHY, *ſ.* [*geographie*, Fr. *geografia*, Ital. *geographia*, Span. Port. and Lat. γεωγραφια, of γη, the earth, and γραφω, Gr. to deſcribe.] The ſcience which teaches and explains the nature and properties of the earth, as to its figure, place, magnitude, motions, celeſtial appearances, &c. with the various lines, real or imaginary, on its ſurface. Golnitz conſiders geography as either exterior or interior; but Varenius more juſtly divides it into general and ſpecial; or univerſal and particular. *General* or *univerſal geography*, is that which conſiders the whole earth, without any regard to particular countries; while *ſpecial* or *particular geography*, contemplates the conſtitution of the ſeveral particular regions, or countries. What is called *general* geography, embraces a wide view of the ſubject, regarding the earth aſtronomically as a planet, the grand diviſions of land and water, &c. and extends to what is called practical or mathematical geography, being that which defines the ſpherical ſtructure of the earth, and demonſtrates the artificial conſtruction of globes, maps, charts, &c.

Among the ſubordinate diviſions of this ſcience, may be named *phyſical* geography, which inveſtigates the materials of which the earth is formed, with the changes or revolutions it has undergone; and which the reader will find moſt amply diſcuſſed under the article EARTH, vol. vi. p. 177–206; and EARTHQUAKE, p. 207–216. But the moſt common acceptation now given to this ſcience, is that of *hiſtorical* geography, not only from its profeſſed ſubſervience to hiſtory, but becauſe it is in fact a narrative ſo nearly approaching the hiſtorical, that Herodotus, and many other ancient hiſtorians, and even the immortal Homer, have enriched their works with it; and the celebrated deſcription of Germany, by Tacitus, contains moſt of the materials adopted in treatiſes of geography. In this popular point of view, therefore, hiſtorical geography may be divided into *civil*, which treats of the cuſtoms, manners, religion, laws, &c. of different communities; and *chorographical*, which points out the diverſified regions of the earth, its various diſtricts, and diviſions into land and water, iſlands, continents, ſeas, lakes, gulphs, &c. and hence we trace hiſtorical geography into its two grand diviſions of ANCIENT and MODERN. From ancient geography, the moſt important facts in the phyſical hiſtory of the globe are to be defined, with the modern appearance of that which is now moſt ſtriking on its ſurface. Dates of remote period cannot be underſtood, unleſs they be connected with thoſe of place, which it is the object of geography to aſcertain; and hence aſtronomy, natural hiſtory, natural philoſophy, geometry, navigation, and all the principal arts of civil life, are, in truth, intimately related to the ſcience of geography, either as ſupplying its facts and principles, or as deriving their beſt lights from it. A well-grounded knowledge of the ſcenes of ancient hiſtory may ſeem, to a perſpicacious mind, to annihilate the lapſe of ages, and to give us the privilege of being contemporaries of thoſe earlier races of men, whoſe progreſs in civility we delight to contemplate; and but for a knowledge of their geography, more than half the information which we find in the writings of the ancients, would be loſt to us. Yet there is nothing more difficult in erudition or ſcientific reſearch, than to acquire a thorough knowledge of the facts of *ancient*, in clear ſatisfactory compariſon with thoſe of *modern*, geography. The notions of the ancients reſpecting the figure of the earth, and its relations to the heavenly bodies, were not ſuch as to afford that accuracy in the diviſions of the world, without which local diſtances can never be diſtinctly recorded. The names which they have given to places, vary or agree in different writings, with a very troubleſome irregularity; and the changes which have taken place on the face of the globe ſince the ancients wrote, have been ſo very conſiderable, that theſe, above every thing elſe, render all the parts of ancient geography in the utmoſt degree difficult and obſcure. Yet we ſhall endeavour to open this reſearch from the records of the moſt diſtinguiſhed writers, whoſe valuable diſcoveries ſeem wholly their own, undertaken without a beacon to conduct, or a fenfire to miſlead.

ORIGIN AND PROGRESS OF GEOGRAPHY.

The origin or firſt principles of geography, muſt have been nearly primeval with the early population of the world, which it is its province to deſcribe. It muſt however be obvious to every obſerver, that arts and ſciences, when repreſented only in their higheſt ſtate of improvement, can never communicate full information, unleſs at the ſame time the ruder ſtages through which they paſſed before they arrived at ſuch perfection, are minutely traced and appreciated. Geography, in this reſpect, is like every other ſcience, whoſe imperfect beginnings ought to be defined, and the time and manner pointed out, by which it received its gradual improvements. Its early twilight rays may in ſome meaſure be collected from Moſes, Job, and Homer; which were afterwards concentrated by the Egyptians, Chaldeans, and Babylonians. From them it appears, that the early geographers, being deſtitute of mathematical inſtruments, and of aſtronomical obſervations, firſt began to determine the ſituation of places according to *climates*; and they were led to fix upon thoſe climates from the form and colour of certain animals which were to be found in thoſe different countries. The appearance of Negroes, or what they called *Ethiopians*, and of the larger animals, ſuch as the rhinoceros and elephant, ſuggeſted to them the line of diviſion where the limits of the torrid zone began towards the north, and ended towards the ſouth. For reaſon, ſaid they, points out to us, that ſimilar things appear in the ſame temperature of the elements; and that whether they were animals or plants, they are produced according to the ſimilar ſtate of the air or climate under the ſame parallels, or a like ſituation equally diſtant from either pole.

This ſimple manner of dividing their climates, muſt be conſidered as the firſt ſcientific outline of geography in the more early ages of the world. But another method was ſoon adopted by the Egyptians and Babylonians, which was the determining the ſituation of places, or their diſtance from the equator, by obſerving the length of their longeſt and ſhorteſt days. And that this obſervation might be performed with ſome accuracy, they made uſe of a kind of perpendicular ſun-dial, having a

ſtilus

ſtilus or gnomon erected upon a horizontal plane, by which they were enabled to meaſure the length or ſhortneſs of the ſhadow, in proportion to the height of the ſtilus. It is difficult to ſay which of theſe two nations are beſt entitled to the credit of the invention. Herodotus, whoſe geographical notices are the firſt that aſſumed a connected and conſiſtent form, tells us, that the Greeks firſt learned the pole, the gnomon, and the twelve diviſions of the day, from the Babylonians. But in anſwer to this aſſertion it may be obſerved, that the merit of this invention of the gnomon in Greece, is aſcribed by Pliny and Diogenes Laertius, to the aſtronomical ſchool of Miletus, and particularly to Anaximander and Anaximenes, the diſciples of Thales; and there is reaſon to believe that this method of obſervation was well known to Thales himſelf. For though the actual erection of a gnomon was an honour reſerved for one of his immediate ſucceſſors, who placed at Lacedæmon the firſt ſun-dial upon that conſtruction that was ſeen in Greece; yet it may be preſumed at the ſame time, that Thales, who had travelled into Egypt, where he learned both his geometry and aſtronomy, might bring from thence the idea alſo and principle of this inſtrument of obſervation; for Diogenes Laertius particularly mentions, that he was the firſt who found out the paſſage of the ſun from tropic to tropic. By what inſtrument, then, could this be determined, unleſs by the gnomon? For the aſtrolab and the armillary circles are generally believed to have been invented by ſome of the later Greek aſtronomers who flouriſhed under the Ptolemies, ſuch as Timocharis, Ariſtillus, or Eratoſthenes.

Thales is likewiſe ſaid to have been the author of two books, one on the tropic, and one on the equinox, the exact times of which he probably determined by the ſhadows of the gnomon; and by this he was naturally led to another of his diſcoveries, which was the diviſion of the year into its four ſeaſons, which was a conſequence of his finding the particular days when the ſun appeared to be in the tropics and in the equinox. His diviſion of the year into 365 days, was undoubtedly brought by him from Egypt, as it is univerſally allowed to have been an Egyptian diſcovery prior to his time, being aſcribed to the ſecond Mercury, ſir-named Triſmegiſtus, who is ſuppoſed to have lived about fifty years after the Exodus, according to Euſebius. And Pliny tells us expreſsly, that the diſcovery of this length of the year by the addition of the five days and a quarter to the 360, was made by obſerving when the ſhadow returned to its marks; which is a clear proof that it was done by the uſe of a gnomon. And that the taking the lengths of the ſhadow, by way of calculation, was an idea familiar to Thales, appears from his firſt inventing the method of determining the height of the pyramids by their ſhadow at that exact inſtant of time in the day when the ſhadow of a man is found to be equal to his height.

It does not therefore ſeem to be an improbable ſuppoſition, that this method of obſerving by the gnomon was originally imported from Egypt, where it was known long before any dawn of the Greek learning; for it has been the opinion of ſeveral eminent writers, that their pyramids and obeliſks, which to common travellers appeared to be buildings merely of ornament and magnificence, were really ſun-dials upon an immenſe ſcale, by which the variation of the length of the ſhadow in proportion to its height could be taken with a greater degree of accuracy. And to confirm this opinion, it was found upon examination by M. de Chazelles in 1694, that the two ſides, both of the larger and ſmaller pyramids, were placed exactly north and ſouth, ſo as to be true meridian lines even at this day, and the other two ſides ſtood eaſt and weſt; which is a clear proof, that even in thoſe remote ages in which they were built, they were ſo contrived by the Egyptians to ſtand in the direction of the four cardinal points of the heavens, for the purpoſes of their aſtronomical obſervations.—See the article EGYPT, vol. vi. p. 360-361.

From the days of Thales and his immediate ſucceſſors, who flouriſhed in the ſixth century before Chriſt, there ſeems to have been little done towards the ſolid improvement of geography for two hundred years, till the eſtabliſhment of the famous aſtronomical ſchool of Alexandria. For we have ſcarcely any fragments remaining of the ſchool of Pythagoras; though at the ſame time it muſt be owned, that their having known the true ſyſtem of the world, by placing the ſun in the centre, and giving the earth both the diurnal and annual revolutions, are proofs that their knowledge of this muſt have been eſtabliſhed by clear and accurate obſervations. There is however an aſtronomical obſervation mentioned during this period, and it is indeed the firſt Greek one that ſtands on record, and is preſerved to us by Ptolemy, which is that of Meton and Euctemon, who obſerved the ſummer ſolſtice at Athens, during the archonſhip of Apſeudes, upon the 21ſt of the Egyptian month Phamenoth, in the morning, being the 27th of June, 432 years before Chriſt. This obſervation was made with a view of determining the beginning of their cycle of XIX years, which commenced upon the new moon of the 15th of July immediately ſucceeding (being exactly eighteen days after the ſolſtice), and fell, according to Diodorus, upon the 13th of the Athenian month Sciropharion.

This ſolſtitial obſervation muſt have given Meton and Euctemon an opportunity of determining the latitude of Athens at the ſame time, had they but known the ſimple manner of drawing the concluſion; for as the length of the ſhadow of the gnomon was narrowly watched at the criſis of the ſolſtice, the proportion of that to the height of the gnomon was eaſily known, by which the angle of the ſun's altitude was given. And though the ſun's greateſt declination was then very inaccurately known, being by ſome ſuppoſed to be 24°, and by others 23° 51′, which is only found at preſent to be 23° 28′ 10″, yet ſtill the latitude of Athens might have been deduced within the limitations of this error; making at the ſame time allowances for the groſs manner in which altitudes were determined without proper inſtruments, and without the ſolutions of trigonometry, which appears to have been unknown till the age of Hipparchus, by whom it was firſt introduced.

It would ſeem that Timocharis and Ariſtillus, who began to obſerve 295 years before Chriſt, were the firſt who introduced the manner of determining the poſitions of the ſtars according to their longitudes and latitudes taken with reſpect to the equator. This we know from Ptolemy, who has preſerved many of their obſervations in his Almageſt; one in particular is well known, and it gave riſe to the diſcovery of the preceſſion of the equinoxes; it was that of the Spica in Virgo, which Timocharis found to be 8° weſt from the autumnal equinoctial point, and likewiſe that it was one degree and two fifths to the north of the equator; both of which were found to be different by Hipparchus; ſo that this bright ſtar had ſhifted its place with regard to theſe two particulars in that interval of time elapſed betwixt theſe two obſervations; for in one caſe he only found it to be 6° weſt from the autumnal equinoctial point; and in the other, that it was three-fifths of a degree, or 36′, to the north of the equator; but it was found both by Timocharis and Hipparchus to have remained nearly at the diſtance of two degrees to the ſouth of the middle of the zodiac or ecliptic. From which it naturally appeared reaſonable for Hipparchus to ſuppoſe that the fixed ſtars had a ſlow motion round the poles of the zodiac: "But, as Ptolemy tells us, that though inclined to this opinion, yet Hipparchus ſays of himſelf, that he heſitated in his own mind upon the deciſion of the queſtion, becauſe the obſervations of Timocharis were not to be confidently depended upon, as being made in a rough

manner; and that the interval of time (though of one hundred and fifty years and upwards) was not ſufficient for a clear and certain comprehenſion of that matter."

There was likewiſe an additional reaſon for this ſuſpenſion of judgment in Hipparchus, which Ptolemy has preſerved in another paſſage of his Almageſt. For he tells us, that Hipparchus had found the greateſt diſtance of the Spica of Virgo from the autumnal equinox to be 6° 30′ in the thirty-ſecond year of the third Calippic period (viz. 146 before Chriſt,) and that he found it to be only 5° 15′ in the forty-third year of the ſaid period (viz. 135 before Chriſt); and as he could not apprehend that this ſtar ſhould make a motion of 1° 15′ in eleven years, he concluded that this difference aroſe from ſome inequality in the apparent motion of the ſun: for though this variation puzzled him, yet, ſays Ptolemy, "he was prompted from his love of truth to conceal nothing which could tend in the leaſt degree to carry any perſons to a ſuſpicion upon his obſervations." But by way of accounting for this, he was induced at one time to ſuppoſe, that this motion of the fixed ſtars, in varying their diſtance from the equinoctial point, was confined to ſuch of them as were near the zodiac, as if this irregularity was occaſioned by the ſun, moon, and planets which moved in this path; and this Ptolemy calls *the firſt hypotheſis of Hipparchus*. But this he afterwards relinquiſhed, when he found that the ſtars in the Great Bear, and others which were at a conſiderable diſtance from the zodiac, ſhifted their places equally with thoſe in the zodiac, both with regard to the equator and the equinoctial colures.

From theſe particulars, however, it ſufficiently appears, that Timocharis and Ariſtillus are intitled to a ſhare of the merit of Hipparchus, who is ſo much celebrated for the boldneſs of his attempt in numbering the ſtars, and ranging them all according to their ſituations in the heavens. And it is likewiſe evident, that the longitudes and latitudes of the ſtars were reckoned from the equator both by Timocharis and Hipparchus; for it was only after the preceſſion of the equinoxes was fully eſtabliſhed by Ptolemy, that the longitudes and latitudes of the ſtars were uniformly referred to the ecliptic. It was then but an eaſy tranſition of thought in Hipparchus to aſſort and diſpoſe the different parts of the earth according to latitude and longitude, being only a new application or tranſpoſition of that artifice which was already ſo happily introduced in the arrangement of the conſtellations, and therefore equally proper to be adopted in tracing the meridians and parallels of the earth.

Strabo has preſerved the very words of Hipparchus, in which he explains his ideas upon this ſubject, being a Fragment extracted from a Treatiſe of his, written againſt Eratoſthenes. "It is impoſſible, ſays he, either for an illiterate perſon, or a man of learning, to acquire the neceſſary knowledge of geography without an attention to the heavens, and to the obſervations of eclipſes. For whether Alexandria in Egypt is more northerly than Babylon, or more ſoutherly, or to what diſtance this amounts, cannot be determined without conſidering them by their climates. In like manner, what places lie towards the eaſt, or towards the weſt, and whether more or leſs, no perſon can know accurately, without comparing the eclipſes of the ſun and moon." As the two diſtinctions here pointed out give us the clear ideas of latitude and longitude, it is with great juſtice that Hipparchus is univerſally allowed to have fixed the firſt ſolid foundation of geography, by uniting it to aſtronomy, and ſo rendering its principles ſelf-evident and invariable.

Pliny likewiſe confirms this, when after mentioning Thales and Sulpicius Gallus, who had both predicted eclipſes, he adds "that Hipparchus had foretold the revolution (of the eclipſes) of the ſun and moon for ſix hundred years, comprehending the months, days, and hours, of different nations, and the ſituation of places." By which it would ſeem, that the latitudes and longitudes of theſe places were particularly given. But the ſtrongeſt authority for appropriating this invention to Hipparchus, is that of Ptolemy in his geography, lib. 1. cap. 4. who ſays, "that Hipparchus was the only author who had given the elevations of the north pole of a few cities, in proportion to the great number that were to be delineated, and ſuch too as lay under the ſame parallels. Some that came after Hipparchus had given thoſe of other places that lay upon the ſame meridian, becauſe their moſt favourable voyages were commonly from north to ſouth; but that moſt of the diſtances, and principally thoſe towards the eaſt and weſt, were laid down in a ſtill more unſatisfactory manner; not from any negligence of thoſe who recorded them, but becauſe they had no ready method of bringing them to a mathematical exactneſs; and likewiſe, becauſe there were not many eclipſes of the moon which had been obſerved at different places at the ſame inſtant of time: for it is upon record, that an eclipſe, which was obſerved at Arbela at five o'clock, was ſeen at Carthage only at two o'clock; from which it clearly appeared what was the diſtance of theſe two places towards the eaſt and weſt given in equinoctial time."—It is however a little remarkable, that though latitudes and longitudes were in this manner introduced and pointed out by Hipparchus, yet ſo little were they attended to till the days of Ptolemy, that none of the intermediate authors, ſuch as Strabo, Vitruvius, and Pliny, who all of them entered into a minute deſcription of the geographical ſituation of places according to the length and ſhadows of the gnomon, have ever given us the leaſt hint of the latitude or longitude of any one place whatever in the language of degrees and minutes.

When the true principles of geography came to be thus pointed out by the invention of latitude and longitude, it was no wonder that maps were from thence made to aſſume a new form of projection, eſſentially different from thoſe in uſe prior to this period. It was for this purpoſe that the planiſphere, or the delineation of the ſphere in plano, is ſaid by Syneſius to have been introduced by Hipparchus, in order to preſerve the fameneſs of the proportions in the diverſity of the figure. It muſt be owned, however, that the previous ſteps to this new projection of the ſphere had been in a great meaſure made eaſy by Archimedes, when he invented, at leaſt fifty years before Hipparchus lived, thoſe noble theorems of his for meaſuring the ſurface of a ſphere and its different ſegments; which were none of the leaſt important diſcoveries of that great geometrician.—See the article GEOMETRY.

We find in Strabo an alluſion to a ſpherical projection in plano, where the meridians bended towards each other, ſo as to make the figure of a cone. Hence we aſcertain that the maps which were projected before the time of Hipparchus, were little more than rude outlines and topographical ſketches of different countries; excepting the ſingle map invented by Eratoſthenes. The earlieſt were thoſe of Seſoſtris, mentioned by Euſtathius in his epiſtle prefixed to his Commentary on Dionyſius's Περιηγησις, who ſays "that this Egyptian king, having traverſed great part of the earth, recorded his march in maps, and gave copies of his maps not only to the Egyptians, but to the Scythians, to their great aſtoniſhment."

The ancient Jews appear alſo to have had ſurveyors among them; and ſome have imagined from this that they actually made a map of the Holy Land, when they gave the different portions to the nine tribes at Shiloh, as mentioned in Joſhua, chap. xviii. ver. 4, 8, and 9. For they are there ſent to walk through the land, and to deſcribe it; and they are afterwards ſaid to have *deſcribed it in ſeven parts, in a book*. And Joſephus tells us, that

that when Joſhua ſent out people from the different tribes to meaſure the land, he gave them as companions perſons well inſtructed in geometry, who could not be miſtaken in the truth from their ſkill. He afterwards mentions, that the men who were ſent, being ten in number, περιοδευσα τες τε και τιμησαμενοι την γην, "going round and eſtimating the land," returned in the ſeventh month to Joſhua at Shiloh. From this therefore we may reaſonably conclude, that a geometrical ſurvey was then made of the Holy Land; though it does not fully determine whether their menſuration was only taken down in numbers, or regularly projected and digeſted into a map.

The firſt Grecian map on record was that of Anaximander, mentioned by Strabo, lib. i. p. 7. It has been conjectured, that this was a general map of the then known world, and is imagined to be the one referred to by Hipparchus under the deſignation of "the ancient map," which he in a few particulars preferred to that of Eratoſthenes; and ſome have conjectured, that Anaximander, "by inventing a ſphere and introducing a map, and a meaſure of the circumference of the ſea and land," according to Diogenes Laertius, may be ſuppoſed to be one of the mathematicians alluded to by Ariſtotle at the end of his ſecond book *de Cælo*, who made the circumference of the earth to be four hundred thouſand ſtadia, being the firſt groſs calculation attempted to be given of that great problem in geography.

The map of Ariſtagoras, tyrant of Miletus, is likewiſe particularly worthy of our attention, becauſe it is minutely deſcribed by Herodotus, and furniſhes a curious idea of the nature of maps in thoſe early ages. He tells us, that Ariſtagoras ſhewed it to Cleomenes king of Sparta, with a view of inducing him to attack the king of Perſia even in his palace at Suſa, in order to reſtore the Ionians to their ancient freedom. It was traced upon tables of braſs or copper, and contained the intermediate countries which were to be traverſed in that march. The words of Herodotus muſt not however be interpreted too literally, as if it contained "the whole circumference of the earth, the whole ſea or ocean, and all the rivers." For notwithſtanding the pompouſneſs of the expreſſion, it may fairly be concluded from the ſtate of geography at that time, that the ſea meant only the Mediterranean, and therefore the earth or land the coaſts of that ſea, and more particularly the Leſſer Aſia extended towards the middle of Perſia, and the rivers were the Halys, the Euphrates, and the Tigris, which Herodotus mentions as neceſſary to be croſſed in that expedition. It contained one ſtraight line called the "Royal Highway," οδος η Βασιληιη, taking in all the ſtations or places of encampment, which were called σταθμοι, from Sardis to Suſa; ſo that it was an itinerary, or what the Greeks diſtinguiſhed by the title of απογραφη σταθμων. There were one hundred and eleven of theſe ſtations in the whole extent of this line or road, containing 13500 ſtadia, or 450 paraſangæ, which being reduced to the Roman mile, allowing eight ſtadia to each mile, amounts to 1687½ Roman miles; and as it was a march of ninety days, Herodotus tells us, that 150 ſtadia were allowed for a day's march, which brings it to eighteen and three-quarters Roman miles for each day. If we would accommodate this to the Engliſh ſtatute mile, which contains 5280 feet, whereas the Roman mile conſiſted only of 5000 feet, it will reduce a day's march to eighteen Engliſh ſtatute miles and one-ſixth of a mile nearly, as the Roman itinerary foot differed very little from the preſent Engliſh foot, as appears from two itinerary diſtances which have been meaſured; one is the twenty-five miles from Bologna to Modena, taken by Ricciolus, and the other the twenty-one miles betwixt London and Verulam, found by ſome ſurveyors quoted by Bernard to contain 20·37 miles, of 5000 Engliſh feet to a mile.

Theſe itinerary maps of the roads and places of encampment, were indiſpenſably neceſſary in all armies. We find Athenæus, in his Deipnoſoph. lib. x. p. 442, quotes Bœton as author of a work intitled Σταθμοι της Αλεξανδρε πορειας, the Encampments of Alexander's March; and he likewiſe cites Amyntas, εν τοις σαθμοις. And Pliny, lib. vi. cap. 17. tells us, that Diognetus and Bœton were the ſurveyors of his marches; he then quotes the exact number of miles according to their menſuration, and afterwards confirms it by referring to the letters of Alexander himſelf. It likewiſe appears from Strabo, that Alexander was very careful in perſonally examining the meaſures of his ſurveyors, having his deſcriptions always from the moſt ſkilful in every country. And the ſame author acquaints us, that a copy of this great monarch's ſurvey was given by Xenocles his treaſurer to Patrocles the geographer, who, as Pliny informs us, was admiral of the fleets of Seleucus and Antiochus. His book on geography is often quoted both by Strabo and Pliny; and it appears that this author furniſhed Eratoſthenes with the principal materials and authorities for conſtructing the oriental part of his map of the then known world. For the voyages of Patrocles under Seleucus upon the Caſpian ſea, and elſewhere, were a kind of ſupplement to thoſe meaſurements given by Bœton and Diognetus already mentioned, and by Nearchus and Oneſicritus, the two admirals who were employed under Alexander, and therefore Pliny quotes them immediately after. It appears likewiſe from the ſame paſſage, that Megaſthenes and Dionyſius were two ſurveyors ſent into India by Ptolemy Philadelphus for the purpoſes of geography, and their authority was ſometimes ſet in oppoſition to Patrocles by Hipparchus in his Criticiſm upon Eratoſthenes's Geography.

We have dwelt the longer upon theſe different ſurveys which took their riſe from Alexander's expedition and conqueſts, and thoſe of his immediate ſucceſſors, becauſe geography began to aſſume a new face and form from this memorable era. For Eratoſthenes, who is deſervedly conſidered as the great father of chronology, employed his eminent abilities and learning with equal ſucceſs to reduce geography into a regular ſyſtem, and laid its foundation upon clear and ſolid principles. We muſt do him the juſtice to allow, that it was he who firſt introduced into his map a regular parallel of latitude. It was a geographical outline traced over certain places whoſe longeſt day was obſerved to be exactly of the ſame length. He began it from the Straits of Gibraltar, and it thence paſſed through the Sicilian ſea, and near the ſouthern extremities of Peloponneſus, and was continued through the iſland of Rhodes and the bay of Iſſus, and there entering Cilicia, and ſo croſſing the Euphrates and Tigris, was extended to the mountains of India. By means of this parallel line he endeavoured to rectify the errors in the ancient geographical map, ſuppoſed to be that of Anaximander. In drawing this parallel, he was regulated by obſerving where the longeſt day conſiſted of fourteen hours and a half, which Hipparchus afterwards determined to be the latitude of 36°, making by this a ſort of tranſlation of it into his own aſtronomical language.

This firſt parallel through Rhodes, was ever afterwards conſidered with a degree of preference, like the foundation ſtone of all the ancient maps; for it was traced through the middle of the Mediterranean, whoſe coaſts were in the centre of the principal nations of antiquity, and the longitude of the then known world was often attempted to be meaſured in ſtadia and miles, according to the extent of that line, by many ſucceeding geographers. The running of this parallel was ſo happy a thought in Eratoſthenes, that it not only encouraged him to trace upon his map other parallels at certain intervals from his firſt, ſuch as one through Alexandria, another through Syene, and another through Meroe, but he undertook to trace at right angles to theſe a meridian

ridian paſſing through Rhodes and Alexandria down to Syene and Meroe. And as the progreſs he thus made tended naturally to enlarge his ideas upon this ſcience, he attempted a ſtill more arduous taſk, which was to determine the circumference of the globe by an actual meaſurement of a ſegment of one of its great circles, making his computation upon the whole by uniting certain accurate obſervations made in the heavens with a correſponding diſtance carefully ſurveyed and taken upon a meridian of the earth.

The ſegment of the meridian which he fixed upon for this purpoſe, was that between Alexandria and Syene, the diſtance of which was meaſured, and found to be 5000 ſtadia, and the angle of the ſhadow upon the ſcaphia or ſun-dial which was obſerved at Alexandria, was equal to the 50th part of the circle; for at Syene there was no ſhadow from the gnomon at the mid-day of the ſummer ſolſtice; and that this might be more accurately taken, they dug a deep well, which being perpendicular, was completely illuminated at the bottom when the ſun was vertical. Though this even was not fully ſufficient to give the exact line of the tropic, becauſe the ſun was found to be vertical, or to caſt no ſhadow at all, for a circular ſpace of 300 ſtadia, becauſe the ſun's diameter, being equal to 32 minutes, would therefore appear perpendicular at the ſame inſtant of time to an extent of ground correſponding to that number of minutes; and therefore Ricciolus concludes, that this vertical obſervation muſt have extended 150 ſtadia on each ſide of Syene.

The ſubſtance of this account is taken from Cleomedes, who ſeems to have extracted it literally from Eratoſthenes's original work, intitled Μετρησεις, and it is publiſhed as ſuch at the end of the Oxford edition of Aratus, in 1672, though under the title of Μετρου της γης περιφερειας. By this account Eratoſthenes made the circumference of the earth amount only to 250,000 ſtadia, whereas a cloud of original authors have uniformly given the numbers to be 252,000. And to reconcile theſe two calculations, Dr. Murdoch has ingeniouſly ſuppoſed, that inſtead of 7° 12′, the difference of latitude was 7° 8′½, which was the $\frac{1}{50}\frac{2}{5}$ of the circumference, which would bring the calculation to 250,000 ſtadia, and that Cleomedes neglected the ſmall fractional part of the denominator; but that the principal miſtake was in meaſuring the diſtance, and finding it to be 5000 ſtadia. Indeed nothing is more common than to find a confuſion of numbers in the diſtances given us by ancient authors; for though theſe 5000 ſtadia are mentioned as the diſtance betwixt Alexandria and Syene by ſo many authors, yet we know that Marinus and Ptolemy did not allow above 3600 ſtadia to that diſtance, as the 7° 12′ amounted exactly to that number upon the proportion of 500 ſtadia to a degree, which Ptolemy tells us, was agreeable to menſurations that were allowed and acknowledged. The ſame number of 5000 ſtadia is ſaid to have been the diſtance ſuppoſed by Poſidonius betwixt Rhodes and Alexandria, where he had concluded that the ſegment of the meridian was the 48th part of a great circle from an obſervation of the ſtar Canopus; whereas Strabo tells us, that the ſeamen only allowed it to be a diſtance of 4000 ſtadia, and that Eratoſthenes, by his gnomonical obſervations, concluded it to be only 3750. In like manner Pliny tells us, that it was 5000 ſtadia betwixt Syene and Meroe; but in another paſſage, after mentioning the various meaſures of Eratoſthenes, Artemidorus, and Sebofus, who differed from each other, he adds, that the diſputes upon that head had been lately determined by ſurveyors ſent thither by Nero, who found it to meaſure 862 miles; though from the intermediate diſtance there ſpecified, it appears that the collected numbers give 874, and by multiplying each of theſe by 8 to increaſe them to ſtadia, will give in the firſt 6896 ſtadia, and in the ſecond 6992, both of which differ very materially from 5000 ſtadia.

The inveſtigation of this problem of the circumference of the earth, was eſſentially neceſſary for determining the radical principles of all maps, and therefore the moſt eminent of the ancient aſtronomical geographers made repeated endeavours to obtain an accuracy in this calculation. Eratoſthenes, by making the circumference to be 252,000 ſtadia, allowed therefore 700 ſtadia to a degree; which by the reduction of 8 ſtadia to a Roman mile of 5000 feet, amounted to 87½ Roman miles to each degree. Hipparchus added 25,000 ſtadia to this meaſure of Eratoſthenes, according to Pliny, lib. ii. cap. 108, though the obſervation is not mentioned from which this concluſion is drawn, which it were to be wiſhed Pliny had done, as it increaſes the error of Eratoſthenes. This addition however makes the circumference to conſiſt of 277,000 ſtadia, which was an allowance of 769 ſtadia, or 96 Roman miles, to each degree.

Poſſidonius, in like manner, computed the circumference of the earth to be 240,000 ſtadia, by multiplying 5000 (the ſuppoſed diſtance betwixt Rhodes and Alexandria) by 48, the ſegment of the meridian according to his obſervation betwixt theſe two places; but Cleomenes, when he mentions this concluſion, adds, "if the diſtance is 5000, but if not, in proportion to the diſtance." And as Eratoſthenes had made the diſtance to be only 3750 ſtadia, and Poſſidonius reſting his concluſion upon the deduction from his aſtronomical obſervation of the arch of the meridian, it was natural for him to infer, that if he admitted the diſtance given by Eratoſthenes to be true, being taken upwards of 170 years before his time, upon that hypotheſis, the circumference of the earth would be only 180,000 ſtadia, as 3750 multiplied by 48 will produce that number; and indeed Strabo tells us, that this very calculation was approved of by Poſſidonius. It is for this reaſon that he is quoted as having had two opinions upon the quantity of the circumference of the earth, and that he was therefore the firſt geographer who advanced the opinion of allowing only 500 ſtadia to a degree, which was afterwards adopted by Marinus and Ptolemy. By the firſt hypotheſis, therefore, there would be 666 ſtadia, or 83 Roman miles to a degree; and by the ſecond, 500 ſtadia, or 62½ Roman miles.

The diſcoveries and improvements of Eratoſthenes, as a geographer, naturally led to an explanation of theſe various menſurations and calculations of the circumference of the earth, which indeed materially affected the dimenſions of all the ancient maps. It is proper, however, to obſerve, that his map appears to have contained little more than the ſtates of Greece, and the dominions of the ſucceſſors of Alexander, digeſted from thoſe ſurveys already mentioned. He had ſeen indeed, and has quoted, the voyages of Pytheas into the great Atlantic Ocean, which gave him ſome faint idea of the weſtern parts of Europe; but withal ſo imperfect, that they could not be realiſed into the outline of a chart. Strabo tells us, that he was extremely ignorant of Spain, Gaul, Germany, and Britain, as well as of the Geti and Baſtarni; he was equally ignorant of Italy, the coaſts of the Adriatic, of Pontus, and of all the countries towards the north. And he mentions in another paſſage, that Eratoſthenes had made the diſtance from Epidamnus, or Dyrrachium, on the Adriatic, to the bay of Thermæ on the Ægean Sea, quite acroſs Epirus, to be only 900 ſtadia, when it was really above 2000 ſtadia; and in another inſtance he had enlarged the diſtance from Carthage to Alexandria to be 15,000 ſtadia, whereas it amounted to no more than 9000 ſtadia. Major Rennell, in his "Geographical Syſtem of Herodotus," aſcertains the Grecian ſtadium, or that employed by Herodotus in his ſtatements of diſtance, to have been the $\frac{1}{732}$ part of a geographical degree; that of Xenophon, $\frac{1}{750}$; that of Eratoſthenes, $\frac{1}{700}$; that of Strabo, the ſame; that of Pliny, $\frac{1}{727}$; that of Nearchus, $\frac{1}{729}$ and $\frac{1}{3}$; the mean ſtadium of the ancients, $\frac{1}{718}$, or 505½ Engliſh feet. The

pace,

pace, in the measurements of the ancients, he justly states it at five feet.

Such was the imperfect state of geography, and the inaccuracy of maps, prior to the discoveries of Hipparchus; who, like an abler architect, introduced a new plan of building, more certain in its principles, and more simple in its construction, and where they might employ without waste all the better parts of the ancient materials. His additions tended to make a new and closer union betwixt astronomy and geography, from which they derived mutual advantages, and widened their bottom for the accession of new improvements.

It appears that war has generally given rise to the most accurate maps of different countries; and therefore geography, about this era, began to make considerable advances from the progress of the Roman arms. For that warlike people, as they were the conquerors, so they became the surveyors, of the world. In all the provinces they occupied, we find that camps were every where constructed at proper intervals, and roads were raised with substantial materials for an easy communication between these different places of encampment; so that civilization and surveying were carried on according to system, through the whole extent of that large domain. Every new war produced a new survey and itinerary of the countries where the scenes of action passed; so that the materials of geography were accumulated by every additional conquest. Polybius, when he tells us, that at the beginning of the second Punic war, Hannibal was preparing his expedition against Rome, by crossing from Africa into Spain, and through Gaul into Italy, says, that all these places were measured or surveyed with the utmost care by the Romans.

Without entering into the minuter execution of the surveys of particular provinces with which every Roman general was regularly furnished before his march, and which Vegetius has well described, we shall only add a remarkable fact preserved to us by Æthicus in the Preface to his *Cosmographia*. We are there informed, that Julius Cæsar ordered a general survey to be made of the whole Roman empire by a decree of the senate; the surveyors are said to have been men of great wisdom, and instructed in every branch of philosophy. The three surveyors were Zenodoxus, Theodotus, and Polyclitus, and were each of them appointed to survey a different division of the empire. It began in the consulship of Julius Cæsar and Marc Antony, B. C. 44, and continued for twenty-five years one month and ten days, to the consulship of Sentius Saturninus and Lucretius Cinna, B. C. 19. The eastern part of the empire was assigned to Zenodoxus, who finished it in fourteen years five months and nine days, being in the consulship of Augustus IV. and Crassus, B. C. 30. The northern part was completed by Theodotus, in twenty years eight months and ten days, in the consulship of Augustus X. and Flaccus, B. C. 24. And the southern part was finished by Polyclitus, in twenty-five years one month and ten days.

The Roman Itineraries that are still extant, show evidently with what accuracy their surveys were made in every province: and Pliny has filled the third, fourth, and fifth, books of his Natural History, with the geographical distances that were thus measured. We have likewise one ancient set of maps still preserved to us, known by the name of the *Peutingerian Tables*, published by Welser and Bertius, which give a sufficient specimen of what Vegetius calls the *Itinera Picta*, for the clearer direction of the march of their armies.

The Roman empire had been enlarged to its greatest extent, and all its provinces well known and surveyed, when Ptolemy, in the days of Antoninus Pius, about 150 years after Christ, composed his System of Geography, which has been happily preserved to us amidst the general wreck that consumed so many other books of science. The materials then extant, and in his possession, for the completing of that great work, consisted of various particulars, some of greater and others of a less degree of authenticity. The principal were the proportions of the gnomon to its shadow, taken by different astronomers at the times of the equinoxes and solstices; calculations founded upon the length of the longest days; the measures or computed distances of the principal roads contained in their surveys and itineraries, and the various reports of travellers and navigators, who often determined the intervals of places by hear-say and guess-work. All of these were to be compared together, and digested into one uniform body or system, and after this were converted and translated by him into a new mathematical language, expressing their different degrees and minutes of latitude and longitude, according to the invention of Hipparchus, but which Ptolemy had the merit of carrying into full practice and execution, after it had been neglected for upwards of 250 years.

No author has ever supposed that Ptolemy had in his possession real astronomical observations sufficient to determine all the longitudes and latitudes he has laid down; so that we must always remember that their degree of accuracy depended upon the veracity of the fact or suggestion communicated to him, from which they were afterwards deduced. Agreeable to this idea, we find that Regiomontanus, in his Commentary upon Ptolemy's Geography, quoted by Gesner, though never published, endeavoured to explain an instrument called *meteoroscopium*, by which he supposes Ptolemy reduced and brought forth the numbers of his geography. We must not therefore be surprised at the multitude of errors to be found, when his original materials were so imperfect for executing so large a work as the fixing the longitudes and latitudes of all the places, coasts, bays, and rivers, of the then known world; an undertaking which even in our days has not yet been brought to sufficient accuracy.

It was almost impossible for him not to have committed many mistakes in the places beyond the extremities of the Roman empire, which were indeed out of the range both of astronomers and surveyors. So that those learned writers who have so severely criticised some of his errors, have not treated him with that candour and liberality which a work of this nature deserved. His mistakes arose from the ignorance of the age in which he lived, which could give him no better information, and were not properly the personal ignorance of the author. And this remark ought to have its due weight in restraining the wantonness of criticism in a thousand instances. Ricciolus, Cellarius, Paul Merula, and Salmasius, have all of them committed this mistake in their censures of his geography, as if they were disappointed in not finding this science in its full maturity in the writings of Ptolemy, at a time when it was evidently but just beginning to emerge from its infantine state.

If the observations from which Ptolemy compiled his geography, had been as accurate as the principles upon which it was digested were well founded, then this science would have advanced much sooner towards maturity. But when premises are admitted to be true, which are either doubtful or false, then the conclusions drawn from them must also be erroneous. Now the principal mistakes in Ptolemy took their rise from certain astronomical observations and surveys, which were supposed to have been made with accuracy in an age prior even to Ptolemy himself; and as that great author received and adopted them as genuine, having none more authentic by which their accuracy might have been tried, and having otherwise no reason to suspect them; so succeeding geographers, for want of better information, were induced to copy and insert them in their maps, as being, in their opinion, of acknowledged and undoubted authority. And thus error, when it has once assumed the counterfeit stamp of truth by the unguarded concession of some eminent writer, often preserves its currency during a great length of time. For these mistakes kept

their place in all maps whatever, by a ſort of unqueſtioned preſcription, down even to the beginning of the eighteenth century.

Neither were theſe errors ſuch as were introduced in the more diſtant regions of his maps, which are generally leſs viſited and more uncertain; but they were in the very centre of that part of the world which was the beſt known to the ancient Greeks and Romans. For whoever is the leaſt converſant in their hiſtory, muſt know that the coaſts of the Mediterranean were the claſſic ground of all antiquity; war and commerce occaſioned its being inceſſantly traverſed by the ſhips of all the contiguous nations; ſeveral great empires had their capitals upon its ſhores, or at a few miles diſtance; and almoſt all the ancient practical aſtronomers made their obſervations in its neighbourhood. Yet it appears, from major Rennell's Analyſis of the Geography of Herodotus, that though the Mediterranean ſea, and its European coaſts, were evidently well known to that hiſtorian; it is nevertheleſs certain that he knew but little of its weſtern ſhores and boundaries. With the extent and ſubdiviſions of the ſouthern countries on the Danube, however, he appears to have been well acquainted. His Scythia is the Weſtern Sarmatia of ſome later writers among the ancients, and the Ukraine of modern geography. But his notion of the form of this country was incorrect, as he ſuppoſed it to be one-half leſs than it really is. This ingenious author alſo purſues his examination through the countries which Herodotus has deſcribed as bordering on Weſtern Scythia; remarks, after Gibbon, that the Genoeſe conſtructed thoſe fortifications of the Crimea, whoſe origin has been by ſome referred to earlier times; traces the courſe of the famous expedition of Darius into Weſtern Scythia; attends Herodotus into the countries beyond the Euxine ſea; deſcribes the Hyperboreans of the Romans as being the ſame with the Gog and Magog of the Scriptures, or the Juje Majuje of the preſent Orientals.

The Aſia of Herodotus he next defines. Its weſt and ſouth-weſt boundaries were the ſhores of the Arabian gulph, and of the Mediterranean and Euxine ſeas: its eaſtern limits were the country of the Oigurs, the deſert of Robi, and India taken incluſively: on the ſouth its only boundary known to Herodotus was the Erythrean ſea. The north of Aſia was to him unknown; and he had but little knowledge of India. The length of Aſia eaſtward was leſs known to Herodotus, than to ſome later geographers among the ancients. With the bounds and extent of the Caſpian ſea, he was better acquainted than the followers of Alexander. He knew it to be a lake; they ſuppoſed it to communicate with the great northern ocean. China, Chineſe and Weſtern Tartary, Thibet, the peninſula beyond the Ganges, and the greater part of Siberia, were entirely unknown to Herodotus. To him and the other Greeks of his time Eaſtern Scythia was alſo little known. The Maſſagetæ, the Sacæ, and the Dahæ, were the great Scythian tribes. He has deſcribed the geography of the Perſian empire as divided into twenty governments. The maritime ſtrength of the Phœnicians under the Perſian power, is well marked by the fact which Mr. Rennell here notices, that they furniſhed to the fleet of Xerxes 450 triremes, of which 150 were derived from their eſtabliſhment in the iſland of Cyprus. Of the Ganges it appears that Herodotus had never even heard.

Africa was beſt known to Herodotus where it is adjacent to the middle and eaſtern limits of the Mediterranean ſea. Of its great rivers, he knew only the Niger and the Nile, as recently traced to their ſources by Bruce and Park. He knew thoſe *oaſes*, or inſulated ſpots in the ſandy deſert, which have been lately re-diſcovered by Brown. He knew that Africa had been circumnavigated. The voyage was performed at the rate of thirty-two geographical miles a day, and finiſhed in the ſpace of two years. The whole tract of the earth known to Herodotus might be meaſured by a radius of one thouſand Britiſh miles, moving from the centre of Halicarnaſſus. The Seewa of Brown, the traveller in Africa, is the Oaſis of Ammon of Herodotus.

It appears that little was done in geography from the days of Ptolemy, above-mentioned, to the reſtoration of learning in Europe; during which time the Arabian geographers copied and retailed all his principal errors. They obſerved indeed under their caliph Almamon, in the beginning of the ninth century, a degree of latitude on the plains of Sinjair, or Shinar, near Babylon, and found it to meaſure 56⅔ Arabian miles, each of which conſiſted of 4000 cubits, or 6000 feet, from which they determined the circumference of the earth.

When ſcience began to be revived in Europe, it was ſome time before the aſtronomers of that age were able to obtain copies of Ptolemy's Geography; and even then it was with difficulty they could read and clear the manuſcripts of ſome of their groſſeſt errors: for wherever numbers were inſerted in any author, and made the bulk of the compoſition, the miſtakes were generally multiplied more abundantly in the tranſcribing; becauſe the ſenſe did not there, as in moſt other books, by a kind of ſelf-evidence, aſſiſt the copier in preſerving the authenticity of the original. It required likewiſe ſome longer ſpace of time before the aſtronomers conſtructed proper inſtruments in order to try whether theſe latitudes ſo recorded, correſponded with the ſituations as they really ſtood in nature. But when they came actually to obſerve them, they diſcovered the latitude of many places materially different from what had been ſet down by Ptolemy; and finding this variation in ſome of them to be nearly of the ſame quantity, inſtead of accounting for this difference from the imperfection of inſtruments, the inaccuracy of obſervers, and the method of Ptolemy's Converſions, they haſtily concluded that the axis of the earth had ſhifted its poſition, by which the latitudes of all the places in Europe had been increaſed. This was the idea of Dominicus Maria of Ferrara, about the year 1489, who fancied that the variation was at the rate of one degree in 1050 years; ſo that after a long revolution of ages, it would happen that the countries now under the frigid zone ſhould be found under the torrid; and that in like manner thoſe regions which ſuffer from the violence of the heat ſhould gradually paſs into the temperate and frigid zones. Men of warm imaginations might eaſily work up this dream of geographers into a beautiful and an equitable diſpoſition of nature.

This fanciful hypotheſis was again adopted by Maginus of Bologna, about a hundred years after, towards the cloſe of the ſixteenth century, in which he had the concurrence of ſeveral of the Italian aſtronomers. And their authority made ſuch an impreſſion upon Tycho Brahe, that being deſirous of clearing up a doubt which he thought had ſome foundation, he applied to the republic of Venice to ſend ſome good obſervers into Egypt, to verify whether the height of the pole was ſtill the ſame at Alexandria as it had been found by Ptolemy. For as that city had been formerly as it were the metropolis of aſtronomy, there could be no doubt but that the height of the pole there muſt have been accurately obſerved for a long ſeries of years by their ableſt aſtronomers, and that Ptolemy muſt have examined it himſelf with his utmoſt attention before he had made uſe of it in his aſtronomical calculations. But Tycho's requeſt was not then complied with. However, when the obſervation was made, it did not ſufficiently ſupport their hypotheſis; for Ptolemy having found Alexandria to be 30° 58′ according to his Almageſt, or 31° according to his Geography; the obſervations made ſince by Mr. Greaves in 1638, made it amount to 31° 10′, and thoſe by M. Chazelles in 1694, and by M. Condamine in 1731, fix it at 31° 11′; which though a variation of eleven or thirteen minutes, may be charged, as in many other ſimilar caſes, upon the errors of inſtruments and obſervers.

Peter

Peter Petit, a mathematician of ſome eminence in France, endeavoured to revive this opinion in a diſſertation publiſhed in 1660, from the apparent variations in the latitude of Paris, as taken by the ableſt aſtronomers, ſome of whom had made it 48° 39′, others 48° 45′, ſometimes 48° 50′, and at other times 48° 55′. All of which only confirms an obſervation made by an eminent French aſtronomer, that they had no good quadrant fit for taking an obſervation of the latitude, even in the whole kingdom of France, in the year 1664. For M. Auzot, in a letter which he addreſſed to Louis XIV. in this very year, made uſe of the following words: *Mais, ſire, c'eſt un malheur, qu'il n'y a pas un inſtrument à Paris, ni, que je ſçache, dans tout votre royaume, auquel je vouluſſe m'aſſurer pour prendre preciſement la hauteur du pole.*

The latitude of London was known much ſooner than that of Paris, and brought to a greater degree of accuracy; for it was determined by Edward Wright, who is otherwiſe diſtinguiſhed as the original inventor of what is called *Mercator's Chart*, by obſervations made in 1593 and 1594, from the greateſt and leaſt height of the pole ſtar, and found to be 51° 32′, taken by a braſs quadrant of ſix feet radius; before that time the latitude of London was ſuppoſed to be 51° 45′ in all the maps of that age. And though this obſervation was made at a time when the error from refraction had been juſt diſcovered by Tycho, and not fully known, yet it is allowed to be juſt and exact even now, when the inſtruments which are conſtructed at preſent enable obſervers to come to the utmoſt preciſion of ſeconds.

There is another particular hitherto unnoticed, which has greatly contributed to the ſolid advancement both of aſtronomy and geography, and this is the more accurate method now practiſed for the meaſuring of time, which though in appearance of a different nature, is equally capable of being applied to the menſuration of ſpace. For in the tables of longitude it is well known that time and ſpace are uſed like two different languages, where the ſame truth is expreſſed with equal clearneſs in both, though in characters that are eſſentially different from each other; as one hour in time is allowed to be equal to fifteen degrees in ſpace upon the ſurface of the earth, and of courſe all the aliquot parts of each are in the ſame proportion. Sun-dials, and clepſydræ, or water-clocks, were the principal meaſurers of time among the ancients. It was only about the year of Chriſt 1300, that clocks with indented wheels are ſaid to have been firſt in uſe; and it was not till two hundred years after this that they ſeem to have been employed for the purpoſes of aſtronomy. For Waltherus, the diſciple of Regiomontanus, is ſaid to have had one about the year 1500; which Schoner, who publiſhed his obſervations in 1544, ſays, was ſo regular, that from mid-day to mid-day it perfectly agreed with the ſun, and was almoſt as exact in the times given, as in thoſe drawn from calculation. Tycho Brahe is ſaid to have had four clocks which marked minutes and ſeconds, the largeſt of which had only three wheels; the diameter of one of them was three feet, and it had 1200 teeth. But all of thoſe were exceedingly imperfect, till M. Huyghens improved them in 1656, by his invention and application of the pendulum, whoſe vibrations were regular and iſochronical. The improvements that have been ſince made in time-pieces, and the manner in which they have been applied to the determination of longitude, is a branch of knowledge of the utmoſt importance to geography and navigation.

Theſe advantages, however, and many other acquiſitions derived from mathematical geography, were not ſo completely underſtood, till the voyages of Magellan, Drake, and Cook, round the world, and the great extenſion of commerce, impelled the learned to call forth their ableſt exertions. The authors moſt diſtinguiſhed for their works in this department are, Cluverius, Heidmann, Janſon, Cellarius, Schwartz, Mannert, Bochart, and Michaelis; the two Bienewitz, Munſter, Gemma, Mercator, and others, of the ſixteenth century, have alſo in this reſpect conſiderable merit. In the eighteenth century, by the meaſurement of a degree at the polar circle, and on the equator, the French were enabled to aſcertain the real form of the earth; and ſimilar meaſurements have ſince been made by the Engliſh and Germans. The principal mathematical geographers of this period were Picard, Sturm, Caſſini, Kraft, Maupertuis, Clairaut, Le Monnier, Bouguer, Condamine, Boſcowich, Friſi, Maſon, De la Lande, De la Place, Klugel, Bode, Kloſtermann, and Zach. Beſides theſe, we have others more remote, ſuch as Edreſi, a learned Mohammedan of Cordua; the beſt tranſlation of whoſe work was publiſhed by Hartmann at Gottingen, in 1796; Abdollatif Ibn-Juſuph of Bagdad, whoſe Compendium, &c. was publiſhed by Dr. White in Arabic, with a preface by Paulus, in 1789, and tranſlated into German by Wahl in 1790; Abulfeda, whoſe works have been at different times, and in parts, edited by Reiſke, Grævius, Koehler, Michaelis, and Eichhorn; Benjamin of Tudela, a travelling Jew, whoſe itinerary was firſt publiſhed by l'Empereur, in 1633, and has ſince been tranſlated into French by Barratier, and into Engliſh by Gewans. Mercator's ſyſtem of projection now became the grand foundation for the improvement of modern maps and charts. He was followed, in the ſeventeenth century, by Hond, Munſter, Sanſon, and others. The ampleſt ſtrides, however, towards perfection, have been made in the eighteenth century by De l'Iſle, d'Anville, Goſſelin, and others, of the French; by Jefferys, Faden, Rennell, Arrowſmith, and others, of the Engliſh; by Schmidt, Gliſſeman, &c. of the Germans; and by various others. In the department of phyſical geography we are much indebted to the labours of Suſſmilch, Lulof, Bergman, Wallerius, Haidinger, Forſter, De Luc, Pallas, Dolomieu, Zimmermann, Meierſtto, Otto, and other ingenious philoſophers.

Among the miſcellaneous authors who have contributed to the illuſtration of geography, are Johannes de Sacroboſco, or John Hallifax, who wrote a treatiſe on the ſphere; Clavius, on the ſphere of Sacroboſco; Piccioli's *Geographia & Hydrographia Reformata*; Weigelius's *Speculum Terræ*; De Chales's Geography, in his *Mundus Mathematicus*; Leibnecht's *Elementa Geographiæ generalis*; Stevenius's *Compendium Geographicum*; Wolfius's *Geographia*, in his *Elementa Matheſeos*; Buſching's New Syſtem of Geography; Gordon's, Salmon's, and Guthrie's, Grammars; Varennius's *Geographia generalis*, with Jurin's additions; and Pinkerton's Modern Geography, the moſt ſyſtematic and perfect of this claſs.

Of PRACTICAL GEOGRAPHY.

The fundamental principles of geography are only to be acquired by an intimate knowledge of that department of the ſcience, which is termed *mathematical* or *coſmographical* geography; becauſe it teaches the mechanical conſtruction of the univerſe, connects the aſtronomical with the geographical circles of the ſphere, exhibits the ſeveral diviſions of the earth and heavens on a plane, and furniſhes to the mind's eye a comprehenſive view of the world, without the labour of travel; whence is derived the artificial conſtruction of globes, the projection of charts and maps, with all the inſtruments that are ſubſervient to our reſearches in aſtronomical and geographical ſcience.

The principal terreſtrial phenomena, with which it is neceſſary for the young ſtudent to be acquainted, ariſe chiefly from the ſpherical figure of the earth conſidered as a planet, and the poſition of its axis with relation to the ſun; particularly the riſing and ſetting of the celeſtial luminaries, the length of the days and nights, the variation of climates, the ſeaſons of the year, &c. all of which are amply explained under the article ASTRONOMY, vol. ii. p. 361–374; yet ſtill it belongs

to geography to take notice of the difference betwixt the ſame phenomena in different parts of the earth. Thus, though the ſun riſes and ſets all over the world, the circumſtances of his doing ſo are very different in different countries. The moſt remarkable of theſe circumſtances is the duration of the light not only of the ſun himſelf, but of the twilight before he riſes, and after he ſets. In the equatorial regions, for example, darkneſs comes on very ſoon after ſunſet; becauſe the convexity of the earth comes quickly in between the eye of the obſerver and the luminary, the motion of the earth being much more rapid there than in any other part. In our climate, the twilight always continues two hours, or thereabouts; and during the ſummer-ſeaſon it continues in a conſiderable degree the whole night. In countries farther to the northward or ſouthward, the twilight becomes brighter and ſtronger as we approach the poles, until at laſt the ſun does not appear to touch the horizon, but goes in a circle at ſome diſtance above it for many days ſucceſſively. In like manner, during the winter, the ſame luminary ſinks lower and lower, until at laſt he does not appear at all; and there is only a dim twinkling of twilight for an hour or two in the middle of what is called the day. By reaſon of the refraction of the atmoſphere, however, the time of darkneſs, even in the moſt inhoſpitable regions, is always leſs than that of light; and ſo remarkable is the effect of this property, that in 1682, when ſome Dutch navigators wintered in Nova Zembla, the ſun was viſible to them ſixteen days before he could have been ſeen above the horizon had there been no atmoſphere, or had it not been endowed with any ſuch power. The reaſon of this is, that in the northern and ſouthern latitudes only a ſmall part of the convexity of the globe is interpoſed betwixt us and the ſun for many days, and in the higher latitudes none at all. In the warmer climates the ſun has often a beautiful appearance at riſing and ſetting, by reaſon of the refraction of his light through the vapours which are copiouſly generated in thoſe parts. In the colder regions, halos, parhelia, aurora borealis, and other meteors, are frequent; the two former owing to the great quantity of vapour continually flying from the warm regions of the equator to the colder parts of the poles. In the high northern latitudes, thunder and lightning are unknown, or but ſeldom heard of; but the more terrible phenomena of earthquakes, volcanos, &c. are there not unfrequent. Theſe, however, ſeem chiefly to affect iſlands, and the maritime parts of the continent. See the articles EARTHQUAKE, and VOLCANO.

Notwithſtanding this ſeeming inequality in the general diſtribution of light and darkneſs, it is nevertheleſs certain that throughout the whole world, there is nearly an equal proportion of light diffuſed on every part, abſtracting from what is abſorbed by clouds, vapours, and the atmoſphere itſelf. The equatorial regions have indeed the moſt intenſe light during the day, but the nights are impenetrably dark; while, on the other hand, in the northerly and ſoutherly parts, though the ſun ſhines leſs powerfully, yet the length of time that he appears above the horizon, with the greater duration of the twilight, fully compenſates for every other deficiency.

Were the earth a perfect plane, the ſun would appear to be vertical in every part of it: for in compariſon with the immenſe magnitude of that luminary, the diameter of this globe is comparatively ſmall: and as the ſun, were he near to us, would do much more than cover the whole earth; ſo, though he were removed to any diſtance, the whole diameter of the latter would make no difference in the apparent angle of his altitude. By means of the globular figure of the earth alſo, and the great diſparity between the diameters of the two bodies, ſome advantage is given to the day over the night: for thus the ſun, being immenſely the larger of the two, ſhines upon more than one half of the earth; whence the unenlightened part has a ſhorter way to go before it again receives the benefit of his rays. In fact, on the globular figure of the earth depends the whole phenomena of nature which ſurround us; and were the ſhape of the planet we inhabit to be altered to any other, beſides the *real* differences which would of conſequence take place, the *apparent* ones would be ſo incalculable, that we cannot form any idea of the face which nature would then put on.

In geography, the circles and lines which the ſun apparently deſcribes in the heavens, are ſuppoſed to be extended to the earth, and marked on its ſurface; and in like manner we may imagine as many circles and lines as we pleaſe to be deſcribed on the earth, and their planes to be extended to the celeſtial ſphere, till they mark concentric ones on the heavens. The connection of theſe circles and lines may be imagined to take place from the axis or poles of the earth, as well as by the interſections which they reſpectively make with each other at their angles of meeting, as repreſented by the armillary ſphere, and the celeſtial and terreſtrial globes. It is from this connection of circles and lines that the ſciences of aſtronomy and geography are ſo cloſely interwoven; to elucidate which we muſt diſtinctly illuſtrate them by name, and trace their utility and deſignation, both as they regard the heavens and the earth, and the ſituation of places on the earth's ſurface; referring, for correſpondent particulars, to the article ASTRONOMY, in our ſecond volume.

PRINCIPLES AND DEFINITIONS.—1. The *axis* of the earth is an imaginary line paſſing through its centre, about which its diurnal revolution is performed.—The *poles* of the earth are the extremities of its axis, north and ſouth.

2. The *equator* is the circumference of an imaginary *great* circle paſſing through the centre of the earth, perpendicular to the axis, and at equal diſtances from the poles.—If the axis of the earth be produced both ways, as far as the concave ſurface of the heavens, in which all the heavenly bodies appear to be placed, it is then called the *axis of the heavens*; its extremities are called the *poles of the heavens*; and the circumference produced by extending the plane of the equator to the ſame concave ſurface, is called the *equator in the heavens*.—Circles drawn through the poles of the earth or heavens perpendicular to the plane of the equator, are called *ſecondarius* of the equator.

3. The *horizon*, properly ſpeaking, is a double circle; one of which is called the *ſenſible*, the other the *rational*.—The *ſenſible horizon* is that imaginary circle, which, touching the ſurface of the earth, ſeparates the viſible part of the heavens from the inviſible. The *rational horizon* is a circle parallel to the former, the plane of which paſſes through the centre of the earth.—The *poles of the horizon* are two points, the one of which, over the head of the ſpectator, is called the *zenith*; the other, which is under his feet, is called the *nadir*.—Circles drawn through the zenith and nadir of any place, cutting the horizon at right angles, are called *vertical circles*.

4. A vertical circle paſſing through the poles of the heavens, is a *meridian*, and is ſaid to be the meridian of any place through which it paſſes.—The meridian of any place paſſing through the poles, and falling perpendicularly upon the horizon, cuts it in two oppoſite cardinal points, called *north* and *ſouth*.

5. A *meridian line*, is the common interſection of the plane of the meridian and the plane of the horizon. Hence any line which lies due north and ſouth in an horizontal plane, may be conſidered as part of the meridian line.—To draw a meridian line, perpendicular to an horizontal plane, erect a wire, or ſtile, ſeven or eight inches long; and, as it is not eaſy to determine preciſely the extremity of the ſhadow, it will be beſt to make the ſtile flat at top, and to drill a ſmall hole through it, noting the lucid point projected by it; mark, at ſeveral different

rent times before noon, these lucid points, and through them draw concentric circles about the middle point of the wire's station; observe in the afternoon when the lucid points again touch these circles; and find the middle point of each arc between the points already taken: a line, drawn through these middle points and the common centre, will be the meridian line; for, since at equal distances from noon the sun is at the same height, or in verticals equally distant from the meridian, the circle drawn through the zenith at equal distances from these verticals, is the meridian. This should be done about the summer solstice, between the hours of 9 and 11 in the morning, and 1 and 3 in the afternoon.

To observe the transit of any heavenly body over the plane of the meridian; place, in this plane, a telescope, having two cross hairs before its object-glass, one vertical, the other horizontal, and observe when the vertical hair passes through the centre of the heavenly body: or, hanging two plumb-lines exactly over the meridian line, place your eye close to one of the threads in such manner, as that it shall cover the other thread, and observe when the body transits, or is behind the threads. —See the article ASTRONOMY, vol. ii. p. 456.

6. The *altitude* or *depression* of any heavenly body above or below the horizon, is the arc of a vertical circle intercepted between the body and the horizon, or the angle at the centre measured by that arc.—The altitude of any heavenly body is found by the help of a quadrant, thus: bring the quadrant into such a situation that the star may be seen through the sights; then the angle, contained between the string of the plummet and the side of the quadrant on which the sights are not placed, is the altitude of the star.—The *prime vertical*, is that which crosses the meridian at right angles in the zenith and nadir, cutting the horizon in the cardinal points *east* and *west*.

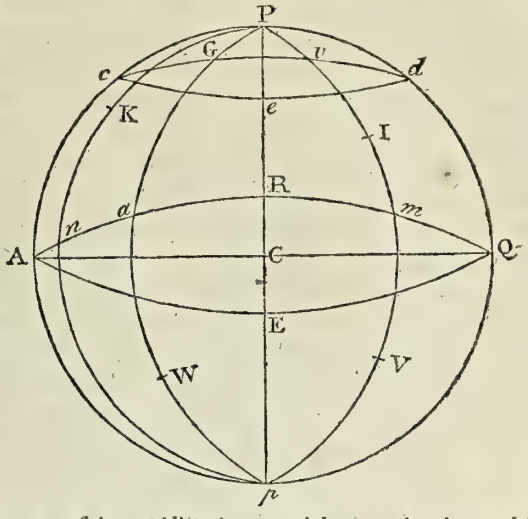
7. The *azimuth* of a heavenly body, is the arc of the horizon intercepted between the meridian and the vertical circle passing through that body; it is eastern or western, as the body is east or west of the meridian.

8. The *amplitude* of a heavenly body at its rising, is the arc of the horizon intercepted between the point where the body rises, and the east; its amplitude at setting, is the arc of the horizon intercepted between the point where the body sets, and the west: it is northern, or southern, as the body rises, or sets, to the north or south of east or west.—If a heavenly body rises, or sets, when the sun rises, it is said to rise or set *cosmically*; if it rises, or sets, when the sun sets, it is said to rise or set *achronically*; it is said to set or rise *heliacally*, when it approaches so near the sun as to become invisible, or recedes so far from him as to become visible.

9. The *latitude* of a place upon the surface of the earth, is its distance from *the earth's equator*; it is measured by the arc of the geographical meridian of the place intercepted between the place and the equator: latitude is either northern or southern.—*Parallels of latitude*, are circles on the surface of the earth drawn parallel to the equator; and a degree in the equator is to a degree in any parallel of latitude, as radius to the cosine of latitude.

10. The *longitude* of a place, is the distance between the meridian of that place, and the meridian of some other place, taken at pleasure, and called *the first meridian*; it is measured by the arc in the equator intercepted between these two meridians. Longitude is either eastern or western, and is measured 180 degrees each way.

Or, as illustrated by professor Vince, let PA*p*Q in the annexed diagram, represent the earth, P C *p* its axis, P the north pole, *p* the south pole; and let A E Q R be a circle passing through the centre C, perpendicular to the axis P*p*, then that circle is called the *equator*. This circle divides the earth into two equal parts, A P Q called the *northern*, and A *p* Q called the *southern*, *hemisphere*. Let K, G, I, be the situations of three places upon the surface, and through them draw the great circles P K *p*, P G *p*, P I *p*, called *meridians*, intersecting the equator in *n*, *a*, *m*, respectively. Now as every circle is supposed to be divided into 360 degrees, the distance from the pole to the equator must be 90 degrees. The *latitude* of a place,



is *an arc of its meridian intercepted between the place and the equator, measured in degrees*. Hence, the latitude of K is measured by the degrees of the arc *n* K; and the latitudes of G and I are measured by the degrees of the arcs *a* G, *m* I, respectively, and these are called *north* latitudes, the places lying in the northern hemisphere; and the latitude of W is measured by the degrees of the arc *a* W, and is called *south* latitude, the place lying in the southern hemisphere. Let the small circle *c* G *v d e* be parallel to the equator, then this circle is called a *parallel of latitude*, because every point of it has the same latitude, all the arcs *m v*, *a* G, intercepted between it and the equator, being equal, on account of the circles being parallel. The *longitude* of a place is measured upon the equator, and is the arc intercepted between the point from which you begin to reckon, and the point where the meridian of the place cuts the equator, estimated in degrees. Hence, all places in the *same* meridian have the *same* longitude; the longitude of G is the same as the longitude of W. Geographers of different countries begin to reckon from different points, each beginning from that point where the meridian of its capital city cuts the equator; and if the city have a national observatory in or very near to it, that meridian is taken which passes through the observatory. This is called the *first meridian*. We therefore define the *longitude* of a place to be *an arc of the equator intercepted between the first meridian and the meridian passing through the place*. In England, therefore, we begin from that meridian which passes through the observatory at Greenwich; in France, they begin from that meridian which passes through the observatory at Paris. Let therefore G represent the royal observatory at Greenwich, and *a* is the point of the equator from which we begin to reckon the longitude. Hence, the degrees of the arc *a m* is the longitude of the place I; and the longitude of the place K is measured by the degrees of the arc *a n*. Now the direction *a m* from *a* is east, and the direction *a n* is west; it is therefore usual to call *a m*, east longitude, and *a n*, west longitude, each till you come to the point opposite to *a*, or till the longitude each way becomes 180 degrees. But sometimes the longitude is reckoned all the way round in the same direction; that is, the point *m*, wherever it may be, is called east longitude from *a*.

If the latitude and longitude of a place be given, the place itself may be found; for if the longitude be known, set off the arc *a m* equal to it, if it be east longitude, and draw the meridian P *m p*; then if the latitude

be north, ſet off *m* I equal to it, and I is the place required; but if the latitude be ſouth, ſet off *m* V equal to it, and V is the place. If the longitude be weſt, ſet off *a n* equal to it, and take *a* G, or *a* W, equal to the latitude, according as it is north or ſouth, and G, or W, will be the place. Thus, all the places upon the ſurface of the earth, whoſe latitudes and longitudes are known, may be laid down accurately upon a globe or map; and the boundaries of the different countries may be traced out, and each exhibited in its proper ſituation and figure. By means of a globe, therefore, we may get a perfect idea of the relative magnitudes, figures, and ſituations, of all the countries of the earth, and of the ſituations of all the principal places in them; but a map, being a plane ſurface, cannot ſo correctly repreſent the proportions, boundaries, and poſitions, of places. The determination of the latitude and longitude is therefore eſſential to geography, and conſequently to navigation.

The arc G *v* contains the ſame number of degrees as the arc *a m*; the degrees of longitude therefore between any two places, when meaſured upon a ſmall circle parallel to the equator, diminiſh as that circle approaches the pole. The arc *a m* contains the ſame number of degrees as the angle *a* P *m*; hence, the angle formed by the meridians paſſing through any two places, is the meaſure of the difference of the longitudes of thoſe places.

11. The *altitude* of one pole, and the *depreſſion* of the other, at any place on the earth's ſurface, is equal to the latitude of that place.—For let R, in the Geographical Plate II. fig. 1, be a place upon the earth's ſurface; Z N, its zenith and nadir; P S, the poles of the heavens, and F *s*, the poles of the earth; E E, the celeſtial equator, *e e*, the terreſtrial equator, and H O, the horizon. The latitude of the place is *e* R, or the equal arc E Z; P O, is the elevation of one pole; and H S, the depreſſion of the other. Becauſe Z O, being the diſtance of the zenith from the horizon, is an arc of 90 degrees; and becauſe E P, being the diſtance of the pole from the equator, is alſo an arc of 90 degrees: Z O, and E P, are therefore equal. Take from each of theſe the common arc Z P, and the remainders, E Z and P O, are equal. But H S and P O are alſo equal, becauſe they ſubtend the equal angles H T S, P T O: therefore the elevation of one pole P O, and the depreſſion of the other H S, are equal to the latitude of the place E Z.—Hence the circumference of the earth may be meaſured, by meaſuring the length on the ſurface of the earth paſſed over in a line which lies north and ſouth, while the pole gains one degree of elevation, and multiplying this length by 360. A degree of latitude contains 69¼ Engliſh miles, whence 24930 miles is the meaſure of the circumference of the earth, and the radius 3985; the earth being a ſpheroid, whoſe polar diameter is to the equatorial as 229 to 230.

12. The elevation of the equator, at any place, is equal to the complement of its latitude.—Becauſe Z O, fig. 1, is equal to E P, (each being an arc of 90 degrees) E Z is equal to P O; that is, to the latitude of the place. But E H, the elevation of the equator, is the complement of E Z; it is therefore equal to the complement of the latitude of the place.

13. The earth revolving daily round its axis from weſt to eaſt, the heavenly bodies will appear to a ſpectator on the earth to revolve in the ſame time from eaſt to weſt. Let R C B F, fig. 1, repreſent the earth, T its center, H T O, the rational horizon to a ſpectator at R, whoſe zenith is Z; let a ſtar appear in the horizon at H. The earth revolving from weſt to eaſt, that is, in the order of the letters R, C, B, F, in a fourth part of one revolution, the ſpectator will be carried from R to C: conſequently, his horizon will become Z N, and the ſtar which appeared in his horizon at H, when he was at R, will now appear nearly in the zenith. When another fourth part of the revolution is completed, the ſpectator will be at B, and N being now his zenith, and H O, his horizon, the ſtar will be ſet with reſpect to him, and will not riſe till he is again in the ſtation R, that is, till the earth has completed one revolution. Thus whilſt the earth has turned once round upon its axis from weſt to eaſt, all the heavenly bodies in the concave ſphere of the heavens will *appear* to have turned round from eaſt to weſt.

14. The alternate ſucceſſion of day and night is the effect of the revolution of the earth round its axis. For, all the heavenly bodies appearing to move from eaſt to weſt, while the earth revolves from weſt to eaſt, the ſun will appear, in each revolution, to riſe above the horizon in the eaſt, and after deſcribing a portion of a circle, to ſet in the weſt, and will continue below the horizon, till by the revolution of the earth it again appears in the eaſt: and thus day and night will be alternately produced. The time of noon may be conſtantly found, by obſerving the inſtant when the center of the ſun is cut by the perpendicular hair in a meridian teleſcope, or by a correct ſun-dial.

15. The earth revolving round the ſun in 365 days, 6 hours, 56 minutes, 4 ſeconds, the ſun appears to revolve round the earth in the ſame time, but in the contrary direction.—It is manifeſt that the circle in which the ſun thus appears to move, is the ſame in which the earth would appear to move to a ſpectator in the ſun. Hence the apparent place of the ſun being found, the true place of the earth in its orbit is known. But the orbit in which the earth revolves round the ſun is not a circle, but an ellipſe, having the ſun in one of its foci. This circle, which the ſun appears to deſcribe annually in its progreſs through the concave ſphere of the heavens, is called the *ecliptic*.

16. A portion of the heavens, about ſixteen degrees in breadth, through the middle of which paſſes the ecliptic, is called the *zodiac*; in which lie the orbits of all the planets.—The ſtars in the zodiac, or ecliptic, are divided into twelve *ſigns*, Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricorn, Aquarius, Piſces. The figures, repreſenting theſe ſigns, are drawn upon the celeſtial globe, in that portion of its ſpherical ſurface, which correſponds to the portion of the concave ſphere of the heavens, in which the ſtars belonging to each ſign are reſpectively placed.—See the article ASTRONOMY, vol. ii. p. 326, and 414.

17. The axis of the earth in every part of the earth's revolution about the ſun, makes, with the plane of its orbit, that is, of the ecliptic, an angle of 66½ degrees. This is illuſtrated in the Geography Plate II. fig. 2: Let B A repreſent the plane of the ecliptic or earth's orbit, ſeen edgeways; S, the ſun; and P *p* produced, the axis of the equator. If the earth be at S, its axis is not perpendicular to the plane of the ecliptic, but makes an angle with it, P S A, about 66° 30′. In any other part of its orbit, as at M, or X, the axis of the earth is ſtill inclined to the plane of the ecliptic in the ſame angle.—It muſt be noted that the planes of the equator and ecliptic, make with each other an angle of 23½ degrees nearly. The obliquity of the ecliptic is not permanent, but is continually diminiſhing, by the ecliptic approaching nearer to a parallelism with the equator, at the rate of about half a ſecond in a year, or from 50″ to 55″ in one hundred years. The inclination, at the commencement of the nineteenth century, was 23° 28′ 5″ nearly. The diminution of the obliquity of the ecliptic to the equator is owing to the action of the other planets upon the earth. The whole variation, it is ſaid, can never exceed one degree, when it will again increaſe.—The obliquity of the ecliptic may be thus found: Obſerve with a good inſtrument, very accurately divided, the meridian altitude of the ſun's centre on the days of the ſummer ſolſtice; then the difference of the two will be the diſtance between the tropics; the half of which will be the obliquity ſought.—By the ſame method, the

declination

declination of the ſun for every day in the year may be found, and a table conſtructed.

18. The ecliptic being divided into twelve equal parts, each of theſe parts is called a *ſign*; and the names of the ſigns in the ecliptic are the ſame with thoſe in the zodiac, as ſtated in article 16, but do not exactly correſpond with them.

19. The two points in which the ecliptic cuts the equator, are called the *equinoctial points*: the vernal equinox is at the firſt degree of Aries in the ecliptic; the autumnal, at the firſt of Libra.—The moment of time in which the ſun enters the equator, may be found by obſervation, the latitude of the place of the obſerver being known. For in the equinoctial day, or near it, with an inſtrument exactly divided into degrees, minutes, and parts of minutes, take the meridian altitude of the ſun: if it be equal to the altitude of the equator, or to the complement of the latitude, the ſun is then in the equator; but if it is not equal, mark the difference, which will be the declination of the ſun. The next day, again obſerve the meridian altitude of the ſun, and gather from thence his declination. If theſe two declinations be of different kinds, as the one ſouth and the other north, the equinox happens ſome time between the two obſervations; if they be both of the ſame ſort, the ſun has either not entered the equinoctial, or has paſſed it. And from theſe two obſervations of the ſun's declination, the moment of the equinox may be inveſtigated.—See ASTRONOMY, vol. ii. p. 370–373.

20. The points of the ecliptic which are at the greateſt diſtance from the equator, are called the *ſolſtices*; and the circles which paſs through theſe points parallel to the equator, are called the *tropics*: the ſummer ſolſtice is at the firſt of Cancer, the winter ſolſtice at the firſt of Capricorn: the northern tropic is called the tropic of Cancer, the ſouthern of Capricorn. The ſun is once in the year at each of the tropics, and twice at the equator.

21. Circles which paſs through the poles at right angles to the equator, or any other *great* circle, are called *ſecondaries* to that circle: the ſecondary which paſſes through the equinoctial points, is called the *equinoctial colure*.

22. That pole which is neareſt the tropic of Cancer is called the *north pole*; that which is neareſt the tropic of Capricorn, is called the *ſouth pole*.

23. An imaginary line paſſing through the centre of the ecliptic, and perpendicular to the plane of it, is the *axis of the ecliptic*: its extremities are the *poles of the ecliptic*, and all circles, paſſing through theſe poles, and perpendicular to the ecliptic, are its ſecondaries. The axis of the ecliptic makes an angle of 23½ degrees nearly with that of the equator.

24. The *polar circles* are deſcribed by the revolution of the poles of the ecliptic about the poles of the equator: that which is next to the north pole, is called the *arctic* circle; the oppoſite, the *antarctic* circle.

25. The *declination* of any *heavenly body*, is its diſtance from the equator; this is either northern, or ſouthern. The degrees of declination of any body are reckoned upon a ſecondary of the equator paſſing through that body.

26. The *right aſcenſion* of any *heavenly body*, is its diſtance from the firſt of Aries reckoned upon the equator; this is meaſured, by obſerving the arc which is intercepted between Aries and a ſecondary to the equator paſſing through the ſun or ſtar.

27. The *latitude* of any *heavenly body*, is its diſtance from the ecliptic; and the degrees of latitude are reckoned on a ſecondary of the ecliptic paſſing through the body.

28. The *longitude* of any *heavenly body* is its diſtance from the firſt of Aries; and is meaſured on the ecliptic by the arc intercepted between the firſt of Aries and the ſecondary of the ecliptic which paſſes through the body: the longitude increaſes, as the body recedes from Aries, through the whole revolution, till it reaches 360°, or comes again to Aries.

29. Two bodies are ſaid to be in *conjunction* with each other, when they have the ſame longitude, or are in the ſame ſecondary of the ecliptic on the ſame ſide of the heavens, though their latitude be different: they are ſaid to be in *oppoſition*, when their longitudes differ half a circle, or they are on oppoſite ſides of the heavens.

30. The axis of the heavens is perpendicular to the planes of all the circles which the heavenly bodies deſcribe in their apparent diurnal motions. For the heavenly bodies, from the revolution of the earth round its axis, appear to move from eaſt to weſt in circles perpendicular to the axis. The planes of all theſe circles are parallel to the equator; and the axis paſſes through the centres of the circles.

31. The celeſtial ſphere is called *right*, *oblique*, or *parallel*, as the celeſtial equator is at right angles, oblique, or parallel, to the horizon.

32. In all places on the equator, the poles lie in the horizon, and all the circles of daily motion make right angles with the horizon.—For theſe places having no latitude, the poles are neither elevated above, nor depreſſed below, the horizon; and ſince the equator is 90 degrees from the poles, it is at right angles to the horizon, and alſo all circles parallel to it.

33. Thoſe who live at the equator are in a right ſphere; and, conſequently, their days and nights are always equal. The great circle of the celeſtial equator and its parallels, make right angles with the horizons of all places in the earth's equator; therefore the inhabitants of thoſe places live in a right ſphere. Hence, becauſe the celeſtial axis P T S, Plate II. fig. 3, is in the plane of their horizon, and becauſe this axis is at right angles to the plane of the equator, and paſſes through its centre, and through that of all circles parallel to the equator, the plane of the horizon alſo paſſes through the centres of theſe circles; and conſequently divides the equator and its parallels into two equal parts. One half of theſe circles will therefore always be above the horizon, and the other half below it. But each of the heavenly bodies in their daily motion deſcribes ſome one of thoſe circles, and the diurnal motion of the earth is uniform; therefore any heavenly body will, in this ſituation, be juſt as long above the horizon as below it. And becauſe this will be the caſe with reſpect to the ſun, as well as any other body, in whatever part of the heavens he is ſeen, the days and nights at the equator will always be of equal length.—See ASTRONOMY, vol. ii. p. 369.

34. At the poles of the earth, one celeſtial pole is in the zenith, and the other in the nadir; the equator coincides with the horizon, and all the circles of daily motion are parallel to the horizon.—For the latitude of the poles is 90 degrees from the equator, and the circles of daily motion are parallel to the equator.

35. Thoſe who live at either pole are in a parallel ſphere; they ſee the heavenly bodies carried round them in circles parallel to the horizon; and their day and their night, continues each half a year. An inhabitant at P, Plate II. fig. 3, has the equator E Q in the horizon, and all its parallel circles are parallel to the horizon. Therefore each of the heavenly bodies, in its apparent daily motion, being in ſome one of theſe circles, muſt deſcribe a path parallel to the horizon: ſo that thoſe which are above the horizon will never ſet by this motion, and thoſe which are below it will never riſe. The ſun, therefore, in this place, will not riſe or ſet by the diurnal motion of the earth. But from the annual motion of the earth, the ſun daily changes its apparent place in the heavens, till it has deſcribed the circle of the ecliptic, C L; one half of which is above the horizon, and the other half below it, becauſe theſe circles have their common centre in T, the centre of the earth. Therefore, for one half of the year the ſun will be in ſome part of C T, that half of the ecliptic which

which is above the horizon, and will daily revolve in circles above the horizon; and for the other half, it will be in ſome part of T L, and will perform its daily revolutions in circles below the horizon.

36. In any place between the poles and the equator, one celeſtial pole will be elevated, and the other depreſſed, at an angle leſs than a right angle; and the celeſtial equator will make an angle leſs than a right angle with the horizon. For, ſince the place is not in the equator, it has ſome latitude; and ſince it is not at either of the poles, its latitude is leſs than 90 degrees: whence the poles are elevated, or depreſſed, in an angle leſs than a right angle; and conſequently the equator, which is perpendicular to the axis, makes an angle leſs than 90 degrees with the horizon.

37. Thoſe who live on any part of the ſurface of the earth between the equator and either pole, are in an oblique ſphere, and have all the circles of daily motion oblique to their horizon.—Let H O, Plate II. fig. 3, be the horizon of a place which lies between the earth's equator and either of its poles; the celeſtial equator E Q, and all its parallel circles, will be oblique to the horizon, and therefore each of the heavenly bodies, being in ſome one of theſe circles, will appear to move in a path oblique to the horizon.

38. When the ſun, in his annual apparent courſe, is in the points in which the ecliptic cuts the equator, the day and night will be of the ſame length at all places on the ſurface of the earth: but, when the ſun is in any other part of the ecliptic, the days will be longer as the ſun's declination towards the elevated pole increaſes, and ſhorter as its declination towards the depreſſed pole increaſes. The plane of the horizon H O, Plate II. fig. 3, of any place, paſſing through T, the centre of the ſphere, and alſo through the centre of the equator, divides the equator C L into two equal parts, one half above, and the other half below, the horizon. When therefore the ſun has no declination, or is in the equator, it will appear in its daily revolution to deſcribe the equator C L; and, therefore, during one half of the revolution, it will be above the horizon, and, during the other half, below it. But ſuppoſe the ſun to have its declination towards P, the elevated pole, equal to E *m*: its diurnal apparent revolution will be in the circle *m m*, the centre of which is in a part of the axis above the horizon; whence the plane of the horizon does not paſs through the centre, and conſequently the circle *m m* is divided into two unequal parts, the greater above the horizon, and the leſs below it. Therefore the ſun, deſcribing the circle *m m*, with an uniform velocity, in its apparent diurnal revolution, will be longer in deſcribing the part above the horizon, than the part below it. And this difference manifeſtly increaſes, as the circle of the ſun's apparent diurnal motion recedes from the equator, that is, as the ſun's declination towards P increaſes. In like manner, it may be ſhewn, that the days will be ſhorter, as the ſun's declination towards the depreſſed pole increaſes.

Or thus: Let A B, Plate II. fig. 2, repreſent the plane of the ecliptic ſeen edgeways; S, the ſun in the focus of the orbit; M O, K L, X Y, the earth in different parts of its orbit. If F I, the axis of the ecliptic B A, were alſo the axis of the earth, that is, if the planes of the equator and ecliptic were coincident, it is manifeſt that the ſun, the apparent annual motion of which is in the plane of the ecliptic, would at all times of the year appear to move in the circle of the equator, and to be equally diſtant from the poles, and conſequently could produce, by its apparent motion, no varieties in the length of days and nights. But the earth's axis being inclined to the plane of its orbit, as P *p*, when the earth is at M O, the pole P will be towards the ſun, and the pole *p* turned from it, and the reverſe when the earth is arrived at X Y. When the earth is in the middle ſtation between B and A, in either part of its orbit, both the poles will be in the circle illuminated, as at K L.—In the poſition M O, ſince the ſun muſt always illuminate one half of the globe, the light will paſs beyond the pole P as far as F, and will extend towards the pole *p* no farther than I. Conſequently, in the diurnal revolution of the earth round its axis, while the earth remains in this poſition, all the parts of the globe between F and G will be illuminated, and all the parts between I and H will be dark. Farther, in this poſition greater portions of thoſe parallels which lie between the equator and the circle F G, will at any inſtant be in the illuminated, than in the dark, hemiſphere; and, on the contrary, greater portions of thoſe which lie between the circle H I and the equator, will at any inſtant be in the dark, than in the enlightened, hemiſphere. Conſequently, any given place on the ſide of the equator towards P, will, in one diurnal revolution, be longer in the light than in the dark, and the reverſe on the ſide towards *p*. The difference between the length of day-light and night, will decreaſe on either ſide of the equator, as we approach towards it; and at the equator, the illuminated and dark portions of the circle being always equal, the days and nights will be of equal length. The contrary to all this will take place in the ſituation X Y. Continual variations will take place, while the earth paſſes from M O to K L, and from K L to X Y. But in the ſituation K L, the illumination extending exactly to both poles, all the parallel circles are half illuminated, and half dark: conſequently, any place upon the globe will, in a diurnal revolution, have equal portions of light and darkneſs; that is, day and night will be every where of equal length. This muſt happen twice in every annual revolution.

All bodies, which are on the ſame ſide of the equator with the ſpectator, continue longer above the horizon than below it, and vice verſa; and as the orbits of the moon and planets are inclined to the equator, a variation of the times of their continuance above and below the horizon will take place.—When the ſun is very near either of the tropics, the days do not appear of different lengths, for the circles of apparent diurnal motion are ſo near to each other, that they cannot be ſenſibly diſtinguiſhed.—The different degrees of heat at different ſeaſons of the year are owing partly to the different lengths of the days, and partly to the different degrees of obliquity with which the rays fall upon the atmoſphere at different altitudes of the ſun.—See ASTRONOMY, vol. ii. p. 368.

39. When the ſun, or any other heavenly body, is in the equator, it riſes in the eaſt, and ſets in the weſt. For it then riſes and ſets in the points in which the equator cuts the horizon; that is, becauſe the equator is at right angles to the meridian, which paſſes through the north and ſouth points, in the points of eaſt and weſt. In north latitude, thoſe bodies which have north declination, riſe between the eaſt and north; thoſe which have ſouth declination, riſe between the eaſt and ſouth.

40. When the declination of the ſun is towards the elevated pole, its meridian altitude is equal to its declination added to the elevation of the celeſtial equator: when its declination is towards the depreſſed pole, its meridian altitude is equal to its declination ſubtracted from the elevation of the equator.—Let H O, Plate II. fig. 3, be the horizon, T the earth, P and S the celeſtial poles, D the zenith, N the nadir, E Q the equator. If the ſun be at C, having its declination towards the elevated pole P, when it arrives at the meridian P S, its meridian altitude C H, is equal to the ſum of C E, its declination, and E H, the elevation of the equator. If the ſun be at I, having its declination towards the depreſſed pole S; when it arrives at the meridian, its altitude I H, is equal to the difference of E H, the elevation of the equator, and E I, the ſun's declination, as appears from the figure.—See ASTRONOMY, vol. ii. p. 432.

41. When the declination of a heavenly body towards the elevated pole, is equal to the latitude of any place, the body will paſs through the zenith of that place: and when its declination towards the depreſſed pole is equal

to

to the latitude, it will pass through the nadir.—For any star or planet which passes through D, Plate II. fig. 3, the zenith, in its apparent diurnal revolution, must describe the circle D O; whence its distance from the equator or declination will be E D. But E D is the distance of the zenith from the equator, which, because the elevation of the equator is equal to the complement of latitude, so it is equal to the latitude. In like manner the reverse may be shewn.

42. A heavenly body seen from any place, will never set, from the diurnal motion of the earth, if the complement of its declination towards the elevated pole be equal to, or less than, the latitude of the place: and it will never rise, if the complement of its declination towards the depressed pole be equal to, or less than, the latitude. Let P D, Plate II. fig. 3, which is the complement of declination of a body at D, and also the distance of the body at D from the pole, be equal to P O, the elevation of the pole, or the latitude; it is manifest, that the body at its lowest depression will be no farther from the pole than the horizon is, that is, will never be below it. In like manner the reverse may be shewn. Hence the latitude of a place may be found, by observing the greatest and least altitude of a fixed star that never sets.—Let A, in the abovementioned fig. 3, be a star near the north pole, which in its daily motion describes the circle A B, without setting. A quadrant being placed in the plane of the meridian, or along the meridian line, observe its altitude when it is at A, and afterwards when at B; the difference of these altitudes is A B. And, since the star, in its revolution about the pole, is always at equal distances from it, if A B be bisected in P, this point will be the pole, and consequently P O will be the elevation of the pole. But, since the lengths of the arcs A O, B O, have been found by observations, their difference A B, and the half of this difference, A P or B P, is known: and P O is equal to B P + B O, or to A O — P A. Whence the elevation of the pole, that is, the latitude, is equal to the sum of the least altitude added to half the difference of the greatest and least altitude, or it is equal to the remainder arising from subtracting half the difference of the greatest and least altitudes from the greatest altitude.

Or, the latitude may be found from the sun's meridian altitude and declination. If the sun's meridian altitude, found by a quadrant, be C H, this altitude is equal to the sun's declination C E, added to the elevation of the equator E H. Therefore, if C E, the declination towards the elevated pole, be taken from the meridian altitude, the remainder E H will be the elevation of the equator. But since the elevation of the equator is the complement of latitude, the latitude is the complement of the elevation of the equator. This elevation, therefore, being found, the latitude of the place is known.—Or, the latitude of a place is equal to the sun's meridian zenith distance, added to his declination, when he passes the meridian between the zenith and the equator.

Example 1. To find the latitude from an observation of the sun's altitude, August 7, 1776, at the observatory at Cambridge.

Apparent meridian altitude of the sun's lower limb	53°	46′	8″
Sun's apparent semi-diameter, from the Ephemeris	0	15	50
Apparent altitude of the sun's centre	54	1	58
Deduct for refraction	0	0	41
Altitude of the sun's centre	54	1	17
Zenith distance of the sun's centre is found by subtracting the last altitude from 90°	35	58	43
Add the sun's declination	16	13	57
Latitude of the place	52	12	40

Ex. 2. On the 1st of December, 1793, the observed meridian altitude of Sirius was 59° 50′; required the latitude.

Observed altitude	59°	50′	S.
Therefore, Zenith distance	30	10	N.
Declination of Sirius	16	27	S.
Consequently, the latitude required	13	13	N.

43. The two tropics, and two polar circles upon the surface of the earth, divide it into five parts called *zones*: the *torrid* zone lies between the two tropics; the *temperate* zones between the tropics and polar circles; and the *frigid* zones between the polar circles and the poles.

44. At any place in the torrid zone the sun is vertical twice every year.—The sun in passing from the equator to the tropic of Cancer, 23½ degrees from the equator, has every northern declination from 0 to 23½: and every place between the equator and the tropic of Cancer has some northern latitude between 0 and 23½: therefore, in some part of its course from the equator to the tropic of Cancer, the sun must have a declination equal to the latitude of every place between the equator and the tropic: whence it must be once in the zenith of every such place in its course towards the tropic of Cancer. For the same reason it must be once in the zenith of every such place in its course from the tropic to the equator. The like also happens on the southern side of the equator.

45. The sun is vertical once every year at the places which lie in the tropics.—For the sun's declination is then 23½ degrees, equal to the latitude of the tropics.

46. At the polar circles, the longest day, and the longest night, are twenty-four hours.—When the sun is in the tropic of Cancer, the complement of its declination towards the elevated pole is 66½ degrees, equal to the latitude of the arctic polar circle: on this day, therefore, the sun will not set. When the sun is in the tropic of Capricorn, the complement of its declination towards the depressed pole will be 66½ degrees, equal to the latitude of the arctic pole; whence the sun will not rise during that day. The same happens with respect to the antarctic circle.

47. The longest day, and the longest night, are each of them more than twenty-four hours, *within the frigid zone*.—For, while the sun's complement of declination towards the elevated pole is less than the latitude of the place, the sun will not set: while the complement of declination towards the depressed pole is less than the latitude of the place, it will not rise: but this must be the case with respect to every place within the frigid zones, in some part of the sun's course towards the tropics.

48. The sun is never vertical to any place in either of the temperate zones.—For the latitude of all places in the temperate zone, is greater than any declination of the sun.

49. The longest day, and the longest night, in any part of the temperate zones, are less than twenty-four hours; and the days and nights will be longer, the nearer the place is to the polar circles.—For the complement of the sun's declination can never be less than, or equal to, the latitude of any place in the temperate zones; whence the sun will rise and set every day within these zones. But the farther any place is removed from the equator, the nearer the latitude approaches to an equality with the complement of the sun's greatest declination, when the day is twenty-four hours; that is, at the polar circles.—See ASTRONOMY, vol. ii. p. 369.

50. At different places, the hour of the day differs in proportion to the difference of longitude; 15 degrees of longitude making the difference of one hour in time; 15′, one minute of time, 15″, one second of time: and it is seen at any given place *sooner* than at places which lie to the west of it, and *later* than at places which lie to the east of it.—The sun in its daily apparent motion, which is from east to west, must arrive at the meridian of any given place, as London, sooner than it will arrive

at the meridian of any place which lies to the weſt of London, and later than at the meridian of any place to the eaſt of London: that is, ſince it is noon at any place when the ſun is in its meridian, it will be noon at London ſooner than at places weſt, and later than at places eaſt, of it. For example, if any place lies 15 degrees eaſt of London, that is, has 15 degrees of eaſtern longitude from London taken as the firſt meridian, the ſun will be one hour ſooner at its meridian than at the meridian of London; for, ſince the ſun every day appears to make a complete revolution from any meridian to the ſame, in twenty-four hours, it will in every hour deſcribe a 24th part of the circle, that is, 15°. And ſince a minute of a circle is a 60th part of a degree, and a ſecond of a circle a 60th part of a minute, and 15′ the 60th part of 15°, and 15″ the 60th part of 15′, the ſun will move at the rate of 15′ in every 60th part of an hour, and 15″ in every 60th part of a minute, that is, in every minute or ſecond of time. Conſequently, it will be noon one minute or one ſecond ſooner at a place which is 15′ or 15″ eaſt of London, than at London.

51. The difference of longitude at two places may be found by obſerving, at the ſame time from both places, ſome inſtantaneous appearance in the heavens.—If the eclipſe of Jupiter's innermoſt ſatellite, on the inſtant of its immerſion into the ſhadow of Jupiter, be obſerved by two perſons at different places, it will be ſeen by both at the ſame inſtant. But if this inſtant be half an hour, for example, ſooner at one place than at the other, becauſe the places differ half an hour in their reckoning of time, their difference of longitude is 7° 30′.—From tables of eclipſes correctly calculated for any place, the longitude of any place may be found by one obſerver. But ſuch obſervations can only be made with certainty by land, on account of the motion of a ſhip at ſea. In order to determine accurately the longitude at ſea, it is neceſſary to have a clock which ſhall not be ſenſibly affected by difference of climate, difference of gravity at different places, or the motion of the ſhip. Such a clock ſet for the meridian of London would conſtantly ſhew the hour of the day at London, which it is eaſy to compare with the hour of the day where the ſhip is, found by obſervations on the ſun or ſtars.

52 Thoſe who live in oppoſite ſemicircles of the ſame meridian, but in the ſame circle of latitude, have oppoſite hours of the day, but the ſame ſeaſons.—Being both on the ſame ſide of the equator and at the ſame diſtance from it, when the ſun's declination makes it ſummer or winter in one of the places, it will be the ſame at the other: but becauſe they are diſtant from each, 180 degrees of longitude, when it is noon at one place it will be midnight at the other: theſe are called *periæci*.

53. Thoſe who live in oppoſite circles of latitude, but in the ſame ſemicircle of the meridian, have oppoſite ſeaſons of the year, but the ſame hour of the day.—When the ſun has declination towards the north pole, it will be ſummer to thoſe who live in the northern circle of latitude, and winter to thoſe who live in the ſouthern circle of latitude. But, having the ſame longitude, their hours of the day will be the ſame: theſe are called *antæci*.

54. Thoſe who live in oppoſite circles of latitude and oppoſite ſemicircles of the meridian, have both oppoſite ſeaſons of the year, and oppoſite hours of the day.—Becauſe they are in oppoſite latitudes, they will have oppoſite ſeaſons; and becauſe they are in oppoſite ſemicircles of the meridian, they will have noon when it is midnight at the other: theſe are called *antipodes*.

55. Twelve ſecondaries to the celeſtial equator being conceived to be drawn at equal diſtances from each other, that is, dividing the equator into twenty-four equal parts, and the meridian of any place being made one of theſe ſecondaries, they are called *hour-circles* of that place.

56. If the celeſtial ſphere had an opake axis, the ſhadow of the axis would always be oppoſite to the ſun; and when the ſun was on one ſide of any hour-circle, the ſhadow of the axis would fall upon the oppoſite ſide of the ſame hour-circle.—For all the hour-circles being ſecondaries to the equator, paſs through the poles, and the celeſtial axis is in the plane of every hour-circle. And the ſhadow of any opake body, being oppoſite to the ſun, is in the ſame plane with the ſun. Therefore in whatever hour-circle the ſun is, the ſhadow of the ſuppoſed opake axis would be in the plane of that circle and oppoſite to the ſun, that is, while the ſun is in one ſemicircle of any hour-circle, the ſhadow of the axis would fall upon the oppoſite ſemicircle.—Hence, as the ſun performs its apparent courſe from eaſt to weſt, the ſhadow of the ſuppoſed axis would move from weſt to eaſt.—The gnomon of a ſun-dial repreſents this ſuppoſed axis, and therefore its ſhadow is a meaſure of time.

In every ſun-dial the gnomon, when fixed, is parallel to the earth's axis. Now when the ſun is in the meridian of any place, the twelve o'clock hour-circle is perpendicular to the plane of the horizon, and the arc from the pole to this plane is equal to the latitude of the place; and the one o'clock hour-circle makes an angle at the pole with it of 15°, and forms the hypothenuſe of a right-angled triangle to the above perpendicular, and the baſe is the arc meaſuring the angle between twelve and one o'clock; therefore we have, by Spherical Trigonometry, Rad : Sin. L : : tan. 15° : tan. of the hour-angle between twelve and one o'clock. If inſtead of 15, we ſubſtitute 30, 45, &c. we get the angles between twelve and 2, 3, &c. o'clock; the ſame may be done for the half-hours or other diviſions.—The *rational* and *ſenſible* horizons are, in this caſe, ſuppoſed coincident, which, on account of the ſun's great diſtance, will not occaſion any ſenſible error.

In a vertical ſouth-dial, we muſt conceive a plane paſſing through the centre of the earth perpendicular both to the horizon and meridian; and on the ſouth ſide, lines are drawn from the centre to the points where the hour-circles cut that plane. In finding theſe points, we ſay, as Rad : co. ſ. Lat : : tan. 15° : tan. of the hour angle between twelve and one o'clock. For the arc of the meridian, from the pole to the plane, is equal to the complement of latitude. The other hour-angles, &c. muſt be obtained in the ſame way as in the laſt.—See HOROLOGY.

57. The orbit in which the earth revolves about the ſun, is elliptical. It is known from obſervation, that the apparent motion of the ſun, that is, the real motion of the earth, in the ecliptic, is not uniform. But by the univerſal law of bodies revolving about a centre, if its orbit were circular, its velocity muſt be uniform; ſince it muſt deſcribe equal areas in equal times. Whereas if its orbit be an ellipſe, and the ſun be placed in one of the *foci*, the ſame law will require that its velocity ſhould not be uniform, but that in paſſing through its greateſt diſtance, to its leaſt diſtance, it ſhould be accelerated, and in paſſing from the leaſt diſtance to the greateſt, it ſhould be retarded. Since then the motion of the earth is in fact thus retarded and accelerated in different parts of its orbit, it is manifeſt that its orbit is elliptical.

58. A part of the earth's ſurface, bounded by two leſſer circles parallel to the equator, and of ſuch a breadth as that the longeſt day in the parallel nearer the pole exceeds the longeſt day in that next the equator, by ſome certain ſpace, as half an hour, or an hour, or a month, is called a *climate*. The beginning of a climate, is a parallel circle in which the day is the ſhorteſt; and the end of the climate, is that in which the day is the longeſt. The climates therefore are reckoned from the equator to the pole; and are ſo many zones or bands, terminated by lines parallel to the equator: though, in ſtrictneſs,

ſtrictneſs, there are ſeveral climates, or different degrees of light or temperature, in the breadth of one zone. Each climate only differs from its contiguous ones, in that the longeſt day in ſummer is longer or ſhorter, by half an hour, for inſtance, in the one place than in the other.

As the climates commence at the equator, at the beginning of the firſt climate, that is at the equator, the day is juſt twelve hours long; but at the end of it, or at the beginning of the ſecond climate, the longeſt day is twelve hours and a half long; and at the end of the 2d or beginning of the third climate, the longeſt day is thirteen hours long; and ſo of the reſt, as far as the polar circles, where the hour climates terminate, and month climates commence. And as an hour climate is a ſpace compriſed between two parallels of the equator, in the firſt of which the longeſt day exceeds that in the latter by half an hour; ſo the month climate is a ſpace contained between two circles parallel to the polar circles, and having its longeſt day longer or ſhorter than that of its contiguous one, by a month, or thirty days. But many authors, as Ricciolus, &c. make the longeſt day of the contiguous climates to differ by *half* hours, to about the latitude of 45 degrees; then to differ by an hour, or ſometimes two hours, to the polar circle; and after that by a month each.

The ancients, who confined the climates to what they thought the habitable parts of the earth, reckoned only ſeven, the middles of which they made to paſs through ſome remarkable places; as the firſt through Meroe, the ſecond through Sienna, the third through Alexandria, the fourth through Rhodes, the fifth through Rome, the ſixth through Pontus, and the ſeventh through the mouth of the Boryſthenes. But the moderns, who have ſailed farther toward the poles, make thirty climates on each ſide. Commonly the term climate is beſtowed on any country or region differing from another either in reſpect of the ſeaſons, the quality of the ſoil, or even the manners of the inhabitants; without any regard to the length of the longeſt day. Abulfeda, an Arabic author, diſtinguiſhes the firſt kind of climates by the term *real climates*, and the latter by that of *apparent climates*.

59. The greateſt diſtance of the earth or any other planet from the ſun, is called its *aphelion*; its neareſt diſtance, its *perihelion*; the longer axis of the ellipſe is called the *linea apſidum*; the aphelion is alſo called the *ſumma apſis*, and perihelion the *ima apſis*.

60. The *excentricity* of the earth, or any planet, is the diſtance between the ſun and the centre of the elliptical orbit.

61. The ſun is eight days longer in performing its apparent courſe through the ſix northern ſigns, than through the ſix ſouthern ſigns.—While the ſun appears to paſs through the northern ſigns, the earth paſſes through more than half of its orbit; and while the ſun appears to paſs through the ſouthern ſigns, the earth paſſes through leſs than half of its orbit. Therefore, if the velocity of the motion of the earth were uniform, the ſun muſt appear to be longer in paſſing through the ſix northern than the ſix ſouthern ſigns. But whilſt the earth is paſſing through the greater part of its orbit, it is farther from the ſun, and conſequently moves ſlower than in the leſſer part. On both theſe accounts, the ſun's apparent motion is ſlower in the northern ſigns than the ſouthern: the difference is found by obſervation to be about eight days.

62. The apparent diameter of the ſun is greater in winter than ſummer.—It is found by obſervation, that the diameter of the ſun in winter is 32′ 47″; in ſummer, 31′ 40″. And his mean apparent diameter is 32′ 12″, according to ſir Iſaac Newton, in his Theory of the Moon. Hence it appears, that the earth, at the winter ſolſtice, or Capricorn, is in its perihelion. The difference between ſummer and winter in the degrees of heat, is owing chiefly to the different heights to which the ſun riſes above the horizon, and the different lengths of the days. When the ſun riſes higheſt, in ſummer, its rays fall leſs obliquely, and conſequently more of them fall on the earth's ſurface than in winter; and when the days are long, and the nights ſhort, the earth and air are more heated in the day than they are cooled in the night, and the reverſe.

To illuſtrate more obviouſly the principles of mathematical geography above laid down, it will here be neceſſary to call in the aid of the armillary ſphere, and of the terreſtrial and celeſtial globes, which are calculated to impreſs on the mind the nature and uſe of thoſe great circles which aſtronomers and geographers have ſuppoſed to exiſt in the concave ſphere of the heavens, and over the convex ſphere of the earth, for the purpoſe of inveſtigating with accuracy and preciſion the various phenomena applicable to both.

Of the ARMILLARY SPHERE.

This is an artificial inſtrument, calculated to repreſent, by its real circles, thoſe imaginary ones which we have above deſcribed as dividing the heavens and the earth into various diſtinct parts. So that if the eye could be placed in the centre of this ſphere, we ſhould ſee its circles upon or againſt thoſe very points of the heavens where the imaginary circles above-mentioned are ſuppoſed to be ſituated. It is called *armillary*, becauſe it conſiſts of a number of rings of braſs, called by the Latins *armillæ*, from their reſembling bracelets or rings for the arms. The ſix *great* circles of the ſphere require particular attention: viz. the horizon, the meridian, the equator, the ecliptic, the equinoctial colure, and the ſolſtitial colure. The ſphere is ſuſtained in a frame, on the top of which is a broad circle repreſenting the horizon. On the inſide of the horizon are two notches for receiving a ſtrong braſs circle, which repreſents the meridian. It is ſuſpended on two pins, at two oppoſite points of the meridian; theſe pins are a continuation of the axis of the ſphere both ways; and as the ſphere turns round upon them, they are conſidered as poles; one the *north*, the other the *ſouth*, pole.

The *equator* is that circle which goes round the ſphere exactly in the middle, between the two poles.—The *ecliptic* is that circle which croſſes the equator obliquely; it is divided into twelve equal parts, each of which conſiſts of thirty degrees.—The *equinoctial colure* is the great circle which paſſes through thoſe two points of the equator that are intercepted by the ecliptic.—The *ſolſtitial colure* is the other great circle at right angles to the equator.

There are alſo four leſſer circles in the ſphere, two tropics, and two polar circles; theſe are all parallel to the equator.—The *tropic of Cancer* is the parallel which is on the north ſide of the equator; and the *tropic of Capricorn* is ſituated on the ſouth ſide of the equator. The two *polar circles* are at the ſame diſtance from the two poles, as the tropics are from the equator; that towards the north pole is the *arctic circle*, that towards the ſouth pole the *antarctic circle*.

The armillary ſphere is correctly repreſented in the Geography Plate I. fig. 1. The broad circle, HO, is the *horizon*, becauſe it terminates the view of the ſpectator, dividing the ſphere into two equal parts; that called the viſible hemiſphere, and that below, the inviſible hemiſphere. When the ſun, moon, &c. deſcend below this circle, we ſay, *they are ſet*; when they appear above it, we ſay, *they have riſen*. On the broad circle, repreſenting the horizon, are marked the thirty-two points of the mariner's compaſs; in which the eaſt, weſt, north, and ſouth, points, are called *cardinal* points.

The large braſs circle, MR, repreſents the *general meridian*, becauſe it ſerves to repreſent any particular meridian; for as it is fixed, and the ſphere is moveable about its axis, we can, by turning the ſphere, bring

bring any part of its ſurface under this circle, which will then repreſent the meridian of any given place.—One ſide of this circle is divided into four quadrants, each conſiſting of ninety degrees. The numbers on two of theſe quadrants commence from the equator, and proceed each way to the north and ſouth pole; the numbers on the other two quadrants increaſe from the pole towards the equator. The numbers which proceed from the equator point out the diſtance of the zenith of any place from the equator, which is its *latitude*. And the latitude is *north* or *ſouth*, according as the places are on the north or ſouth ſide of the equator. The degrees which are numbered the contrary way from the pole, are to ſhew the height or elevation of the pole above the horizon. We have before ſhewn that the elevation of the pole is equal to the latitude of the place.—By this circle is alſo meaſured the diſtance of the ſun or ſtar from the equator, which is its *declination*; and thus, if we bring the higheſt or moſt northern part of the ecliptic to the meridian, it will cut the ſame in 23½ degrees; and ſo much is the declination of that point.

To rectify the ſphere, is to put it in that poſition in which it may repreſent exactly the apparent motion of the heavens. For different places that poſition muſt be different, according to the different elevation of the pole, or latitude of the place. Therefore to rectify the ſphere, elevate the pole till the ſame number of degrees are above the plane of the horizon, as the pole of the place you are conſidering is above its horizon; and then the circles on the ſphere will, with reſpect to the globe ſuſpended within it, correſpond with the imaginary circles in the heavens.

The *equator*, E Q, is the great circle which ſurrounds the ſphere exactly in the middle between the two poles of the world; and the ecliptic, which repreſents the ſun's path, cuts this circle in two oppoſite points, and therefore, as ſtated above, the ſun is twice a-year in this circle; and as one half of it is always above the horizon, and the other half below, when the ſun is in thoſe two points, the days and nights are equal. This circle is called the *equator*, becauſe it equates or divides the globe of the earth into two equal parts; it is often alſo called the *equinoctial*, becauſe that when the ſun is in this circle, *the days are equal to the nights*. It is divided into 360 degrees, beginning and ending in the equinoctial point, and numbered from weſt to eaſt; theſe degrees on the ſphere are called degrees of *right aſcenſion*, but the degrees on the equator, as laid down on a terreſtrial globe, are called degrees of *longitude*, explained above. Hence a meridian, paſſing through the ſun, planets, or ſtars, ſhews on the equator the degree of its right aſcenſion, or diſtance from the equinoctial point.

The *hour circle*, *a*, is a ſmall circle fixed about the north pole, with a hand on the axis of the ſphere, ſo that by turning the ſphere on its axis, the index will be carried round the circle. This is uſed to convert the degrees of the equator into time; it is divided into twenty-four equal parts, anſwering to twenty-four hours, or the time of an entire revolution of the heavens. The index, by pointing ſucceſſively to thoſe hours, ſhews in what ſpace of time any part of that revolution is performed. The twelve hours are twice engraved on this circle; the firſt twelve hours ſhew the time from noon to midnight, the other from midnight to noon the next day. And ſince all aſtronomers begin the day at noon, therefore the two hours of twelve ſtand directly upon the graduated edge of the meridian.

The *ecliptic*, C D, is ſo called, becauſe there can be no eclipſes of the ſun and moon, but when the moon is in or near this circle; for this repreſents the ſun's apparent annual path, and therefore whenever the moon obſcures the ſun, or is obſcured by him, ſhe muſt be in or near the ecliptic. It is generally graduated into twelve equal parts, conſiſting of thirty degrees each, the beginning of the part being marked with characters repreſenting the twelve ſigns. Aſtronomers divided the ecliptic in this manner in order to judge more eaſily, and expreſs more clearly, the places of the ſun, moon, and planets; for it is eaſier to obtain an idea of their ſituation by referring them to ſome part of a known figure, than it could poſſibly be by merely conſidering degrees in the circumference and expanſe of the heavens. The points where this circle cuts the equator, are called the equinoctial points. It is by the ecliptic that we eſtimate the latitude and longitude of the heavenly bodies.

The *zodiac*, H O, is the broad circle in the heavens, which contains the twelve ſigns; and is called the zodiac, becauſe, according to the Chaldean diviſion, it conſiſted only of animal figures; what is now called Libra, being by them reckoned a part of Scorpio, and making the claws of that animal. The diviſion of the zodiac into twelve parts correſponds with the diviſion of the year into twelve months, and anſwers to the apparent motion of the ſun, as deſcribed above.

The next circles of the ſphere are thoſe two called the *colures*, both of which paſs through the poles of the world, and cut the equator at right angles. One of theſe paſſes through the equinoctial points, and is called the *equinoctial colure*, N; the other paſſes through the ſolſtitial point, P, and is called the *ſolſtitial colure*.

The *two tropics*, S and T, are parallels, and diſtant 23½ degrees from the equator on each ſide of it, at which diſtance they touch the ecliptic in the ſolſtitial points. While the ſun is going from Aries to Cancer, he advances every day more northward, till he comes to Cancer, his moſt northward ſituation; after which he begins to deſcend to Libra, getting every day more ſouthward than before. Now, when he is in the beginning of Cancer, he changes his motion, and turns from going northward to go ſouthward; this turning back is meant by the word *tropic*, from whence the parallel paſſing through Cancer is called *the tropic of Cancer*; and for the ſame reaſon the other is called *the tropic of Capricorn*, becauſe there the ſun returns from the ſoutherly courſe to the northern one.

The *polar circles*, V and U, are the imaginary circles in the heavens, which correſpond to thoſe parts of the earth that were termed by the ancients the *frigid zones*; they include 23½ degrees on each ſide their reſpective poles. Theſe circles are by many authors called the *arctic and antarctic circles*, but improperly, as the ancients meant by the arctic circle the largeſt parallel that was always above the horizon of any particular place, containing all thoſe ſtars which never ſet at that place, but ſeem to be carried round above our horizon in circles parallel to the equator. The largeſt parallel, which is entirely hid below the horizon of any place, they called the antarctic circle, or circle of perpetual occultation. This includes all the ſtars which never riſe to an inhabitant of the northern hemiſphere, but are perpetually below the horizon. All arctic circles touch their horizons in the north point, and all antarctic circles touch their horizons in the ſouth point. Thoſe who live under either tropic have one of the polar circles for their arctic, and the other for their antarctic, circle; thus the names of *mutable circles* have been given to the immutable polar circles, which are only arctic and antarctic circles in one particular caſe.

Of the three ſituations of the celeſtial ſphere, deſcribed above, (article 31,) as applicable to the inhabitants of the earth, we may form a very clear conception by means of the armillary ſphere.

The right ſphere, or ſphere of thoſe inhabitants who live under the equator.—To ſhew the poſition of the circles of the ſphere with reſpect to theſe inhabitants, bring the equator into the zenith, and the poles of the world lie in the horizon. The equator, the tropics, and polar circles, all ſtand perpendicular to the horizon; the heavenly

venly bodies always riſe and ſet perpendicularly; and as the horizon cuts all the circles in half, the days and nights will be equal throughout the whole year. Hence this poſition is called a *right ſphere*: for under the equator the ſtars muſt every day appear to riſe out of the horizon, then to aſcend perpendicularly for ſix hours, and deſcend perpendicularly for the ſix following hours, ſet and remain below the horizon twelve hours ſucceſſively. The planets do the ſame, there being no difference between them and the fixed ſtars, but that the latter always deſcribe the ſame parallel; whereas the parallels deſcribed by the former differ every day, being greater or leſs, according to their diſtance from the equator.

The parallel ſphere.—This ſhews the ſituation of the heavens to an inhabitant who lives under the poles. Bring the pole of the armillary ſphere into the zenith, as ſhewn in fig. 1; in this poſition the axis is at right angles to the horizon, the equator and horizon coincide, and the tropic and polar circles are parallel thereto; here there will be but one day and night throughout the whole year: for the ſame reaſon, the moon, in half her monthly revolution, will never riſe, and in the other half will never ſet. The fixed ſtars will every day deſcribe circles parallel to the horizon, ſome never riſing, others never ſetting. Hence, alſo, an inhabitant of the north pole has the ſun above his horizon, and therefore perpetual all the time the ſun is on the north ſide of the equator, that is, for ſix months together. But the ſun is below his horizon, and it is night with him all the time the ſun is on the ſouth ſide of the equator, which is alſo for ſix months: or, in other words, the ſun will be ſeen for half a year, and then it will be day; and it will be hidden for half a year, and then it will be night.

The oblique ſphere.—We in England are ſituated in an oblique ſphere. This poſition agrees with all the inhabitants who live neither under the poles, nor under the equator; here the equator, and all the circles parallel to it, make oblique angles with the horizon. It is evident, that in this ſituation, all the parallels to the equator are divided by the horizon into two *unequal* parts, but the equator into two *equal* parts; conſequently, the day and night are never equal to an inhabitant in an oblique ſphere, but when the ſun is in the equator, that is, twice a-year, on the 20th of March, and the 22d of September. All the reſt of the year the days are either longer or ſhorter than the nights; and the ſun, which always appears to move in the ecliptic, deſcribes one of the parallels to the equator, which are all cut by the horizon into two unequal parts. On the northern ſide of the equator, the days are longer than the nights, as long as the ſun is on the north ſide of the equator; but the nights are longer than the days, when the ſun is to the ſouth of the equator.

The portion of the parallels above the horizon is greater in proportion as they are nearer the elevated pole; but when the diſtance of the parallel from the pole becomes leſs than the elevation of the pole, then that parallel, and all thoſe which are included within it, are wholly above the horizon, no part of them ſetting or paſſing under it. The contrary happens in the parallels that are ſituated towards the depreſſed pole, a ſmaller portion of theſe being above the horizon, and the greater part lying under it. Thoſe parallels which are nearer the depreſſed pole, than the elevation of the pole, or latitude of the place, remain perpetually, together with the ſtars included within them, under the horizon, and are never viſible to us.

The arc of the equator intercepted between the beginning of Aries, and a ſtar, &c. when on the meridian, is its *right aſcenſion*. It is ſo called, becauſe in a right ſphere, that point of the equator, which riſes with a ſtar, &c. comes alſo to the meridian with it. Hence we find the right aſcenſion of a ſtar, &c. by bringing it to the meridian; for that point of the equator which comes to the meridian with it, is its right aſcenſion. The right aſcenſion of a fixed ſtar is always the ſame, but that of a planet varies. The arc of the equator intercepted between the beginning of Aries and the point of the equator, riſing or ſetting along with any heavenly body, is the *oblique aſcenſion or deſcenſion*. The difference between the right and oblique deſcenſion, is the *aſcenſional difference*. Thus many problems, ſolved by the globes, may be performed equally correct with the armillary ſphere.

In the centre of the ſphere is placed a ſmall globe of the earth, ſupported by an axis, the ends of which go through the ſphere in the places of the celeſtial poles. It is ſo contrived, that we can either turn the globe round within the ſphere, or turn the ſphere round the globe; thus this inſtrument exhibits the real motion of the earth round its axis within the ſphere of the heaven, or the apparent motion of the heaven round the earth; and hence it ſhews the correſpondence between the terreſtrial and celeſtial ſpheres; and that the appearances of the heavenly bodies would be the ſame to us, whether they moved round the earth as they appear to do, and the earth ſtood ſtill; or they ſtand ſtill, and the earth is carried round the contrary way.

By the armillary ſphere it is alſo manifeſted, that the poles of the earth, when extended, reach the poles of the heavens. By placing a ſmall patch on the different circles of the ſphere to repreſent ſtars, we ſhall perceive, that thoſe which are furtheſt from the poles will deſcribe the greateſt circles; and thoſe will deſcribe the largeſt poſſible circles that are ſituated in the equator, which is equi-diſtant from both poles. We likewiſe perceive, that a ſtar has acquired its greateſt elevation when it comes to the upper ſemicircle of the meridian, and its greateſt depreſſion when it is at the lower circle of the meridian; and that the arc of its apparition is biſected at the meridian.

Of the GLOBES.

Though the celeſtial and terreſtrial globes are juſtly allowed to be the beſt artificial inſtruments for combining a general knowledge of aſtronomy and geography, yet there are imperfections in the common globes, which often tend to confuſe a learner; but which it has been recently propoſed to remedy by an improved ſtructure. It is our province to conſider the merits and demerits of both. A pair of globes, on the improved principle, are repreſented in the Geography Plate I. fig. 2 and 3; and their advantages might be eaſily pointed out, by comparing them with thoſe of the common conſtruction. To rectify the common globes to any particular latitude, the axis of the earth muſt be ſhifted from one falſe poſition to another, by which the mind of the pupil is liable to be confuſed, ſince he with difficulty conceives that the axis of the earth never varies its poſition, but always preſerves the ſame inclination to the plane of its orbit. Again, the broad circle of the common globes is deſigned to repreſent the ecliptic and the horizon; but on examination it repreſents neither the one nor the other correctly. The ecliptic is the *apparent* path of the ſun, to which the earth's axis always makes an angle of 66½ degrees; yet by ſhifting the axis of the globe to rectify it for the latitude, this circle can never be in its *true* poſition as ecliptic, except when the axis is at 66½ degrees, and, conſequently, can only then be uſed as the ecliptic. Next let us conſider it as the horizon. Now, as we have ſhewn above, every place is always in the zenith of the horizon, and the place and horizon always move together; but in the common globes, the broad circle is only the horizon in one particular ſituation, that is, when the place is in the zenith; for after having rectified the globe to the latitude, the moment you move the globe, the broad circle is no longer the horizon. Thus it is plain, that this circle, in many inſtances, cannot with propriety be conſidered either as an

horizon or ecliptic. A circle is alſo laid down on the common terreſtrial globe to repreſent the ecliptic, and to be uſed as ſuch in ſolving problems upon the common globes, though it involves numerous abſurdities: thus, having marked the ſun's place in the ecliptic, and rectified the globe to the latitude, then turn the globe, and the ſun and earth have a diurnal motion together; of courſe, if you have day when you begin, you will have the ſame during the whole twenty-four hours; or, *vice verſa*, twenty-four hours of night. Several other imperfections might eaſily be adduced; but theſe are ſufficient to ſhew the defect of their conſtruction.

The terreſtrial globe, repreſented in Plate I. fig. 2, does not hang in a frame like the common globes, but is mounted on a pedeſtal, ſupported by, and moveable on, an axis, which is inclined 66½ degrees to the ecliptic, and of courſe is always by this means parallel to the axis of the earth, ſuppoſing the path of the globe to be parallel to the ecliptic. On the pedeſtal, but under the globe, is a graduated circle C D, marked with the ſigns and degrees of the ecliptic; adjoining to which is a circle of months and days, anſwering to every degree of the ecliptic; within this circle is the ſun's declination for every day of the month. There is alſo a moveable arm A B, which, being ſet to the day of the month, immediately points out the ſun's place in the ecliptic, and his declination. On this moveable arm, but near the index, is added a pillar E; on the top of this pillar is fixed a ſmall ball, through which a ſteel wire paſſes, to repreſent a ray proceeding from the centre of the ſun.

Round the whole globe is a braſs circle F, to repreſent the horizon of any place; and at right angles to this horizon, is fixed a ſemicircle G, to anſwer for a general meridian. The middle point of this ſemicircle anſwers for the ſituation of any inhabitant on the earth, for which reaſon a ſteel pin is fixed over the middle point of this ſemicircle. One ſuppoſition only is neceſſary for performing every problem with this globe; namely, that a ſpherical luminous body will enlighten one half a ſpherical opake body, and, conſequently, that a circle at right angles to the central ſolar ray, and dividing the globe in half, will be a terminator, ſhewing the boundaries of light and darkneſs for any given day. For this purpoſe, at the end of the moveable arm oppoſite to the ſun, there is a pillar H, from the top of which projects a piece to carry a circle I, which alſo ſurrounds the globe, and always divides it into equal portions, ſeparating the enlightened from the dark parts. Eighteen degrees behind this circle, but parallel to it, is another circle, intended to repreſent the limits of twilight.

There are two braſs plates, K and L, placed under the globe, which are turned by the diurnal revolution thereof, as by the ſame revolution of the earth. Each of theſe is divided into twice twelve hours, and parts of an hour, to anſwer for the hours of the day; on the outſide are laid down the degrees of longitude for every hour; ſo that theſe circles give at ſight the hour of the day or night, at any two places on the globe, with the difference of longitude correſponding thereto. There is alſo a further improvement added to this conſtruction, which renders it a planetary globe; for, by ſetting the pillar, fig. 4, to the place of any planet in the ecliptic, and the ball to the latitude of the planet, it will ſolve all problems relative to that planet, or to the moon; as it does likewiſe for the ſun, by means of a central ſolar ray.

To rectify this globe, ſet the diviſion under the repreſentative inhabitant over the given place, ſet the ſolar index, L, to the day of the month; then turn the globe round on the axis till the meridian coincides with the central ſolar ray, and the hour index under the globe to XII; and this globe is then in the true poſition of the earth, with reſpect to the ſun and that given place. If the inhabitant be placed on the weſtern ſide of the terminator, he will ſee the ſun, or the central ſolar ray, riſing in the horizon; and this ray will mark thereon the ſun's amplitude, while the hour circle gives the hour and minute of the ſun's riſing on that day and place. Turn the globe gradually till the meridian coincides with the central ſolar ray, and the point will mark out the ſun's meridian altitude for that day. As the globe goes on, the altitude decreaſes, and when the inhabitant is arrived at the other ſide of the terminator, the ſolar ray is in the horizon, and points out the ſun's amplitude, with the time of his ſetting on the hour circle. If you proceed to turn the globe till the inhabitant is under that circle which is behind the terminator, the hour-circle gives the time that twilight finiſhes. The ſun's altitude for any given time of the day, is obtained by ſtopping the globe when the index points out that hour, and the quadrant of altitude over the inhabitant, and then bringing it to the central ray, which will point out thereon the altitude for that hour.

In this manner may be ſolved ſimilar queſtions for any other place, or any other day; always obſerving, 1. To fix the inhabitant over the given place. 2. To ſet the ſun's annual index to the given day of the month. 3. To bring the meridian to the central ſolar ray, and the hour index under the globe to XII. By placing the ſmall pillar, fig. 4, to the moon's place in the ecliptic, and the ball to her latitude, the ſame problems may be ſolved at the ſame time for the moon; and ſo reſpectively of any other planet. Hence, by this globe, a perſon entirely unacquainted with aſtronomy may, in a few days, acquire a competent and natural notion of the principal phenomena, and be enabled to ſolve the greateſt part of the moſt intereſting problems concerning the ſun, moon, and planets.

The celeſtial globe is repreſented at fig. 3, in the ſame engraving. As the terreſtrial globe is mounted to correſpond exactly with our earth, and every problem anſwered as they are really occaſioned by the annual and diurnal motion of the earth; ſo the celeſtial globe, to be conformable to nature, ſhould be as nearly as poſſible an exact imitation of the heavens, and their ſituation with reſpect to the earth; which is far from being the caſe with the common globes. To make the celeſtial globe thus conformable to nature, it ſhould have no motion; the appearance of motion in the firmament, ariſes entirely from the diurnal motion of the earth; it is plain, therefore, that whatſoever gives a true repreſentation of the heavens, will have no motion. This celeſtial globe is therefore fixed on an axis, making, like that of the terreſtrial globe, 66½ degrees with the plane of the ecliptic; and the ecliptic on this globe exactly coincides with the ſun's apparent path round the earth. All problems concerning the ſun, moon, and planets, are performed by the terreſtrial globe. This celeſtial globe needs only to be uſed for the ſtars; and one or two problems will give a ſufficient idea of the manner of ſolving all that relates to the ſtars.

To find the latitude and longitude of a given ſtar.—Firſt find the ſtar on the globe, and then place the index and clip, marked A, on the ecliptic plate, ſlide the ſiderial index till it is exactly over the ſtar, and the latitude is ſhewn on the arc, and the longitude, by the index, on the ecliptic.

To find the riſing, ſetting, amplitude, and meridian altitude, of the ſame ſtar.—Take the clip from the celeſtial globe, and put it to the ſame degree of longitude on the terreſtrial ecliptic plate; turn the globe on its axis, and the time of its riſing and ſetting is immediately pointed out by the hour index; its amplitude is ſhewn on the horizon; its meridian altitude, by the meridian; and its azimuth and altitude for any hour, by applying the quadrant of altitude under the ſiderial index for that hour.

With regard to the utility or difference between theſe improved

J. Pass fc.

Published as the Act directs, March 28, 1807, by J. Wilkes

improved globes, and thoſe of the common conſtruction, candour impels us to remark as follows: In the improved terreſtrial globe, repreſented at fig. 2, the moveable horizon is ſhifted, as it would naturally ſhift, ſhould an inhabitant move from one latitude to another. In the common globe, we can elevate the pole to the ſame effect; but in London, ſhould we elevate the pole for the latitude of Jamaica, the axis at London would not point to the north pole, or polar ſtar; yet, ſuppoſing we were at Jamaica, it would then point juſtly. The axis of the earth, with reſpect to the horizon, may therefore be ſaid, relatively to the horizon, to be continually ſhifting, as an inhabitant changes his latitude. This may be eaſily underſtood by an attentive learner, without confuſing his ideas.

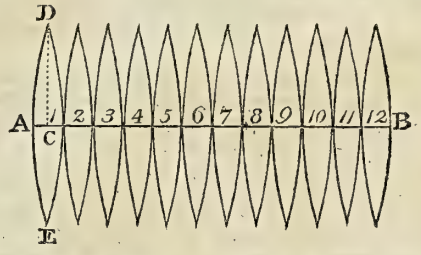
The horizon, on the broad circle upon the ſtand of the common globes, containing alſo the ecliptic, divided into ſigns and degrees, and a contiguous calendar, is not deſigned to repreſent more than the horizon of a place. The graduated circle of the ecliptic is uſeful for finding the place of the ſun for any day in a ready manner, without the trouble of referring to an ephemeris; the ſun's place being found, the ecliptic circle upon the globe is immediately uſed to have the requiſite mark ſet on it. The ſun's place being thus fixed on the globe, the performance of a problem, by turning the ſun and globe round together, is certainly not ſo ſtrictly agreeable to nature, but it is ſufficient for the reſult of a problem. Yet in the inſpecting of particular countries on the terreſtrial globe, it is proper to have it quite clear, and without being obliged to puſh away any contiguous appendages. For the performance of the problems on the planets, and tracing the paths of comets, &c. the celeſtial globe, mounted in the common way, will be found more convenient. Upon the whole, therefore, the following particulars appear to be the chief advantages in the improved mounted globes, and thoſe in the common manner.

In the improved globes, the axis always retains a natural and permanent poſition, directing to the north pole in the heavens, when duly ſet by the compaſs. The ſun, upon the ſtem E, fig. 2, or moon, or planets, being in a fixed poſition, and the globe turning about its axis before, is the natural and juſt repreſentation of the cauſe of all the various phenomena reſpecting their riſing, culminating, ſetting, lengths of days and nights, &c. reſulting from the diurnal motion of the earth, and the reſpective ſituations of the planets in their orbits.—The moveable horizon, meridian, &c. applied to this globe, can have their poſitions naturally changed, according to the motion or ſituation of any inhabitant of the earth.—This globe, being placed in a darkened room, and a candle or lamp being placed at a proper diſtance, in a line with the centre of the ſun; the globe will be divided, as in nature, into the enlightened and darkened hemiſpheres, and ſhew in what degree the various countries enjoy the preſence of the ſun or day, and the lengths at that time of the day and night.—By the wheel-work, contained on the plate C D, the relative poſition of the axis to the terminator of light and darkneſs is ſhewn, conſequently, the ſtate of the light and darkneſs of the earth at any ſeaſon of the year.

With reſpect to the globes, mounted in the common manner; their having no braſs circles or other appendages, contiguous to their ſurfaces, renders them more eaſy for inſpection, and in the performance of a variety of problems.—All great circles of the ſphere, being imaginary, and referred to in the heavens, the poſition of right, parallel, and oblique, to the inhabitants of the earth, can only be repreſented by the common mounted globe, where there is a contrivance of the horary circle being under the meridian, or to ſhift away occaſionally from the pole. Globes of large dimenſions, ſuch as eighteen inches in diameter and upwards, are much leſs expenſive and portable, mounted in the common way, than in the new way. Theſe obſervations will be ſufficient to give the reader a fair idea of the merits, and defects, of both mountings. In the performance of a variety of problems upon the common globe, he will find many others that are not neceſſary to be noticed here; as well as to convince him that a correct knowledge of the celeſtial and terreſtrial phenomena, can only be obtained by joining real obſervations of the heavenly bodies, and the true geographical phenomena of the earth, with the portions of his ſtudies on the globes.—See the common terreſtrial globe in the Geography Plate III. fig. 5.

PROJECTION OF GLOBES AND MAPS.

To project the countries, or conſtellations, on Globes.—From the given diameter of the intended globe, find a right line, as A B in the annexed figure, equal to the circumference of a great circle, and divide it into 12 equal



parts. Through the ſeveral points of diviſion, 1, 2, 3, 4, &c. with the interval of ten of them, deſcribe arches mutually interſecting each other in D and E; theſe figures, or conical pieces, duly joined together, will make the whole ſurface of the globe. Divide each part of the line A B into 30 equal parts, ſo that the whole line A B, repreſenting the periphery of the equator, may be divided into 360 degrees. In the Geography Plate II. fig. 4, one of theſe cones, projected for a celeſtial globe, is repreſented on a larger ſcale. Now from the poles marked D and E, in this cone, with the interval of 23½ degrees, deſcribe arches *a*, *b*; theſe will be twelfth-parts of the polar circles. After the like manner, from the ſame poles D and E, with the interval of 66½ degrees, reckoned from the equator, deſcribe arches *c*, *d*; theſe will be twelfth-parts of the tropics. Through the degree of the equator *e*, correſponding to the right aſcenſion of any given ſtar and the poles D and E, draw an arch of a circle, and, taking in the compaſſes the complement of the declination from the pole D, deſcribe an arch interſecting it in *i*; this point *i* will be the place of that ſtar. All the ſtars of a conſtellation being thus laid down, the figure of the conſtellation is to be drawn according to Bayer, Hevelius, or Flamſtead. In the ſame manner are the declinations and right aſcenſions of each degree of the ecliptic *dg* to be determined. The ſurface of the globe thus projected on a plane, is to be engraven on copper, to ſave the trouble of doing this over again for each globe. A ball in the mean time is to be prepared of plaſter, &c. of the intended diameter of the globe; on this, by means of a ſemicircle and ſtyle, is the equator to be drawn, and through every 30th degree a meridian. The ball thus divided into twelve parts, correſponding to the ſegments before projected, the latter are to be cut from the printed paper, and paſted on the ball. Nothing remains but to hang the globe in a brazen meridian and wooden horizon, to which may be added a quadrant of altitude made of braſs, and divided in the ſame manner as the ecliptic and equator.—See the article GLOBE.

If the declinations and right aſcenſions of the ſtars be not given, but the longitudes and latitudes in lieu thereof, the ſurface of the globe is to be projected after the ſame manner as before, except that in this caſe D and

E, fig. 2, are the poles of the ecliptic, and *f h* the ecliptic itself; and that the polar circles and tropics, with the equator *g d*, and the parallels thereof, are to be determined from their declinations.

M. de la Lande, in his *Aſtronomie*, tom. iii. p. 736, deſcribes the following methods. "To conſtruct celeſtial and terreſtrial globes, gores muſt be engraved, as ſhewn in the engraving, at fig. 5. The length P C, the axis of this curve, is equal to a quarter of the circumference of the globe; the intervals of the parallels on the axis P C, are all equal, the radii of the circles K D I, which repreſent the parallels, are equal to the co-tangents of the latitudes; and the arches of each, as D I, are nearly equal to the number of the degrees of the breadth of the gore (which is uſually 30°) multiplied by the ſine of the latitude: thus there will be found no intricacy in tracing them; but the difficulty proceeds from the variation found in the trial of the gores when paſting them on the globe, and of the quantity that muſt be taken from the paper, leſs on the ſides than in the middle (becauſe the ſides are longer), to apply it exactly to the ſpace that it ſhould cover.

"The method uſed among workmen to delineate the gores, deſcribed in the 7th vol. of the *Encyclopédie*, is little geometrical, though ſufficient in practice. Draw on the paper, as at fig. 5, the line A C, equal to the chord of 15°, to make the half breadth of the gore; and a perpendicular P C, equal to three times the chord of 30°, to make the half length: for theſe papers, the dimenſions of which will be equal to the chords, become equal to the arcs themſelves when they are paſted on the globe. Divide the height C P into nine parts, if the parallels are to be drawn in every 10°; divide alſo the quadrant B E into nine equal parts through each diviſion point of the quadrant, as G; and through the correſponding point D of the right line C P draw the perpendiculars H G F and D F, the meeting of which in F gives one of the points of the curve B E P, which will terminate the circumference of the gore. When a ſufficient number of points are thus found, trace the outline P I B with a curved rule. By this conſtruction are given the gore-breadths which are on the globe, in the ratio of the coſines of the latitudes; ſuppoſing theſe breadths, taken perpendicular to C D, which is not very exact (but it is impoſſible to preſcribe a rigid operation), ſufficient to make a plane which ſhall cover a curved ſurface, and that on a right line A B ſhall make lines P A, P C, P B, equal among themſelves, as they ought to be on the globe. To deſcribe the circle K D I, which is at 30° from the equator, there muſt be taken above D a point, which ſhall be diſtant from it the value of the tangent of 60°, taken out either from the tables, or on a circle equal to the circumference of the globe to be traced; this point will ſerve as a centre for the parallel D I, which ſhould paſs through the point D, for it is ſuppoſed equal to that of a cone circumſcribing the globe, and which would touch at the point D. The meridians may be traced to every 10 degrees, by dividing each parallel, as K I, into three parts at the points L and M, and drawing from the pole P, through all theſe diviſion points, curves, which repreſent the intermediate meridians between P A and P B, (as B R and S T, in fig. 6.) The ecliptic may be deſcribed by means of the known declination from different points of the equator that may be found in a table; for 10°, it is 3° 58′; for 20°, 7° 50′ = B Q; for 30°, 11° 29′, &c."

It is obſerved in general, that the paper on which charts are printed, ſuch as the *colombier*, ſhortens itſelf $\frac{1}{72}$ part or a line in ſix inches upon an average, when it is dried after printing; this inconvenience muſt therefore be corrected in the engraving of the gores: if, notwithſtanding that, the gores are found too ſhort, it muſt be remedied by taking from the ſurface of the ball a little of the white material with which it is covered, thereby making the dimenſions ſuitable to the gore as it was printed. But what is moſt ſingular is, that in drawing the gore, moiſtened with the paſte to apply on the globe, the axis G H, fig. 6, lengthens, and the ſide A K ſhortens, in ſuch a manner, that neither the length of the ſide A C K nor that of the axis G E H of the gore, are exactly equal to the quarter of the circumference of the globe, when compared to the figure on the copper, or to the numbered ſides ſhown in the engraving. Mr. Bonne having made ſeveral experiments on the dimenſions that gores take after they had been paſted ready to apply to the globe, and particularly with the paper he made uſe of for a globe of one foot in diameter, found that it was neceſſary to give to the gores on the copper the dimenſions ſet forth on the left hand ſide of fig. 6. Suppoſing that the radius of the globe contained 720 parts, the half breadth of the gore is A G = 188$\frac{5}{10}$, the diſtance A C for the parallel of 10 degrees taken on the right line L M is 128·1, the ſmall deviation from the parallel of 10 degrees in the middle of the gore E D is 4, the line A B N is right, the radius of the parallel of 10°, or of the circle C E F, is 4083; and ſo of the others as marked in the figure. The ſmall part under H, has its radius 253, inſtead of 274, which it would have if the ſine of 20° had been the radius of it.

To project Maps and Charts.—A map is the repreſentation of the ſurface of the earth upon a plane; and theſe are either *general* or *particular*. A general map, is a map of the whole earth, and this is repreſented in two circles touching each other, repreſenting two hemiſpheres of the earth, the boundaries of which are meridians. A particular map, is a map of only a part of the ſurface of the earth, as of one of the quarters of the world, or of any particular country. The laying down of theſe maps is called *projection*, of which there are ſeveral kinds. In doing this, three principal things are required: viz. To ſhow the latitude and longitude of places; this is done by drawing a certain number of meridians, and parallels of latitude. The ſecond requiſite is, to exhibit, as nearly as poſſible, the ſhape of all the countries; for it cannot be done accurately by any projection, on account of its being made on a plane, when the earth is globular. The third is, to ſhow the bearings of places from each other, and their diſtances; the former can be done in one projection, but the latter cannot.

The projection of maps is made according to the rules of perſpective. If the eye be ſuppoſed to view the earth from an infinite diſtance, the appearance repreſented upon a plane is called an *orthographic* projection. In this caſe, the parts about the middle are very well repreſented, but the extreme parts are very much contracted. But the method generally made uſe of by geographers for maps, is the *ſtereographic*, where the eye is ſuppoſed to be on the ſurface of the earth, and looking at the oppoſite hemiſphere. There is alſo a very uſeful projection, called *globular*, in which meridians, equidiſtant upon the ſurface of the earth, are repreſented by equidiſtant circles in the map. There is alſo another projection, uſed by navigators, called *Mercator's*, in which, both the meridians and parallels of latitude are repreſented by ſtraight lines. Theſe are called *ſea charts*, wherein are exhibited ſome part of the ſea, with the ſhores that bound it: the inlands are generally omitted, as being of no uſe to the ſailor; but the parts near the ſhore are carefully laid down, with marks ſignifying rocks, ſands, or flats, and figures expreſſing the *ſoundings*, or depths of the water.

When we are to delineate a map of a *ſmall* part of the earth, if it be near the equator the meridians and parallels of latitude may be repreſented by equidiſtant ſtraight lines. If at ſome diſtance from the equator, the meridians muſt then be made to converge a little, and the more ſo, the further you recede from the equator. When a map is made of a *very ſmall diſtrict*, as of a county, on whatever

Projection of Globes and Maps.

Neele sc. Strand.

London Pub.d as the Act Directs February 21.st 1807 by J. Wilkes.

whatever part of the earth it is, the meridians and parallels of latitude may be repreſented by equidiſtant parallel lines.

A line which cuts all the meridians at the ſame angle, is called a *rhumb* line; as long therefore as a ſhip ſails upon the ſame rhumb, it ſails upon the ſame point of the compaſs. When the projection of the meridians is by circles, then the rhumb line is a curve; but when the meridians are repreſented by ſtraight and parallel lines, the rhumb becomes a ſtraight line, it being the property of a ſtraight line to cut parallel ſtraight lines in the ſame angle. Hence the great uſe of Mercator's chart, which is conſtructed upon this principle. Upon the earth's ſurface, the degrees of latitude are all equal, but the degrees of longitude decreaſe as you approach the poles. Now in this projection, the meridians being equidiſtant ſtraight lines, the degrees of longitude muſt be every where equal; in order therefore to preſerve the proper proportion between the degrees of longitude and latitude, the degrees of latitude are increaſed in a proper proportion; the degrees of latitude therefore increaſe as you go from the equator to the pole. In ſailing from one place to another, the ſhorteſt way is to ſail upon a great circle, but that is a thing which is impracticable, there being nothing to direct you in ſuch a courſe. Navigators, therefore, when they have to go from one place A, to another B, find upon what rhumb they muſt ſail, that is, upon what point of the compaſs they muſt go, ſo as to come to B, and by their ſteering compaſs they can tell when they ſail on the ſame point. On Mercator's projection, if you draw a ſtraight line from A to B, it gives you the rhumb required; for in theſe maps, there is a point aſſumed, and from it there are drawn 32 ſtraight lines to the 32 points of the compaſs; when therefore you draw the ſtraight line from A to B, you muſt obſerve to which of the 32 lines it is parallel, or to which it is neareſt ſo, and you thus get the rhumb, or the point of the compaſs you muſt continue to ſail upon, in order to go from A to B. For inſtance, if you find the line A B is parallel to the ſouth-weſt line of the compaſs, then if you continue to ſail on the ſouth-weſt point, you muſt come to B.

In all maps, the upper part is, or ſhould be, northern, the lower part ſouthern, the right hand ſide is eaſtern, and the left hand ſide is weſtern. On the right and left ſides, the degrees of *latitude* are marked; and on the top and bottom, the degrees of *longitude* are marked. When the maps are very large, the degrees may be ſubdivided into halves, quarters, &c.

When the meridians and parallels of latitude are *ſtraight and parallel lines*, the *latitude* of a place is found by ſtretching a thread over the place, ſo that it may cut the *ſame* degree of latitude on the right and left ſide of the map, and that degree is the latitude of the place. And to find the *longitude*, ſtretch a thread over the place, ſo that it may cut the *ſame* degree of longitude on the top and bottom of the map, and that degree is the longitude of the place. For inſtance, if we take the chart of the Eaſt-India iſlands, and ſtretch a ſtring over Siam, we ſhall find that it will cut each ſide at 14° N. lat. and the top and bottom at 100° 10′ E. lon. Theſe therefore are the latitude and longitude of that place. On the contrary, if the latitude and longitude of a place be given to find the place, ſtretch one thread over the given degree of latitude on each ſide, and another thread over the given degree of longitude at the top and bottom; and at the interſection of the threads is the place required. By this means you may put down in a map, any place whoſe latitude and longitude are known.

Now let the meridians and parallels of latitude be *curve lines*. Then to find the *latitude* of a place, a parallel of latitude muſt be drawn through it, by the ſame rules as the other parallels are drawn, and it cuts the ſides at the degree of latitude of the place. And to find the *longitude* of the place, draw a circle of longitude through it, by the ſame rules as the other circles are drawn, and it cuts the top and bottom at the degree of longitude of the place. But as it is troubleſome to draw theſe circles, the following method may generally be ſufficiently accurate. To find the *latitude*, find by a pair of compaſſes and a ſcale of equal parts, how far the place is from the two parallels between which it lies, and divide the diſtance of the parallels in that proportion, and you get very nearly the latitude. Suppoſe, for inſtance, the diſtance between the parallels to be 5°, and that one is a parallel of 45°, and the other of 50°; and ſuppoſe the place to be within 3 parts of the parallel of 45°, and 7 parts of the parallel of 50°; then 5° muſt be divided into 10 parts, and 3 of thoſe parts muſt be added to 45°, and it gives the latitude. This is done by proportion, thus, 3+7, or 10 : 3 :: 5° : $\frac{3\times 5^\circ}{10}=\frac{15^\circ}{10}=1\frac{1}{2}^\circ$; therefore the latitude is $46\frac{1}{2}^\circ$ nearly. In the very ſame manner you may find the *longitude* nearly. On the contrary, if the latitude and longitude of a place be given, to find the place, draw a circle of latitude through the given latitude on each ſide, and a circle of longitude through the given longitude at the top and bottom, and their interſection denotes the place.

To project a Map of the World on a plane ſurface, according to the improved globular projection.

To draw the circles of latitude.—Deſcribe the circle N Q S E, Plate II. fig. 7, of any convenient magnitude, repreſenting one hemiſphere, or half of the earth's ſurface; draw the diameters N S, and E Q, perpendicular to each other. The line E Q will repreſent the equator; N S the axis, or firſt meridian. Divide the quadrant Q S, into nine parts, as 10, 20, 30, &c. or into ſmaller parts if the circle be large enough to admit of it. From E to each of theſe diviſions draw right lines, as E, *f*, 20; E, *g*, 30; E, *d*, 60; &c. Divide into two equal parts the lines *f*, 20; *g*, 30; *d*, 60; &c. and from *c*, the point of diviſion, let fall the perpendiculars *c* F, *c* G, and *c* D, produced till they cut the polar diameter N S, extended indefinitely in *y*; then the points F, G, D, will be the centres from which the circles of latitude *z*, *f*, 20; *z*, *g*, 30; *z*, *d*, 60, are to be deſcribed, or ſtruck with the compaſſes, which will be the true repreſentations of the parallels of 20, 30, and 60, degrees of ſouth latitude. In the ſame manner draw the parallels for every *tenth* or *fifth* degree of latitude.—To obtain thoſe in the northern hemiſphere, ſet off on the line N S, produced in the oppoſite direction, the diſtances S D, S G, S F, &c. which will give centres on which the circles of latitude are to be deſcribed for every tenth or fifth degree in that hemiſphere.

To draw the circles of longitude.—Divide the quadrant E N, into equal parts, 10, 20, 30, &c. Divide the quadrant S Q, into two equal parts at *s*, of forty-five degrees each, and let fall a perpendicular *s s*, from the point *s*; ſet off on the line N S produced S *x*, equal to *s s*: then lines drawn from *x* to 10, 20, 30, &c. in the quadrant E N, will divide the radius in the points 10, 20, 30, &c. through which the circles of longitude are to be drawn.—Here the geometrician will recollect that a circle may be drawn through any three points, not ſituated in a right line: and the method of finding the centre is to join the three points, then biſect or divide in two equal parts the two lines ſo drawn, and from the points of biſection, let fall perpendiculars, which being produced, will cut each other, and the point of interſection is the centre.—See this demonſtrated at fig. 5, in the Geography Plate IV.

The next thing required, therefore, is to find the *centres* from which theſe circles may be drawn.—To find the centre of the circle S, 30, N; join the points S, 30, and N, 30; divide into two equal parts, the two lines in *o*, and let fall the perpendiculars *o*, 30; *o*, 30; and the point where they meet is the centre of a circle of 30 degrees of longitude. The other centres may be found exactly in the ſame manner.—Or, the centres may be

found mechanically, by the following table: let the radius of the circle E C, be divided into 100 equal parts, by a ſcale: then the circle of

10° will be equal to	12	of thoſe parts ſet off, from C towards Q added to the diſtance between C and the ſeveral points, 10, 20, 30, &c. in the radius E C.
20 - - - - -	25	
30 - - - - -	42	
40 - - - - -	61.5	
50 - - - - -	88	
60 - - - - -	133	
70 - - - - -	208	
80 - - - - -	464	

Thus the radius of the circle of 10 degrees of longitude is equal to the diſtance between 10 in the line E C, and 10 in the line Q C;—of that of 50 degrees between 50 and 50;—and that of 80 degrees, between 80 in the line E C, and a given point in E Q produced, which taken from C, will be equal to 342·2 parts, of which the radius is equal to 100.

By this method, equal ſpaces on the earth are repreſented by equal ſpaces on the map, as nearly as any projection will admit; for a ſpherical ſurface, as before noted, can by no poſſible method be repreſented exactly upon a plane. And now the ſeveral countries of the world, the ſeas, iſlands, towns, &c. are to be entered on the map, according to their known latitudes and longitudes.—Thus the map of the world, diſplaying the two hemiſpheres, as given in this treatiſe, is conſtructed upon the globular projection.

In completing maps of countries, all places repreſenting land are diſtinguiſhed with ſuch objects as the ſeveral countries contain, as mountains, foreſts, &c. but the ſeas are left white, edged with a green tint; the ſhores adjoining the ſea being ſhaded, more or leſs, as a flat, or a bold ſhore may occaſionally require. Rivers are marked by ſtrong lines, or by double lines, drawn winding in the form of the rivers they repreſent, and ſmaller rivers are expreſſed by ſmaller lines. Different countries are beſt diſtinguiſhed by different colours; foreſts by trees, and mountains ſhaded, to give them their lofty effect. Sands are denoted by ſmall points or ſpecks; and rocks under water by a ſmall croſs.

To draw a map of any given portion of the earth.—Suppoſe it be required to draw a map of a portion of the earth's ſurface containing ſix degrees of latitude, viz. from the 39th to the 45th degrees: draw the line E F, in the Geography Plate II. fig. 8; and in the middle raiſe the perpendicular D C, which divide into ſix equal parts, or degrees of latitude, and through C draw a line parallel to E F.—Next divide a degree into 10; or if large enough, into 60 equal parts; and in the annexed table find the number of miles which a degree of longitude contains, in the latitude of 39 degrees, viz. 46·62, and from any ſcale of equal parts, ſet off one half of the ſame, viz. 23·31, on each ſide of D.—Then find in the table the number of miles contained in a degree of longitude in the latitude of 45 degrees, viz. 42·43, and from the ſame ſcale ſet off 21·215 on each ſide of C. Draw the ſtraight lines from I to E, and from K to F; divide them into the ſame number of parts as the line C D contains, and through the points draw parallel lines. Thus I K E F is a projection for one degree of longitude, including ſix degrees of latitude.

Since the degrees muſt be ſo drawn that the two diagonal lines in each muſt be equal to each other, they are to be projected in the following manner: Firſt, take the diſtance from E to K, or from F to I, and ſetting one foot of the compaſſes firſt in E and then in F, deſcribe the arcs L and M. Then ſet one foot firſt in I, and afterwards in K, and with the ſame extent draw the arcs N and O. Secondly, take the diſtance between E and F, and ſet it off in the arcs deſcribed from E to N, and from F to O; then take the diſtance between I and K, and ſet it off from I to L, and from K to M. Thirdly, draw the lines between L and N, and M and O; divide them into degrees, and draw parallels from thoſe points to the correſponding ones in the meridians I E, and K F. The ſame method muſt be purſued in drawing all the other meridians and parallels, as the map is to contain degrees.

If the map be very large, ſo that the compaſſes will not extend to the fartheſt degree, or from F to I; then draw one or more diagonals at once, and afterwards proceed with the reſt.—Thus when the ſquares P G N E and H Q F O are deſcribed, L I P G and K M H Q may be done.

Number the degrees of latitude up both ſides of the map, and the degrees of longitude on the top and bottom, as before directed; then make the proper diviſions and ſubdiviſions of the country; and having the latitudes and longitudes of the principal places, it will be eaſy to ſet them down in the map, by the methods explained above; which ſhew that every town, &c. muſt be placed where the circles of longitude and latitude interſect. Thus, if the map contain that part of Europe that lies between 39 and 45 degrees of latitude, and between 7 and 16 degrees of eaſt longitude, then Florence muſt be placed at A, where the circles of 43° 46′ 30″ north latitude, and 11° 3′ 30″ eaſt longitude, cut each other: and Naples muſt be placed at B, on the ſea-ſhore, at 40° 50′ 15″ N. lat. and 14° 17′ 30″ E. lon.

In like manner the mouth of a river, as of the Tiber for inſtance, muſt be ſet down; but to deſcribe the whole river, the latitude and longitude of every turning ſhould be marked down, and the towns and bridges by which it paſſes. In the projection here deſcribed, the diagonals being all equal, the number of meridians cauſes no defect in the repreſentation, as equal ſpaces on the globe are repreſented by equal ſpaces on the map; conſequently places lying in the remoteſt degrees of longitude, are as truly exhibited as thoſe near the middle, and their diſtances will agree with a common meaſure; ſo that compaſſes extended between any two places, and applied to the ſcale, give the diſtance without farther trouble.—Indeed, there ſhould be a ſcale of miles, or of degrees, on every map, to ſerve for finding the diſtances of places on it. It is uſual alſo to draw the mariner's compaſs or a fleur de lys, to ſhew the points of the compaſs.

TABLE, ſhewing the number of miles contained in a degree of longitude, in each parallel of latitude, from the equator to the poles.

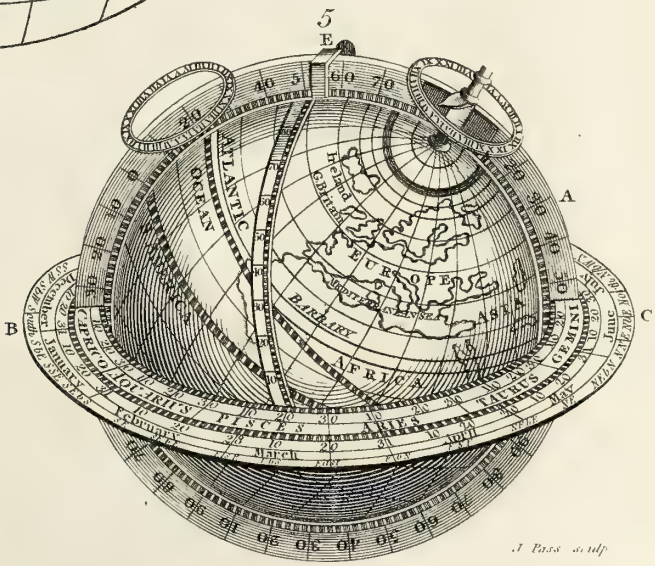
When

GEOGRAPHY.



Projections of the Sphere, and common Terrestrial Globe.

Published as the Act directs, Jan.ʸ 1.st 1807, by J. Wilkes.

When the place is but ſmall of which a map is to be made, as of a county for inſtance, or of any portion of the earth of not more than one hundred miles in length and breadth, the meridians, as to ſenſe, are parallel to each other, and may be repreſented by ſtraight lines. But, the whole will differ ſo little from a plane, that it will be ſufficient to meaſure the diſtances of places in miles, and ſo lay them down in a plane right-lined map. In the projection of a quadrant of an hemiſphere, according to this method, the parallels of latitude are all concentric circles, and the only difficulty is to find the common centre.

In projecting a map for Aſia, Plate II. fig. 9, on the globular conſtruction, the centre of the parallel of 60 degrees of latitude is found to be 30 degrees beyond the north pole, or at the ſame diſtance north of the parallel of 60 degrees, as the equator is ſouth of it; and the centre for this parallel is therefore the centre for all the others: and it is evident that in this map, the two diagonals of each figure are equal to one another, ſo that all the parts are of their proper magnitude. In projecting the map of Europe, on this conſtruction, it is found that the common centre for all the parallels of latitude is at ſix degrees and ſeven tenths beyond the pole.

Suppoſe it be required to draw the meridians and parallels for a map of Great Britain. This iſland lies between 50 and 60 degrees north latitude, and between two degrees eaſt and ſix weſt longitude. Having, therefore, choſen the length of the degrees of latitude, the degrees of longitude muſt be proportioned to it. By the table it appears, that in latitude 50°, the length of a degree of longitude is to one of latitude, as 38·57 is to 60; that is, the length of a degree of longitude is ſomething more than half the length of a degree of latitude. The exact proportion may be had by a diagonal line: after which ſeven or eight of theſe degrees are to be marked out upon a right line for the length of the intended map. On the extremities of this line raiſe two perpendiculars, upon which mark out ten degrees of latitude for the height of it. Then having completed the parallelogram, conſult the table for the length of a degree of longitude, in latitude 60°, which is found to be very nearly one half of the length of a degree of latitude. It will always be neceſſary, however, to draw a vertical meridian exactly in the middle of the parallelogram, to which the meridians on each ſide may converge; and from this you are to ſet off the degrees of longitude on each ſide: then having divided the lines bounding the map into as many parts as can conveniently be done, to ſerve for a ſcale, the longitudes and latitudes may by their means be ſet off with much leſs trouble than where curve lines are uſed. This method may be always followed where a particular kingdom is to be delineated, and will repreſent the figure and ſituation of the places with tolerable exactneſs. Towns and other places, whoſe bearings and ſituation are known, may be accurately expreſſed by this means; and this is the only kind of maps to which a ſcale of miles can be truly adapted.

To project maps upon the other poſitions of the ſphere.—The circles upon which theſe projections are uſually made, are the equator, ſome of the meridians, or the rational horizon of ſome particular place. For maps of the world a meridian is generally choſen; and it has been moſt commonly that which paſſes through Ferro, one of the Canary iſlands; becauſe thus Europe, Aſia, and Africa, are conveniently delineated in one circle, and America in the other. To project, therefore, a map of the world *orthographically* on the plane of any meridian, we have only to conſider, that, as the eye is ſuppoſed to be at an infinite diſtance, all the rays which come from the diſk of the earth are parallel; and conſequently all lines drawn from the eye to the diſk muſt be perpendicular to the latter. Let A B C D, Geography Plate III. fig. 1, repreſent the plane of one of the meridians. The equator, which cuts all the meridians in the centre, muſt be repreſented by a number of points let fall upon the plane of projection, and dividing it exactly in the middle: that is, by the right line B D. The parallels of latitude, being alſo perpendicular to the plane of the meridian, will be marked out by a number of right lines let fall from their peripheries upon that plane, thus forming the right lines *a b*, *c d*, &c. The meridians will likewiſe be repreſented on the diſk by a number of right lines let fall perpendicularly from their peripheries upon the plane of projection, and thus will form the elliptic curves A 10 C, A 20 C, &c. From an inſpection of the figure, therefore, it appears, that in this projection both longitudes and latitudes are meaſured by a line of ſines, and both of them decreaſe prodigiouſly as we approach the edges of the diſk; and hence the countries which lie at a diſtance from the equator, or on the diſk, are exceedingly narrowed, ſo that it is impoſſible to draw them with any degree of accuracy. The orthographic projection on the plane of a meridian, therefore, is ſeldom uſed but for a map of the world.

On the plane of the equator, the orthographic projection repreſents the meridians as ſtraight lines diverging from a centre, and the parallels of latitude as concentric circles. This projection is repreſented in the ſame Plate at fig. 2. The latter, however, are by no means to be placed at equal diſtances from each other; for the meridians are to be divided by the line of ſines, as in the preceding; and thus the equatorial parts of the globe are as much narrowed and confuſed as the polar ones are in the foregoing. This projection, therefore, is ſeldom uſed for a map of the whole world, though it anſwers extremely well for delineating the countries near the polar regions.

On the horizon of any particular place, except either of the poles, or any point lying directly under the equator, the orthographic projection repreſents both parallels and meridians by ſegments of ellipſes. Fig. 3, in the engraving, repreſents a map executed on this principle, on the horizon of Ur of the Chaldees: it is obvious, however, that a conſiderable degree of inequality takes place here alſo, though leſs than in the former caſes. Projections of this kind, therefore, are now uſed only for the conſtruction of ſolar eclipſes.

The ſtereographic projection of the ſphere ſuppoſes the eye to be in the pole of the circle of projection. The laws of this projection are, 1. A right circle is projected into a line of half-tangents. 2. The repreſentation of a right circle, perpendicularly oppoſed to the eye, will be a circle in the plane of the projection. 3. The repreſentation of a circle placed oblique to the eye will be a circle in the plane of the projection. 4. If a great circle is to be projected upon the plane of another great circle, its centre will lie in the line of meaſures, diſtant from the centre of the primitive by the tangent of its elevation above the plane of the primitive. 5. If a leſſer circle, whoſe poles lie in the plane of the projection, were to be projected, the centre of its repreſentation would be in the line of meaſures, diſtant from the centre of the primitive, by the ſecant of the leſſer circle's diſtance from its pole, and its ſemidiameter or radius be equal to the tangent of that diſtance. 6. If a leſſer circle were to be projected, whoſe poles lie not in the plane of the projection, its diameter in the projection, if it falls on each ſide of the pole of the primitive, will be equal to the ſum of the half tangents of its greateſt and neareſt diſtance from the pole of the primitive, ſet each way from the centre of the primitive in the line of meaſures. 7. If the leſſer circle to be projected fall entirely on one ſide of the pole of the projection, and do not encompaſs it; then will its diameter be equal to the difference of the half-tangents of its greateſt and neareſt diſtance from the pole of the primitive, ſet off from the centre of the primitive one; and the ſame way in the line of meaſures. 8. In the ſtereographic projection, the angles made by the circles of the ſurface of the ſphere are equal to the angles made by their repreſentatives in the plane of their projection.—Theſe laws are demonſtrated as follows:

To draw the ſtereographic projection of the ſphere, or a map

of

of the world, on the plane of the meridian.—With the chord of 60 degrees in the compaſſes, deſcribe a circle, as A C B D, in fig. 1, Geography Plate IV. This circle may repreſent the meridian, or horizon, through which draw diameters at right angles, as A B, and C D; then A B will repreſent the equator, and C D will repreſent the poles, and alſo the zenith and nadir; and C D the equinoctial colure, and prime vertical circle; and thus the circle will appear in quarters. Divide now the degrees in a quadrant, viz. 90°, by the number of parts required, ſuppoſe 9, and the quotient ſhows the number of degrees equal to each diviſion, which in this caſe is 10°. Apply this diſtance taken from the firſt part of the line of chords, from D to A, as often as it will admit, and it will divide the arc A *b* D into the number of parts required.

It is neceſſary to obſerve, that, except the given circle is drawn with the chord of 60°, the above rule is not applicable; in ſuch caſes, proceed as follows: From the centre of the given circle, as *o*, with the chord of 60° deſcribe another circle, (either within, or without the given circle,) to which produce the diameters, and divide as above; tranſfer the diviſions, found on the circle deſcribed by the chord of 60°, and they will in like manner divide the given circle into the parts required. Circles, or any part thereof, may be more conveniently divided, by making the centre of the ſemicircle coincide with the centre of the given circle, and its flat ſide with one end of the arc, to be divided; then mark off the degrees that each diviſion contains, through which tranſfer lines from the centre, as above. But the inſtrument beſt calculated for inſcribing polygons of any number of ſides into circles, or for dividing a circle, or an arc thereof, into any number of equal parts, *is the ſector*, as it accommodates the diviſions at once to any radius. Rule. Open the ſector, until C—C, upon its ſcale, is equal to the radius of the given circle, then find the degrees anſwering to each diviſion on the ſame lines, in the former caſe 10—10, take the extent between them in the compaſſes, which apply to the arc, or circle, to be divided as often as it will admit, and it will point out the diviſions, as required.

To find the centres of the parallels of latitude.—Divide the arc A C, or A D, fig. 2, by either of the foregoing methods, into as many equal parts as the parallels of latitude, to be projected in each hemiſphere, require; the uſual number is nine.—Then draw lines from the centre of the circle *s*, through each diviſion on the divided arc of the horizon, and where theſe lines cut the horizon, raiſe perpendiculars towards the colure C D produced in *y*, which extend until they cut the colure produced, and their points of ſection will be the centres required.

For the tropics and polar circles: With 23½° in the compaſſes, from the line of chords, lay off that extent from the equator, both ways, for the tropics; and alſo from the poles for the polar circles, and find their centres as in the parallels of latitude; then *t* will be the centre for the polar circle; and *x* for parallels of latitude, &c.

For the ecliptic: Join the extremity of the equator with the point where the tropics interſect the equinoctial colure, as from *r* to B, biſect this line; and through the ſections extend a line, until it cut the colure produced in *u*, which will be its centre of projection required. And thus the centres to any parallel, &c. found on one ſide, will be the radius of the correſponding parallel on the oppoſite ſide.

Another method for deſcribing the tropics, parallels of latitude, &c. is by ſetting off the half-tangents of their reſpective diſtances, taken from the ſcale of the ſector, on the line marked S T on the ſector, from the centre of the circle *s*, both ways on the colure, which will give the diviſions through which the parallels, &c. are to paſs. Their centres are found by ſetting off the tangents of their reſpective complements, each way, from their points of ſection, in the colure, on the colure produced; or, by ſetting off their co-ſecants from the centre *s*, on the colure produced.

To find the centres of the meridians.—Find the points 15°, 30°, 45°, 60°, 75°, and 90°, which will be hour-lines in the equator, by ſetting off their half-tangents, taken from the line marked S T on the ſcale of the ſector, from the centre of the circle *o*, both ways.—The centres are found by ſetting off the co-ſecants, of the diſtances found in the equator, both ways, from their points of ſection with the equator, in the equator produced; or, with their co-tangents, ſet off both ways, from the centre of the circle on the equator produced, and the centre for the meridian will be *t*, as ſhewn in fig. 3.

The centres of the meridians, or hour-lines, may be found, after the points are found in the equator, by ſetting off the half-tangents, by the method uſed for finding the centres of the parallels of latitude; that is, join C or D with each diviſion, as 15 C, 30 C, &c. biſect theſe lines, and lines carried through the ſections, as *s r*, fig. 3, will cut the equator produced, in the centres required.

This method of finding the points through which the meridians are to paſs, by ſetting off the half-tangents from the plane ſcale, is only applicable when the radius of the ſphere is taken from the line of chords. To find the points of ſection for any given radius, open the ſector until the diſtance between C—C is equal to the given radius, then take the half tangents of their diſtance from the lines on the ſector marked T—T, which apply as before, and find their centres as directed above; that is, by joining the pole and each diviſion, &c.—On the ſtereographic projection, moſt of the maps in common uſe are drawn; the globular projection has been but recently introduced in England, by the ingenious Mr. Arrowſmith.

To find the breadth of a degree, in any latitude.—With any convenient opening of the compaſſes, deſcribe the ſemicircle A C B, as ſhewn in the Plate at fig. 4; which divide into 90 equal parts. Join A B, to repreſent a degree on the equator, and divide it into 60 equal parts, to repreſent the miles in a degree.

Application.—The extent from 90°, at B, to the propoſed parallel of latitude on the circular part, will reach from B to the number of miles, on the line A B, in a degree, in the propoſed parallel of latitude.

Example, for lat. 51° 30′.—The extent from 90°, at B, to 51° 30′ on A C B, will reach from B towards A to 37½ miles nearly, the breadth of a degree in the parallel of London.

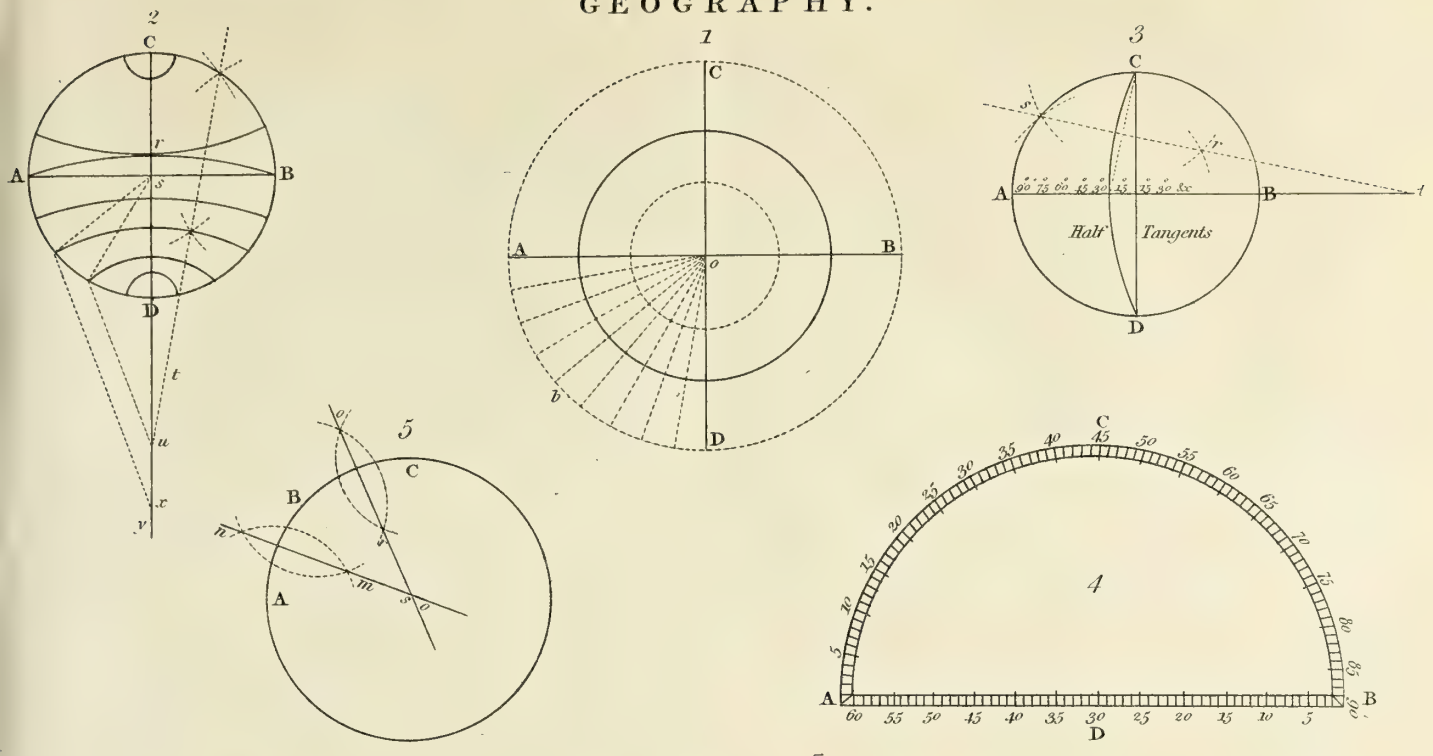
Example, for lat. 60°.—The extent from 90°, at B, to 60° on A C B, will reach from B to D, being 30 miles, the breadth of a degree in the latitude required.

For drawing circles of longitude, and in many other caſes where it is required to project a circle through any three points not ſituated in a right line, the method is as follows: with any convenient opening of the compaſſes, greater than half the diſtance between A B and B C, and one point in A, as ſhewn in the Plate at fig. 5, deſcribe an arc with the ſame opening and one point in B; croſs the former arc in *n* and *m*, with the point in B and C, deſcribe ſimilar arcs croſſing each other in *o r*. Through the ſections *n m*, and *o r*, draw lines which will croſs one another in *s*, the centre of the required circle. Then, with the diſtance *s* A, *s* B, or *s* C, as a radius, deſcribe a circle, and it will paſs through the points A B C, as required.

After all, though maps founded upon the ſtereographic projection, have for many years paſt been in general eſtimation, yet it muſt be confeſſed that by this conſtruction, the true outline of different countries cannot be correctly drawn; becauſe every part from the diſk to the centre is gradually contracted by the parallels of longitude, as ſhewn in Plate III. at fig. 4; and therefore thoſe diſtricts alone, which lie on the border of the

map,

GEOGRAPHY.



The Stereographic Projection, with Churchman's New Projection for Mountainous Countries.

London, Published as the Act directs, Jan.ry 10th 1807, by J. Wilkes.

map, are truly exhibited; and of courſe *equal* ſpaces on the earth, or on the globe, are repreſented by *unequal* ſpaces on the map; a defect propoſed to be remedied by the globular projection.

But if, inſtead of its globular figure, we ſuppoſe the earth to have a conical form, it is plain, that the meridians would be repreſented by ſtraight lines diverging from the apex of the cone, while the parallels are ſhown by concentric circles placed at equal diſtances. This kind of projection is not without its uſe. It hath this great advantage, that the longitudes and latitudes may be found with the greateſt eaſe by means of a moveable index placed on the centre. The whole earth may alſo be thus repreſented on a ſingle circle: but thus the countries towards the ſouth pole are prodigiouſly augmented in breadth in proportion to their length; for the degrees of longitude conſtantly increaſe the farther we are removed from the pole, while thoſe of latitude ſtill remain the ſame. This apparent error, however, doth not in the leaſt affect the real proportion of the map, or render it more difficult to find the longitudes, or latitudes upon it; as may be ſeen by an inſpection of fig. 2, Plate III.

Mercator's projection ſuppoſes the earth, inſtead of a globular, to have a cylindrical figure; in conſequence of which, the degrees of longitude become of an equal length throughout the whole ſurface, and are marked out on the map by parallel lines. The circles of latitude alſo are repreſented by lines croſſing the former at right angles, but at unequal diſtances. The farther we remove from the equator, the longer the degrees of latitude become in proportion to thoſe of longitude, and that in no leſs a degree than as the ſecant of an arch to the radius of the circle: that is, if we make one degree of longitude at the equator the radius of a circle; at one degree diſtant from the equator, a degree of latitude will be expreſſed by the ſecant of one degree; at ten degrees diſtance, by the ſecant of ten degrees; and ſo on. A map of the world, therefore, cannot be delineated upon this projection, without diſtorting the ſhape of the countries in an extraordinary manner. The projection itſelf, however, as above noticed, is moſt uſeful in navigation, ſince it ſhews the different bearings with perfect accuracy, which cannot be done upon any other projection. See Map of the World on Mercator's projection, Plate XI.

The *globular projection*, above recommended and defined, is an invention of M. de la Hire, and is more uſeful than any of the others for exhibiting the true ſhape of the countries. To this, therefore, we have given the preference, except for the purpoſes of navigation, wherein Mercator's projection is ever to be preferred.

In moſt of theſe projections, the firſt meridian is made to paſs through Ferro, which is 17° 45′ 50″ weſt of Greenwich. To reduce therefore the longitude from Ferro to that from Greenwich, *add* 17° 45′ 50″ if the place be *weſt* of Ferro, and it gives the longitude weſt from Greenwich; if the place be *eaſt* of Ferro, and in longitude *leſs* than 17° 45′ 50″, the difference of its longitude and 17° 45′ 50″ ſhews the longitude weſt from Greenwich; but if the longitude be *greater* than 17° 45′ 50″, the difference ſhews the longitude eaſt of Greenwich. Thus we may reduce the longitude from one place to that from any other.

For mapping elevated lands, or for laying down the heights of mountainous and hilly countries, an ingenious method of projection has been recently ſuggeſted by Mr. John Churchman, of John-ſtreet, Tottenham-court, London; and for which the London Society of Arts, in 1804, preſented him with their ſilver medal. We ſhall ſtate this improvement in his own words:

"It appears to be a matter of much importance to the people of any country, at all times, whether in war or peace, to poſſeſs a complete knowledge of its ſurface. In war, ſuch knowledge is abſolutely neceſſary for defence; in peace, for improving the country to the beſt advantage. Now, ſince geography may be improved, an eaſy and accurate method to lay down maps of mountainous countries and hilly eſtates, will perhaps prove uſeful, as it will ſhew at a ſingle view the true ſhape and comparative height of the ground without the art of painting.

"As mountains are apt to eclipſe each other, a perſpective view is ſeldom very extenſive, the rules of which fall ſhort of giving an accurate idea of any hilly country; becauſe ſuch a view, though ſtrictly true in one particular place, is not ſo in any other. The altitudes of mountains appear in proportion to the diſtance from the eye, and no rule in geometry has been found ſufficient to determine diſtances from any ſingle ſtation. Neither can a bird's-eye view of an eſtate aſcertain the depth of valleys, or the height of mountains. But the method here propoſed will be found equally capable of giving the true ſhape of any ground above or below water. It may be ſucceſsfully applied to ſea charts, and will prevent much confuſion, ariſing from the tedious method of diſtinguiſhing ſoundings by a multitude of figures.

"Suppoſe a full deſcription is required to be given of any iſland in the ocean. Firſt, let an accurate map be laid down in the common way; and let the perpendicular height between the higheſt point of land and the ocean be divided into any number of equal parts. Suppoſe theſe equal diviſions are 100, 200, 300, 400 feet above the low-water mark. From the different points of theſe ſeveral diviſions, let horizontal lines be run with a good theodolite, and ſpirit level annexed, all round the iſland. If the work is well done, each line will end where it began; and if the bearings and diſtances of theſe ſeveral lines are truly laid down on the map, the crooked courſes of them will clearly ſhew the ſhape of the ground over which they paſs. For example: if any horizontal line paſſes by the ſide of a ſteep hill, it will incline towards the ocean, or approach the next horizontal line below it. When the ſame line croſſes a ſtream of running water or a valley, it will naturally bend up the ſide of the ſaid ſtream, until it can croſs it without loſing the level; or, in other words, it will bend towards the centre of the iſland. Hence, by a little practice, the ſhape of the ſeveral horizontal lines on the map will give as clear an idea to the mind, of the ſhape of any country over which they paſs, as a ſight of the country itſelf can convey to the eye. But to obtain a mathematical and true knowledge of the altitude and declivity of any part of the country, we have the following propoſition:—

"As the perpendicular height of any one horizontal line above another is to the radius: ſo is the horizontal diſtance between the horizontal lines meaſured on the map at any particular place, to the co-tangent of declivity at that place.—If the horizontal diſtance between any two horizontal lines on the map is equal to the perpendicular height of any horizontal line above another, the angle of altitude, or declivity, of any hill, will be 45 degrees.

"The preſent improvement will be found to poſſeſs the following advantages:—1ſt. Military men are well acquainted with the many advantages always to be gained from the exact repreſentation of high grounds. By this method, we are able to give the angle of altitude, the angle of declivity, and perpendicular height, of every hill; likewiſe the comparative height of different hills, the beſt route by which the high grounds may be gradually aſcended, and where heavy burthens can be drawn up with moſt eaſe.—2dly. Experience has ſufficiently ſhewn, that the inhabitants of low grounds are ſubject to different kinds of ſickneſs, from which thoſe living at places elevated to a certain degree are exempt. A map on this improved plan will point out the moſt proper ſituation for building dwelling-houſes.

It will be useful in botany, in discovering or cultivating some kinds of plants which flourish best at particular distances above the level of the ocean. It will trace the line of vegetation on the sides of lofty mountains, whose tops are covered with eternal snow.—3dly. Some high lands are known to produce good grain, while low lands afford grass more abundantly; but most grounds produce good grass, over which a moderate quantity of running water is conveyed. A plan of any country in this way will shew all the ground that can be irrigated; where water-works may be erected; where navigable canals may be cut; and where high-ways and rail-roads may be laid out on the best and most level ground.—4thly. The subterraneous treasures of the mineral and fossil kingdoms are generally found in strata; and if they are not truly horizontal, they make a certain angle with the horizon. A map on this projection may enable the mineralogist to follow any one stratum, at places even far distant from each other.

"*To find the true declivity of any piece of ground, in any map laid down on the principles of the present plan.*—Example 1, to elucidate the ground at D, in the Geography Plate IV. fig. 6.—

As the perpendicular height, 4 feet -	60206
Is to radius, 90° - - - - -	10.00000
So is the horizontal distance, 4 feet -	60206
	10.60206
To the co-tangent of the declivity, 45°	10.00000

Example 2, for the elevated ground at B.

As the perpendicular height, 4 feet -	60206
Is to radius, 90° - - - - -	10.00000
So is the horizontal distance, 8 feet -	90309
	10.90309
To the co-tangent of the declivity, 26° 34′	10.30103

Example 3, for the sloping ground at C.

As the perpendicular height, 4 feet -	60206
Is to radius, 90° - - - - -	10.00000
So is the horizontal distance, 18 feet -	1.25527
	11.25527
To the co-tangent of the declivity, 12° 32′	10.65321

The various depths of the water in the river and lake, are shewn by the corresponding figures engraved on the surface.

Since the art of projecting maps, and the consequent facility of ascertaining particular districts and divisions on the surface of the earth, constitutes the most valuable part of practical geography; and as this acquisition cannot but be highly improved by uniting the principles of astronomy with those of geography, we shall, on that account, annex the following interesting problems on the common terrestrial and celestial globes, by way of familiarising the reader in this valuable department of the science. And further to illustrate the subject, a correct representation of the common terrestrial globe, whereby the geographical problems are solved, is given in Plate III. fig. 5. In this globe a groove is turned on the back part of the brass meridian A, and by unscrewing the nut of the hour-circle D, at the north pole, the circle is made to slide away to any other part of the meridian, as at G. The meridian is fixed, or moveable, at pleasure, by a screw passing into the groove through the side of the notch in which it moves, on the bottom or nadir point; by properly loosening this screw, the meridian is free to move, and the globe will turn with it, into any required position, either under or above the broad circle of the horizon and ecliptic, B C. This is the best construction of the common globe.

PROB. 1. *To find the latitude of any place.*—Bring the place to the graduated side of the fixed brass meridian; the degree under which it is found, is its latitude. See Plate III. fig. 5. All places under the same degree are in the same latitude. Thus the latitude of London is 51°½ north, that of the Cape of Good Hope 34° south.

2. *To find the longitude of any place.*—Bring the place to the fixed meridian; the distance of this meridian from the first meridian, measured on the equator, is the longitude of the place. The longitude of Boston in New England is 70°½ west, or 4 hours 42 minutes in time. That of Rome 12°½ east, or 50 minutes in time.

3. *To rectify either globe to the latitude of any place, the zenith, and the sun's place.*—If the place be in the northern hemisphere, raise the north pole above the horizon; but if the place be in the southern hemisphere, raise the south pole. Then move the brass meridian up and down in the notches, till the degree of the place's latitude, counted upon the meridian, below the pole, cuts the horizon; and then the globe is adjusted to the latitude of the place.—Having elevated the globe according to the latitude of the place, count the same number of degrees upon the meridian, from the equator towards the elevated pole, and that point will be the zenith or vertex of the place. To this point of the meridian screw the quadrant of altitude, so that its graduated edge may be joined to the said point; then is the globe rectified for the zenith.—Bring the sun's place in the ecliptic to the meridian, and set the hour-index to XII. at noon; and then the globe will be rectified for the sun's place.

4. *To determine the difference of time in different places.*—Find the longitude of each place, and reduce the difference into time, allowing an hour for every 15 degrees, and proportionally for smaller parts; the difference of time will be found: if the place lies westward of another, it has its noon later than that other; if eastward, sooner. The longitude of Rome is 12°½ east, that of Constantinople 29°, the difference is 17°½, consequently the difference of time between Rome and Constantinople is 1 hour 10 minutes.

5. *The latitude and longitude of any place being known, to find the place on the globe.*—Bring the degree of the equator which expresses the given longitude to the fixed meridian, then find the given latitude on the meridian; under this point is the place sought.

6. *To find the distance between any two places, and their bearing, or relative situation with respect to the points of the compass.*—Rectify the globe to the latitude of one of the places, and bring that place to the meridian: then fix the quadrant of altitude to the uppermost point of the meridian, and putting its lower end between the horizon and the globe, slide it along, till it passes through the other place; the number of degrees on the quadrant between the two places, will give their distance, allowing 69½ English miles for each degree; and the number of degrees upon the horizon between the meridian and the quadrant, will give the bearing of the second place with respect to the first. Thus the bearing of the Lizard point from the island of Bermudas is nearly E. N. E.

7. *To find the right ascension and declination of the sun, or any star.*—On the celestial globe find the day of the month under the ecliptic, against which is the sun's place, or find his place by an *ephemeris*; bring that point under the meridian, and the degree which is over the point is the sun's declination, and the degree of the equator then under the meridian will be the sun's right ascension. A star's declination and right ascension are found, by bringing the star on the globe to the meridian, and proceeding as with respect to the sun. The sun's declination, April 19, is 11° 14′ north, and his right ascension 27° 30′. The right ascension of Sirius is 99°, its declination 16° 25′ south.

8. *To find what stars pass over, or near, the zenith of any place.*—Having found the latitude of the place on the terrestrial globe, all those stars on the celestial globe, which pass under the same degree of the meridian with the given latitude, become vertical at that place.

9. *To find what ſtars never riſe, nor never ſet, in any given place.*—The globe being rectified for the given place, thoſe ſtars which do not paſs under the wooden horizon, never ſet; thoſe which do not come above it, never riſe.

10. *To repreſent the appearance of the heavens at any time.*—Rectify the globe to the latitude; bring the ſun's place in the ecliptic to the meridian, and ſet the horary index to the upper 12th hour: then turn the globe till the index points to the given hour. The north pole of the globe muſt be ſet to the north in the heavens, then will all the ſtars upon the globe correſpond to their places in the heavens, ſo that an eye at the centre of the globe would refer every ſtar upon its ſurface to the place of the ſtars in the heavens. By comparing, therefore, the ſtars in the heavens with their places on the globe, a perſon will eaſily get acquainted with all the ſtars.

EXAMPLE.—The ſituation of the ſtars at London on the 9th of February, at nine o'clock in the evening, is as follows; Sirius, or the dog-ſtar, is on the meridian, its altitude 22°: Procyon, the little dog-ſtar, 16° towards the eaſt, its altitude 43°: about 24° above this laſt, and a little more towards the eaſt, are Caſtor and Pollux: S. 65° E. and 35° in height, is Regulus, or Cor Leonis: exactly in the eaſt, and 22° high, is Deneb in the Lion's-tail: 30° from the eaſt towards the north, Arcturus is about 3° above the horizon: directly over Arcturus, and 31° above the horizon, is Cor Caroli: in the north-eaſt are the ſtars in the extremity of the Great Bear's tail.—Reckoning weſtward, we ſee the conſtellation Orion; the middle ſtar of the three in his belt is S. 20° W. its altitude 35°: nine degrees below the belt, and a little more to the weſt is Rigel, the bright ſtar in his heel: above his belt, in a ſtraight line drawn from Rigel, between the middle and moſt northward in his belt, and 9° above it, is the bright ſtar in his ſhoulder: S. 49° W. and 45°½ above the horizon, is Aldebaran, the ſouthern eye of the Bull: a little to the weſt of Aldebaran, are the Hyades: the ſame altitude, and about S. 70° W. are the Pleiades: in the W. by S. is Capella in Auriga, its altitude 73°: in the north-weſt, and 42° high, is the conſtellation Caſſiopeia: and almoſt in the north, near the horizon, is the conſtellation Cygnus.

11. *The latitude of a place being given, to find the time of the ſun's riſing and ſetting, on any given day, at that place.*—Having rectified the globe according to the latitude, bring the ſun's place in the ecliptic to the graduated edge of the meridian, and ſet the horary index to the upper XII. Then turn the globe to bring the ſun's place to the eaſtern part of the horizon, the index will point to the hour at which the ſun riſes; on the weſtern ſide, to the time of its ſetting. On the 5th of June, the ſun riſes at 3 h. 40 min. and ſets at 8 h. 20 min. The length of the day is 16 h. 40 min. that of the night 7 h. 20 min.

12. *To find all the places on the globe to which the ſun will be vertical on a given day.*—Bring the ſun's place to the fixed meridian, and obſerve the point of the ſun's declination; all the places which, in turning the globe round, paſs under that point, have the ſun vertical on the given day.—When the ſun's declination is equal to the latitude of any place, *then* the ſun will be vertical to the inhabitants of that place.

13. *To find the ſun's amplitude.*—The globe being rectified for the latitude of the place, bring the ſun's place to the eaſtern ſide of the horizon; the arc of the horizon intercepted between that point and the eaſtern point, is the ſun's amplitude at riſing. Thus on the 24th of May, the ſun's amplitude at riſing is 36° eaſt, and he ſets with 36° weſtern amplitude.—The amplitude increaſes with the latitude of the place.

14. *To find the ſun's meridian altitude.*—The globe being rectified for the latitude, zenith, and ſun's place, the number of degrees contained between the ſun's place and the zenith, is the diſtance of the ſun from the vertex at noon; the complement of which to 90°, is the ſun's altitude. The meridian altitude of the ſun on the 17th of May, at London, is 57° 55′.—The altitude being given, bring the quadrant of altitude to meet the ſun's place, and the interſection of the quadrant and horizon will ſhew the *azimuth*. Thus, on the 21ſt of Auguſt, at London, when the ſun's altitude is 36° in the forenoon, the azimuth is 60° from the ſouth.

15. *To find the place of any heavenly body upon the globe, its longitude and latitude being given.*—Place the firſt degree of the quadrant of altitude upon that degree of the ecliptic which expreſſes the given longitude, and the 90th degree on the pole of the ecliptic; the point of the globe which is under that degree of the quadrant which expreſſes the given latitude, is the place of the body: for the quadrant repreſents a ſecondary of the ecliptic, an arc of which between the body and the ecliptic is its latitude, and the arc of the ecliptic between the ſecondary and the firſt degree of Aries, its longitude.

16. *To find the place of any heavenly body upon the globe, its right aſcenſion and declination being given.*—Bring that point of the equator which expreſſes the given right aſcenſion to the meridian; the place ſought is under that degree in the meridian, north or ſouth, which expreſſes the given declination.

17. *To find all thoſe places where it is noon, at any given hour of the day, at any given place.*—Bring the given place to the braſs meridian, and ſet the index to the uppermoſt 12; then turn the globe till the index points to the given hour, and it will be noon at all the places under the meridian. When it is 4 h. 50 m. in the afternoon at Paris, it is noon at New Britain, St. Domingo, Terra Firma, Peru, Chili, and Terra del Fuego. As the diurnal motion of the earth is from *weſt to eaſt*, it is plain that all places which are to the eaſt of any meridian, muſt neceſſarily paſs by the ſun before a meridian which is to the weſt can arrive at it.

18. *The hour being given at any place, to tell what hour it is in any other part of the world.*—Bring the place where the time is given, under the meridian; ſet the hour index to the given time, and turn the globe till the other place comes under the meridian, and the horary index will point to the hour required. Thus, when it is nine in the morning at London, it is half paſt four in the afternoon at Canton, in China; when it is three in the afternoon at London, it is eighteen minutes paſt ten in the forenoon at Boſton in America.

19. *To find in what climate any given place, not in the frigid zones, is ſituated.*—Rectify the globe for the given latitude, bring the firſt degree of Cancer to the meridian, ſet the index to the upper 12, turn the globe until Cancer comes to the verge of the horizon, the index will point to the time of his riſing, the time between which and noon being doubled, gives the length of the longeſt day at that place, from which take twelve hours, and the half hours contained in the remainder will anſwer to the number of the climate that the given place lies in, viz. What climate is Gibraltar in? Anſwer, the 5th climate.—Required the climate that London is in. Anſwer, the 9th.—Given Peterhead, the eaſternmoſt town in Scotland, required the climate it is in. Anſwer, the 12th.

20. *To find in what climate any given place in the frigid zone is ſituated.*—Find the time that the ſun ſhines conſtant at the place given, which, if leſs than thirty days, the place is in the 25th climate; if between thirty and ſixty days, it is in the 26th climate; if between ſixty and ninety days, the 27th, &c. each ſucceeding another thirty days.—Given the North Cape, Lapland, required what climate it is in? Anſwer, the longeſt day being ſeventy-ſeven days, anſwers to the 27th climate.—In what climate is Nova Zembla, lat. 78° N.? Anſwer, the 28th.

What

What climate is Spitzbergen in, at lat. 80° N.? Anſwer, the 29th.—For an explanation of the climates, ſee article 58, in the preceding p. 354.

21. *To find the antœci, the periœci, and the antipodes, of any place.*—Bring the given place to the meridian, then, in the oppoſite hemiſphere, and in the ſame degree of latitude with the given place, will be the *antœci*. The given place remaining under the meridian, ſet the index to 12, and turn the globe till the other 12 is under the index; then the *periœci* will be under the ſame degree of latitude with the given place, and the *antipodes* of the given place will now be under the ſame point of the brazen meridian where the *antœci* ſtood before.

22. *To find the two days on which the ſun is in the zenith of any given place between the tropics.*—That parallel of declination which paſſes through the given place, will cut the ecliptic line upon the globe in two points, which denote the ſun's place; againſt which, on the horizon, will be found the days required. The ſun is vertical at Barbadoes April 24, and Auguſt 18.

23. *The time and place being given, to find all thoſe places where the ſun is riſing, ſetting, culminating; and alſo where it is day-light, twilight, or dark-night.*—Find the place where the ſun is vertical at the given hour, rectify for the latitude of that place, and bring it to the meridian. Then all the places that are in the *weſt* ſemicircle of the horizon, have the ſun *riſing*; thoſe in the *eaſt* ſemicircle, have it *ſetting*; thoſe under the meridian above the horizon, have it *culminating*; and all places above the horizon, have the ſun ſo many degrees above the horizon as the places themſelves are. Thoſe places that are below the horizon, but within 18° of it, have *twilight*; thoſe lower than 18° have *dark-night*; and to thoſe under the meridian, it is *midnight*.

24. *To find the place of the moon, or any planet, for any given time.*—Take the nautical almanac, or White's Ephemeris, and againſt the given day of the month will be found the degree and minute of the ſign which the moon or planet poſſeſſes at *noon*. The degree thus found, and marked in the ecliptic on the globe, you may proceed to find the declination, right aſcenſion, latitude, longitude, altitude, amplitude, azimuth, riſing, ſetting, &c.

25. *To find the planets which are above the horizon at ſun-ſet, upon any given day and latitude.*—Find the ſun's place for the given day, bring it to the meridian, ſet the index hour to 12, and elevate the pole for the given latitude, then bring the ſun's place to the weſtern ſemicircle of the horizon, and obſerve what ſigns are in that part of the ecliptic above the horizon; then look to the ephemeris for the day, and it will be ſeen what planets are in thoſe ſigns, for ſuch will be viſible on the evening of that day.

26. *To find whether Venus be a morning or an evening ſtar.*—Rectify the globe for the latitude and ſun's place; find the ſituation of Venus by an ephemeris, and ſtick there a ſmall black patch; bring the ſun's place to the edge of the eaſtern horizon. If Venus be *in antedecentia*, that is, for inſtance, in Taurus when the ſun is in Gemini, ſhe will be a morning ſtar.—But, if Venus be *in conſequentia*, that is, for example, in Gemini when the ſun is in Taurus, ſhe will ſet after the ſun, and be an evening ſtar.

27. *To find all the places to which a lunar eclipſe will be viſible at any inſtant.*—Find the place to which the ſun is vertical at the given time, and bring that place to the zenith, and the eclipſe will be viſible to all the hemiſphere below the horizon, becauſe the moon is oppoſite to the ſun.—Since lunar eclipſes continue, in general, for a conſiderable time together, they may be ſeen in more places than in one hemiſphere of the earth; for, by the earth's rotation about its axis during the time of the eclipſe, the moon will riſe to ſeveral places after its commencement. But we cannot by a globe only, determine the places to which a ſolar eclipſe is viſible, becauſe that eclipſe does not happen to the whole hemiſphere next the ſun, nor does it happen at the ſame time to thoſe places where it is viſible. Calculations are therefore neceſſary; for which ſee the article ASTRONOMY, vol. ii. p. 443–452. And for the change of ſeaſons, and other phenomena of the earth not explained above, ſee the ſame article.

OF HISTORICAL GEOGRAPHY.

The hiſtorical, or progreſſive, geography of the world, is unqueſtionably a moſt captivating as well as intereſting branch of ſtudy; ſince it acquaints us, not only with the ancient and modern nations of the earth, but introduces us to a pleaſing view of the primitive economy of mankind; of the progreſſive ſtate of refinement and manners in ſociety; of the arts both of ſavage and of civilized life; and of the characters and coſtume of the inhabitants of the whole globe. In ſhort, this department of ſpeculative literature may begin with the firſt man; may trace the early ſtages of population among the antediluvian nations; and connect their hiſtory with the progreſſive geography of the ſons of Noah, quite up to the era of the preſent times.

Every event, and every circumſtance, attending ſuch reſearch, will concur in proving, that mankind are not compoſed of ſpecies eſſentially different from each other; but that, on the contrary, there was originally but one ſpecies of the human race, which, after multiplying and ſpreading over the whole ſurface of the earth, have undergone various changes by the influence of climate, food, mode of living, epidemic diſeaſes, and the fortuitous mixture of diſſimilar individuals: that, at firſt, theſe changes were ſcarcely diſcernible, producing only trifling and individual varieties, which afterwards became ſpecific, by being longer continued; and were rendered ſtill more ſtrongly marked, and more permanent, by the continual action of the ſame cauſes; and thus they have been tranſmitted from generation to generation, as deformities or diſeaſes paſs from parents to children, or from one hereditary family to another.

It will be ſeen, by a compariſon of the ancient geography with the modern, that there are immenſe regions of country, inhabited by people, who, although they have obtained among themſelves different names, are nevertheleſs clearly and diſtinctly of the ſame origin; only varied by the arts of life, by the cultivation of manners, and the poliſh of ſociety.

In a ſimilar way, the harſh and rugged features of unknown countries have been brought into view, by the immortal Cook, and other circum-navigators; at the peril of whoſe lives diſcoveries have been made far beyond the boundaries of ancient hiſtory. And by the perſevering induſtry of man, the progreſs of agriculture, and the extenſion of commerce, thoſe diſtant regions have been made to put on the face of luxuriance and plenty; and to pour out, as freſh incitements to civilization, their hidden ſtores, which the unreſtrained hand of Providence has made indigenous in different parts of the globe, for the ſuſtentation and comfort of his creatures, wherever found.

We cannot, however, in this article, purſue the thread of hiſtorical geography throughout the wide field of information which it preſents to our view, and which it is the province of the geographer to inveſtigate and digeſt. Our limits confine us within the circle of a ſmall horizon; and our plan conſtrains us to notice, under the proper names or titles of different countries, many eſſential particulars in their geography, as connected with their phyſical and political exiſtence. To each of theſe ſpecific titles, therefore, in the order of the alphabet in our Encyclopædia, we muſt refer the reader for more copious information; while we deem it convenient, if not eſſential, to give, in this place, a *Summary* of Ancient, and of Modern, Geography, whereby the young ſtudent may readily trace the various names and revolutions of

particular ſtates; and ſcan with a ſingle glance of the eye, the geographical connection of all the regions which inveſt the globe.

SUMMARY OF ANCIENT GEOGRAPHY.

The firſt diviſion of the Earth by the ancients, was into *land*, and *water*. The land was the *eaſtern* continent, ſurrounded by the ocean, compriſing Europe, Aſia, and Africa, which were ſometimes called by the ancients, *three* continents.

The ocean, *Mare* or *Oceanus*, was divided into two general parts: *Mare Externum*, and *Mare Internum*. The *Mare Externum* lay beyond the Streights of Gibraltar, *Herculis Columnæ*. To the north it was called *Oceanus Septentrionalis*, *Hyperboreus*, *Glacialis*, the Northern Ocean: to the weſt, *Oceanus Occiduus*, *Atlanticus*, *Heſperius*, the Atlantic: to the ſouth, *Oceanus Auſtralis*, *Meridionalis*, the Indian Ocean: to the eaſt, *Oceanous Eous*, *Orientalis*, commonly called the Pacific or Great South Sea.

Oceanus Septentrionalis, the Northern Ocean, was divided into *Mare Arctoum*, the North Sea, and *Mare Britannicum*, the Britiſh Sea.—*Mare Arctoum* included *Sinus Codanus*, the Baltic, and the ſeas to the north of *Thule*, generally ſuppoſed to be Iceland.—*Mare Britannicum* comprehended the ſeas from *Thule* to the coaſt of Spain and Portugal.—*Mare Internum* or *Noſtrum*, the Mediterranean, communicated with the ocean by *Fretum Herculeum* or *Gaditanum*, the Streights of Gibraltar. It may be divided into the following ſeveral parts:

1. *Mare Sardoum*, the Sardinian Sea, which extended from the Streights of Gibraltar to the iſland of Sardinia. 2. *Mare Inferum*, *Tyrrhenum*, *Tuſcum*, which waſhed the weſt coaſt of Italy down to Sicily. 3. *Mare Ionium*, the Ionian Sea, extending from Sicily to the Morea; it included *Mare Superum*, the Adriatic, or Gulf of Venice. 4. *Mare Ægeum*, the Archipelago. 5. *Mare Parthenium*, the Levant. 6. *Mare Lybicum*, the African Seas. 7. *Pontus Euxinus*, the Black Sea; at the entrance into which is *Propontis*, the Sea of Marmora; and beyond it *Palus Mæotis*, the Sea of Zabacche.

EUROPA.

This diviſion of the world, by the ancient geographers, is ſtated to be bounded on the North and Weſt by the Great Ocean; on the South by *Mare Internum*, the Mediterranean; on the Eaſt by the Tanais, or Don.—Ευρωπην δ' Ασιης Ταναις δια μεσσον οριζει. *Dionyſ. Perig.*

The Romans divided Europe into nine principal parts: 1. *Inſulæ Britannicæ*, the Britiſh Iſles. 2. *Hiſpania*, Spain. 3. *Gallia*, Gaul. 4. *Germania*, Germany. 5. *Sarmatia*, Poland, and part of Ruſſia. 6. *Dacia*, part of Hungary and Tranſylvania. 7. *Illyricum*, part of Auſtria and Hungary, Sclavonia, Boſnia, Dalmatia. 8. *Græcia*, Greece. 9. *Italia*, Italy.—Theſe we ſhall deſcribe in their reſpective order.

BRITANNIA ANTIQUA.—The Britiſh Iſles were divided into three parts: *Albion*, *Hibernia*, and *Inſulæ Minores*. Albion, or Britannia Major, *naturâ triquetra*, was divided into *Britannia Romana* or *Citerior*, South Britain; and *Britannia Ulterior*, or North Britain. Being of a triangular form; the point or headland to the North was called *Orcas*, Dungſby Head; the other two were *Bolerium Promontorium*, the Land's End, and *Cantium Promontorium*, the North Foreland. *Britannia Romana* or *Citerior*, South Britain, or England, was divided into *Superior* and *Inferior*, Higher and Lower.

ALBION SUPERIOR contained the three provinces of *Britannia Prima*, *Flavia Cæſarienſis*, and *Britannia Secunda*.—BRITANNIA PRIMA, the Southern part of England, lying between the Severn and Thames, was divided into ſix parts; and contained, 1. The *Cantii*, inhabiting Kent. Their chief towns were: *Dorobernium*, Canterbury; *Dubris*, Dover; *Rutupiæ* or *Rutupis*, Richborough; *Regulbium*, Reculver; *Durobrivis*, Rocheſter; *Portus Lemanis*, Stutfall Caſtle; according to others, Lime, near Hythe; *Anderidæ*, Newenden. 2. The *Regni*, inhabiting Surrey, Suſſex, and part of Hampſhire; and, 3. the *Belgæ*, inhabiting Somerſetſhire, Wiltſhire, and part of Hampſhire. Their chief towns were: *Aquæ Solis*, or *Calidæ*, Bath; *Theodorunum*, Wells; *Sorbiodunum*, Old Sarum; *Venta Belgarum*, Winchester. 4. The *Atrebates*, inhabiting Berkſhire: chief towns, *Galleva*, Wallingford; and *Spinæ*, Speen, adjoining to Newbury. 5. The *Durotriges*, inhabiting Dorſetſhire: chief town, *Durnovaria* or *Durnium*, Dorcheſter. 6. The *Damnonii*, inhabiting Cornwall and Devonſhire: their chief town, *Iſca*, Exeter. Here were alſo *Damnonium* or *Ocrinum Promontorium*, the Lizard Point; *Bolerium* or *Antiveſtæum Promontorium*, the Land's End; *Silurum Inſulæ*, or *Caſſiterides*, the Scilly Iſlands.

FLAVIA CÆSARIENSIS, ſo named from the family of Veſpaſian, was the country lying between the Thames and the Humber, alſo divided into ſix parts; and contained, 1. The *Trinobantes*, inhabiting Middleſex and Eſſex. Their chief towns were: *Londinum*, London; *Camalodunum*, Malden, or Colcheſter, perhaps the firſt Roman colony in Britain.—In Coloniam Camelodunum recens deducti, pellebant domibus, exturbabant agris. *Tacitus.*—2. The *Iceni*, inhabiting Suffolk, Norfolk, Cambridge, and Huntingdonſhire. Chief towns: *Venta Icenorum*, Norwich; *Villa Fauſtini*, St. Edmund's Bury; *Camboritum*, afterwards *Granta* and *Cantabrigia*, Cambridge. 3. The *Catyeuchlani*, inhabiting Buckinghamſhire, Hertfordſhire, and Bedfordſhire: whoſe chief towns were: *Pontes*, Colnbrook; and *Verulamium*, Verulam, near St. Alban's.—Eadem clades Municipio Verulamio fuit. *Tacitus.*—4. The *Dobuni*, inhabiting Glouceſterſhire, and Oxfordſhire. Their chief towns were: *Oxonia*, Oxford; *Clanum* or *Clevum*, afterwards *Claudia Caſtra*, Glouceſter. 5. The *Cornavii*, inhabiting Warwickſhire, Worceſterſhire, Staffordſhire, Shropſhire, and Cheſhire. Their chief towns were: *Præſidium*, called alſo *Verovicum*, Warwick; and *Deva*, or *Duna*, Cheſter. 6. *Coritani*, inhabiting the ſhires of Northampton, Leiceſter, Rutland, Lincoln, Nottingham, and Derby. Their chief town was, *Lindum Colonia*, Lincoln.

BRITANNIA SECUNDA, the ſecond part of the iſland conquered by the Romans, lay between the Severn and the Iriſh Sea; it is ſometimes called *Superior*, and anſwers to Wales. It contained, 1. The *Silures*, the inhabitants of Hereford, Radnor, Brecknock, Monmouth, and Glamorganſhire. To them belonged *Iſca Silurum*, Caerleon; *Venta Silurum*, Caerwent. 2. The *Demetæ*, inhabiting Caermarthen, Pembroke, and Cardiganſhire. 3. The *Ordovices*, inhabiting Flint, Denbigh, Montgomery, Merioneth, Caernarvonſhire, and Angleſea.

ALBION INFERIOR, contained the two provinces of *Maxima Cæſarienſis*, and *Valentia*. *Maxima Cæſarienſis*, lying between the Humber and the Tyne, contained, 1. *Pariſi*, the Eaſt Riding of Yorkſhire. 2. The *Brigantes*, inhabiting the Weſt and North Ridings of Yorkſhire, Durham, Lancaſhire, Weſtmoreland, and Cumberland. Their chief towns were: *Eboracum*, York, where Severus and Conſtantius Clorus died; *Luguballum*, or *Caſtra Exploratorum*, Carliſle.

Valentia, between the Tyne and Frith of Forth, was occupied chiefly by the *Ottadini*, inhabiting Northumberland. It alſo contained the three Roman walls, 1. *Adriani Vallum*, the Picts Wall, eighty miles in length, from the mouth of the Tyne to the Solway Frith. 2. *Antonini*, or *Lolli Urbici Vallum*, Graham's Dyke, thirty-eight miles in length, from the Frith of Forth to the Frith of Clyde, where Agricola had before raiſed forts. 3. *Severi Murus*, a wall of free-ſtone, built on or near Adrian's Rampart.

ALBION ULTERIOR, called alſo *Borealis*, or *Barbara*, now Scotland, was inhabited by the Picts, divided into the *Vecturiones* and *Caledonii*, or *Ducaledones*, *Attacottæ*, and *Horeſti*.—Rutilæ Caledonium habitantium comæ, magni artus,

artus, Germaniæ originem adſeverent. *Tacitus.*—In this diviſion, the general name of thoſe who lived to the ſouth of Antoninus's Rampart, was *Mæatæ*; and *Caledonii*, of thoſe who lived to the north of it. Their chief towns were: *Caſtra Alata*, Edinburgh; and *Alaterva*, Cramond.

Concerning the original ſtem-tribes of Britain, M. Mannert, in his "Northern Geography," ſtates as follows:—"Cæſar came to Britain, and found Celts immemorially ſettled there. He ſays, "people of Belgium," not that he meant to indicate a nation diſtinct from the Celts, as ſome believe, but becauſe the Belgian coaſt, lying next to Britain, may naturally be ſuppoſed to have furniſhed the coloniſts. That they did not differ from the other Celts, either in language or cuſtoms, may be inferred from the circumſtance that young men were ſent from Gaul to be educated under the Britiſh Druids. Later writers concur with Cæſar. Tacitus, in the life of Agricola, c. 11, diſcovers among the Britons manners and cuſtoms reſembling thoſe of the Gauls. The Silures appear to him a colony from Spain, on account of their full complexion and criſp hair. The Caledonians he derives from the Germans. Conceiving, like all his cotemporaries, that the weſtern extremity of Britain lay oppoſite to the north coaſt of Spain; and the northern extremity of Britain to have been its eaſtern part, and oppoſite to the north coaſt of Germany; he ſuppoſes each portion of the iſland to have derived its inhabitants from the moſt contiguous continent.

"In the interior of the iſland, Cæſar mentions a nation, which he conſiders as the *Autochthones*, but of theſe he had only heard. A century later, the march of the Roman conqueſts firſt led them under Agricola to this unknown people, who manfully reſiſted and never wholly ſubmitted to the invader. *Caledonii* was the name given by the Latins to this newly-found people, and probably it was their domeſtic appellation. The Grampian hills formed their favourite reſort. Tacitus and Ptolemy have preſerved the names of ſome ſubdiviſions of theſe tribes: Dion Caſſius, lxxvi. 12, aſſigns to them the collective name of *Maiatæ*. Theſe were no doubt Celts, who either ſtrolled thither at their original ſettlement, or were forced thither by the progreſs of the Roman arms. The next century affords no farther intelligence concerning the inhabitants of the north, until the ſudden appearance of the Picts and Scots in Ammianus Marcellinus, xxvii. 8; the former of which names, as may be inferred from Claudian, was beſtowed from their practice of tattooing with blue ſtains.—For the manner in which the ancient Britons tattooed or painted their bodies, ſee the article ENGLAND, vol. vi. p. 538.

"Probably the Caledonians of Scotland belong to the ſame race with the Iberi. Hiſtory, at leaſt, informs us, that, before the appearance of the Celts, the weſt of Europe was inhabited by a nation of this name, which retired before them. Our oldeſt accounts of the Caledonians deſcribe them as entertaining a violent antipathy againſt the Celts. We know of the Iberi, that ſome tribes were driven towards Spain, incorporated the Celts among them, and ſettled in Aquitaine. If this reſemblance do not ſubſiſt between the Iberians and the Caledonians, the latter muſt be a wholly inſulated European tribe. A cloſe compariſon of the language of the Biſcayans, who call themſelves *Euſcaldunac*, would aſſiſt in deciding this queſtion. The Maiatæ of the third century appear in the fourth divided into Attacotti and Scotti, the latter of which tribes has ultimately given its name to the northern provinces.

"The early native writers differ ſomewhat from the ancients. Beda (Hiſt. Eccleſ. i. 1.) places the Scots originally in Ireland, whither they are ſuppoſed to have come from Spain. The arrival of a Scythian fleet, bringing ſtrangers in ſearch of ſettlement, occaſioned firſt a war and then a compromiſe; in virtue of which the Gothic ſtrangers were provided with wives among the Scots of Ireland, and aſſiſted by their new relations in ſeizing that part of the oppoſite iſland which lay to the north-eaſt, where they became the people now called *Highlanders*."

This account by M. Mannert is in great part well founded, though liable to ſome objections. The three ſtem-tribes of the Britiſh nation, however intermingled in all the towns, retain in the mountainous diſtricts their original phyſiognomy and language. Theſe tribes are, 1. The Iriſh and Highland Scots, who ſpeak the Erſe or Gaelic tongue; 2. The Cumbrian or Cymbric race, who ſpeak the Welſh tongue; and, 3. The Goths from the vicinity of Denmark, one of whoſe tribes, called *Angles*, gave its name to the Engliſh tongue. The denomination of *Celt*, is often uſed vaguely, but it can with propriety be applied only to the firſt of theſe races; and, if ſo reſtricted, it is evident that Cæſar never ſaw the Celts of Britain at all: his intercourſe was confined to the ſecond race, who, like the Belgæ of Gaul, had Druidiſm for their religion, and Welſh for their language. The Silures of Tacitus are probably of the firſt race, as their phyſiognomical character agrees with that of the Celts: but his Caledonii, for the ſame reaſon, are of the third or Gothic race, and not, as Mannert ſuppoſes, Iberian or Celtic: the information of Beda being correct that the Lowlanders are the original inhabitants of Scotland, the antagoniſts of Agricola, and the conquerors of Caracalla; and that the Highlanders are an Iriſh colony of the third or fourth century.

The head lands on the coaſt of Britain were, *Cantium-Promontorium*, North Foreland; *Ocellum Prom.* Spurnhead; *Bolerium*, or *Antiveſtæum Prom.* Land's End; *Damnonium*, vel *Ocrinum*, Lizard Point; *Orcos*, Dungſby Head.—Rivers: *Tameſis*, the Thames; *Sabrina*, the Severn; *Abus*, the Humber; *Ituna*, the Eden; *Tueſis* vel *Alaunus*, the Tweed; *Bodotria*, the Forth; *Glota*, the Clyde; *Taus*, the Tay; *Devana*, the Dee. See the article ENGLAND, vol. vi. p. 534, and the Map of Ancient Britain annexed.

HIBERNIA, Ireland.—*Hibernia*, *Britannia Parva*, *Ierne*, *Scotia*, *Erin*, or the Country of the Weſt, was inhabited by eighteen different tribes, whoſe names it is unneceſſary to enumerate, as they ſeldom occur in hiſtory; but among them were tribes of *Scoti*.—Scotorum tumules flevit glacialis Ierne. *Claudian.*

Their chief towns were: *Eblana*, Dublin, with a tribe called *Eblani*. *Menapia*, Wexford, with a tribe called *Menapii*.—In the middle ages the *Nalli* occupied the centre of the country, the *Dalriadi* were to the north-eaſt, and the *Cruthini* to the north-weſt.

INSULÆ MINORES.—*Silures*, *Caſſiterides*, *Heſperides*, the Scilly Iſlands. The name *Caſſiterides* was not confined to thoſe iſlands, but ſometimes applied to the Britiſh Iſlands at large. *Vectis*, the Iſle of Wight. *Mona*, Angleſea, the principal ſeat of the Druids in Britain.—Monam inſulam, incolis validam, et perfugarum receptaculum. *Tacitus.*

Monabia, *Monœda*, and alſo *Mona*, the Iſle of Man. *Ebudæ*, *Hebudes*, *Hebrides*, the Weſtern Iſles. *Iona*, Icolm Kill. *Orcades*, the Orkney Iſlands. *Thule*, ſuppoſed to be Shetland, Iceland, the North of Scotland, &c. *Cæſarea*, Jerſey. *Sarnia*, Guernſey. *Arica*, Sark. *Riduna*, Alderney.

Of the various tribes, ſuppoſed to have been about thirty in number, inhabiting the Roman province of Britain, the moſt conſiderable were, the *Belgæ* to the weſt, the *Brigantes* to the north, the *Silures* in South Wales, and the *Iceni* in Norfolk and Suffolk. This province was of ſuch conſequence to the Romans, that they maintained on it one hundred and fifty military ſtations, and a ſtanding army of about thirty-ſix thouſand foot, and ſix thouſand horſe. Of the Roman roads, Watling-ſtreet led from *Rutupiæ*, Richborough in Kent, north-weſt through London to Cheſter; the Ermin-ſtreet paſſed from London to Lincoln, to Carliſle, and into Scotland; the Foſſe-way probably led from Bath and the weſt of England north-eaſt, till it joined the Ermin-ſtreet. laſt of theſe great roads is thought to have extended from Norwich ſouth-weſt, into Dorſetſhire. From theſe branched off others in various directions, the remains of which are in many parts of England ſtill viſible.

HISPANIA ANTIQUA, called alſo *Heſperia*, from its weſtern ſituation, and from the river *Iberus* called *Iberia*, or *Celtiberia*; comprehended both Spain and Portugal:

Pyrene celſa nimboſi verticis arce
Diviſos Celtis late proſpectat Iberos. *Sil. Ital.*

It was divided into two general parts; *Hiſpania Ulterior, Exterior*, and *Inferior*; and *Hiſpania Citerior, Interior*, or *Superior*.

HISPANIA ULTERIOR, was divided into *Bætica* and *Luſitania*. *Bætica*, ſo named from *Bætis*, the Guadalquiver, comprehended the provinces of Andulaſia, Granada, part of New Caſtille, and Alentejo. Its inhabitants were the *Baſtuli* or *Pæni*, *Celtici*, and *Turditani*. Their chief towns were, *Corduba*, Cordova, the birth-place of Seneca, Lucan, and Martial. *Hiſpalis*, Seville, the birth-place of Trajan and Adrian. *Italica*, Alcala del Rio. *Munda*, Monda, where Cæſar defeated Pompey's ſons. *Illiberis*, Elvira. *Gades*, Cadiz. *Tarteſſus*, Tariffa. *Carteia, Calpe, Columna Herculis*, Gibraltar. Abyla, on the coaſt of Africa, was the other pillar of Hercules. *Luſitania* lay between the Guadiana and the Douro. It contained Portugal, part of Leon, and the two Caſtilles. It was chiefly inhabited by the *Luſitani, Vettones, Celtici, Turdetani*:

—— Profugique a gente vetuſta
Gallorum Celtæ miſcentes nomen Hiberis. *Lucan.*

Their chief towns were: *Auguſta Emerita*, Merida; *Norba Cæſarea*, Alcantara; *Evora*, or *Liberalitas Julia*, Evora; *Oliſippo*, Liſbon, fabled to have been built by Ulyſſes; *Coimbrica*, Coimbra.

HISPANIA CITERIOR, or *Tarraconenſis*, the largeſt diviſion of Spain, extended from the Pyrenees to the mouth of the Douro, and was divided into twenty-eight diſtricts, being inhabited by as many tribes. The moſt remarkable of theſe were the *Gallæci*, who gave name to Gallicia; *Aſtures*; *Carpetani*; *Cantabri*, the laſt nation in Spain which yielded to the Roman arms.—Cantabrum indoctum juga ferre noſtra. *Horace.*—They gave the name of *Oceanus Cantabricus* to the Bay of Biſcay; *Celtiberi*; *Vaſcones*; *Concani*, a people of ſavage manners; *Ilergetes*; *Auſetani*.—Their chief towns were: *Tarraco*, Tarragona; *Barcino*, Barcelona; *Emporiæ*, Ampurias; *Gerunda*, Girona; *Rhoda*, Roſas; *Oſca*, Hueſcar; *Ilerda*, Lerida, where Cæſar reduced Afranius and Petreius; *Dertoſa*, Tortoſa; *Saguntum*, Morviedro; the occaſion of the ſecond Punic war:

Nec pavet hic populus pro libertate ſubire,
Obſeſſum Pæno geſſit quod Marte Saguntum. *Lucan.*

Valentia, Valentia; *Carthago Nova*, Carthagena; *Cæſar Auguſta*, Saragoſa; *Julia Celſa*, Xelſa; *Pompeiopolis*, Pampeluna; *Numantia*, which ſtood a fourteen years ſiege againſt the Romans:—Noviſſime, maximo duce oppreſſa civitas, nullum de ſe gaudium hoſti reliquit. Triumphus fuit tantum de nomine. *Florus.—Calagurris*, Calahorra; which underwent a ſevere famine in the Sertorian war. *Toletum*, Toledo; *Segovia*, Segovia; famous for its aqueduct; *Aſturica*, Aſtorga; *Calle*, Oporto.

Auguſtus diſtributed Spain into the three provinces of *Luſitania, Bætica*, and *Tarraconenſis*. It was afterwards divided into fourteen *Juridici Conventus*, or Juriſdictions. Of theſe, *Bætica* contained four, *Luſitania* three, *Tarraconenſis* ſeven. Under the later emperors it was divided into theſe ſeven provinces. 1. *Bætica*; chief town Seville. 2. *Luſitania*; chief town *Auguſta Emerita*, Merida. 3. *Galæcia*; chief town *Bracara-Auguſta*, Braga. 4. *Tarraconenſis*; chief town *Tarraco*, Tarragona. 5. *Carthaginienſis*; chief town *Carthago Nova*, Carthagena. 6. *Inſulæ*, Majorca, Minorca, &c. 7. *Mauretania*, and *Tingitana*, now Fez and Morocco in Africa, including alſo Cadiz in Spain. The chief town, taking its name from a cognominal people, *Tingi*, Tangier.

Rivers.—*Minius*, the Minho; *Durius*, Douro; *Tagus*, Tajo; *Anas*, Guadiana; *Bætis*, Guadalquiver; *Sucro*, Xucar; *Turtas*, Guadalaviar; *Iberus*, Ebro; *Sicoris*, Segre; *Rubricatus*, Lobregat; *Sambroca*, Ter.

ISLANDS ON THE COASTS OF SPAIN.—*Inſulæ Baleares*, or Gymneſiæ, contained *Majorca*, and *Minorca*. *Inſulæ Pityuſæ*, contained *Ebuſus*, Yvica; and *Ophiuſa*, Formentara.

CAPES. *Pyrenæum, Aphrodiſium ſive Veneris Promontorium*, Cape de Creus. *Charidemum Promontorium*, Cape de Gates. *Calpe Prom.* Gibraltar Rock. *Sacrum Prom.* Cape St. Vincent. *Barbarium Prom.* Cape d'Eſpichel. *Lunæ Prom.* Cape de Mandego. *Artabrum Celticum, ſeu Nerium Prom.* Cape Finiſterre.

Concerning the ancient hiſtory of Spain, we ſelect the following account from Mannert:—"The name of *Spain* is probably of Phœnician origin. The Romans borrowed it from the Carthaginians, through whom they firſt became acquainted with the country. The Greeks every where call it *Iberia*, without attaching always the ſame idea to the denomination. The elder Greeks, till the period of the Achæan league, and of their cloſer acquaintance with Roman affairs, underſtand by it the whole ſea-coaſt from the columns of Hercules to the mouth of the Rhine: becauſe, throughout this diſtrict, the Iberi were to be found, ſometimes apart, ſometimes mingled with Ligurians. The river Ebro has its name from them. The ſea-coaſt beyond the pillars they called Tarteſſis. The interior of the country went long without a name among the inhabitants, becauſe each nation conſidered itſelf as a whole, and lived nearly unconnected with its neighbours. Among the Greeks, it obtained the vague name of Kelrica; which was alſo applied to the whole north-weſt of Europe. Time altered theſe ideas, and the latter Greeks appropriated the name *Iberia* to the ſame country which the Romans called *Hiſpania*. Even this laſt name the Greeks occaſionally uſe, but underſtand by it the region between the Pyrenees and the Iber or Ebro. Not till the ſecond or third century was the Latin name fully received into the Greek tongue, although earlier inſtances occur. *Heſperia* or the *weſt country*, is a common name among the Greek poets both for Italy and Spain; for the latter, with the occaſional epithet *ultima*.

"Hiſtory mentions as the moſt ancient ſettled inhabitants of the country in the weſtern parts, the Kynetæ; and on the ſouthern coaſt, the Tarteſſians beyond, and the Iberians within, the pillars of Hercules. Part of the latter, between the Pyrenees and the Ebro, were known by the name of Igletæ. Herodotus learned theſe names from the Phocæans; ſo that our firſt notices of the country reach back to the times of the early Perſian kings. The fable of *Luſus* and *Pan*, generals of Bacchus, is ſaid to have given the names to Luſitania and Hiſpania. Herodotus alſo notices other intruded tribes, the Phœnicians who had colonized the coaſts, and the Celts who had wandered into the interior. Theſe dwell leſs weſtward than the Kynetæ, and probably in the ſame regions in which we find them at a later period; and theſe were probably the only Celts or Kelts of whom the Phocæans had experimental knowledge; which occaſions Herodotus to place erroneouſly among them a city, Pyrene, near to which he ſuppoſes the Danube to riſe.

"Whether the Phœnicians or the Kelts were the earlier intruders cannot be aſcertained. Both their immigrations precede the beginning of authentic hiſtory. The building of Gadeir, their chief ſea-port, by the Phœnicians, is placed ſoon after the Trojan war. The intruſion of the Kelts loſes itſelf in the miſt of antiquity. Later hiſtory mentions them to have come from beyond the Pyrenees, to have waged long wars with the Iberi, and finally to have melted into one nation; which, under the name of Keltiberi, poſſeſſed a conſiderable tract of land in the ſouth, and was noted for its bravery during the wars between the Carthaginians and the Romans.

The

The union was not general: only the inhabitants of the south became one nation with the Kelts; the other Iberi remained unmixed. From the great Keltic army some tribes separated, who established themselves near to the mouth of the river Anas (Guadiana.) Another portion occupied the north-west extremity under the name Artabri. The former preserved the general name of Kelts.

"The Greeks established some colonies along the coast of the Iberi within the columns: but, except the Saguntum of the Lakynthians, and the Emporium of the Massilians or Phocæans, they were of little importance. All the numerous tribes, therefore, which are afterward found in Spain, may be divided, 1. into the unmixed aboriginal inhabitants, and 2. into the tribes wholly or partially composed of intruders. The former occupied the east and west coast of the ocean, the Pyrenees, and great part of the country east of the Iber. It cannot be proved that the north-west inhabitants are the same with the proper Iberi of the south-east. To these belong the Lusitani, Karpetani, Kallaiki, and Vakkæi, of the west; the Asturian, Cantabrian, and Vask, of the north; the inhabitants of the Pyrenees, through whose territory many hordes passed without staying, and some tribes dwelling along the Iber, of the east; finally, the inhabitants of the highlands, of Ortospeda, the Oretani, Olkadi, and Bastitani, of the south. The language, manners, and weapons, of these people are alike: they are one people in many subdivisions.

"The mixed tribes may be again divided into the Keltiberi and the people of the south-coast. The former comprehend in a manner all the inland inhabitants of the south. The Kelts chiefly struggled with the Iberi in the neighbourhood of the river so called: but, after the incorporation, they jointly occupied the mountainous country on the west of the Iber, as far as the source of the Durius and Tagus. This was Keltiberia in its narrowest import: but the nation, having multiplied greatly, dispossessed or reduced to slavery several tribes, as the Vakkæi, Karpetani, Oretani, &c. who are thence incorrectly reckoned as a part of it.

"The people of the coast beyond the pillars of Hercules, are a mixture of the natives with Phœnicians; and, within the pillars, a mixture of the natives with Greeks, Romans, and Carthaginians. Their commerce with strangers destroyed all peculiarity of character. At first they learned the Punic, afterward the Roman, language and manners. The commerce, to which they were devoted, habituated them to assume every form. For this reason, the inlanders despised them, made inroads on them, and forced them to recur for defence to foreign protection."

GALLIA ANTIQUA.—This country was called by the Greeks *Galatia*, and *Celto-Galatia*. By the Romans it was divided into *Cisalpina*, *Citerior*, or *Togata*, and *Transalpina*, *Ulterior*, or *Comata*. *Gallia Cisalpina* is properly part of Italy. *Gallia Transalpina* was bounded by the Rhine, the Alps, Var, Pyrenees, and the Ocean.

The chief rivers of ancient Gaul were, *Rhenus*, the Rhine; *Mosella*, Moselle; *Mæsa*, Maese or Meuse; *Sabis*, Sambre; *Scaldis*, Schelde; *Matrona*, Marne; *Sequana*, Seine; *Liger* or *Ligeris*, Loire; *Carantonus*, Charente; *Garumna*, Garonne; *Duranius*, Dordogne; *Arar*, Saone; *Rhodanus*, Rhone, which passes through *Lacus Lemanus*, the lake of Geneva; *Isara*, Isere; *Druentia*, Durance; *Argentus*, Argens; *Varus*, Var.

The most noted mountains were: *Vogesus*, Mount Vauge; *Cebenna*, the Cevennes; *Jura*, Mount Jura; *Alpes*, the Alps. The Alps were divided into *Alpes Maritimæ*, *Cottiæ*, *Græcæ*, *Penninæ*, *Rhæticæ*, *Noricæ*, *Pannonicæ*, *Juliæ*, supposed in their circuit to embrace about five hundred and fifty miles, and extending in a direct line two hundred and fifty miles from *Monœci Portus*, Monaco, to *Sinus Flanaticus*, the Gulf of Carnero, in the Hadriatic.

Της δε προς αντολην αναφαινεται Αλπιος αρχη,
Της δια μεσσατιης κατασυρεται ὑδατα Ρηνε,
Υστατιον ποτι χευμα βορειαδος αμφιτειτης.
Ρηνῳ δ' εξεης επιτελλεται ἱερος Ιστρος. *Dionys. Per.*

Gaul was divided by Julius Cæsar into three parts; the *Belgæ*, *Galli* or *Celtæ*, and the *Aquitani*. *Gallia Belgica* was bounded by the Seine, Marne, mountains of Vauge, Rhine, and the Ocean. *Gallia Celtica* was bounded by the Seine, Marne, mountains of Vauge, Saone, Rhone, and Garonne. *Gallia Aquitanica* was bounded by the Ocean, Garonne, and the Pyrenees. *Gallia Celtica* was the most considerable division, and anciently gave its name to the whole country of Gaul; which was divided by Augustus into four parts; *Gallia Narbonensis* or *Provincia*, *Aquitania*, *Lugdunensis* or *Celtica*, and *Gallia Belgica*.

GALLIA NARBONENSIS, or *the Roman Province*, called also *Braccata*, from a part of the dress worn there, was bounded by the Pyrenees, Garonne, Cevennes, Alps, and the sea-coast of the Mediterranean; and was divided into two parts by the Rhone. It comprehended Languedoc, Provence, Dauphiny, and part of Savoy. There were in it seventeen different tribes; the chief of which, to the east of the Rhone, were the *Allobroges*, *Centrones*, and *Vacontii*; whose chief towns were *Geneva*; *Vienna Allobrogum*, Vienne in Dauphiné; and *Cutaro*, afterwards *Gratianopolis*, or Grenoble.—The *Cavares*; in whose country were these towns: *Avenio*, Avignon; *Arausio*, Orange; *Avia Julia*, Apt; *Vasio*, Vaison.—In the country of the *Salyes* or *Salvii*: *Aquæ Sextæ*, Aix; *Massylia*, Marseilles; *Telo Martius*, Toulon; *Forum Julii*, Frejus; *Antipolis*, Antibes; *Arelate*, Arles.—On the west of the Rhone, the *Helvii*, *Volcæ Arecomici*, and *Volcæ Tectosages*: whose chief towns were, *Nemausus*, Nismes; *Narbo Martius*, Narbonne; *Tolosa*, Toulouse; *Carcasso*, Carcassonne.

AQUITANIA, was bounded in Julius Cæsar's time, by the Pyrenees, the Ocean, and the Garonne.—In Augustus Cæsar's time, it was extended to the Loire, and included the part of the Lyonnois and Orleanois which is to the southward of that river. It contained eighteen states; the chief of which, to the south of the Garonne, were the *Convenæ*, *Tarbelli*, *Auscii*, *Vasates*, *Bituriges*, and *Vibisci*; whose chief towns were: *Aquæ Tarbellæ* on the *Aturus*, or Acqs on the Adour; *Vasates* or *Cossio*, Bazas; *Burdegala*, Bourdeaux; *Climberrum* or *Augusta Ausciorum*, Ausch.

Between the Garonne and the Loire, were the *Cadurci*, *Petrocorii*, *Lemovices*, *Santones*, *Pictones*, *Bituriges-Cubi*, *Arverni*, under whom are included the *Boii*. Their chief places were: *Uxellodunum*, near Cadenac; *Vesuna* or *Petrocosi*, Perigueux; *Mediolanum* on the *Carantonus*, or Xaintes on the Charante; *Santonum Portus*, Rochelle; *Uliarus Insula*, the Isle of Oleron; *Limonum*, Poictiers; *Augustoritum*, Limoges; *Avaricum*, Bourges; *Nemossus*, *Arvernum*, *Augustonomemetum*, Clermont; *Gergovia Boiorum*, Moulins; *Gergovia Arvernorum*, Gergoie.

GALLIA LUGDUNENSIS, or CELTICA, the largest part of Gaul, according to Cæsar's division, as it then included the *Helvetii* and *Sequani*, was bounded by the Ocean, the Loire, Seine, Marne, Rhine, and Rhone. It included part of the Lionnois, Burgundy, Champagne, Isle of France, Orleanois, and all Brittany and Normandy south of the Seine. In Cæsar's time it comprehended twenty-nine different states, including the *Helvetii* and *Sequani*, who being afterwards ranked by Augustus as part of Gallia Belgica, the boundaries of Gallia Celtica to the east became *Mons Vogesus* and the *Arar*.

Their chief states and towns were:—*Segusiani*, inhabiting chiefly the Lionnois; the cities *Lugdunum*, Lyons; *Forum Segusianorum*, Feurs.—*Ædui*, inhabiting Burgundy; their cities, *Bibracte* or *Augustodunum Æduorum*, Autun; *Cabalinum*, Chalons; *Matisco*, Macon.—*Mandubii*, inhabiting Auxois: chief town *Alesia*, or Alese, the last place reduced

GERMANIA ANTIQUA.

reduced by Cæsar in Gaul.—*Senones*, the Senonois: chief cities, *Agendicum* or *Senones*, Sens; *Melodunum*, Melun.—*Parisii*, the Isle of France: chief city, *Lutetia* or *Lucotetia*, Paris.—*Carnutes*, the Chartrain, part of Orleannois: chief cities, *Autricum* or *Carnutum*, Chartres; *Genabum*, Gien, or perhaps Orleans.—*Turones*, Touraine: chief city, *Cæsarodunum* or *Turonica*, Tours.—*Andes* or *Andegavi*, inhabiting Anjou: chief city, *Juliomagus*, Angers.—*Nannetes*, inhabiting Nantois: chief city, *Condivienum*, Nantes.—*Veneti*, the country near Vannes: chief town, *Venetica*, Vannes.—*Curiosolitæ*, inhabiting the country about Quimpercorantin: chief town, *Vendona Portus*, Blavet.—*Osismii*, Osismer: chief city, *Brivates*, Brest.—*Rhedones*, the people about Rennes, Dol, and St. Maloes: chief towns, *Condate*, Rennes; *Aletum*, now in ruins near St. Maloes.—*Abrincatæ*, who succeeded the *Ambibari* in the country about Avranches: chief town, *Ingena*, Avranches.—*Unelli*, the Coutantin: chief towns, *Alauna*, Cherburg; *Cosedea*, Coutance.—*Lexovii*, inhabiting the country about *Noviomagus*, Lisieux.

The country along the coast from the *Liger* to the *Sequana*, was, in a subsequent period, called *Armorica*. The islands on this coast, besides *Riduna*, *Sarnia*, and *Cæsarea*, Alderney, Guernsey, and Jersey, which belong to Britain, were: *Uxantes*, Ushant; *Venetorum Insulæ*, Belleisle, Quiberon, &c. *Gobæum Prom.* Cape St. Mahé.

Gallia Belgica, was bounded, according to Augustus's division, by the Marne, Seine, Ocean, Rhine, Arar, and Rhone. It included part of Picardy and of the Isle of France, Champagne, the Low Countries, Germany to the west of the Rhine, Alsace, Lorrain, Franche Comté, part of Burgundy, and Switzerland. This part of Gaul, if we include in it the *Helvetii* and *Sequani*, contained twenty-three different states.

The chief of these states were the *Helvetii*, inhabiting Switzerland. The *Helvetii* were divided into nine different parts, viz. *Tigurinus Pagus*, the country of Zurich, Appenzil, and Rinthal: chief town, *Tigurum*, Zurich. Here was *Lacus Brigantinus* or *Venetus*, the Lake of Constance.—*Tugenus Pagus*, the country of Zug, Schwitz, Glaris, Uri: chief towns, *Tugum*, Zug; *Aquæ Helvetiæ*, Baden.—*Ambronicus Pagus*, part of Friburg, Berne, Underwald, Lucern, and Solothurn: chief towns, *Vindones*, Windisch; *Salodurum*, Solothurn.—*Urbigenus Pagus*, Neufchatel, part of Friburg, and the Pays de Vaud: chief towns, *Aventicum*, Avanches; *Urba*, Orbe; *Colonia Equestris* or *Noviodunum*, Nyon. These lay between the Lakes of Geneva and Constance.—*Nantuates*, the lower part of the Pays de Vaud: chief town, *Bibiscus*, Vevay.—*Rauraci*, inhabiting the canton of Basle: chief town, *Arialbinum* or *Basilea*, Basle.—The *Veragri*; the *Seduni*; and the *Latobrigi*; inhabited *Octodurus Veragrorum*, Martigni; and *Sedunum*, Sion.

The *Sequani*, inhabited Franche Comté, and were separated from the *Helvetii* by *Jura Mons*, Mount Jura: chief town, *Bisontio* or *Visontio*, Besançon.—The *Lingones*, inhabited *Lingones* or *Andomatunum*, Langres: the *Leuci*, *Verodunum*, Verdun: the *Tribocci*, *Argentoratum*, Strasburg: the *Nemetes*, *Noviomagus*, Spire: the *Vangiones*, *Vangiones* or *Borgetomagus*, Worms; and *Maguntiacum*, Mentz.

The *Treviri* inhabited *Augusta Trevirorum*, Treves or Triers; and *Confluentes*, Coblentz. The *Mediomatrici*, had their chief towns, *Divodurum*, Metz; and *Totonis Villa*, Thionville. The *Rhemi*, inhabited *Durocortorum*, Rheims; *Bibrax*, Braisne; and *Catalaunum* or *Duro-Catalauni*, Chalons. The *Suessiones*, had *Augusta Suessionum*, Soissons; and *Noviomagus*, Noyon. The *Bellovaci et Sylvanectes*, inhabited *Cæsaromagus* or *Bratuspantium*, Beauvais; and *Augustomagus*, Senlis. The *Velocasses et Caletes*, inhabited Upper Normandy: their chief towns were, *Rotomagus*, Rouen; *Caracotinum*, Havre de Grace; and *Juliobona*, Lisiebonne, perhaps Dieppe. The *Ambiani*, inhabited *Samarobriva*, Amiens. The *Veromandui*, Vermandois, had *Augusta Veromanduorum*, St. Quentin. The *Atrebates*, Artois, had *Nemetacum*, Arras.

The *Morini*, inhabited Picardy; their chief towns were, *Teruanna*, Terouenne; *Gesforiacum*, Boulogne sur Mer; and *Iccius Portus*, Gravelines, or Calais, or Mardike; supposed, however, by some to have been the same with Gesforiacum.—The *Nervii*, inhabited Hainault: their chief towns were, *Bagacum*, Bavay; *Valentinianæ*, Valenciennes; *Pons Scaldis*, Condé; *Camaracum*, Cambray.—The *Sunici*, inhabited Limburg and part of Juliers.—The *Ubii*, Cologne, and part of Juliers: their chief towns were, *Colonia Agrippina*, Cologne; *Ara Ubiorum*, *Bonna* or *Julia Bonna*, Bonne; and *Novesium*, Nuys.—The *Aduatici*, *Tungri*, *Germani*, *Esuones*, inhabited Namur, and part of Brabant: their chief towns were, *Atuatica*, Tongeren; *Fons Tungrorum*, Spa; and *Geminiacum*, Gemblours.

The *Menapii*, inhabited part of Flanders, Brabant, Cleves, and Juliers, including the *Gugerni* or *Sicambri*. *Castellum Menapiorum*, Kessel; *Asciburgum*, Asburg; *Colonia Trajani*.—The *Toxandri*, inhabited Zealand; and occupied *Helium Castellum*, the Brill; *Medioburgum* or *Mattiacum*, Middleburg; and *Batavi*, part of Holland and Gelderland; *Batavodurum*, Battenburg; *Lugdunum Batavorum*, Leyden; *Noviomagus*, Nimeguen; and *Arenacum*, Arnheim.

In this district were *Rhenus*, the Rhine, and its mouths; *Vahalis*, the Vahal; *Alveus Civilis*, the Lech; *Sala* or *Ifala*, the Issel; *Mæsa*, the Maese or Meuse.

Sylva Arduenna, the Forest of Ardenne, extended from the Rhine through the country of the *Treviri*, towards the *Rhemi* southwards, and *Nervii* northwards, about two hundred and fifty miles in length, and one hundred in breadth.

The Gallic side of the Rhine, having been occupied by various tribes of Germans, was called *Germania Cisrhenana*.—Neque enim conferendum esse Gallicum cum Germanorum agro, neque hanc consuetudinem victus cum illa comparandam. *Cæsar*.—It was divided into *Germania Prima* or *Superior*, and *Germania Secunda* or *Inferior*.

Germania Superior extended from Switzerland to the Moselle; and *Germania Inferior* from the Moselle to the mouths of the Rhine.

Gaul was, in the fourth century, divided into the five great provinces, *Lugdunensis*, *Belgica*, *Germania*, *Viennensis*, and *Aquitania*, which were again subdivided into other provinces. About the time of its first invasion by the Romans, it contained above a hundred independent states. Plutarch, and some others, increase the number of its tribes to three or four hundred. The name of *Gallia* is confined, by modern Latin writers, to France, as being the greater portion of ancient Gaul; *Belgium* to the Netherlands; *Belgium Regium*, the Austrian Netherlands; and *Belgium Fœderatum* or *Batavi*, the Seven United Provinces. After the irruption of the Franks, this country formed part of *Neustria*, or the New Kingdom. *Helvetia* became appropriated to Switzerland; the term *Helvetii* to the Swiss; and *Allobroges* to the people of Savoy.—See the article France, vol. vii. p. 647, &c.

GERMANIA ANTIQUA.—This country was called by the Romans *Germania Magna*, or *Barbara*. The natives called themselves *Theutisci*, *Theutoni*, *Theutones*, and were by others called *Germani*, *Celtæ*, *Alemanni*. It was bounded by the Rhine and German Ocean on the west; the Vistula, Sarmatia, and Carpathian Mountains, on the east; the Ocean, north; and the Danube and Alps south. The forest, called the *Hercynian* Forest, covered a great part of Germany; the *Silvæ*, *Bacena*, *Cesia*, *Gabreta*, *Luna*, and *Marciana*, were probably parts of it. It may be therefore considered as a common name for the *great woodland*. It was supposed to join the *Silva Arduenna*, in Gallia Belgica, on the one side, and the woods in *Sarmatia Europæa* on the other.

The rivers of ancient Germany were: *Rhenus*, the Rhine, which takes its rise in the country of the Grisons; *Nicer*, the Neckar; *Mænus*, the Maine; *Luppia*, the Lippe; *Sala*, the Sala; *Amisia*, the Ems; *Visurgis*,

the Weſer; *Albis*, the Elbe; *Suevus* or *Viadrus*, the Oder; *Viſtula*, the Viſtula; *Marus*, the Mariſch; *Cuſus*, the Waag; *Danubius* or *Iſter*, the Danube, which riſes at the foot of a mountain in Wirtemberg, formerly called *Abnoba*, the Baar.

The ſeveral tribes of the ancient Germans, are claſſed under the four following general diviſions:—The *Iſtævones*, who were ſubdivided into twelve tribes, chiefly between the Rhine and the Weſer. The *Hermiones*, divided alſo into twelve of the inland and ſouthern tribes. The *Vindeli*, into twenty-one northern tribes. The *Ingævones*, into three tribes, inhabiting Denmark, Norway, and Sweden.

The German nations were alſo divided according to the rivers between which they inhabited. 1. Between the Rhine and the Elbe. 2. Between the Elbe and the Viſtula. 3. Southern Germany, between the Rhine and the Danube. 4. Germany beyond Sea.—Between the Rhine and the Elbe, the chief nations were the *Friſii*, *Chauci*, *Bructeri*, *Angrivarii*, *Salii*, *Franci* or *Sicambri*:

Te cæde gaudentes Sicambri
Compoſitis venerantur armis. *Horace.*

the *Marſi*, *Uſipetes-Tenctheri*, and *Catti*. Alſo the *Ubii*, *Mattiaci*, and *Cheruſci*, who, under Arminius, defeated Varus at the head of three Roman legions.—Ingentes Albim liquere Cheruſci. *Claudian.*

Between the Elbe and the Viſtula were the *Angli Foſi*, or *Saxones*, in Holſtein and Mecklenburg; *Cimbri*, afterwards called *Jutæ*, inhabiting Jutland, to which they gave the name of *Cherſoneſus Cimbrica*; the *Varini*; and the *Suevi*, a name given in common to many of the inland German tribes between the Elbe and Viſtula, as the *Suevi Angli*, and *Suevi Semnones*; the *Burgundiones*, in part of Great Poland; *Longobardi*, in Brandenburg; *Gothones*, *Semovii*, and *Heruli*, in Pomerania.

Southern Germany contained the *Marcomanni*, near the Neckar; the *Boii*, in Bohemia, and afterwards in Bavaria; *Alemanni*, after whoſe name Germany is ſometimes called Allemagne; *Seduſii*, towards the Maine; *Harudes*, in Franconia; *Hermunduri*, in Miſnia; the *Nariſci* and *Quadri*, in Auſtria; and the *Gothini* and *Marſigni*, in Sileſia. The chief towns were: *Marobudum*, Prague; *Eburodunum*, Brin; *Eburum*, Olmutz; *Mattium*, Marpurg; *Lupia*, Lippe; *Chattorum Caſtellum*, Heſſe Caſſel; *Trophæa Druſi*, Tangermund; *Amiſia*, Embden; *Berama*, Bramen; *Statio*, Staden; *Marionis*, Hamburgh; *Marionis Altera*, Wiſmar; and *Treva*, Lubec.

Germany, beyond the *Oceanus Sarmaticus*, *Mare Suevicum*, or *Sinus Codanus*, the Baltic, was little known by the ancients. It comprehended what they ſuppoſed to be two large iſlands: 1. *Baltia*, *Scandia* or *Scandinavia*, Norway and Sweden. 2. *Finingia*, Finland; with ſeveral ſmaller iſlands; as, *Codanonia*, Zealand, &c. inhabited by the *Teutones*. Norway was inhabited by the *Suiones*, and Sweden by the *Sitones*, who are thought to have taken their name from *Sictuna*, their chief town. The *Hilleviones*, and other uncertain tribes, were alſo placed here.—Beſides *Helvetia*, and a great part of *Gallia Belgica*, there were other countries connected with the Germans; viz. *Vindelicia*, *Rhætia*, and *Noricum*.

VINDELICIA, the country between the Danube, from its ſource to the *Ænus*, the Inn, was inhabited by the *Brigantii*, in the Biſhopric of Conſtance, and part of Tyrol. The *Eſtiones*, and the *Licates*, inhabiting Walgow. The *Iſarci*, in Upper Bavaria; and the *Boii*, in Lower Bavaria. Their chief towns were: *Brigantium*, Brigentz; *Cumpodunum*, Kempen; *Damaſia* or *Auguſta Vindelicorum*, Augſburg; *Iſariſca*, Munich; *Batava*, Paſſau.

RHÆTIA, the country of the Griſons, Trent, Brixen, and Tyrol, was inhabited by the *Curia*, Coire; *Sarunetes*, the people and town of Sargans; *Brixentes*, the people and town of Brixen; *Tridentum*, Trent; *Feltria*, Feltri; *Terioli*, Tirol:

Videre Rhœti bella ſub Alpibus
Druſum gerentem et Vindelici. *Horace.*

Rhætia and *Vindelicia*, under the emperors, formed but one province; the former was called *Rhætia Prima* or *Propria*, the latter *Rhætia Secunda*.

The lakes in this country were, *Lacus Brigantinus*, the Lake of Conſtance; *Lacus Verbanus*, Laco Maggiore; *Lacus Larius*, Laco di Como. The rivers, beſides the Rhine and the Danube, were *Ticinus*, now the Teſin; *Addia*, the Adda; *Atheſis*, the Adige; *Vindo*, the Wertach; *Licus*, the Leck.

NORICUM, extended from the confluence of *Oenus*, the Inn, with the Danube, to *Cetius Mons*, Mount Kalenberg, near *Vindebona*, Vienna; and as far inland as the ridges of the Alps, including the higher part of the Drave. It was divided into *Noricum Ripenſe* on the Danube, at preſent part of Auſtria and Saltzburg; and *Noricum Mediterraneum*, towards the Alps; now Carniola, Stiria, and Carinthia. The chief towns were: *Boioduram*, Innſtat; *Lauriacum*, Larch; *Lentia*, Lintz; *Jovanum*, Saltzburg; *Celeia*, Cillei; *Emona*, Laubach.

SARMATIA, *ſeu* SCYTHIA EUROPÆA.—This country lies to the eaſt of Germany, being bounded by the Viſtula, Euxine, Don or Tanais, and the then unknown regions of the North. The Tanais ſeparated it from *Sarmatia Aſiatica*. The principal rivers were *Viſtula*, the Viſtula, which diſcharges itſelf into *Sinus Venedicus*, the Gulf of Dantzic; *Rubo*, the Lower Dwina, which diſcharges itſelf into *Sinus Clilipenus*, the Gulf of Livonia; *Tyra*, the Nieſter; *Hypanis*, the Bog; *Boriſthenes*, the Nieper or Boriſthenes; *Tanais*, the Don or Tanais; *Rha*, the Wolga.

The principal tribes were—The *Venedi*, and *Eſtiæi* or *Oſtiones*, who inhabited Pruſſia, Livonia, the North of Poland, and the *Inſulæ Electrides*, famous for the amber gathered on them. The *Peucinæ*, *Baſtarnæ*, and *Tyragetæ*, occupied the South of Poland, and the country as far as the mouth of the Danube. Their chief towns were: *Carrodunum*, Cracow; *Clepidava*, Caminiec.

The *Roxolani*, inhabited Muſcovy and Little Tartary. They were divided into the two nations of the *Hamaxobi* and *Georgi*. The *Hamaxobi* comprehended the *Eſſedones*, *Tanaitæ*, *Baſilydæ*, *Jazyges*, and *Mæotidæ*. To the north of theſe lay the *Rhyphæi*, *Agathyrſi*, *Arymaſpi*, *Hyperboræi*.—The *Georgi* conſiſted of the *Tauri* and *Boſphorani*, who inhabited *Taurica Cherſoneſus*, Crim Tartary, which had been poſſeſſed by the *Cimmerii*. It was bounded to the weſt by *Sinus Carcinites*, the Gulf of Nigropoli; to the eaſt by *Palus Mæotis*, the Sea of Caffa or Zabache; and the *Boſphorus Cymmerius*, the Strait of Caffa, which joined the Palus to the Euxine:

Βοσπορος, ὲ μονον ο Σκυθικος, αλλα και
Θρακιος ὡτως ἐκαλειτο. *Heſychius.*

—Their chief towns were: *Taphræ*, Perecop; *Cherſoneſus*, Cherſon; *Theodoſia*, Caffa; *Boſphorus* or *Panticapæum*, where Mithridates the Great died, now Kirche; *Cymmerium*, Bachiſerai.

DACIA.—This diſtrict, in its more extenſive uſe, was divided into three parts: 1. *Dacia Vera*. 2. *Jazyges Metanoſtæ*. And, 3. *Mœſia*.—*Dacia Vera*, extended from the Danube to *Montes Carpates*, Mount Crapach, between the rivers *Patiſcus* or *Tibiſcus*, the Theyſſe, on one ſide; and *Tyras*, the Dnieſter, on the other. It was divided into *Dacia Ripenſis*, *Dacia Mediterranea* or *Vera Gepidia*, and *Dacia Alpeſtris*. The inhabitants towards the Euxine were called *Getæ*, and thoſe towards Germany, *Daci*. Their chief towns were: *Tibiſcus* or *Zarobara*, Temeſwar; *Sarmizegethuſa* or *Ulpia Trajana*, Varhel or Gradiſki, the ſeat of Decebalus, who was defeated by Trajan; *Apulum* or *Alba-Julia*, Weiſſenburg; *Sandrova*, *Petrodava*, *Netindava*, *Prætoria Auguſta*, *Cokajon Mons*, the reſidence

of

of royal prieſts, who ſucceeded Zamolxis; *Jaſorum Municipium*, or Jaſſi.

Fugit in Rhodopen atque in deſerta Getarum,
Et lac concretum cum ſanguine potat equino. *Virgil.*

The *Jazyges Metanaſtæ*, reſided between *Dacia Vera* and the Danube. They were bounded to the North by *Montes Carpates* or *Alpes Baſtarnicæ*, the Carpathian Mountains. Their chief towns were: *Viſcenum*, Bars; *Tranſacincum* or *Contra-Acincum*, Peſth; *Singidunum*, Seged.—*Dacia Vera*, and the country of the *Jazyges Metanaſtæ*, anſwer to Upper Hungary, Tranſilvania, Walachia, and Moldavia.

Mœſia or *Myſia*, ſometimes called *Dacia Aureliana*, was the country which lay between the northern boundary of Thrace and Macedon, and the Danube. *Illyricum* and *Pannonia* lay to the weſt of it; and the Euxine to the eaſt. It was divided by *Ciabrus*, the river Zebritz, into *Mœſia Superior*, Servia, and *Mœſia Inferior*, called alſo *Scythia Minor*, Bulgaria. The inland part of it was called *Dardania*. The inhabitants were the *Mœſi*, *Dardani*, *Scordiſci*, *Triballi*, *Scythæ*, and *Peucini*, towards the mouths of the Danube. Among the laſt of theſe was *Tomi*, the place of Ovid's baniſhment:

Tum mihi cara Tomis; patriæ quæ ſede fugatis
Tempus ad hoc nobis hoſpita fida fuit. *Ovid.*

The places of moſt note were: *Singidunum*, Zenderin; *Aureus Mons*, Spenderow; *Pons Trajani*, Trajan's Bridge, conſiſting of twenty arches, over the Danube, intended to unite the provinces of *Dacia* and *Mœſia*; it was deſtroyed by his ſucceſſor Adrian; *Bononia*, Bidin; *Nicopolis*, Nicopoli; *Duroſtorus*, Driſtra; *Iſtropolis*, Kara-Kirman. In the inland country were *Naiſſus*, Niſſa; *Sardica*, Sophia, the reſidence of the Beglerbeg, or governor of Romili; *Ulpianum*, or Juſtindil.

In *Scythia Minor*, the country towards the mouth of the Danube, beſides *Tomi*, now Baba or Temeſwar, already mentioned, were *Calatis*, now Colia; *Odeſſus*, now Varna; and the point of land called *Dromus Achillei*:

Ιτρος ες αντολιην τετραμμενος αγχι θαλασσης
Ευξεινε, τοθε πασαν ερευγεται υδατος αχνην,
Πενταπορoις προχοησιν ελισσομενος περι Πευκην. *Dionyſ. Per.*

The rivers on the Dacian ſide of the Danube or *Iſter*, were: *Mariſus* or *Rhabo*, the Maros; *Tibiſcus*, the Theyſs; *Aleuta*, the Aluth; *Hieraſus* or *Poretus*, the Pruth; *Tyras*, the Dnieſter. On the Mœſian ſide were, *Drinus*, the Drinazzo, which bounded Mœſia to the Weſt; *Margis*, the Marawa; *Timacus*, the Timok; *Ciabrus*, the Zebritz; *Oëſcus*, the Eſker.

ILLYRICUM, ILLYRIS, or ILLYRIA.—This country, according to ancient authors, was variouſly bounded. It extended from *Arſia*, a river of *Iſtria*, to *Epirus*; and its general limits to the north were, *Noricum*, the Danube, and *Mœſia*. It comprehended great part of Auſtria, Hungary, Croatia, and Sclavonia. That part of it which lay to the north of *Liſſus*, was called *Illyricum Barbarum*; to the ſouth of it, as far as *Epirus*, along the Adriatic, was *Illyricum Græcum*.—Macedonibus aſſidua certamina cum Thracibus et Illyriis fuere. *Juſtin.*—It was divided into *Pannonia*, *Liburnia*, and *Dalmatia*.

PANNONIA, was bounded by *Noricum*, the Danube, *Mœſia*, and *Dalmatia*. It comprehended part of Auſtria, Hungary, &c. and was divided by *Arrabo*, the Raab, into *Superior* and *Inferior*. The rivers Drave and Save run through both diviſions. The country between theſe rivers was called *Interamna*. The chief towns in *Pannonia Superior*, were: *Vindebona*, Vienna; *Flexum*, Preſburg; *Sabarium*, Sarwar, Ovid's burying-place; *Viſontium*, Waradin.—In *Pannonia Inferior*, were: *Arrabona*, Rab; *Aquincum*, Buda or Offen; *Taurunum*, Belgrade, by others Semlin; *Acumincum*, Salamkemin; *Sermium*, Sermium.

LIBURNIA contained the *Japydes*, and *Liburni*. The *Japydes* inhabited part of Croatia and Iſtria.—Regna Liburnorum et fontem ſuperare Timavi. *Virgil.*

The chief towns of the *Japydes* were: *Flanona*, Fianona; *Tarſatica*, Terſatz; *Senia*, Segna; *Metulum*, Metuc Vetus.—The principal river: *Colapis*, the Kulp, one of the boundaries of the Alps.

The *Liburni* extended from the *Japydes* to the river *Titius*, now *Kerka*. Their country comprehended the weſt part of Dalmatia, with many ſmall iſlands. Their chief towns were: *Enona*, Nona; *Jadera*, Zara; *Scardona*, Scardo.

DALMATIA, was chiefly inhabited by the *Autariatæ*, *Vardæi*, and *Scordiſci*, whoſe chief towns were: *Salona*, Spalatro, the retreat of Dioclesian; *Tragurium*, Trau; *Narona*, Narenta; *Epidaurus*, Old Raguſa; *Liſſus*, Aleſſo; *Scodra*, Scutari; *Dalmium*, *Dalminium*, Delminio, which gave name to the nation.

Iſlands in the *Sinus Flanaticus*, the Gulf of Carnero, were: *Inſulæ Abſyrtides*, *Crepſa*, Cherſo; *Apſorus*, Oſero; *Arba*, Arbe; *Curieta*, Veglio; *Ciſſa*, Pago; *Scardona*, Iſola Longa; *Iſſa*, Liſſa; *Pharus*, Leſina; *Brattia*, Brazza; *Corcyra Nigra*, Curzola; *Melita*, Melida, by ſome thought to be the iſland on which St. Paul was ſhipwrecked.

Rivers: *Dravus*, the Drave; *Murus*, the Muer; *Saus* or *Savus*, the Save; *Colapis*, the Kulp; *Drinus*, the Unna.

Mountains: *Mons Cetius*, Calenberg; *Ocra*, *Bebius*, *Albius*, *Scardus*, now Monte Argentaro, ranges of mountains running from the Alps towards Macedonia.

Lakes in *Pannonia*, were: *Lacus Felix*, called alſo *Peiſo* or *Pelſo*, New Sedler Sea, near which was the country called *Deſerta Boiorum*; *Volciæ Paludes*, Balaton or Platen Sea; *Hiulca*, a marſh drained under the emperors: in *Japydia* was *Lugeus Lacus*, now the Lake of Zernitz, in which there is a ſingular ebb and flow.

Concerning the diſputed geography of Illyricum, Mannert ſtates as follows:—"The Illyrians are probably of the ſame ſtem with the Thracians; at leaſt, the elder writers, who had viſited the country or converſed with natives of it, confound them together: whereas the Kelts are always contradiſtinguiſhed from them, even when reſident among them. Of all the European nations, the Illyrians and Thracians only had the practice of tattooing their bodies. Their original language is probably preſerved in the Epirotic dialect of the preſent times: but in Illyria itſelf, the Slavonian tribes have wholly extinguiſhed every other tongue. The eaſtern continuation of the Alps compriſed the ancient dwellings of the Illyrian nations. From the Julian Alps, the high land ſpreads uninterrupted between the Save and the Adriatic to the Hæmus and to Macedon. Of this mountainous diſtrict, the Illyrians occupied the ſouthern declivity, together with the ſea-coaſt, from about Aquileia to the modern Epirus. On theſe very mountains, down the ſouthern declivity towards the Save, were the oldeſt ſeats of the Pæonians, as the Greeks ſtyled them: of the Pannonians, as the Latins called them. They extended from Ukrain to Macedonia. Thus Strabo ſpecifies their ſtation, and he flouriſhed while Auguſtus and Tiberius were in conflict with them; his account is confirmed by Velleius Paterculus, and Appian, from the commentaries of Auguſtus.

"Strabo does not in any thing diſtinguiſh the Pæonians from the other Illyrians. Herodotus, who knew them experimentally, does not indeed expreſsly reckon them as a branch of the Thracian ſtem, becauſe he ſays that the quantity of ſingle tribes is too great to be enumerated: but he knows only of Thracians on the ſouth-ſide of the Danube; he deſcribes them as covering many diſtricts, and places among them the Pæonians by the Strymon and the Drino, without diſtinguiſhing them from Thracians; and, as he deduces the Pæonians from the Teucri of Aſia, he farther corroborates the opinion

of their being of Thracian race, whofe Afiatic origin is certain. If the Thracians be one race with the Pæonians and Illyrians, the Kelts muft not be derived from the Thracians; for the Romans conftantly diferiminate between the language and warfare of Kelts and Illyrians. Thucydides alfo notices the Pæonians in this fite.

"Perhaps, in elder periods, they had extended their feats farther north into the Danube, and were compreffed in the fouthern mountains by the Kelts; who overflowed at one period the whole fouth of Hungary. Certain it is that the Romans found towns of the Pannonians only about the Save: but, when the Kelts were repulfed, and the plains emptied, the Pannonians began to migrate from their mountains into the champaign, and to extend their habitations to the Danube. At this period, probably under Claudius, Pannonia obtained its conftitution and boundary as a Roman province; although fortreffes had long before been raifed along the river. The original diftrict of the Pannonians materially differs, it fhould be remembered, from the Roman province of Pannonia.

"Dion Caffius, himfelf a governor of Upper Pannonia, blames the Greeks for confounding the Pæonians near Macedon with the Pannonians near the Danube: but, as he fupports his opinions on flight grounds, and would derive the name Pannonia from *pannis*, (the material of their large fleeves,) it feems more rational to reject his notion, truffing rather to Strabo, Velleius, and Appian, who place the Pæonians and Pannonians all along thefe mountains. His error is natural enough to one who firft knew the Pannonians in modern Hungary, in a tutored agricultural ftate, and had only heard of the rude Pæonians of Macedon; between which nations, much of Illyria and Mœfia feemed to interpofe."

GRÆCIA ANTIQUA.—This celebrated country was called *Græcia*, and *Hellas*; the people *Danai*, *Pelafgi*, *Argivi*, *Achivi*, *Græci*, and *Iones*. The general boundaries of it were, *Illyricum* and *Mœfia*, to the north; the Ionian Sea to the weft; the Cretan, fouth; and the Ægean, eaft.—Η απασα Ελλας χερρονησος οριζεται. *Strabo.*—It conffted of *Regnum Macedonicum*, the kingdom of Macedon, and *Græcia Vera*, Greece Proper. The kingdom of Macedon conffted, in Philip's time, of Macedon, Theffaly, Epirus, and Thrace.

MACEDONIA,—more anciently called *Pæonia*, and *Æmonia*, was bounded by *Illyricum*, *Thrace*, *Dardania*, and *Theffaly*. It was divided into four parts: 1. *Edonis*, the chief towns of which were *Crenides* or *Philippi*, famous for its plains, *Philippici Campi*; *Amphipolis* or *Novem Viæ*, Jamboli. The chief river of this part was the *Strymon*, which anciently divided Macedonia from Thrace. It runs into *Sinus Strymonicus*, the Gulf of Conteffa.

The principal countries of the Second Diviffon were, *Migdonia* and *Pæonia*, fometimes called *Pelagonia*. The chief towns were: *Therma* or *Theffalonica*, Salonichi; *Stobi*, Starachino; *Apollonia*, Polini; *Stagira*, Stauros, the birthplace of Ariftotle; *Chalcis*, *Potidæa*, the caufe, or the pretence, of the Peloponnefian war; *Olynthus*, one copious fubject for Demofthenes's Orations againft Philip, &c. The principal rivers were: *Axius*, the Vardari, and *Echedorus*, which run into the *Sinus Thermaicus*; *Chabrius*, which runs into *Sinus Singiticus*.—In this diviffon was *Athos Mons*, Mount Athos; the peninfula which joins it to the main land was cut through by Xerxes. It is now called Monte Santo, from the number of monafteries on it.

The principal countries of the Third Diviffon were, *Emathia* or *Macedonia Propria*, and *Pieria*. The chief towns were: *Pella*, the birth-place of Philip and Alexander, and capital of the kingdom; *Ægæ* or *Edeffa*, Vadena, the burying-place of the kings of Macedon; *Pydna* or *Citron*, *Methone*, *Coronæa*, *Beræa*, *Dium*, *Deborus*.—The rivers, *Erigonus*, the Veftrizza, running into the Axius; *Aliacmon*, the Pelacas, running into the *Sinus Thermaicus*.—The mountains, *Cambunii Montes*, *Olympus*, fabled to have been Heaven, on account of its height; *Pieris*, the haunt of the Mufes, between Macedon and Theffaly.

The Fourth Diviffon, now called *Albania*, was chiefly inhabited by the *Parthini*, *Albani*, and *Taulantii*.—Their chief towns were: *Albanopolis*, Albafano; *Epidamnus*, afterwards more auffpiciouffy called *Dyrrachium*, now Durazzo, the correfponding port to *Brundufium*; *Aulon*, Velona; *Elyma*, Canini.—The rivers: Two rivers of the name of *Drilo* or *Drinus*, Drino; *Naro*, Narenta; *Genufus*, Arzenza; *Apfus* or *Thapfus*, Spirnazo; *Aous* or *Alorus*, Polina; *Celidnus*, Salnich.

Gulfs of Macedon.—*Sinus Strimonicus*, Gulf of Conteffa, to the north, and *Sinus Singiticus*, Gulf of Monte Santo, to the fouth, of Mount Athos; *Toronaicus Sinus*, Gulf of Caffandria, to the north, and *Thermaicus Sinus*, Gulf of Salonichi, to the fouth, of the Peninfula of *Pallene* or *Phlegra*, famous for the fables of the Gigantomachia.—Ωκεν δ'αυτην οι μυθευομενοι γιγαντες, εθνος ασεβες και ανομον, ες Ηρακλης διεφθειρεν. *Strabo.*

Iflands.—*Scyros*, Skyro, for fome time the abode of Achilles, and the feat of Thefeus's exile; *Aloneffus*, Pélagnafi; *Peparethos*, Piperi; *Lemnos*, facred to Vulcan, Stalimene.—Hoc Pater Æoliis properat dum Lemnius oris. *Virgil.*

THESSALY, was bounded by the *Sinus Thermaicus*, and the mountains *Olympus*, *Stympha*, and *Oeta*. The Peneus runs through it from weft to eaft. On its banks lay the Vale of Tempé. The principal rivers it receives are, *Apidanus*, the Epideno; and *Enipeus*, Salampria.

Theffaly was divided into various countries: *Magnefia*, *Phthiotis*, *Pelafgiotis*, *Theffaliotis*, *Perrhæbia*, and *Dolopia*. The chief towns were: *Magnefia*, *Gomphi*, *Tricca*, *Joannina*, *Menelais*, *Pharfalus*, on the plains of which Cæfar defeated Pompey, now Pharfa; *Demetrias*, *Thebæ Phthioticæ*, *Iolcos*, *Aphetæ*, *Pagafæ*, from which the Argo failed:

Namque ferunt olim Pagafæ navalibus Argo
Egreffam longe Phafidos iffe viam. *Propert.*

Several of thefe cities ftood on *Sinus Pagafæus* vel *Pelafgicus*, the Gulf of Volo; *Lariffa*, the chief town of *Phthiotis*, the country of Achilles and the Myrmidons; *Thaumaci*, *Trachys*, *Lamia*: not far from this laft place runs the river *Sperchius*, now Agriomela, which difcharges itfelf into *Sinus Maliachus*, the Gulf of Zeiton. A little to the fouth are the Straits of *Thermopylæ*.

EPIRUS, was chiefly bounded by *Acroceraunii Montes*, to the north, and *Pindus*, to the fouth. The principal diviffons of it were, *Chaonia*, *Thefprotia*, *Moloffis*, and *Acarnania*. The chief towns: *Oricum*, to the north of Acroceraunia, Valona or Orcha; *Chimæra*, Chimæra; *Dodona*, famous for its prophetic oaks and cauldron.—Ore Jovis Dodona fonet. *Lucan.*—*Panormus*, Palormi; *Buthrotum*, Butrinto; *Argos Amphilochium*, Filoquia; *Ambracia*, l'Arta; *Leucas*, *Actium*, famous for the defeat of Anthony, Figalo. It has a bay, called *Ambracius Sinus*, Golfo de l'Arta.

Rivers.—*Acheron*, flowing from the Lake Acheruffa, and joined by *Cocytus*, infernal ftreams in mythology; perhaps common names for fetid peftilential ftreams, being applied to fome fuch in Italy and elfewhere. *Achelous*, Afpropotamo, which divides Acarnania from Ætolia.

Mountains.—*Cerauni* or *Acroceraunii*, Monti della Chimæra; *Pindus*, Monte Mezzovo. This range of mountains runs between Epirus, Theffaly, Macedonia, and Greece Proper. It has different names in different countries; as *Tymphe* or *Stymphe*, *Pelion*, *Othrys*, *Oeta*, &c.

THRACE, now ROMANIA, (though this name is applied by the Turks to all Greece,) was bounded, at firft, by the *Strymon*, afterwards by the *Neffus*, on the fide of Macedon; nay by fome it is thought at an early period to have included all the country to the north of the Ifthmus of Corinth; and on the other fides by the Ægean Sea, Propontis, Euxine, and Mount *Hæmus*, which feparates

GRÆCIÆ ANTIQUÆ.

Published Mar.ch 1807, by J. Wilks.

rates it from *Mæsia*. A branch of Mount Rhodope runs through it from west to east.

The country between the *Strymon* and *Nessus* was called *Macedonia Adjecta*. It was divided into Thrace between *Hæmus* and *Rhodope*; Thrace between Rhodope and the Sea; and the Thracian Chersonesus. The river *Hebrus* also, by its course, divides Thrace into north and south.

The chief provinces were: *Mædica* or *Græcia Macedonica*, *Drosica*, *Astica Cœnica*, *Selletica*, *Bessica*. The principal tribes: The *Bessi*, *Denseletæ*, *Medi*, *Edones*, *Odrysæ*, *Bistones*, *Cicones*, *Odomantes*, *Agriani*. Their chief towns between Rhodope and Hæmus, were: *Ulpia Plautalia*; *Bessapara*; *Trimontium* or *Philippopolis*; *Uscudama*, Statimaka; *Oresties* or *Hadrianopolis*, Adrianople or Hedrina; *Carpudemum*; *Zela* or *Flaviopolis*; *Deultum*, Develto; *Anchialus*, Akkiali; *Bizio*, Vise; *Beræa*, Eski-zadra; *Halmydessus*, Apollonia; *Mesembria*, Misevria; *Hæmi Extrema*, Hemenburn.

Between Rhodope and the Sea were: *Philea* or *Phrygea*, *Phinopolis*, Fenopoli; *Byzantium*, Constantinople; *Melantias*, from which a wall, *Macronteichos*, was built across the country to *Derkon*, on the Euxine; *Selymbria*, Seliurea; *Perinthus* or *Heraclea*; *Ganos*, *Bisanthe* or *Rhædestos*; Rhodosto; *Aphrodisias*, *Apros*, Aprio; *Dyme*, *Trajanopolis*, *Syracella*, *Cypsela*, *Aenos*, *Doriscum*, *Maronea*, Marogna; *Abdera*, the birth-place of Democritus, now Asperosa; *Nicopolis*, *Jamphorina*.

Of the Thracian Chersonesus, or Peninsula of Romania, the chief towns were, *Cardia*, afterwards *Hexamilium*; *Macronteichos*, which took its name from a wall built across the Isthmus; *Callipolis*, Gallipoli; *Aegos*, *Madytes*, Maitos; *Sestus* or *Posidonium*, the Castle of the Dardanelles, on the side of Europe; *Calus Portus*, *Elæus*, Critea; *Alopeconesus*, *Panormus*, Panormo; *Agora*, Malagra.

Mountains.—*Hæmus*, of which the southern branch was *Rhodope*, Monte Argentaro; *Pangæus Mons*, Monte di Malaca, or the Castagnats:

Vides Pangæa nivosis
Cana jugis, latosque Hæmi sub rupe Philippos. *Lucan.*

Islands.—*Thasus*, Tasso, famous for its marble; *Samothrace*, noted for the mysteries of the *Cabiri*, now Samandraki; *Imbros*, Imbro; *Proconnesus*, Marmora; *Cyanæa Insulæ*, called also *Symplegades* and *Sundromades*.

Rivers.—*Nessus*, Nesto; *Hebrus*, Mariza; *Melas*, Crionera, which flows into the *Sinus Melanes*; *Ægos Potames*, in the Chersonese, at the mouth of which Lysander destroyed the Athenian fleet; *Anzus Athyrus*, Aqua dolce; *Bathynias*, *Panysus*, the Nizo.

Seas, Gulfs, &c.—*Pontus*, the Euxine or Black Sea; *Bosphorus Thracius*, the Straits of Constantinople; *Propontis*, so called from its situation with respect to *Pontus*, the Sea of Marmora; *Sinus Heracleoticus*; *Hellespontus*, the Hellespont or Dardanelles; *Sinus Melanes*, on the south side of the Chersonese, so called from the river *Melas*, the Gulf of Eno.

Græcia Vera or Libera; or *Greece*, properly so called.—This country was variously called by the ancients, *Græcia*, *Hellas*, *Achaia*, *Doris*; and the people *Pelasgi*, *Danai*, *Argivi*, *Achivi*, *Græci*, *Iones*, *Dolopes*, *Myrmidones*. It was bounded, on the side of Thessaly, by the mountains *Othrys* and *Oeta*; on the side of Epirus, by the river *Acheloüs*; on the east by the Ægean, and on the west by the Ionian, Sea, or southern part of the Adriatic Gulf, forming what is now the southern part of Turkey in Europe: and it was divided into three parts; *Achaia*, *Peloponnesus*, and the *Islands*; though the Romans gave the name of *Achaia* to the whole.

Achaia, or Hellas, is the name commonly given to that part of Greece which lay to the north of the Isthmus: it was, however, borrowed from a people who lived in the Peloponnesus. It is now Livadia; and is divided into six parts.

1. *Ætolia*, now called Vlakia, from a colony of Wallachians settled there by the Greek emperors. It borders on Acarnania and Thessaly. The chief towns were: *Thermus*, *Erythræ*, *Chalcis*, *Calidon*, *Olenus*, *Pleuron*, *Oenias*, Dragomisto; *Naupactus*, Lepanto.

Οἱ Πλευρῶν ἐνέμοντο, καὶ Ὠλενον, ἠδὲ Πυλήνην,
Χαλκίδα τ' ἀγχίαλον, Καλυδῶνά τε πετρήεσσαν. *Homer.*

Rivers.—*Evenus*, Fidari; *Asius* or *Thestius*, *Acheloüs*, Aspri.—Poculaque inventis Acheloia miscuit uvis. *Virgil.*

2. *Locris*, inhabited by the *Locri Ozolæ*, so called from the bad smell said to have been emitted by the arrows of Hercules, which had been dipped in the blood of the Hydra, and buried there by Philoctetes. The *Locri Epicnemidii*, so called from Mount *Cnemis*, were separated by Mount Parnassus from the *Ozolæ*; and the *Locri Opuntii* took their name from the city Opus. The chief towns were: *Antirrhium*, the Castle of Romelia, opposite to Rhium, in the Peloponnesus, called the Dardanelles of Lepanto; *Opus Talandi*, *Scarphia*, *Thronium*, *Amphissa*.—In the country of the *Epicnemidii* were the Straits of *Thermopylæ*, between Mount *Oeta* and the *Sinus Maliacus*, famous for the stand made by Leonidas against the army of Xerxes; now called Bocca di Lupo.

3. *Doris*, or *Dorica*, was called *Tetrapolis*, from its four principal cities, *Erineus*, *Citineum*, *Bœa*, *Lilæa* or *Sperchium*.

4. *Phocis*, now Livadia, contained *Delphi* or *Pytho*, Castri, famous for the oracle of Apollo, at the foot of Mount Parnassus; near it was the *Fons Castalius*. It was called *Umbilicus Terræ*, as it was reckoned the centre of Greece, and of the world. *Elatia*, *Crissa*, which gave name to the *Sinus Crissæus*, the Gulf of Salona; *Cirrha-Anticyra*, famous for hellebore, Aspro-Spitia. The three last cities were destroyed in the sacred war.—Tribus Anticyris caput insanabile. *Horace.*

5. *Bœotia*, was bounded by *Phocis*, *Locris*, *Attica*, the *Euripus*, and extended as far as the Gulf of Corinth. It was called Τριθάλαττος, from its convenient situation on three seas. The chief towns were: *Thebæ*, Stives, destroyed by Alexander, who spared only the house of Pindar; its citadel, *Cadmea*, was so called from Cadmus, the founder of Thebes; *Lebadea*, Livadia, famous for the oracle of Trophonius, whence the name given to the country; *Cheronæa*, famous for several battles, especially for the defeat of the Greeks by Philip, which put an end to the liberties of Greece, and for being the birth-place of Plutarch; *Orchomenus*, near which was *Acidalus*, a fountain in which the Graces used to bathe; *Coronæa*, where Agesilaus defeated the Athenians and Thebans; *Haliartus*; *Thespiæ*, sacred to the Muses, who were sometimes called *Thespiades*; *Creusa*, the Port of Thebes, on the Corinthian Gulf; *Ascra*, the birth-place of Hesiod; *Leuctra*, where Epaminondas defeated the Lacedæmonians; *Platæa*, famous for the defeat of the Persians under Mardonius by Pausanias; *Larymna*, *Tanagra*, *Delium*, *Aulis*, a sea-port on the *Euripus*, the Straits of Eubœa, or the Negropont, from which the Greeks embarked for Troy:

Non ego cum Danais Trojanam exscindere gentem
Aulide juravi, classemque ad Pergama misi. *Virgil.*

Mountains.—*Cithæron*, famous for the orgies or rites of Bacchus, now Citherone, or Monte di Stiva; *Helicon*, and *Pimpla*, mountains sacred to the Muses, hence called *Heliconiades*, and *Pimpleides*.

Rivers.—*Cephissus*, the river Cephisso, which in its course forms *Copais Lacus*, the Lake of Stiva, and receives *Cuarias* or *Coralias*, the Corali; *Ismenus*, the Ismeno; *Asopus*, the Asopo.—The Fountains were: *Dirce*, *Aganippe*, *Hippocrene*, *Arethusa*, the haunts of the Muses:

Dicite quæ fontes Aganippidos Hippocrenes,
Grata Medusæi signa tenetis equi. *Ovid.*

6. *Attis*, or *Attica*, so called from its maritime situation, (Actè signifying shore.) It included *Megaris*, and extended to the Isthmus. The chief towns were: *Athens*, the seat of all the fine arts, now Atheni, or Setines. It was, by way of pre-eminence, called *Astu*, the City; and it had three ports, *Piræus*, *Munichia*, and *Phalerus*; *Eleusis*, famous for the temple and mysteries of Ceres

Lepſina; *Megara*, *Ægoſthena*, *Pagæ*, *Niſæa*, *Rhamnus*, *Marathon*, famous for the victory of the Athenians over the Perſians; *Oropus*, *Phyle*, *Decelea*, *Panormus*, *Sunium*, of the ſame name with the promontory which bounded *Attica* to the ſouth-eaſt, and which, from the ruins of a temple of *Minerva*, is now called *Capo di Colonni*.

Mountains.—The moſt remarkable are, *Hymettus*, famous for its honey; and *Pentelicus*, for its marble.—Its rivers: *Eridanus*, *Iliſſus*, and *Cephiſſus*.

Peloponnesus.—This country took its name from Pelops, ſon of Tantalus. From its ſuppoſed reſemblance to a mulberry-leaf, it is now called the Morea. The Iſthmus of Corinth, now called Hexa-mili, joins it to the main-land. The gulfs or bays which belong to it are: *Sinus Corinthiacus*, the Gulf of Lepanto; *Sinus Saronicus* or *Eleuſinius*, the Gulf of Engia; *Argolicus Sinus*, the Gulf of Napoli; *Laconicus Sinus*, the Gulf of Colocynthia; *Sinus Meſſeniacus*, or *Aſinæus*, the Gulf of Coron; *Cypariſſius Sinus*, the Gulf of Arcadi; *Mare Myrtoum*, the Sea between the Morea, Crete, and the Cyclades, ſometimes called the Sea of Mandria.

It was divided into ſix countries; *Achaia Propria*, *Argia* or *Argolis*, *Laconia*, *Meſſenia*, *Elis*, which occupied the circumference of the peninſula, and *Arcadia*, the more inland part.—1. *Achaia Propria* lay along the *Sinus Corinthiacus*, and included the Diſtricts of *Sicyon* and *Corinth*. Its chief towns were: *Corinthus*, Coranto; its citadel *Acrocorinthus* ſtood on an adjoining mountain; *Iſthmus*, famous for the celebration of the Iſthmian games in honour of Neptune; *Cenchreæ*, the port of Corinth, on the *Sinus Saronicus*, and *Lechæum*, its port on the *Sinus Corinthiacus*; *Sicyon*, which gave its name to the moſt ancient kingdom of Greece, Baſilica; *Phlius*, *Pellene*, *Ægira*, *Ægæ*, *Ægium*, where the ſtates of Achaia were held; *Patræ*, Patras; *Pharæ*, *Olenus*.—*Drepanum* or *Rhium Promontorium*, Cape Rio; and *Araxum Promontorium*, Cape Clarence.—Rivers: *Aſopus*, the Arbon; *Nemea*, the Angia.

2. *Argia* or *Argolis*.—Its chief towns were: *Argos*, Argo, to which *Nauplia*, Napoli di Romania, was the ſea-port; *Mycenæ*, the city of Agamemnon; *Epidaurus*, Pidavra, famous for a temple of Eſculapius; *Nemea*, Triſtena, near which the Nemean games were celebrated; *Tiryns*, which gave a name to Hercules, now Vathra; *Ægina*, Engia, which has given its name to the Gulf of Engia; *Troezen*, Damala.—*Spiræum Promontorium*, Cape Spireo; *Scyllæum Prom.* Cape Skilleo.—Rivers: *Inachus*, the Planiza; *Eraſinus*, Eraſino.—Lake: *Lerna*, Petrina, which gave name to the Hydra killed by Hercules.—Lernæus turba capitum circumſtetit anguis. *Virgil.*

3. *Laconia*: the inhabitants *Lacedæmonii*, *Lacones*, *Spartani*.—The chief towns were: *Sparta* or *Lacedæmon*, Miſtra, which ſtood on the River *Eurotas*, near Mount *Taygetus*; *Amyclæ*, Vordonia; *Zarex*, Care; *Epidaurus-Limera*, Malvaſia Vecchia; *Hælos* or *Gythium*, the inhabitants of which, *Helotæ*, were reduced by the Spartans to abject ſlavery, now Palæopoli, the port of Sparta; *Tænarus*, a cavern near which was one of the fabled entrances into hell, now Caibares:

Quo Styx et inviſi horrida Tænari
Sedes. *Horace.*

—River: *Eurotas*, Baſilipotamo.—Promontories: *Cynoſura*, Cape Sidro; *Malea Promontorium*, Cape Malea, to the North; *Tænarium Prom.* Cape Matapan, bounding the Laconic Gulf, and the moſt ſouthern point of Europe.—Mountains: *Taygetus Mons*, famous for hunting and Bacchanalian revels, the Mountains of the Mainots; *Chronius* or *Cturius*, Mount Grenenos.

4. *Meſſenia*: the chief towns in which were: *Meſſene*, famous for its wars with the Lacedæmonians, Moſſeniga; *Ithome*, a ſtrong fortreſs near to it; *Corone*, Coron; *Pylus*, the city of Neſtor, Novarin; *Methone*, Modon; *Cypariſſus*, Arcadia; and *Pheræ*, Cheramidi:

Rex Pylius, magno ſi quidquam credis Homero,
Exemplum vitæ fuit a cornice ſecundæ. *Juvenal.*

—Rivers: *Pamiſus* or *Arcadius*, the Pirnaza; *Neda*, the Longarola.—Promontories: *Acritas Promontorium*, Cape Gallo; *Coryphaſium Prom.* Cape Zunchi.

5. *Elis*: the part of this diſtrict which bordered on *Meſſenia*, was called *Triphyllia*. The chief towns were: *Elis*, on the *Peneus*, Belvidere; its ſea-port *Cyllene*, Chiarenza; *Olympia*, famous for the Olympic Games, on one ſide the *Alpheus*, Longanico; *Piſa*, which long enjoyed the right of preſiding at theſe games, on the other ſide the Alpheus. There were alſo in this diſtrict two towns of the name of *Pylus*.

Rivers: *Alpheus*, the god of which was fabled to have fallen in love with the nymph Arethuſa, now the Alfeo:

——Alpheum fama eſt huc Elidis amnem
Occultas egiſſe vias ſubter mare, qui nunc
Ore, Arethuſa tuo, Siculis confunditur undis. *Virgil.*

Stymphalus, which gave the name of *Stymphalides* to the ravenous birds on its banks, which fed on human fleſh; *Peneus*, the Igliaco.—Promontories: *Chelonites Promontorium*, Cape Torneſe; *Ichthys Prom.* Cape Jardan.—Mountain: *Erimanthus*, which gave name to the prodigy of a boar killed by Hercules, now Mount Dimizano.—Nigris aut Erymanthi Silvis. *Horace.*

6. *Arcadia*: which being a common centre to the other diſtricts, communicated with each of them. Its chief towns were: *Mantinea*, famous for the victory which Epaminondas gained over the Lacedæmonians, and which coſt him his life; *Orchomenus*, *Tegea*, *Megalopolis*, Leontari, the birth-place of Polybius.

Mountains: *Cyllene*, the birth-place of Mercury; *Pholoe*, *Stymphalus*, *Lycæus*, *Ceraufius*, *Mænalus*, ſacred to Pan; *Erymanthus*, *Olympus*.—Rivers: *Erymanthus* and *Ladon*, both of which flow into the *Alpheus*; *Styx*, a poiſonous ſtream, fabled to be a river of hell:

Cocyti ſtagna alta vides, Stygiamque paludem,
Di cujus jurare timent et fallere numen. *Virgil.*

Greek Islands.

The Greek Iſlands are commonly divided into thoſe in the *Ionian* Sea, the *Cretan* Sea, and the *Ægean* or Archipelago.—In the *Ionian* Sea: *Corcyra* or *Phæacia*, Corfu, where were the gardens of Alcinoüs, and on which Ulyſſes was wrecked; *Leucadia* or *Leucas*, alſo called *Neritos*, originally a peninſula, till its iſthmus was dug through, now Santa-Maura: it gave name to *Leucate Promontorium*, the Lovers Leap; *Echinades Inſulæ*, ſmall iſlands between the main land and *Cephalenia*, or *Same*, Cephalonia; *Zacinthus*, Zante; *Ithaca*, Ulyſſes's Iſland, Iſola del Compare; *Dulichium*, one of the *Echinades*, belonging to the ſame prince; *Strophades*, the Iſlands of the Harpies:

Jam medio apparet fluctu nemoroſa Zacynthos,
Dulichiumque, Sameque, et Neritos aſpera ſaxis. *Virgil.*

In the *Cretan* Sea: *Creta*, now Candia, from its capital. Its cities were formerly ſo numerous, that it was called *Hecatonpolis*. The principal cities were: *Gnoſſus*, *Gortyna*, on the river *Lethe*, famous for Minos's Labyrinth; *Cydon*, *Lyctus*.—Οι γαρ Κρητες εθαλασσοκρατησαν πρωτα, ναυτικῳ μεγαλῳ χρωμενοι. *Strabo.*

River of Crete: *Lethe*, the River of Oblivion.—Mountains: *Ida* and *Dicte*.—Cape: *Arietus Frons*, or *Kriou Metopon*, Cape Leon.

Between Crete and the Promontory of *Malea* was *Cythera*, or *Porphyris*, the Iſland of Venus Cerigo. Here was the principal port of the Lacedæmonians.

In the Ægean Sea, or Archipelago: *Cyclades Inſulæ*, about fifty in number, extending from the Cretan Sea to Euboea. They were ſo called from their being ſuppoſed to lie in a circle round Delus. The principal of theſe were: *Delus*, called alſo *Ortygia*, now Sdilles, the birth-place of Apollo and Diana. Hence the epithets of *Delius* and *Delia*, applied to theſe deities; as alſo of *Cynthius*.

ITALIA ANTIQUA.

Published Mar. 1st 1807, by J. Wilkes.

Stele sc. 352, Strand.

thius and *Cynthia*, from *Cynthus*, a mountain on the iſland; *Paros*, famous for its marble, Paro; *Oliarus*, Anti-Paro; *Naxos*, famous for its wines, Nicſia; *Ceos*, *Myconus*, *Andros*, *Melos*, *Gyarus*, &c.

The *Sporades* Iſlands are about forty in number, ſcattered chiefly over the Eaſtern part of the Ægean Sea, and commonly reckoned as belonging to Aſia, though ſeveral of them are on the European ſide of the Archipelago, as *Amorgus*, and *Thera*. The chief of the others were *Icaria*, which gave name to the Icarian Sea, Nicariſſa; and *Patmus*, Palmoſſa.

In the *Sinus Saronicus*, the Gulf of Engia, were *Ægina*, the country of *Æacus*, and for ſome time the rival of Athens, now Engia; *Salamis*, Coluri, famous for the defeat of the Perſian fleet by Themiſtocles.

Eubœa, Negropont, was parted from Bœotia by the *Euripus*, ſometimes denominated *Chalcidicus* and *Euboicus*, the Straits of Negropont, remarkable for the irregularity of its tides, which are ſaid to ebb and flow there ſeven times a-day.—Ὁ μεν γαρ Σικελικος, δις· ὁ δε χαλκιδικος, επταχις· ὁ δε κατα Βυζαντιον, ϐδ' ολως παλινοστει. *Strabo.*

Its chief towns were *Chalcis*, Negropont, and *Eretria*.

—Aulidaque Euboicam compleruntmille carinæ. *Ovid.*

ITALIA ANTIQUA.—This fertile country was anciently called alſo *Saturnia*, *Latium*, *Tyrrhenia*, *Magna Græcia*, *Auſonia*, *Ænotria*; and as it lay to the Weſt of the Greeks, it was by them called *Heſperia*. It was bounded to the North by the Alps, and the rivers *Varus*, the Var, and *Arſia*, the Arſa, which ſeparated it from Tranſalpine Gaul, Rhætia, Vindelicia, and Noricum; to the Eaſt by the Adriatic; and to the Weſt and South by the Mediterranean; being interſected from North to South by the Apennine:—Ορη (Αλπες) εν τειχυς σχηματι περικειται και προϐεϐληται Ιταλιας. *Herodian.*

It may be divided into three principal parts—*Gallia Ciſalpina*, *Italia Propria*, and *Magna Græcia*.

GALLIA CISALPINA took its name from the Celtic nations which here eſtabliſhed themſelves, was alſo called *Inter Alpes*, *Subalpina*, *Citerior*, and *Togata*, after the inhabitants were admitted to the right of Roman citizens. It was bounded by the Alps to the North; by the river *Arſia* and the Adriatic to the Eaſt; *Sinus Liguſticus*, the Gulf of Genoa, to the Weſt; and the rivers *Macra* and *Rubicon* to the South; the latter of which was the famous boundary of Italy and Gaul, now Fiumicino. It was divided by *Padus*, the Po, into *Gallia Tranſpadana* to the north, and *Ciſpadana* to the ſouth, of that river.

Of the principal tribes of *Gallia Tranſpadana*, the *Ligures* inhabited between the Macra and the Var. Thoſe on the coaſt were called *Capellati*, the others were *Montani*. Their chief towns were: *Genua*, Genoa; *Claſtidium*, *Dertona*, Tortona; *Statiellæ*, *Albium Intemelium*, Ventimille; *Albingaunum*, Albenga; *Portus Herculis Monœci*, Monaco; *Nicæa*, Nice.

The *Seguſini*, inhabited the country called *Regna Ideonni* et *Cottii*, part of Piedmont and Dauphiny. Their chief towns were: *Seguſia*, Suza; *Brigantium Vicus*, Briançon; *Ocellum*, Exilles.

In this diſtrict were *Graius Mons*, or *Cremonis Iugum*, Little St. Bernard; *Cineſius*, or *Cinereus Mons*, Mount Cenis; the *Alpes Cottiæ*, &c. And the river *Durentia*, the Durance.

The *Taurini*, *Salaſſi*, and *Lepontii*, alſo inhabited Piedmont. Their chief towns were: *Auguſta Taurinorum*, Turin; *Auguſta Prætoria*, Aouſt; *Pollentia*, Pollenza.

The *Inſubres* and *Orobii*, inhabited the Milaneſe. In their country were the *Raudii Campi*, famous for the victory gained by Marius over the Cimbri:

—— Ad Cimbros ſtragemque volabant
Qui nunquam attigerant majora cadavera Corvi. *Juv.*

—Chief towns were: *Mediolanum*, Milan; *Ticinum*, Pavia, which gave name to the river *Ticinus*, the Teſſin; on which Hannibal's firſt action with the Romans took place. *Laus Pompeia*, Lodi; and *Bergomum*, Bergamo.

The *Cenomanni*, inhabited part of the Cremoneſe, Veroneſe, Mantuan, &c. *Brixia*, Breſcia; *Mantua*, at a village near which, called *Andes*, Virgil was born; *Cremona*, where he was educated; *Bedriacum*, famous for the defeat of Galba by Otho, and of Otho by Vitellius's generals; and *Verona*, for its amphitheatre.

The *Euganei*, inhabited part of the Frentin, Breſſan, and Valteline. Their chief towns were: *Anaunia*, Nan; *Clavenna*, Chiavenna.—In this country was *Benacus Lacus*, the Lake of Garda; *Larius Lacus*, the Lake of Como; *Summus Lacus*, the Lake of Chiavenna:

Adde Lacus tantos, te Lari maxime, teque
Fluctibus et fremitu aſſurgens, Benace, Marino. *Virgil.*

Pars Rhætia, contained *Tridentum*, Trent, and *Feltria*, Feltra.

The *Veneti*, *Carni*, and *Iſtri*, inhabited the Venetian territories, Goritz, and a part of Iſtria. The chief towns of the *Veneti* were: *Patavium*, Padua, the birth-place of the hiſtorian Livy; *Adria*, Adri, which gave name to *Mare Adriaticum*, the Gulf of Venice:—of the *Carni*; *Aquileia*, Aquilea, famous for its reſiſtance to Attila king of the Huns; *Forum Julii*, Friuli; *Tergeſte*, which gave name to the *Sinus Tergeſtinus*, Trieſte:—of the *Iſtri*; *Pola*, Pola; *Parentium*, Parenzi; and *Ægida*, Cabo di Iſtria.

Rivers: *Eridanus*, or *Padus*, the Po; *Addua*, the Adda; *Oglius*, the Oglio; *Atheſis*, the Adige; *Medoacus Major*, the Brenta; *Timavus*, the Timavo.

Gallia Ciſpadana.—The principal tribes of *Gallia Ciſpadana* were: the *Anamani*, *Boii*, *Lingones*, and *Senones*, tribes from Tranſalpine Gaul, who ſucceſſively ſettled in different diſtricts of this country. The Flaminian and Æmilian roads paſſing through it, gave their names to it in a ſubſequent period. The chief towns of the *Anamani* were *Placentia*, Piacenza:—of the Boii, *Parma*: between Placentia and Parma was a canal, called *Foſſa Æmilia*: *Brixellum*, Briſcello; *Mutina*, where Brutus was beſieged by Marc Antony, Modena; *Forum Lepidi*, Rezzo; *Bononia*, Bologna:—of the *Lingones*, *Forum Cornelii*, Imola; *Faventia*, Faenza:—of the *Senones*; *Ravenna Umbrorum*, Ravenna, the reſidence of the exarchs, and of ſome of the emperors; *Forum Livii*, Forli; *Forumpopilii*, Forimpopoli:

Sit Ciſterna mihi quam vinea malo Ravennæ,
Cum poſſim multo vendere pluris aquam. *Martial.*

Rivers: *Trebbia*, Trebbia, famous for Hannibal's victory over the Romans commanded by L. Sempronius; *Adria*, Larcha; *Rhenus Parvus*, the Reno; *Tarus*, the Taro; *Rubicon*, already mentioned.

ITALIA PROPRIA, was bounded to the North by *Gallia Ciſalpina*, and to the South by *Magna Græcia*. It extended along the Mediterranean from the *Macra* to the *Silarus*, now the Silaro, and on the Adriatic from Ancona to the *Frento*, now Fortore. The principal diviſions of it were: *Etruria*, *Umbria*, *Picenum*, *Sabinia*, *Latium*, *Samnium*, and *Campania*.

1. *Etruria*, or *Tuſcia*, called by the Greeks *Tyrrhenia*, was bounded by the *Mare Inferum*, the Apennines, the *Macra*, and the *Tiber*. It was divided into *Tuſcia trans Arnum*, between the Magra and the Arno, and *Tuſcia cis Arnum*, between the Arno and the Tiber. The chief towns of *Etruria trans Arnum* were: *Luna*, *Luca*, Lucca; *Piſtoria*, Piſtoia. The principal people of this diſtrict were: the *Apuani Ligures*, and the *Magelli*.—*Tuſcia cis Arnum* was inhabited by twelve tribes, who took their names from their principal cities, and whoſe chiefs were named *Lucumones*.

On the *Arno* were *Piſæ*, Piſa; *Florentia* or *Fluentia*, Florence; *Arretium*, Arrezzo; *Cortona* and *Peruſia*, Perugia, were near *Lacus Thraſimenus*, the Lake of Perugia, where Flaminius was overthrown by Hannibal; *Sena Julia*, Sienna; *Volaterræ*, Volterra, noted for its hot ſprings; *Herculis Liburni Portus*, Leghorn; *Vetulonii*, from which the Romans borrowed the badges of their magiſtrates;

Populo-

Populonium, on a promontory of the ſame name, oppoſite the iſland *Ilva*, now Elbe; *Cluſium*, the ſeat of king Porſena, now *Cluſio*; *Ruſellæ*, *Portus Herculis Coſani*, Porto Hercole; *Tarquinii*, from which the Tarquins took their name, Torchina; *Vulſinii*, on a lake of the ſame name, Bolſena; *Centum Cellæ*, Civita Vecchia; *Cære*, the ſeat of Mezentius, the people of which (the *Cerites*) poſſeſſed the rights of Roman citizens, except that of voting, now Cer-veteri; *Veii*, the people of which were called *Vejentes*, long a formidable rival to the Romans, and taken, after a ten years ſiege, by Camillus; *Falerii*, the people of which were named *Faliſci*, taken alſo by Camillus; *Feſcennia*, which gave its name to the *Carmina Feſcennina*; *Soracte*, better known as the name of a mountain in its neighbourhood, ſacred to Apollo:

Vides ut alta
Stet nive candidum Soracte. *Horace.*

Rivers: *Arnus*, the Arno, which receives the *Auſer*, Il Serchio; *Cluſina Palus*, Chiana Palude, which communicated with the *Arnus*, and alſo with the Tiber, by the river *Clanis*, la Chiaca; *Cæcina*, at the mouth of which was the town of *Vada Volaterrana*; *Umbro*, Umbrone; *Marta*, which flows from the Volſinian Lake; *Cremera*, which flows into the Tiber, noted for the ſlaughter of the Fabii, now the Baccano.

2. *Umbria*; which was bounded towards the weſt by Tuſcany; and on the other ſides by the Rubicon, the Adriatic, the Tiber, Nar, and Æſis. It was divided by the Apennines into two parts. Of *Umbria trans Apenninum*, inhabited by the *Velumbri*, the chief towns were: *Ariminum*, Rimini; *Piſaurum*, Piſaro; *Fanum Fortunæ*, Fano; *Sena Gallica*, Senegaglia; *Forum Sempronii*, on the *Metaurus*, memorable for the defeat of Aſdrubal, Foſſombrone; *Urbinum*, Urbino; *Camarinum*, the people *Camertes*, Camarino.

Of *Umbria cis Apenninum*, inhabited by the *Olumbri*, the chief towns were: *Tifernum*, *Tiberinum*, Citta di Caſtello; *Nuceria*, Nocera; *Spoletium*, Spoleto; *Ocriculum*, Otricoli; *Narnia*, Narni; *Interamna*, Terni.

Rivers: *Ariminus*, the Marechia; *Piſaurus* or *Iſaurus*, the Foglia; *Metaurus*, the Metaro; *Æſis*, the Eſino; *Nar*, the Nera or Negra, which receives *Velinus*, the Velino, on which is the Fall of Terni.

3. *Picenum*; which lay to the ſouth of *Umbria*. The inhabitants were called *Picentes*. Their principal town was *Ancona*, which has given the name of the Marquiſate of Ancona to the greater part of the country. Their other towns were: *Auximum*, Oſimo; *Aſculum*, Aſcoli; *Hadria*, the chief town of a particular diſtrict belonging to the *Prætutii*, Arri; *Teate*, Chieti; *Aternum*, Peſcara, towns of the Marucini; *Amiternum*, belonging to the Veſtini, Amiterno.

4. *Sabinia*; bounded by the rivers *Tiber*, *Nar*, the Nera, and *Anio*, the Teverone; and was divided into two parts by the lake or river *Velinus*, the Velino, already noticed. Their chief towns were: *Cures*, whence the people of Rome were called *Quirites*, Correſe; *Reate*, near which Veſpaſian was born, Rieti; *Nurſia*, Norcia; *Amiternum*, the birth-place of Salluſt; *Nomentum*, *Cruſtumerium*, *Fidenæ*, *Collatia*, where lived Collatinus, the huſband of Lucretia.

Mountains: *Mons Sacer*, famous for the receſſions of the Roman Commons; *Mons Lucretilis* and *Uſtica*. Near Horace's villa, in this country, was *Fons Blanduſiæ*, which he has celebrated.—O Fons Blanduſiæ ſplendidior vitro. *Hor.*—Beſides the rivers already mentioned, here was *Allia*, the Aja, famous for the defeat of the Romans by the Gauls under Brennus.—Quoſque ſecans infauſtum interluit Allia nomen. *Virgil.*

5. *Latium*; under the kings, was a ſmall diſtrict, bounded chiefly by the *Anio*, the *Tiber*, the Sea, and the *Numicus*, and anſwers to a part only of what is now called the Campagna di Roma. Under the conſuls, in proceſs of time, as the Roman arms proved ſucceſsful, it comprehended the countries of the *Æqui* or *Æquiculi*, *Hernici*, *Rutuli*, *Volſci*, *Aurunci* or *Auſones*. *Circæus Mons*, and *Liris*, the river Garigliano, were at different times conſidered as its boundaries. The former was called *Latium Antiquum*, and the other additional countries were called *Latium Novum* or *Adjectitium*.

The chief city of *Latium Vetus*, was ROMA, *Rome*, long the miſtreſs of the world, about twelve miles from the mouth of the *Tiber*, and built on ſeven hills, from which it was called *Septicollis*. See the article ROME.

The other chief towns of *Latium* were: *Oſtia*, at the mouth of the Tiber, Oſtie, its harbour is now dried up; *Lavinium*, Patrica; *Laurentum*, San Lorenzo; *Ardea*, the chief city of the *Rutuli*, and the retreat of Camillus during his exile, Ardée; *Lavinium*, Citta Lavinia; *Aricia*, *Alba Longa*, Palazzolo, near which is the Alban Lake and Mount; *Tuſculum*, now Fraſcati; near it was the lake *Regillus*, famous for the defeat of the Latins by Poſthumius the Dictator; *Gabii*, *Præneſte*, Paleſtrina; *Tibur*, Tivoli, noted for the pleaſantneſs of its ſituation, near which was the wood and fountain of *Albunea*.

—— Atina potens Tiburque ſuperbum,
Ardea, Cruſtumerique et turrigeræ Antemnæ. *Virgil.*

The chief towns of the *Æqui* or *Æquicoli*, were: *Algidum*, which gave name to a mountain, Oſteria; *Corbio*, *Trebia*, *Carſeoli*, *Cliternum*.

The chief towns of the *Hernici*, were: *Anagnia*, Anagni; *Alatrium*, Alatri; *Ferentinum*, Ferentino; *Veroleæ*, Veroli.

The chief towns of the *Volſci*, who inhabited a conſiderable part of the Campagna di Roma, were: *Antium*, Nettuno, where was a celebrated temple of Fortune; *Aſtura*; *Circeii*, ſaid to have been the abode of Circe, Civita Vecchia, near which was *Circeium Prom.* Monte Circillo, oppoſite the Iſland *Pontia*, Ponza: here alſo were the Grove of *Feronia*, on the River *Ufens*, and the *Paludes Pomptinæ*, frequently, but in vain, attempted to be drained.—To the eaſt of the *Ufens*, *Anxur* or *Terracina*, Terracino; *Forum Appii*; *Tres Tabernæ*, Ciſterna; *Ulubræ*; *Sueſſa Pometia*; *Cora*; *Norba*; *Sulmo*.—Towards the *Liris*, they had ſeveral cities: *Sora*; *Arpinum*, the birth-place of Marius and Cicero, Arpino; *Fregellæ*; *Interamna*.

The *Aurunci* or *Auſones*, once poſſeſſed the coaſt of Italy, from *Circæum* to the Straits of Sicily. The *Montes Maſſici*, beyond the *Liris*, became afterwards their ſouthern boundary. Their chief towns were: *Amyclæ*; *Fundi*, Fondi, near which was the *Lacus Fundanus*, and about it the *Cæcubus Ager*, famous for its wine; *Auſona*; *Caieta*, Gaieta; *Formiæ*, Mola; *Formianum*, Cicero's villa, where he was aſſaſſinated; *Minturnæ*, near the mouth of the *Liris*, in the marſhes of which Marius concealed himſelf; *Sinueſſa* or *Sinope*, the laſt town of *Latium Novum*, towards Campania, la Rocca de Mondragone; and *Sueſſa Aurunca*, in the Campagnia itſelf, Liſſa.

Rivers: *Tiberis*, the Tiber, more anciently the *Albula*; it receives *Anio*, the Teverone; the *Allia*, *Cremera*, *Nar*, *Clanis*, la Chiana; and *Clitumnus*, famous for its milk-white herds; *Aqua Crabra* or *Tuſculana*, the Marana; *Numicus*, the Nemi or Numico; *Aſtura*, the Stura; *Ufens*, Aufento; *Liris*, the Garigliano, which receives *Trerus*, the Trero; *Coſa*, the Piſcia; *Fibrenus*, the Fibreno; *Melſis*, the Melſo, &c.

6. *Samnium*; which extended from *Picenum* and *Sabinia* to *Apulia*, and from *Latium* and *Campania* to the Adriatic, correſponding much with what is now called the Abruzzo. The people, beſides their name of *Samnites*, were alſo called *Sabelli*, being ſprung from the Sabines. Their principal tribes were: the *Peligni*, whoſe chief towns were *Corfinium*, San Perino; *Salmo*, Salmona, the birth-place of Ovid:—the *Marſi*, whoſe chief towns were, *Alba Fucentis*, Albi, on the *Lacus Fucinus*, now called Lago di Celano; *Marrubium*, Morea. Both of theſe tribes were inland:

Te nemus Angitiæ, vitrea te Fucinus unda,
Te liquidi flevere lacus. *Virgil.*

On

On the Upper Sea were the *Frentani*, whoſe chief towns were *Ortona*, Ortona; *Anxanum*, Lanciano; *Hiſtonium*, Guaſto d'Amone; *Buca*; *Larinum*.—Their rivers were: *Sagrus*, the Sagro; *Trinius*, the Trigno; *Trifernus*, the Biferno; *Frento*, the Fortore.

Samnium, the country of the Samnites, properly ſo called, lay inland, to the weſt of the *Frentani*. Their towns were: *Aufidenum*, Alfidenum; *Æſernia*, Iſernia; *Beneventum*, *Maleventum*, *Triventinum*, *Bovianum*, Boiana; *Caudium*, near which were the *Furcæ Caudinæ*, famous for the diſgrace the Romans ſuſtained from the Samnites under their general Pontius; *Allifæ*, Allifa; *Telæſia*, Teleſe. Their rivers were: *Sabatus*, the Sabato, which receives *Calor*, the Calore, and *Tamarus*, the Tamaro, and runs into the Vulturno.

The *Hirpini*, a Samnite people, dwelt to the ſouth of *Samnium*, in the country ſince called the Farther Principality. Their chief towns were: *Abellinum*, Avellino; *Compſa*, Conza; *Equus Tuticus*, Ariano; *Rufæ*, Rufo.—Their rivers: *Aufidi Fons*, the head of the Aufanto; *Amſanƈti Lacus*, a ſtinking lake, now called Mufiti, from Mefitis, the goddeſs of ſtench, who had a temple there. The exhalations of it were ſo unwholeſome, that the poets feigned it to be *ſævi ſpiracula ditis*:

Monſtrantur, ruptoque ingens Acheronte vorago
Peſtiferas aperit fauces. *Virgil.*

7. *Campania*, ſo famous for the richneſs of its ſoil, is now the chief part of the Terra di Lavora. It extended from *Latium* to *Lucania* in length; and was bounded in breadth by the Tuſcan Sea, and *Samnium*. It was inhabited by the *Campani* and *Picentini*. The chief towns of the *Campani* were: *Vulturnum*, Voltorno, on a river of the ſame name; *Liternum*, Torre di Patria, where Scipio Africanus died; *Capua* ſtood ſome miles from the place which now bears its name; its conſequence was transferred to *Neapolis* or *Parthenope*, Naples; *Cumæ*, near which was the Sibyl's Grotto:

Huc ubi delatus Cumæam acceſſeris urbem,
Divinoſque lacus, et Averna Sonantia Silvis,
Inſanam vatem aſpicies. *Virgil.*

Puteoli, the port of *Cumæ*, Puzzoli; near this place was Cicero's Academia, and alſo the *Campi Phlegræi*, or burning plains; *Baiæ*, famous for its baths, and the pleaſantneſs of its ſituation, being the winter reſidence of the Romans, as Tibur, Tuſculum, Teanum, &c. were their ſummer retreats; *Miſenum*, a promontory and town, which was the ſtation of a Roman fleet; *Herculaneum*, Torre di Greco, which, as well as *Pompeii*, now Safati, was overwhelmed by an earthquake during an eruption of Veſuvius, in Nero's time; *Surrentum*, Sorrento, near *Minervæ Promontorium*, alſo oppoſite the iſland *Capræa*, Capri, famous for Tiberius's retreat, and *Sirenuſæ* or *Sirenum Scopuli*, the Iſlands of the Sirens.

Near the promontory of *Miſenum*, ſo called from Miſenus, Hector and Æneas's trumpeter, now Cape Miſeno, were the iſlands *Prochyte* and *Inarime*, thought to have been rent aſunder by an earthquake:

Monte ſub aerio, qui nunc Miſenus ab illo
Dicitur, æternumque tenet per ſæcula nomen. *Virgil.*

The inland towns were: *Teanum*, Tiano; to the north of which, towards Sinueſſa, were the famous Maſſic and Falernian vineyards; *Sueſſa Aurunca*, Seſſo; *Venafrum*, Venafro; *Nola*, where Marcellus repulſed Hannibal; *Sueſſula*, famous for its oil; *Acerræ*, *Nuceriæ*.

Rivers and lakes: *Vulturnus*, the Vulturno; *Liternus* or *Glanius*, the Clanio; *Sebethus*, on which Naples ſtands, the Fornello; *Sarnus*, the Sarno; *Lacus Acheruſius*, the Lake of Collucia; *Avernus*, the Averno, a cave near which was the fabulous deſcent to Hell; *Lacus Lucrinus* or *Baianus*, once famous for its fiſh, but changed by an earthquake into a marſh, Laco de Licola: the Lucrine and Avernine lakes were joined together by Auguſtus; *Charoneæ Scrobes*, Grotto del Cane; *Sinus Baianus*, the Gulf of Pozzuolo, is ſtill celebrated for its elegant ſalubrity.—Nullus in orbe ſinus Baiis prælucet amænis. *Horace.*

Mountains: *Gaurus*, Monte Barbaro; *Tifata*, Monte de Caſſerta; *Maſſicus* or *Falernus Mons*, Monte Dragone; *Veſuvius*, Monte di Somma, the country about which, was called *Campus Phlegræus*.

The *Picentini*, probably a colony from the *Picentes*, on the Adriatic, occupied a part of the Hither Principality. Their chief towns were: *Salernum*, Salerno; *Picentia*, Bicenza.

MAGNA GRÆCIA; though it might be made to include *Campania*, and much of the weſt coaſt of Italy, on account of the various Greek colonies there ſettled, yet is commonly underſtood to mean only *Apulia*, and *Oenotria*.

APULIA was divided into *Daunia*, *Pucetia*, and *Meſſapia*. 1. *Apulia Daunia*, part of the Capitanata, lay between the rivers *Frento* and *Aufidus*, the Fautore and Aufanto, and was divided by *Cerbalus*, the Cervaro. *Mons Garganus*, Mount St. Angelo, is on the peninſula which here advances into the Adriatic, as the ſpur of the boot, to which the ſhape of Italy has been compared.—The chief towns were: *Teanum Apulum*, Teani; *Hurium*, Rodia; *Arpi*, built by Daunus, father-in-law to Diomedes, who gave his name to the country now Arpe; *Sipuntum*, Siponto; *Uria*, Manfredonia, which gave name to *Urias Sinus*, the Gulf of Manfredonia; *Luceria*, Lucera; *Aſculum Apulum*, Aſcoli, famous for the defeat of Pyrrhus by Dentatus and Fabricius; *Salapia*, Salpe, near which was the *Palus Salapinus*, Lago Salſo.

2. *Apulia Pucetia*, the Terra di Bari, and part of the Capitanata, extended from the *Aufidus* to *Brunduſium*. The ridge of the Apennines, which paſſes through this country, was called *Nultur Mons*.—The chief towns were: *Cannuſium*, Canoſa, near which was the village of *Cannæ*, famous for the overthrow of the Romans by Hannibal;—Duo maximi exercitus cæſi ad hoſtium fatietatem, donec Annibal diceret militi ſuo, "Parce ferro." *Florus.*—*Barduli*, Barletta; *Turenum*, Trani; *Barium*, Bari; *Egnatia*, Torre d'Anazzo; *Acherontia*, Acirenza; *Venuſia*, the birth-place of Horace, Venoſa, near which was *Bantia*, and *Ferentum*, Forenza.

3. *Meſſepia*, *Calabria*, or *Japygia*. Theſe names were ſometimes applied to different parts of the ſouth-eaſt peninſula of Italy, though, for the moſt part, common names to the whole of it, now Terra d'Otranto.—The chief towns were: *Brunduſium*, Brindiſi, from which paſſage was uſually taken to *Dyrrachium* in *Illyricum*, by thoſe who were travelling to Greece. Oppoſite to it was a ſmall iſland, called *Pharos*, from the ſimilarity of its uſe to the Pharos of Alexandria; *Aletium*, Leccia; *Lupia*; *Rudiæ*, Ruia, the birth-place of Ennius; *Hydrus* or *Hydruntum*, Otranto, from which there was a paſſage ſtill ſhorter than that of *Dyrrachium*, to *Apollonia* or *Oricum*, in *Epirus*; *Caſtrum Minervæ*, Caſtro; *Veretum*, Aleſſano, not far from which was *Promontorium Salentinum* or *Japygium*, Cape di Leuca; *Callipolis*, Gallipoli; *Uxentum*, Ugento; *Neretum*, Nardo; *Tarentum*, where Phalantus, the Lacedæmonian, planted his colony, and from which the adjoining gulf takes its name, Tarento; near Tarentum was *Mons Aulon*, famous for its vines; and *Galeſus Fluvus*, the Tara. The people who inhabited this coaſt, to the weſt of the Apennine, were called *Salentini*, and *Meſſapii*.

OENOTRIA, was divided into two parts, inhabited by the *Lucani* and *Bruttii*. 1. *Lucania* was, towards the lower ſea, divided from the Picentini by *Silarus*, the Selo or Silaro, and from the Bruttii by *Laüs*, the Laino. On the Tarentine Gulf it extended from *Bradanus*, the Bradano, to *Thurii*, and the river *Sybaris*. It contained a part of the Hither Principality, the Hither Calabria, and Baſilicato. The chief towns, &c. were: *Poſidonia* or *Pæſtum*, Pieſti, now famous for its ruins. It ſtood on the *Sinus Pæſtanus*, the Gulf of Salerno, in which were

Sirenuſæ or *Inſulæ Sirenum*; *Velia*, oppoſite the *Oenotrides Inſulæ*, *Pontia* and *Iſchia*, now Ponza and Iſchia; *Palinurum Promontorium*, which took its name from Æneas's pilot, Cape Palinuro; *Puxus* or *Buxentum*, Polycaſtro, which ſtood on *Sinus Laüs*, the Gulf of Polycaſtro.

On the Tarentine Gulf, were *Abellinum Marſicum*, Avellino; *Metapontum*, where Pythagoras taught, now Torre di Mare; *Siris*, *Heraclea*, *Aciris*, *Sybaris*, famous for its greatneſs, infamous for its luxury: at one time it ruled over ſeveral of the neighbouring nations, and could ſend into the field an army of 300,000 men. On the ruins of it, when deſtroyed by the people of Crotona, was founded *Thurii*, the laſt place for which Charondas legiſlated, for ſome time the reſidence of Herodotus and Lyſias. The Tarentines having planted a colony there, gave it alſo the name of *Copiæ*.

2. The *Bruttii* inhabited what is now called the Hither and Farther Calabria. Their country is the foot or ſouth-weſt peninſula of Italy, being bounded to the north by the Iſthmus and *Laüs*, the Laino, and *Thurii*. They were divided into the *Ciſmontani* and *Tranſmontani*. The former of theſe were alſo called *Rhegini*; the latter *Locri* or *Crotontatæ*. The chief towns of the *Bruttii Ciſmontani* were: *Cerilli*, Cerilli; *Pandoſia*, Mondicino; *Conſentia*, Coſenza, not far from which was the branch of the Apennine called *Clibanus*; *Tropæa*, Tropea; *Metaurum*, on a river of the ſame name; *Valentia*, *Vibo* or *Hipponium*, Bivona, on the *Sinus Terinæus* and *Vibonenſis*, the Gulf of St. Euphemia; *Gioia*, Gioio; *Mamertum*, Oppido; *Scillæum*, Sciglio, on that promontory which gave riſe to the fable of Scylla and her dogs. Oppoſite is Charybdis, and the *Promontorium Pelorium*; *Poſidonium*, Colonna; *Rhegium*, Rheggio; near to it was *Leucopetra*, *Rhegium Herculis*, and *Zephyrium Promontorium*, the termination of the Apennine mountains. This laſt is the moſt ſouthern extremity of Italy, and is called Cape Sparti Vento.

Of the *Bruttii Locri*, the chief towns were: *Ruſcianum*, Roſſano; *Petelia*, Strongoli; *Croton* or *Crotona*, Cortona, the city of Milo, the famous athlet; near it were *Lacinium Promontorium*, on which ſtood a temple of Juno, Cape de la Colonna; and more to the ſouth, *Japygum tria Promontorium*, Cape St. Mary, and oppoſite, *Ortygia*, Calypſo's Iſland; *Caſtra Hannibalis*, Caſtelli; *Scylacium*, Squillaci, which gave name to the *Sinus Scylaceus*, the Gulf of Squillaci; *Aulon* or *Caulon*, Caſtro Vetere; *Locri Epizephirei*, the city of Zaleucus the legiſlator, who is thought to have been the firſt who drew up a written code of laws: it is now Gierazzo, on the *Sinus Locrenſis* or *Bruttius*, the Gulf of Girazzo.

Auguſtus divided Italy into eleven regions; the emperor Antoninus divided it into ſixteen provinces; and Conſtantine into ten. The ſeveral highways took their names chiefly from the perſons who conſtructed them. They were meaſured by miles, marked on pillars or ſtones, reckoning from the *Milliarium Aureum*, a gilt pillar erected in the forum by Auguſtus. *Diverticula* were croſs-roads or bye-ways, leading from the main road. The principal highways were: *Via Appia*, leading from Porta Capena, through Latium, to Capua; and from thence, in two branches, to Brunduſium. *Via Flaminia* took a north-eaſt direction, through Etruria and Umbria, towards the Adriatic, and at *Ariminum*, Rimini, joined the *Via Æmilia*, and from thence paſſed into Ciſalpine Gaul.

The chief intermediate roads were the *Valerian* and *Salarian*; the former leading to *Corfinium* and *Aternum*, the latter to *Reate* and *Ancona*. *Via Aurelia* ran along the ſea-coaſt of *Etruria*, *Liguria*, and the province of Gaul. Near *Luna* it was joined by the *Via Caſſia*, which paſſed through the middle of *Etruria*. It was alſo, in its courſe, joined by the *Via Claudia*, a branch of the *Caſſia*. Some of the roads alſo took their names from the places to which they led; as the *Nomentana*, *Præneſtina*, *Oſtienſis*, &c.

ISLANDS, in *Mare Inferum*, or Sea on the Weſt Coaſt of Italy.

SICILIA.—Sicily, the largeſt iſland in the Mediterranean, was more anciently called *Sicania*. Its triangular ſhape alſo occaſioned its being called *Trinacria* and *Triquetra*. Its three promontories are—*Pelorum*, to the north, Cap de Faro; *Pachynum*, to the ſouth, Paſſaro; and *Lilybæum*, to the weſt, Cap de Boëo.

Fretum Siculum, the Straits of Sicily, about ſeven miles over, ſeparate it from Italy. On the Italian ſhore is the dangerous rock of *Scylla*, and towards the Sicilian, the whirlpool of *Charybdis*. The north coaſt is ſkirted by a range of mountains called *Heræi*, or the mountains of Juno, now Monte Arteſino; *Nebrodes*, or the Mountains of the Fawns, now the Madonia, branches from which run in different directions, of which are the *Montes Hyblæi*, famous for their honey; *Gemelli Colles*; burning *Ætna*, or Monte Gibello, a mountain of great height and extent, and the moſt famous volcano in the world:—Horrificis juxtà tonat Ætna ruinis. *Virgil.*—*Eryx*, Mount Trapani, after Ætna the higheſt in the iſland: on the top of it ſtood the temple of Venus Erycina.

The north coaſt was bounded by the promontories *Pelorum* and *Lilybæum*. The chief towns on it were: *Naulochus*, Diveto, between which and *Melæ*, now Milazzo, Sextus Pompey's fleet was defeated by Octavius's; *Tyndaris*; *Haleſa*; *Himera*, on a cognominal river, now Termini; *Panormus*, Palermo; *Eryx*, Trepano Vecchio; *Drepanum*, Trepano; *Segeſte* or *Aceſte*, which derived its name from king Aceſtes, now Barbara.

The ſouthern coaſt extended from *Lilybæum* to *Pachynum Prom.* The chief towns upon it were: *Lilybæum*, Marſala; *Mazarum*, Mazara, from which one of the three modern diviſions of Sicily is called Val di Mazara; *Selinus*, famous for its palm-trees, and ſeated on the river *Hypſa*, which falls into *Criniſſus*, the Bolici, on the banks of which Timoleon defeated the Carthaginians, now Terra degli Pulci; *Agragas* or *Agrigentum*, the reſidence of Phalaris, Gergenti, on a river of the ſame name; it was the next city in magnificence and population to Syracuſe, containing about 200,000 inhabitants:

Arduus inde Agragas oſtentat maxima longe
Mœnia, magnanimum quondam generator equorum.
Virgil.

Phintias, Licata, at the mouth of *Himera*, the Salci, a different river from that of the ſame name on the north of the iſland, this being the largeſt of all Sicily, and for ſome time the boundary between the Syracuſans and Carthaginians: near to *Phintias* was the mountain *Ecnemos*, on the top of which was Phalaris's citadel, called Dædalium, in which he had his brazen bull. But the ſame is ſaid of *Phalarium*, another caſtle of the ſame prince. *Gela*, Terra Nuova, on a river of the ſame name; the country near it was called *Campi Geloi*; *Camarina*, Camarana.

The eaſt coaſt of Sicily extended from *Pachynum Promontorium*, Cape Paſſaro, to *Pelorum Prom.* Cape di Faro. Along it were *Helorum* and *Helorina Tempe*, Muri Ucci, on a river of the ſame name, which is now called Abiſo; *Neætum*, Noto, which has given its name to the Val di Noto; *Acræ*, d'Arcia; *Phœnicus Portus*, Falconara; *Syracuſæ*, Syracuſe, near which was the iſland *Ortygia*, and the fountain *Arethuſa*, ſuppoſed to communicate with the Alpheus in Peloponneſus; alſo the *Fons Cyane* and the river *Anapus*, the Alfeo, which falls into the *Portus Magnus* of Syracuſe:

Alpheum fama eſt huc Elidis Amnem
Occultas egiſſe vias, ſubter mare; qui nunc
Ore, Arethuſa tuo, Siculis confunditur undis. *Virgil.*

Syracuſe was above twenty-two miles in circuit: it conſiſted of five parts or towns, *Ortygia*, *Acradina*, *Tyche*, *Neapolis*, *Epipolæ*. The other towns were—*Megara* or *Hybla*, of which name there were ſeveral in Sicily; *Leon-*

tium, Lentini, the country about it was called *Campi Leontini*, and more anciently *Læſtrigonii*, from a people coeval with the *Cyclopes*; *Morgentium*, San Giorgio; *Catana*, Catanea, at the foot of Mount Ætna; not far from it to the ſouth was *Simæthus Fl.* the Giaretta, and to the north *Acis Fl.* which has given its name to the Caſtel d'Iaci; *Tauromínium*, Taormino, near which was the *Argennum Promontorium*, Cape St. Aleſſio; *Meſſana* or *Zancle*, Meſſina, the people of which were ſometimes called *Mamertini*, from a mixture with coloniſts of that name from Italy.

Inland towns.—*Noe*, Noara; *Galata*, Galata; *Tiſſa*, Randazo; *Miſſa* or *Ætna*, Maſcali; *Centuripe*, Centorbe; *Agyrium*, the birth-place of Diodorus Siculus, San Philippo d'Agirone; *Enna*, the centre of the iſland, and fabled to have been the abode of Ceres and Proſerpine, now Caſtro-Janni; near which *Perguſa Lacus*, where Proſerpine was carried off by Pluto, now Lago di Goridan; *Menæ*, Meneo; *Palica*, Paliconia, near which was *Fons Palicinus*, Naptia; *Erbeſſus*, Paluzzuolo; *Entella*, Bitella; *Jetæ*, Jato; *Macella*, Strongoli.

The iſlands near Sicily were—To the north, the *Inſulæ Liparenſium*, called *Æoliæ*, from their being the fabled abode of Æolus, king of the Winds; alſo called *Vulcaniæ*, from the volcanos in which they abound, the Lipari iſlands: they are eight in number. One of them is a noted volcano. The *Egades* or *Eguſæ*, three in number, to the weſt: and to the ſouth-eaſt, *Melita*, Malta, on which St. Paul was wrecked; though it is more likely that this happened on *Melite*, at the entrance of the Adriatic; and *Gaulos*, Gozo, ſuppoſed by ſome to have been the iſland of Calypſo.

SARDINIA, or SARDO, called alſo *Ichnuſa*, and *Sandaliotis*, from its ſuppoſed reſemblance to the ſole of the foot. Sardinia is ſeparated to the north from Corſica by a ſtrait, anciently called *Taphros*, or *Foſſa*. The natives were called *Sardi* and *Sardoi*. The chief towns were: *Caralis*, Cagliari, on the *Caralitanus Sinus*, the Gulf of Cagliari; *Sulci*, Palma di Sole; *Uſellis Colonia*, Oriſtagni, near which is *Thyrſus*, the Thyrſo, the largeſt river on the iſland; *Boſa*, Boſa; *Turris Libiſſonis*, Torre; *Tibula*, Longo Sardo; *Olbia*, Terra Nova; *Luquido*, Lugodori. Of the mountains on this iſland, the moſt noted were thoſe to the north, called *Montes Inſani*, Monte di Canelle.

CORSICA, called alſo *Cyrnus*, and the people *Corſi*. The chief towns were: *Mantinorum Oppidum*, Baſtia; *Nicæa* or *Mariana*, a colony planted by Marius, Caſa Barbarica; *Aleria*, a colony planted by Sylla, Leria; *Palania*, Balagna; *Urcinium*, Ajaccio. The northern point of the iſland forms *Sacrum Promontorium*, now Cape Corſo.—See further particulars, with a map of ANCIENT EUROPE, vol. vii. p. 84.

ANCIENT ASIA.

The early geographers ſuppoſed Aſia to be bounded nearly in the ſame manner as is now laid down by modern geographers. They were not, however, well acquainted with thoſe parts of it which lie to the north and north-eaſt; nor as yet are the moderns, notwithſtanding the pains they have been at to inveſtigate them. They were equally ignorant of the parts to the ſouth-eaſt, knowing little of China, of the countries beyond the Ganges, and not much of the countries between the Indus and Ganges. The ancients ſeparated Aſia from Europe by the Don or Tanais, the Euxine, and the ſeas and ſtraits between the Euxine and Mediterranean; and from Africa, according to ſome, by the Nile, but more generally by *Iſthmus Ægypti*, the Iſthmus of Suez, and *Sinus Arabicus*, or *Mare Rubrum* (in the reſtricted ſenſe of the word), the Red Sea. The *Oceanus Eous*, *Mare Erythræum*, the Eaſtern Ocean, bounded it to the ſouth.

The ancients divided it into Aſia on this ſide *Taurus* and the river *Halys*, and Aſia on the fartheſt ſide.—*Ταυρος ος διαιρει διχα την Ασιαν κατα μηκος. Strabo.*—*Aſia Citerior* or *Minor*, a diſtinction of no very ancient date, and which now commonly paſſes under the name of Anatolia, includes the peninſula between the Euxine and Mediterranean, and extends eaſtward as far as the Euphrates. The country beyond the Euphrates was called *Aſia Ulterior* or *Magna*. *Aſia* has been divided into three general parts: the Northern, the Middle, and the Southern. The Northern contained *Sarmatia*, *Scythia*, and *Serica*. *Sarmatia Aſiatica*, extended from the Euxine to the Caſpian, between the rivers Don or Tanais, and the Rha or Wolga. The principal tribes who occupied this country were, the *Sarmatæ*, *Mæotæ*, *Alani*, *Sabiri*, a tribe of Huns. It was ſuppoſed to include part of *Albania*, *Iberia*, and *Colchis*:

Herbaſque quas et Colchis atque Iberia
Mittit venenorum ferax. *Horace.*

The modern diviſions of it are the Cuban Tartary (ſuppoſed to take its name from the *Hypanis*), Circaſſia, Georgia, Mingrelia. In this country were *Caucaſus*, *Hippici*, and *Ceraunii Montes*.

Beyond *Sarmatia* and the Caſpian Sea lay *Scythia*, Tartary, reaching to *Mare Hyperboreum*, the Frozen Sea, and *Serica*, or Northern China. It was uſually divided into *Scythia intra Imaum*, between the *Iaxartes* and *Imaus*; and *Scythia extra Imaum*, Hither and Farther Scythia. *Imaus* was a chain of mountains connected with Mount *Taurus* by *Paropomiſus*, running into various branches; one branch north and ſouth, is the Belur Tag of Tartary. Another, the Himmala, is the northern chain of the Tibetian Alps. An eaſtern branch of it, *Emodus*, ſeparated India from Scythia. The chief tribes of Scythians were the *Maſſagetæ* or Great *Getæ*; *Dahæ*, towards the Caſpian; and the *Sacæ*, towards the Ganges. In the Farther Scythia, the country of the Mongul and Calmuck Tartars, were placed the fabulous nations of the *Abii*, celebrated for their probity; the *Hippophagi*, the *Anthropophagi*; the *Arimaſpi*, men with only one eye; and the *Griphi*, who guarded the treaſure which the *Arimaſpi* would have carried off.

Serica, comprehending the country of the Bogdoi-Tartars, Cathai, and the northern parts of China, was little known. Beyond theſe were the *Hyperborei Scythæ*, Northern or Ruſſian Tartary; and *Montes Riphæi*, the mountains of Stolpe or Oby.

The few notices which relate to Northern China, are collected, and thus ſet down, by Mannert:—Serica is bounded on the weſt by Scythia, on the north-eaſt by an unknown country; on the ſouth by India beyond the Ganges, and alſo by the Sinæ, in a latitude of about 35°. This comprehends Koſhotey, the Chineſe province of Shien-ſi, Mongolia, and part of Siberia. The people are called *Sêres*.

The ſouthern part of the country has many mountains, which are continuations of thoſe in Scythia; ſuch as of the Afzak mountains in the Ruſſian province Nertſhink. Still farther ſouth, occur the Aſmiræan mountains (Ασμιραια ορη), which form the northern limit of the deſert of Kobi. To theſe adjoin the Kaſian mountains, which ſtretch along the Chineſe wall. Mount Thaguron (το Θαγαρον ορος) ſtretches from ſouth to north at the eaſtern end of the Kaſian mountains, and muſt be that part of the Mongolian chain which meets the river Hoang-ho. Next lie the Emodian mountains, which extend from the north of Thibet towards the province Shien-ſi; of which the Ottorokorras, (το Οττοροκορρας,) on which many rivers riſe that fall into the Yellow river, is a portion.

Two great rivers water the major part of Serica. Firſt, the Oichardes, of which the northern ſource is to be ſought in the mountains of Afzak. A ſecond ſtream of it comes from the Aſmiræan mountains of the ſouth-eaſt in the 47½ degree of latitude. Farther weſt, where the main ſtream inclines towards the Emodian mountains, a third tributary river ariſes, under the 44th degree

gree of latitude, but more to the north than the Bautiſus. This latter arm is undoubtedly the Erzineh, which loſes itſelf in the deſert of Sohuk, or in the lake Sopu. The eaſtern ſtream can hardly be any other than the river Onghen; which, like the Erzineh, never mingles with the main ſtream, but in a manner approaches it. Ptolemy, it ſhould ſeem, had two accounts before him: an intervening diſtrict was unknown to both his travellers: it was only from probability that he conducted their ſeveral rivers into the great one. The main-ſtream, Oichardes, then, muſt be the Selenga; which, according to the geographer, takes a ſoutherly direction.

Secondly, the Bautiſus (or, according to the edition of Eraſmus, the Bautes) has its ſource in the north by the Kaſian mountains on the borders of Serica in the 43d degree of latitude. It bends ſouth-eaſt towards the Emodian hills for four degrees, when it receives a ſecond arm thence deſcending. In their farther progreſs, they bend towards the mountain Ottorokorra, and paſs into an eaſtern unknown country. The Hoang-ho, or Yellow river, can ſcarcely be more clearly deſcribed from mere reports. Its northern arm Olanmuren ariſes in Koſhotey, near to the deſert of Kobi, and from the ſame mountains as the Erzineh. Its courſe is ſouth-eaſtward, when it receives a ſouthern branch Haramuren; which, from the mountains of Thibet, takes a crooked north-eaſt courſe. Of its northern bend Ptolemy ſays nothing: but he appears to pre-ſuppoſe it, as he aſſumes another bend to the eaſt; which, if he ſuppoſed the ſtream to flow ſtraight, would be needleſs. The rivers Pſitaras, Cambari, and Lanos, which Pliny aſſigns to the Sêres, probably belong not here, but to the Indian coaſt eaſt of the Ganges.

The people of Serica were divided into the Amthropophagi (or, according to Ammianus, xxiii. 6, Alitrophagi) of the north, and the Annibi, who dwelt contiguous to theſe. Between the latter and the Aſzak mountains are the Siſyges. The Cannibals are placed in the north of Siberia, of which nothing was known; of the other two, who ſeem to have dwelt near the ſea of Baikal, he may have heard. Above the Oichardes are the Damnæ and the Piadæ, and near to the river the Oichardæ. Again, in the north, but eaſt of the Annibi, were ſituated the Garenæi and Rabanei; probably among the Monguls of Kalkas: for, immediately below them, occurs the diſtrict Aſmiræa at the foot of the mountains ſo named. Below theſe extends to the Kaſian mountain the great nation of the Iſſedones. There can be no doubt that, by this name, Herodotus meant Monguls. Beſide them are Throani, near a town of this name; and below them, on the eaſt, Thaguri. Farther to the north-eaſt, Dahuri. Among the Iſſedones dwell Aſpakaræ, who have their name from a city. Near theſe, the Battæ; and the moſt ſoutherly are the Ottokarræ mountaineers. Thoſe three nations occupy the province of Shien-ſi: Ptolemy knew nothing of the more eaſterly parts.

The cities of Serica were Damna, at the weſtern end of the Oichardes, and at ſome diſtance northward from the river: Piada, on the ſouthern bend of the Selenga, here called the Itſcha: Aſmiræa, near the mountains ſo named: Throana, on the eaſt ſide of the Onghen, in the region in which the ruins of Karakorum, once the metropolis of the Mongul ſovereigns, are uſually ſought. The tribes above-mentioned are probably named from theſe towns.

Iſſedon Serica is contradiſtinguiſhed from Iſſedon Scythica, which lay more to the north-weſt. This Chineſe town, which Ptolemy names after the great nation of the Iſſedones, was ſituated north-eaſt from the ſource of the Erzineh, and conſequently on the borders of the deſert of Shamo: he places, in fact, no town beyond it. Aſpakara, which gives name to a tribe, lay near to the northern Bautiſus, and eaſtward from its ſource; on the Olanmuren river, therefore, and probably in Koſhotey. Rhoſoche lay much farther eaſt in the ſame latitude. Paliana and Abragana were both on the banks of the northern Bautiſus and in Koſhotey. Togara and Daxata were both in the middle of the province Shien-ſi, and probably near the Hoa-ho; for all theſe places were in a ſouth-eaſt line towards the bend of the Bautiſus, and towards Sera, the metropolis. Orofana lay near the ſource of the ſouthern Bautiſus, or the Haramuren. Ottorakorra along the courſe of the ſame river near its eaſterly bend, and to the north of the diſtrict to which and to whoſe inhabitants it gives its name. Solana was more eaſtward.

Sera, the capital, was at ſome diſtance from the ſouth bend of the Bautiſus. If Ptolemy means, by this ſouth εκτροπη, the contiguous river Hoa-ho, this Sera can be no other than Singan-fu, which is at ſome diſtance from its ſouthern evolution: but, if he knew of the bow of the Hoang-ho, it muſt be placed more eaſtward, at Honan. The firſt ſeems to me more probable, as Ptolemy appears ignorant of the eaſtern courſe of the river, and may well have miſtaken a part of the Hoa-ho for a continuation of the Bautiſus; and alſo as Signan-fu is named as a former metropolis of the north-weſt parts of China. Sera was the eaſternmoſt reſort of the merchants; and beyond it Ptolemy knows nothing.—See the article CHINA, with the Map, vol. iv. p. 435.

The Middle part of Aſia comprehended *Aſia Minor*, *Armenia*, *Syria*, *Arabia*, and the *Perſian* or *Parthian* Empire.—*Aſia Minor*, may be divided into three parts, each containing four principal countries. The Northern part, towards the Propontis and Euxine, contained *Myſia*, *Bithynia*, *Paphlagonia*, and *Pontus*. The Intermediate part; *Lydia*, *Phrygia*, *Galatia*, and *Cappadocia*. The Southern part, towards the Mediterranean; *Caria*, *Lycia*, *Pamphylia*, and *Cilicia*.

NORTHERN DIVISION.—MYSIA lay between the Propontis and the Ægean Sea, *Bithynia* and *Lydia*. Part of it, from the ſtrait on which it bordered, was called *Helleſpontus*. It was alſo divided into *Major* and *Minor*; the former on the Ægean Sea, and the latter towards the Propontis and Helleſpont. *Troas*, or the kingdom of TROY, may be conſidered as part of Myſia, containing *Ilium* or *Troja*.

The Rivers *Simois*, and *Xanthus* or *Scamander*, however ennobled by Homer, have not now a name. They are ſmall ſtreams, which have but a ſhort courſe from Mount *Ida* to the ſea.

This country was alſo ſometimes called *Phrygia Minor*, to diſtinguiſh it from the Greater *Phrygia*. On the *Thymbris*, a ſtream which runs into the Scamander, ſtood *Thymbra*, famous for the temple of Apollo, called from it *Thymbræus*, in which Achilles was ſlain.—The city of *Dardanus*, which gave the name of *Dardania* to a diſtrict of Troas, and from which the Dardanelles derive their name, no longer exiſts. The ruins which now bear the name of Troy, are the remains of *Alexandria-Troas*:

Jacet ingens littore truncus,
Avulſumque humeris caput, et ſine nomine corpus. *Virg.*

Abydus, the ruins of which are near the caſtle of the Dardanelles on the Aſiatic ſide: near this was the bridge thrown over by Xerxes. *Lampſacus*, Lampſaki.—Europamque Aſiæ, Seſtonque admovit Abydo. *Lucan.*

Towards the Propontis, were *Parium*, Camanar; *Priapus*, Caraboa, near which are the rivers *Æſepus*, the Spiga, and *Granicus*, the Ouſvola, famous for the victory gained in paſſing it by Alexander, and for the defeat of Mithridates by Lucullus. Theſe ſtreams alſo take their riſe in Mount *Ida*, the higheſt ſummit of which was *Gargarus*. Alſo *Cyzicus*, Chyzico, a city of ſuch conſequence, as to ſtand a ſiege againſt all the force of Mithridates; near *Rhyndacus* or *Lycus*, the Artacho, empties itſelf into the Propontis. This river formed the boundary between *Myſia* and *Bithynia*.

On

On the other ſide, oppoſite Alexandria-Troas, is the iſland Tenedos, and near it *Rhætium Promontorium*, where Ajax's tomb was, and *Sigeum Promontorium*, where that of Achilles was. Near the *Prom. Lectum*, now Cape Babo, was *Aſſus*, now *Aſſo*; *Adramyttium*, Adrameſto. That part of the coaſt which lay between the rivers *Caicus*, the Gerinaſti, and *Hermus*, the Sarabat, having been, after the ruin of Troy, ſeized on by a colony of Æolian Greeks, was called *Æolis* and *Æolia*. The river Hermus ſeparated it from Lydia.

At the mouth of the *Caicus* ſtood *Elæa*, now Ialea: it was the ſea-port of *Pergamus*, the capital of the dominions of Eumenes, afterwards left to the Romans by Attalus, the laſt king of Pergamus; it is now Bergamo. *Scepſis*, where Ariſtotle's works were found buried. *Adramyttium* gave name to the bay on which it ſtood; *Thebæ*, the country about which was called *Cilicia Hypoplacia*.

On this coaſt lay the iſlands *Arginuſſæ*, where the Athenians gained a great victory over the Lacedæmonians. Oppoſite is the iſland *Leſbos*, the birth-place of Sappho, now Mitylene, one of the largeſt iſlands in theſe ſeas.

BITHYNIA, more anciently called *Bebricia*, was bounded towards Myſia by the Rhyndacus, and extended from the Sea of Marmora along the Black Sea, to the river *Parthenius*, Partheni. Mount *Olympus*, which is in this country, (there are reckoned no leſs than five mountains of this name in other countries,) gave to part of it the name of *Olympena*. At the foot of it ſtood *Pruſa*, now Burſa, for ſome time the capital of the Turks, before they took Conſtantinople.

On the Propontis ſtood *Myrlea*, called alſo *Apamea*, now Moudania; on the Lake Aſcanius, *Nicæa*, Nice, called alſo Iſnik, where the firſt general council was held; *Nicomedia*, the capital of *Bithynia*, Nicmid; near which was *Libyſſa*, the burial-place of Hannibal. *Chalcedon*, called the City of the Blind, on account of the bad choice of its founders, who overlooked the more advantageous ſituation of *Byzantium*; it is now called *Kadikeni*, or the City of the Cadi. More towards the Boſphorus was *Chryſopolis*, now Scutari. Near this was the temple of *Jupiter Urius*, the Giver of fair Winds.

The next part of Bithynia, towards the Euxine, was inhabited by the *Thyni*. Beyond *Sangaris*, the Sangari, and iſſuing from the mountains called *Hypii*, was the river *Hypius*, the Lippo; and the town *Pruſa ad Hypium*, perhaps now Uſkubi; *Heraclea Pontica*, now Erekli. The promontory which forms a bay near this was called *Acheruſia*, from the fable of Hercules having dragged Cerberus from the lower regions through a cave here:

Tartareum ille manu cuſtodem in vincla petivit
Ipſius a ſolio regis; traxitque trementem. *Virgil.*

The *Mariandyni* and *Caucones* inhabited this part of Bithynia, which, under the Greek emperors, was formed into a province called *Honorias*.

PAPHLAGONIA, extended from the river *Parthenius*, now Partheni, to *Halys*, the Kizil-Ermak, having the Euxine to the north, and Galatia to the ſouth. Its chief towns were—*Seſamus*, incorporated with *Amaſtris*, which took its name from a niece of Darius Codomannus, Amaſreh; *Carambis*, Karempi, near a promontory of the ſame name, which is the correſponding point of land to *Kriu-metopon*, in the *Cherſoneſus Taurica*; *Sinope*, Sinub, a colony from *Miletus*, for ſome time the reſidence of the kings of *Pontus*, and the birth-place of Diogenes. The *Heneti* and the *Chalybes* were the chief tribes inhabiting this country.

PONTUS, extended along the Euxine, from the river *Halys* to the river *Bathys* or *Acampſis*, in the neighbourhood of *Colchis*. It was divided into *Pontus Galaticus*, *Pontus Polemoniacus*, and *Pontus Cappadocius*. The chief towns were: *Amiſus*, now Samſoun, gave its name to the *Sinus Samiſenus*, a gulf which enters deep into the country, and into which flow the rivers *Lycus* and *Iris*; *Amaſia*, Amaſieh, the birth-place of Strabo; *Eupatoria*, called from Pompey *Magnopolis*; *Zela*, Zeleti, where Cæſar defeated Pharnaces, ſon of Mithridates; alſo famous for the rites of *Anaitis*, a Perſian divinity; and *Comana*, famous for thoſe of Bellona. *Themiſcyra*, a city and plains on the banks of the *Thermodon*, Termeti, is ſuppoſed to have been the country of the Amazons.—Θεμισκυρα, εν η τα βασιλεια των Αμαζονων υπηρχε. *Diodorus Siculus.*—*Polemonium*; *Ceraſus*, whence the cherry-tree is thought to have been brought by Lucullus; *Trapezus*, Trebiſond, the reſidence of a branch of the Comnenian princes, till it was taken by Mahomet II. Here were many uncivilized tribes of Moſynæci, Drydæ, Chalibes, Chaldæi. Many ranges of mountains run through the country, viz. the *Paryadres*; *Teches*, from which the Greeks, on their retreat under Xenophon, firſt deſcried the ſea; and *Scydiſſes*, near which are the ſources of the Euphrates.

The INTERMEDIATE COUNTRIES.—LYDIA, otherwiſe called *Mæonia*, lies between the Ægean Sea, Myſia, Phrygia, and Caria. The ſea-coaſt of it between the rivers *Hermus*, Sarabat, and *Mæander*, Meinder, was called, from the coloniſts who ſettled on it, *Ionia*. Theſe Ionians, having been driven out of the Peloponneſus by the Heraclidæ, came into this part of Aſia under the conduct of the ſons of Codrus. Its chief city, *Epheſus*, once adorned with a temple conſidered to be one of the ſeven wonders of the world, is now a heap of ruins, under the name of Aioſoluc; it ſtood near the mouth of the *Cayſter*, now the Chaici; it gave birth to Heraclitus the weeping philoſopher, and Parrhaſius the painter.—Παρραλιην Εφεσον, μεγαλην πολιν. *Dion. Per.*—*Smyrna*, called by the Turks Iſmer, is a city of great trade; it ſtands on the river *Meles*, near which Homer is ſaid to have been born, hence called *Meliſigenes*; no leſs than ſeven cities claimed the honour of his birth-place: *Smyrna*, *Rhodes*, *Colophon*, *Salamis*, *Chios*, *Argos*, *Athenæ*.—*Phocæa*, Fochia, a colony from which founded Marſeilles. *Cumæ* or *Cyme*, which gave name to the *Sinus Cumæus*, the Gulf of Smyrna. *Clazomene*; *Erythræ*, Erethri, on a peninſula oppoſite the iſland *Chios*, Scio; *Teos*, the birth-place of Anacreon; *Lebedus*, noted for feaſts and games in honour of Bacchus; *Colophon*, on the river *Haleſus*: between the two laſt towns was the grove, temple, and fountain, of *Claros*, ſacred to Apollo; and near them was the town and promontory of *Myonneſus*.

Oppoſite the iſland *Samos* is the promontory and mountain *Mycale*, famous for the deſtruction of Xerxes's fleet by the Greeks. *Priene*, on the north of the *Mæander*, was the city of Bias, one of the ſeven wiſe men of Greece, and the ſeat of the Pan-Ionian ceremonies. On the ſouth of that river was *Miletus*, an Ionian city, though within the bounds of *Caria*. It was the birth-place of Thales, the father of philoſophy among the Greeks, and of his ſcholar Anaximander, the inventor of maps and dials, and of Timotheus, the muſician. It was alſo the mother country of many colonies ſettled on the coaſts of the Propontis and Euxine.

In the inland country, *Sardes*, now Sart, was, till the defeat of Crœſus by Cyrus, the capital of a kingdom, which extended to the banks of the *Halys*, the Caſilirmar. It was the uſual reſidence of the king of Perſia's ſatraps or viceroys of this country. *Tmolus*, at the bottom of which it ſtood, is now Bouz-dag, or the Cold Mountain. The country about it is watered by the *Pactolus*, ſometimes called *Chryſorrhoas*, the ſand of which is fabled to have been of gold, and which joins the *Hermus*:

—— Non ſufficit aurum
Quod Tagus et rutila volvit Pactolus arena. *Juvenal.*

At the foot of Mount *Sipilus* is *Magneſia Sipili*, Magneſi, near which Antiochus was defeated by Scipio Aſiaticus. It was for ſome time the reſidence of the Turkiſh princes. *Thyatira*, Ak-hiſſar, or the White Caſtle; *Hypæpi*, Berki; *Magneſia Mæandri*, Guzel-hiſar, the Fair Caſtle; *Tralles*; *Nyſa*, at the foot of Mount *Meſogis*, Noſli; *Philadelphia*,

which long maintained its independence againſt the Turks. An extenſive tract of this country, from *Myſia*, paſſing through *Phrygia*, was called *Catakecaumene*, from its being much ſubject to earthquakes and conflagrations.

PHRYGIA, to the eaſt of *Myſia* and *Lydia*, was the moſt inland part of Aſia Minor. It was divided into *Epictetus* and *Paroreias*: the former expreſſing the country which was diſmembered by the Romans from *Bithynia*, and added to *Phrygia*, in favour of the kings of *Pergamus*; and the latter, the diſtrict which was in the neighbourhood of the mountains. In a ſubſequent period it was divided into *Pacatiana* and *Salutaris*. *Laodicea*, Ladik; and *Coloſſæ*, Chonos, on the *Lycus*, were the chief towns of the firſt of theſe; *Synnada*, of the ſecond. *Celænæ*, afterwards *Apamea Cibotos*, ſtood on the confluence of the *Marſyas* and *Mæander*. *Cotyæum*, Kutaich, now the reſidence of the Beglerbegs of Anatolia.

GALATIA, was the north-eaſt part of *Phrygia*, bordering on *Cappadocia*, ſeized upon by a colony of Gauls in the time of Brennus, and from them called *Galatia*, alſo *Gallo-Græcia*, on account of the mixture of Greeks there was in that country. They were divided into the *Tecto-ſages*, *Toliſto-Boii*, and *Trocmi*. Their chief towns were: *Ancyra*, Angora, now famous for its camblet manufactures and breed of goats; near this place Bajazet was defeated and taken by Tamerlane; *Peſſinus*, at the foot of Mount *Dindymus*, celebrated for the temple and rites of Cybele, the mother of the gods:

O vere Phrygiæ, neque enim Phryges, ite per alta
Dindyma, ubi aſſuetis biforem dat tibia cantum.
Tympana vos buxuſque vocat Berecynthia matris
Idæa. *Virgil.*

Gordium, once the reſidence of the kings of this country, and where Alexander cut the Gordian knot; *Angra*, Kiangari, the reſidence of various princes. There are alſo many mountains in this country; among others, a Mount *Olympus*, different from that of Phrygia.

LYCAONIA, lay between *Phrygia* and *Cappadocia*, and was ſometimes reckoned part of the one, and ſometimes of the other. Its principal town, *Iconium*, Koni, was long the reſidence of the Seljuk Sultans, and the capital of Caramania; *Laodicea Combuſta*, Jurekiam Ladik; *Laranda*, Larandeh. From the *Lycaonum Colles*, the hills of Foudhalbaba, which were to the north-eaſt of *Iconium*, a wide and parched plain ſtretched as far as *Galatia*. In it was *Tatta palus*, a ſalt lake, called by the Turks Tuzla. *Galatia*, and part of *Lycaonia* and *Pamphilia*, were erected into a kingdom for Amyntas, king Dejotarus's ſecretary and general, who quitted the party of Brutus to join that of Anthony and Cæſar.

CAPPADOCIA, included *Armenia Minor*. — *Cappadocia* extended from *Pontus* and the vicinity of Mount *Taurus*, to the banks of the Euphrates. It was ſometimes called *Cappadocia Magna* or *Propria*, or *ad Taurum*, to diſtinguiſh it from *Pontus*, which had the name of *Cappadocia ad Pontum*. Both countries were inhabited by the *Leuko-Siri*, or White Syrians, and were diſmembered from each other under the Perſian monarchy. The part of *Cappadocia* which bordered on the Euphrates was called *Armenia Minor*.

Mazaca, the capital, afterwards called *Cæſarea*, Kaiſarich, was ſurnamed *ad Argæum*, a mountain, from the top of which both ſeas, it was believed, might have been diſcovered. From *Argæus*, Argehdag, iſſued the river *Melas*, which ſtill has a name expreſſive of the blackneſs of its water. Near this the *Halys*, Kizil-Ermak, has its ſource. The chief towns were: *Archelais*, Herekli; *Nazianzus*, which gave its name to one of the Gregories; *Nyſſa*, which has done the ſame to another; *Cybiſtra*, Euſtereh; *Nora*, Nour, where Eumenes ſuſtained a ſiege.

A branch of *Taurus*, called *Antitaurus*, cuts off a diſtrict called *Cataonia*. The chief towns of it were *Tyana* and *Comana*; the former (called *Dana* by Xenophon) was the country of the impoſtor Apollonius; and the latter was famous for a temple of Bellona or Diana, the prieſt of which was a prince little inferior to the kings of Cappadocia. Through *Comana* flowed, in its way ſouthward, the river *Sarus*, Shion.

Melitene, Malaria, gave name to a diſtrict between the *Melas*, Korah-Sou, and *Euphrates*: it was the ſtation of the thundering legion. *Cabira*, afterwards called *Sebaſte*, Sivas, is now the reſidence of the Beglerbeg of Roum, a name given to part of the eaſtern frontier: it ſtood near the *Halys*, and not far from the Mountain *Paryadres*. *Novus*, the ſtrong-hold where Mithridates depoſited his treaſures. *Sinibra*, a retreat of Mithridates, Snarvier; *Tephrice*, Divriki, called Nicopolis, in commemoration of Pompey's victory over Mithridates; *Analiba* or *Daranalis*, Derindeh, where the Euphrates forces its way through a narrow paſſage in Mount *Capotes*, now Kepouh; *Arahrace*, Aralkir; *Satala*, Arzingan, the laſt on the frontier, and the ſtation of a legion.

CARIA, LYCIA, PAMPHYLIA, and CILICIA, are the countries towards the Mediterranean.—CARIA is ſeparated from Lydia and Phrygia by the Mæander and the Lycus, and from Lycia by Glaucus Sinus, the Gulf of Macri. It was divided into *Caria*, *Doris*, *Peræa*, and *Caria Mediterranea*. The *Leleges*, driven from the neighbourhood of Troy, dwelt in part of this country. The chief cities were: *Miletus*, already mentioned as an Ionian city; near it was Mount *Latmus*, fabled for the viſits of Diana to Endymion; *Jaſſus*, which gave name to *Jaſſius Sinus*, Kalaſi; *Mindus*, Mindes; *Halicarnaſſus*, the reſidence of the kings of *Caria*, where Artemiſia erected the monument to her huſband Mauſolus; alſo the birth-place of Herodotus, and Dionyſius the hiſtorian and critic; *Ceramus*, Keramo, gave name to *Sinus Ceramicus*, the Gulf of St. Peter. On this gulf, and at the extremity of the peninſula of Doris, called *Triopium*, or Cape Crio, was *Cnidus*, famous for the worſhip of Venus. —*Peræa*, being ſubject to Rhodes, which is oppoſite to it, was called *Peræa Rhodiorum*. More inland were *Alabanda*, *Antiochia-Mæandri*, *Strattonicea*.

The iſlands in this part of the Ægean Sea are: the *Sporades*, or diſperſed iſlands, the chief of which are, *Rhodus*, απο των ῥοδων, Rhodes, famous for its power at ſea, for its Coloſſus, and for having been, in modern times, the reſidence of the knights of St. John, and the long and furious ſiege by which it was reduced, under Soliman II. A. D. 1522. See the article EGYPT, vol. vi. *Carpathus*, Scarpanto, which gave name to *Mare Carpathium*, the Sea of Scarpanto; *Cos*, now Stanzo, the country of Apelles the painter, and Hippocrates the phyſician; *Patmos*, Palmoſa, where St. John wrote the Revelations; *Icaria*, Nicaria, which derived its name from Icarus, ſon of Dædalus, and which gave name to *Mare Icarium*; *Samos*, ſacred to Juno, and the country of Pythagoras; *Chios*, Scio; *Leſbos*, Mitylene, the country of Alcæus, Sappho, Arion, and Theophraſtus; *Tenedus*, Tenedo, behind which the Grecian fleet lay when they made a feint of raiſing the ſiege of Troy; *Lemnos*, ſacred to Vulcan, Stalimene.

LYCIA, was ſeparated by a gulf on each ſide from Caria and Pamphylia. Ridges of mountains to the north run between it and Phrygia. *Telmeſſus Macri*, on the Gulf of Macri, where runs Mount *Cragus*, an arm of which is called *Anticragus*; *Chimæra*, a volcano, is one of the eight peaks of this mountain.

Xanthus, Ekſenidé, on a river of the ſame name; *Patara*, the oracle from which the *Lyciæ ſortes* were delivered, Apollo reſiding the winter half of the year here, and the ſummer half at *Delos*; *Olympus*, built near a mountain of this name, and *Phaſelis*, on the confines of Piſidia, were noted haunts of pirates, both of them deſtroyed by Servilius Iſauricus.—Sed nec mare ſubmo-

ville

viſſe contentus, validiſſimas urbes eorum, et diutina præda abundantes, Phaſelin et Olympon evertit. *Florus.*

Promontorium Sacrum, or *Chelidonium*, was the commencement of Mount *Taurus*; a branch of which, called *Climax*, projects ſo far into the ſea, that Alexander's army were obliged to march waiſt-deep in water to go round it.—The north of *Lycia*, with part of *Phrygia* and *Piſidia*, formed a country not much known, called *Milyas*.

PAMPHYLIA, and PISIDIA.—The boundaries of theſe two countries are difficult to ſettle. *Pamphylia* lay towards the coaſt; *Piſidia*, more inland. *Pamphylia* extended from *Phaſelis* to *Cilicia Aſpera*. The chief towns were: *Attalea*, Satalie, on the river *Catarractes*; *Perga*, on the *Ceſtrus*; *Aſpendus*, on the *Eurymedon*, at the mouth of which Cimon deſtroyed the Perſian fleet and army; *Side*, *Coraceſium*.—Cypriorum et Phœnicum ducentarum navium claſſem devictam cepit; eodemque die pari fortuna in terra uſus eſt. *Nepos et Plutarchus.*

More inland were, *Termeſſus*, Eſtenaz, once the capital of the *Solymi*, and of an intermediate country between *Lycia* and *Pamphylia*, called *Cabalia*; *Selga*, a ſtrong town of Lacedæmonian extract. *Iſauria* lay to the eaſt of Piſidia, and was inhabited by a people addicted to violence and rapine. Their chief town, *Iſaura*, was deſtroyed by Servilius Iſauricus. Other towns were, *Derbe*, *Lyſtra*, *Coralis*, Kerali. The name of Iſauria was alſo given to part of Cilicia.

CILICIA, was bounded to the north by the ridges of Taurus, and extended along the Mediterranean, from Pamphylia to Syria. The mountainous part of it was called *Trachea*, and alſo *Iſauria*, on account of its vicinity and likeneſs to that country. The chief towns were: *Selinus*, Selenti, where Trajan died; *Antiochia*, Antiochetta, at the foot of a mount named *Cragus* (not to be confounded with that in *Lycia*); *Charadrus*, Calandro; *Anemurium*, Eſtenmur, on a point oppoſite Cyprus; *Celenderis*, Kelnar; *Seleucia Trachea*, Selefkeh, on the *Calycadrus*, now Kelikdni. More inland were: *Homonoda*, a ſtrong-hold, Ermenak; *Olba*, chief town of a diſtrict named *Cetis*.

In the level country, called *Cilicia Campeſtris*, were *Corycus*, Curco; *Soli*, afterwards *Pompeiopolis*; *Anchiale*, ſaid to have been built by Sardanapalus, and where there was a tomb bearing his name; *Tarſus*, Tarſous, once the ſeat of the arts and ſciences, and the birth-place of St. Paul: it ſtood on the *Cydnus*, bathing in which had nearly proved fatal to Alexander; *Adana*, on the river *Sarus*, Scihoun; *Mopſus* or *Mopſueſtia*, Meſſis, on *Pyramus*, the Geihoun; on the ſame river was *Anazarbus*, Anzarba. This part of Cilicia was called, in the time of the cruſades, the kingdom of Leon.

Iſſus, Aiaſſe, where Alexander gained his ſecond victory over Darius, gave name to *Sinus Iſſicus*, a gulf which runs deep into the country. It ſtood near the river *Pinarus*, Deli-Sou. In commemoration of this victory were built *Nicopolis* and *Alexandria apud Iſſum*, in Syria. *Amanus*, Monte Negro, bounds Cilicia towards Syria, and approaches ſo near the ſea as to form the paſs called *Pylæ Syriæ*, or *Amanicæ*. There were other paſſes through the mountains, called *Pylæ Ciliciæ*, *Pylæ Tauri*, &c.

ARMENIA, and the neighbouring countries of COLCHIS, IBERIA, and ALBANIA.—ARMENIA was bounded to the ſouth and eaſt by *Meſopotamia*, *Aſſyria*, and *Media*; to the weſt by the *Euphrates* and *Armenia Minor*; and to the north by the nations of *Colchis*, *Iberia*, and *Albania*, which occupied the country from weſt to eaſt between the Euxine and the Caſpian; on which ſide it extended as far as the confluence of the *Araxis*, the Aras, and *Cyrus*, the Kur. The weſtern part of this country is now Turcomania.

Armenia abounds, and is ſurrounded, with lofty mountains. One ridge of Mount Taurus parts it from Meſopotamia; *Niphates*, which may be conſidered as another, parts it from Aſſyria; *Antitaurus* extends its arms towards it from Cappadocia; the *Montes Moſchi et Caſpii* lie to the north and eaſt of it; while the *Paryadres*, *Gordiæi*, *Ararath*, and others, are ſcattered over the face of it.

Beſides rivers of leſs note, the *Tigris*, *Euphrates*, and *Araxes*, Aras, take their riſe in the mountains of this country; the two latter are ſaid to have their ſource in the ſame mountain, *Abus*, the one running eaſt, and the other weſt.—Tigris et Euphrates uno ſe fonte reſolvunt. *Boetius.*

Quaque caput rapido tollit cum Tigride magnus
Euphrates. *Lucan.*

Phaſis, the Phazzeth, another conſiderable river, gave name to the diſtrict of *Phaſiane*, Paſini, and to *Mare Phaſianum*, the eaſtern part of the Euxine. The country where this river approaches Media, was called *Atropatene*. The *Acampſis*, which flowed between *Armenia* and *Colchis*, roſe in the mountains inhabited by the *Sanni*; the higheſt part of this river is called Boas.

The chief towns in Armenia were: *Arze* or *Arzira*, Erzerum, near which the Euphrates takes its riſe, while another branch, which is alſo called Euphrates, riſes in a diſtrict called *Caranitis*. The country towards the junction of theſe rivers was called *Aciliſene*, now Ekilis. *Artaxata* was a city of great conſequence; *Arſamoſata*, now Shimſet, was another, in an extenſive diſtrict, called *Sophene*; *Amida*, Amid, or Diarbekir, on the Tigris, the ſources of which are in the mountains anciently called *Niphates*: Ὁ Τιγρις απὸ τῦ Νιφατῦ ὀρεος ὁρμηθεις ταχυτατος ἐστιν και ἀμικτος. *Strabo.*—*Tigranocerta*, founded by Tigranes, now Sered; *Artemita*, Van, on the Lake *Narciſſa*, called the Lake of Van.

COLCHIS, the fabulous country of the golden fleece, extended as far as *Caucaſus* to the north, and *Iberia* to the eaſt. It comprehended Mingrelia, Guria, Imaretta, and part of Circaſſia. In the time of the Lower Empire, it was called *Lazica*, and the people *Lazi*. The chief towns were: *Cyta*, Kotatis, the birth-place of Medea; *Æa*; *Phaſis*, on the river of the ſame name: in it were the temple of Phryxus, and the golden fleece; *Pityus*, Pitchinda.

Beſides the nations peculiar to the country, we find here the *Suani*, *Abaſci*, and *Moſchi*.

IBERIA, lay between Colchis and Albania, Caucaſus and Armenia. It now anſwers to great part of Georgia. To the north of this country were *Pilæ Caucaſiæ*, a difficult paſs between the mountains. The river *Cyrus*, Kur, on quitting Armenia, traverſes this country, till it meets the *Araxes*.

ALBANIA lay along the Caſpian to the eaſt of *Iberia*, and was bounded to the ſouth by the *Cyrus*, which parted it from *Media Atropatene*. It anſwers to Dagheſtan and Shirvan. The paſſes through the mountains in this country were called the *Caſpiæ* and *Albaniæ Pylæ*; *Validus Murus* or *Portæ Ferreæ*, Derbent.

SYRIA, including PALESTINE, was bounded to the north by Taurus, and that branch of Taurus called *Amanus*, now Monte Negro; by Arabia and Egypt to the ſouth; extending eaſt and weſt between the Mediterranean and Euphrates. The principal rivers of this country were: the *Orontes* and the *Jordan*.—Jam pridem Syrus in Tiberim defluxit Orontes. *Juvenal.*—It was divided into five parts; *Commagene*, *Syria Propria* or *Seleucis*, *Cœlo-Syria*, *Phœnicia*, and *Paleſtine* or *Judæa*.—The moſt northern of theſe was *Commagene*, in a later period called *Euphrateſia*. It lay between *Amanus* and the Euphrates. Its chief towns were: *Samoſata*, Semiſat, the birth-place of Lucian, on the Euphrates; and *Zeugma*, where there was a bridge over that river.

The next diviſion to the ſouth was *Seleucis*, or Syria Proper; the chief towns of which were: *Antiochia*, Antioch, where Chriſtians firſt received their name. It ſtood upon the Orontes, was founded by Seleucus Nicator,

cator, and was the reſidence of the kings of Syria. Near it was the delightful village and grove of *Daphne*. The ſame Seleucus founded the cities of *Seleucia* and *Apamea* in this diſtrict. *Seleucia* was alſo called *Pieria*, from a neighbouring mountain. Near it was Mount *Caſius*, of a fabulous height. The iſland *Melibœa*, famous for its purple, was at the mouth of the *Orontes*. Near the ſource of this river was *Emeſa*, the city of Heliogabalus.

In *Cirrheſtica*, a diſtrict of this country, lay *Berœa*, now Aleppo, almoſt midway between the ſea and the Euphrates; *Bambyce* or *Hierapolis*, the temple of the Syrian goddeſs *Aſtargatis* or *Mahog*, who was feigned to have the face of a woman and the tail of a fiſh: ſhe was called by the Greeks *Derceto*, and was thought by ſome to have been the ſame with *Aſtarte*.

To the eaſt and ſouth-eaſt of Syria Proper, between the mountains of *Libanus* and *Antilibanus*, lay *Cœlo-Syria*, or Hollow Syria. The chief city of which, *Damaſcus*, now Damas, being delightfully ſituated, ſtill retains much of its ancient importance. It was watered by the two ſtreams of *Abana* and *Pharphar*. *Heliopolis*, Balbec, was famous for a magnificent temple of the ſun, the ruins of which ſtill remain.

This part of Syria was alſo named *Laodicene*. Between it and the Euphrates ſtood *Palmira*, Thadmor, the city of Odenatus and his queen Zenobia, ſubdued by Aurelian, A.D. 272.—Palmyra urbs nobilis ſitu, divitiis ſoli et aquis amœnis; vaſto undique ambitu, arenis includit agros, ac veluti terris exempta a rerum natura. *Pliny*.—It gave the name of *Palmyrene* to the neighbouring country and deſert. Its intermediate ſituation, between two ſeas and two great empires, raiſed it to that importance which is ſtill manifeſted by its ruins. In this diſtrict is ſometimes reckoned *Thapſacus*, where there was a bridge over the Euphrates.

Phœnicia was a narrow tract of coaſt, bounded by the river *Eleutherus*, *Cœlo-Syria*, *Paleſtine*, and the Mediterranean:

Phœnices primi, famæ ſi creditur, auſi
Manſuram rudibus vocem ſignare figuris. *Lucan.*

It contained the cities of *Tyre* and *Sidon*, famous for their commerce. There were two cities of the former of theſe names: the firſt, or ancient Tyre, ſtood upon the continent; it was deſtroyed by Nebuchadnezzar; New Tyre, upon an iſland. The ruins of Old Tyre furniſhed Alexander with materials for building the mole by which he took the town. Tyre was alſo famous for its purple: its preſent name is Sur; that of Sidon is Seyde. *Tripoli*, Tarabolous; *Sarepta*, Sarfat; *Ptolemais* or *Acon*, Acre; *Beritus*, Berut; and *Laodicea*, Ladikieh (which was to the north of the *Eleutherus*) were conſiderable towns. In the mountains of this country dwell ſome Maronite tribes, and the Druzes, who pretend to be deſcended from the cruſaders. On one of theſe alſo is Maſiat, a fortreſs formerly the reſidence of the prince of the Aſſaſſins.

Between this coaſt and that of Cilicia, is the iſland CYPRUS, ſuppoſed to have originally taken its name from its copper mines. It was peopled by the Phœnicians.—The chief towns were: *Salamis*, founded by Teucer, afterwards *Conſtantia*, Coſtanza, not far from Famagouſta; *Paphos*, ſacred to Venus; *Idalium*, alſo ſacred to Venus, Dalin; *Citium*, the birth place of Zeno, founder of the ſect of the ſtoics; *Ledra*, Nicoſia; *Amathus*, where was the temple of Adonis.

PALÆSTINE, or *Judæa*, called alſo the HOLY LAND, and in Scripture the Land of Canaan, the Land of Iſrael, and of Judah, extended from *Phœnicia* to *Arabia*. The Jordan is the only river of note in it; which riſes in Hermon, a branch of *Antilibanus*. Having paſſed through the Lake of Gennesareth, or the Sea of Tiberias or Galilee, after a courſe of one hundred and fifty miles, it loſes itſelf in the *Aſphalites*, or Dead Sea, called alſo the Sea of the Plain. This lake is ſuppoſed to occupy the place of the accurſed Sodom and Gomorrah.

Paleſtine was at different times differently divided. The chief towns of the Philiſtines, its ancient inhabitants, were: *Azotus* or *Aſhdod*, *Gaza*, *Aſcalon*, *Gath*, *Ekron*. Theſe lay in the country between Dan and Simeon and the Sea, and were the chief cities of the five lordſhips of the Philiſtines. The other principal tribes were, the Canaanites, Hittites, Perizzites, Amorites, Jebuſites.

On the driving out of the Canaanites, it was divided between the twelve tribes. After the revolt of the ten tribes under Rehoboam, it was divided into the kingdoms of Judah and Iſrael. On the return from the Babylonian captivity, and during the ſecond temple, it was diſtinguiſhed into the countries of Judæa, Samaria, Galilee, on this ſide the Jordan; and *Peræa*, the country beyond or to the eaſt of Jordan. Of theſe Galilee lay to the north, Judæa to the ſouth, and Samaria occupied the intermediate country. Judæa was ſometimes a general name for the whole.

JUDÆA PROPER, extended from the Dead Sea and the Mediterranean to Egypt, and included, beſide the tribe of Judah, thoſe of Benjamin, Dan, and Simeon. The chief city was *Hieroſolyma*, Jeruſalem, ſometimes called *Jebus*, from its having belonged to the Jebuſites, and ſuppoſed to have been the Salem of Melchiſedec. It was built on ſeveral hills, the higheſt of which was Sion, on which ſtood the Tower of David. Mount Moriah, whereon Iſaac was to have been ſacrificed, was the ſeat of the temple. The other places of note near Jeruſalem were: to the north and eaſt, *Emaus*, *Hierichus*, Jericho; *Bethel*, *Gilgal*, *Ephraim*:—to the ſouth, BETHLEHEM, the birth-place of our Saviour; *Hebron*, *Mamre*:—on the weſt, *Rama*, *Gibea*, *Lydda*, *Joppa*, now Jaffa, the moſt convenient ſea-port for Jeruſalem. Near to *Joppa* Andromeda is fabled to have been expoſed to the ſea-monſter, from which ſhe was delivered by Perſeus.

The city of *Samaria* having been rebuilt by Herod, was called by him *Sebaſte*, in honour of Auguſtus. *Sichem* had been the royal city before Samaria; it was afterwards called *Neapolis*, Nabolus; it ſtands at the foot of Gerizim, on which the Samaritans had their temple; *Cæſarea*, previouſly called *Turris Stratonis*, for ſome time the reſidence of the Roman governors.

The lower part of Galilee was diſtinguiſhed from the northern part of it, which bordering on Phœnicia, was called "Galilee of the Gentiles." The towns of it are: *Jezreel*, Eſdrelon; *Capernaum*; *Bethlehem*, the birth-place of our Saviour; *Nazareth*, his reſidence till he entered on his miniſtry; *Cana*, where he performed his firſt miracle, by turning water into wine; *Aca* or *Ptolemais*, Acre, a ſea-port famous in the time of the cruſades; *Sepphoris* or *Dio Cæſarea*, now Seſouri; *Tiberias*, upon a lake of the ſame name, alſo called the lake of Gennesareth; *Panium* or *Cæſarea Philippi*, more anciently Dan and Laiſh.

The mountains not already mentioned were: *Ghilboa*, famous for the defeat of Saul and Jonathan; *Thabor*, on which our Saviour was transfigured; *Carmel*, the retreat of the prophet Eliſha; *Hermon*, called alſo Sihon, a branch of Lebanon.

Peræa, in general expreſſes all the country beyond, or to the eaſt, of Jordan. It is, however, chiefly applied to the diſtrict between the *Arnon* and the Lake of Gennesareth. The chief towns of it were: *Machærus*, *Heſhbon*, *Medaba*, *Gilead*, *Ephron*, *Ramoth*. The plain between the two lakes of *Aſphaltites* and Gennesareth, was called *Aulon*. Here were the mountains of *Gilead*, *Abarim*, *Nebo*, and *Piſgah*, from which laſt Moſes enjoyed a view of the promiſed land. Certain ſubdiviſions of this country were called *Trachonites* or *Iturea*, *Gaulonitis*, *Batanea* or *Baſan*, *Auranitis*. The reſpective limits of theſe are not well aſcertained. There was in this part of the country a *Decapolis*, or confederacy of ten cities. To the eaſt

lay *Ammonitis*, the chief town of which was *Rabbath-Ammon*, afterwards called *Philadelphia*; to the ſouth, *Moabitis*, whoſe chief town was *Rabbath-Moab*.

Idumæa or *Edom*, lay to the ſouth of the Dead Sea. Its chief towns were: *Zoar* and *Theman*. *Bozra*, at the foot of Mount *Seir*, was reckoned part of Arabia.

Other names which occur in ſacred geography were: *Aſhur*, the ſame as Aſſyria.—*Aram*, part of Syria, with Cœlo-Syria and Meſopotamia.—Land of *Uz*, the South of Syria.—*Elam*, Perſia; *Lud*, a country near it.—Land of *Cuſh*, Æthiopia, including Arabia; part of which, *Sheba*, probably was Arabia Felix; *Havilah*, Arabia Deſerta, near *Babylonia*; *Raamah* and *Dedan*, lying on the Perſian Gulf.

Ophir, concerning which there are various conjectures; ſome placing it in the Eaſt Indies, ſome in Africa, and ſome in Spain.—*Mizraim*, Egypt; part of which, on the eaſt of the Nile, was *Goſhen*.—*Lub* or *Lubim*, Libya, to the weſt of Egypt.—*Phut*, the more diſtant parts of Egypt.—*Hamath*, a royal city, and part of Phœnicia; in it alſo was the city of *Riblah*.—*Arvad* or *Arpad*, *Sepharvaim*, *Henah*, and *Ivah*, cities and principalities near *Hamath*. *Sepharvaim* is ſuppoſed to have been Aleppo.

ARABIA.—The ancient name and boundaries of this country are the ſame with the modern. It extends from the Euphrates and Paleſtine to the Arabian Gulf or Red Sea—(this latter name was given by the ancients to all the Indian Ocean)—and the Perſian Gulf, and forms a large peninſula. The Northern diviſion, comprehending *Idumæa*, or the land of the children of Edom, took the name of *Petræa* from *Petra*, the reſidence of the kings of the *Nabathæi*. *Ælana*, Ailah, gave its name to the *Sinus Ælanites*. From *Eſiongeber*, Solomon's fleets ſailed for *Ophir*. On the Gulf of *Heroopolis* ſtood the town from which it took its name, now Kalaat-Agerud; alſo *Paran*, which gave name to the adjoining wilderneſs; *Arſinöe*, or *Cleopatris*, is now Suez, from which the iſthmus takes its name. In this part of Arabia were Horeb and Sinai, famous for the promulgation of the Moſaic law, contiguous mountains, or perhaps the ſame. The Midianites, Moabites, Amalekites, and Iſhmaelites, dwelt in this country.

Arabia Deſerta, lay to the ſouth-eaſt of *Petræa* and *Syria*, and extended as far as that part of Chaldea now called Baſſora. Arabia Felix bounded it to the ſouth and ſouth-weſt. The principal tribes inhabiting it were the *Scenitæ* and *Nomades*, now commonly called Bedouin Arabs.

Arabia Felix, ſo called from the excellence of its productions, lay between the Gulf of Perſia and the Red Sea. It was inhabited by various tribes, the *Nomades Scenitæ*, and *Nabatæi*, the *Saraceni*, *Homeritæ*, and *Sabæi*, whoſe country, ſuppoſed to have been called *Panchæa*, anſwers nearly to the kingdom of Aden and Yemen. It produces frankincenſe, and is the moſt fertile part of Arabia. Their chief town, *Sabatha*, is probably Sanaa; *Meriaba*, Mareb; *Macoraba*, Mecca; *Jatrippa*, Medina; *Gerra*, El Catif; *Moſcha*, Maſcat; *Niſa*, the fabulous birth-place of Bacchus, is alſo ſuppoſed to have been in this country as well as in India.—India mittit Elur, molles ſua thura Sabæi. *Virgil.*—*Diræ*, were the ſtraits of Babel-Mandel; *Arabia Emporium*, Aden; *Dioſcoridis Inſula*, Socotora.—See the article ARABIA, vol. ii. p. 1–26.

The PARTHIAN EMPIRE, after the revolt from the Syrians, included *Media*, *Aſſyria*, *Babylonia*, *Perſia*, and the dependant countries.—*Media* was ſeparated on the north from Armenia by the *Araxes*; on the other ſides it was bounded by the Caſpian Sea, Perſia, Aſſyria, and Aria. A great part of it is known by the name of Irak-Agemi, or the Perſian Irak, to diſtinguiſh it from Irak-Arabi, the Turkiſh diviſion of it. The part which bordered on Armenia was called *Atropatene*, from the ſatrap Atropates, who ſhook off the Macedonian yoke, and eſtabliſhed his family in this principality. It is now called Aderbeitzin, or the Country of Fire, having been the native country of Zoroaſter, legiſlator of the Magi.—Μαγοι παρα Περσαις οι φιλοσοφοι και φιλοθεοι. *Suidas.*—Its chief city was *Gazæ*, or *Gazaca*, probably now Tauris. *Thebarmai*, Urmiah, was the birth-place of Zoroaſter.—The ſouth-eaſt part, bordering on Perſia, was called *Media Magna*, the chief towns of which were *Ecbatana*, the ſummer retreat of the kings of Perſia, and afterwards of the kings of Parthia, now ſuppoſed to be Hamedan.—Urbem hanc nunc tenent Parthi, eaque æſtiva agentibus ſedes eſt. *Q. Curtius.*—*Ragæ*, called alſo *Europus* and *Arſacia*: the *Nyſæi Campi* in this country were famous for the horſes bred there; the *Pylæ Caſpiæ*, a famous paſſage, was in Mazanderan, the country of the *Tapuri*.—Another diviſion of the country towards *Perſia*, was called *Perætacene*.

Parthia, or *Parthiene*, the eaſtern corner of Media, was, in a great meaſure, bounded by *Hyrcania*, *Aria*, and *Carmania*. The people who inhabited this narrow tract, having ſhaken off the Syrian yoke, formed the formidable empire of the Parthians. Their chief cities, however, *Seleucis* and *Cteſiphon*, were not in this country.

The *Aſſyrian* empire comprehended the greater part of Aſia; but *Aſſyria*, in the limited ſenſe of the name, lay between Armenia to the north, and Babylonia to the ſouth; the Tigris bounded it to the weſt; and on the eaſt it was ſeparated from *Media* by Mount *Zagros*, called by the Turks Tag-Aiaghi: it was ſometimes called *Aturia*, from a diſtrict near Nineveh; and ſometimes *Adiabene*, from a province to the ſouth of it; the *Curduchi*, now Kurdes, who inhabited the mountainous part of it, have given it the name of Curdiſtan.—Imperium Aſſyrii, mille trecentis annis habuere. *Juſtin.*

The principal rivers of this country, beſides the Tigris, were: *Zabus*, ſcarcely inferior to the Tigris, called by the Greeks *Lycus*, or the Wolf, now Zarb; *Zabus Minor*, or *Caprus*, the Boar, now the River of Gold; and the *Gyndes* and *Gorgus*.—A celeritate qua defluit Tigri nomen eſt inditum; quia Perſica lingua Tigrim ſagittam appellant. *Q. Curtius.*

Nineveh, the capital of Aſſyria, ſaid to have been ſixty miles in circumference, ſtood on the eaſt bank of the Tigris: its ruins are oppoſite Mouſul; *Arbela* was famous for the victory of Alexander over Darius, though the battle was fought at ſome diſtance from it, at *Gaugamela*.—Alexandro traditur Arbela, regia ſupellectili Dariique gaza repleta; totius exercitus opibus in iſtam ſedem congeſtis. *Q. Curtius.*—In the neighbourhood of *Corcura*, Kerkur, were many naphtha ſprings; *Sittace* gave name to the province of *Sittacene*, in which was the city of *Cteſiphon*, the reſidence of the Parthian kings.

Babylonia now anſwers to Irak, or Irak Arabi, the northern part of which was *Meſopotamia*, or the country between the rivers, and the ſouthern *Chaldæa*, extending towards the Gulf of Perſia. Between theſe lay *Babylonia Proper*, commencing at the junction of the rivers.

Meſopotamia, alſo called *Aram*, now Diarbec, where not waſhed by the Euphrates and Tigris, was bounded by ridges of Mount Taurus. Its chief towns were: *Niſibis*, on the river *Mygdonius*, the bulwark of the Roman empire againſt the Parthians, now Niſibin; *Seleucia* or *Seleucis*, Bagdat, built by Seleucus Nicanor, with the view of weakening Babylon, as *Cteſiphon* was afterwards by the Parthian princes, with the ſame view againſt *Seleucia*; *Carræ*, Haran, memorable for the defeat and death of Craſſus, and for the murder of Caracalla:

——— Miſerando funere Craſſus
Aſſyrias Latio maculavit ſanguine Carrhas. *Lucan.*

Edeſſa, Roha, near Mount Taurus; *Apamia*, joined to *Zeugma* by a bridge over the Enphrates; *Labana*, now Moſal, on the Tigris, oppoſite Nineveh; *Sippharah*, built immediately above the branching of the Euphrates into its three channels. Some hordes of Arabs gave to

part of this country the name of *Arabia Scenitarum*, or *Euphratenſis*.

Babylonia Proper, was every where encompaſſed by the Tigris, and branches of the Euphrates. *Babel* or *Babylon*, the capital, was founded by Belus, and adorned and enlarged by Semiramis and Nebuchadnezzar; it is ſuppoſed to have been fifty miles in circuit. *Vologeſia* and *Alamundari* took their names from Parthian princes; *Borſippa* gave its name to a Chaldean ſect.

The Euphrates was cut into many branches and canals, communicating with the Tigris. The chief canals were: *Marſes*, *Pallacotta*, and the Royal Canal; veſtiges alſo remain of a channel by which the Euphrates once diſcharged itſelf into the Perſian Gulf, without mixing its waters with thoſe of the Tigris.

Chaldea was ſeparated from Arabia on the ſouth-weſt by a ridge of mountains; it was bounded on the other ſides by the Euphrates, Tigris, and their branches.—Χαλδαιοι τοινυν των αρχαιοτατων οντες Βαβυλωνιων. *Diod. Siculus.*—The chief towns were: *Teredon*, advantageouſly ſituated on the united ſtream of the two rivers for the Indian trade; it is perhaps now Buſſorah; *Orchöe*, ſuppoſed to have been *Ur* of the Chaldees, the ſeat of Abraham's anceſtors; it gave name to a Chaldean ſect. Near it, the moſt weſtern branch of the Euphrates loſt itſelf in the ſands. The rivers, after their junction, were called *Paſitigris*. A tract of land formed by the branching of their mouths, was called *Meſene Euphratis*, to diſtinguiſh it from another inſular tract higher up the river, called *Meſene Tigridis*.—*Mare Erythræum*, the denomination of the whole Eaſtern Ocean, was ſometimes reſtricted to the Gulf of Perſia.

Perſia, or *Perſis*, Pars, Fars, Iran, lay north and ſouth, between Media and the Perſian Gulf; and between the Tigris to the weſt, and *Aria* to the eaſt.—Περσις ολη μεγαλοισι περιδρομος εστι γαια. *Dionyſ. Per.*

Cyrus, who drew this country from obſcurity, ſubjected to it the greater part of Aſia. The country properly ſo called, among others, contained theſe provinces: *Suſiana*, Chuſiſtan, the moſt weſtern. *Suſa*, the chief town, is now thought to be Souſter, the winter reſidence of the kings of Perſia. It is traverſed by the river *Eulæus* or *Choaſpes*, now Karun, which ſupplied the water chiefly drunk by the kings of Perſia.—Ad Choaſpem amnem pervenit, delicatam, ut fama eſt, vehentem aquam. *Q. Curtius.*—The ſame river is the weſtern boundary of the province of *Elimais*, part of Chuſiſtan, on the Perſian Gulf. The diſtrict between the *Elimais* and the mouth of the Tigris, was called *Characene*, from its chief town *Charax*. *Perſis Propria*, now Farſiſtan, and part of Erac Agem. The chief towns of it were: *Perſepolis*, on the *Araxes*, deſtroyed by Alexander; Schiras is not far from its ruins. *Paſargadæ*, an ancient royal city, where Cyrus was buried; *Aſpadana*, Iſpahan.

The Perſian empire, in the time of the Darius's, was divided into twenty large provinces or ſatrapies.—The principal rivers, beſides thoſe already mentioned, are the *Araxis* or *Aroſis*, (not to be confounded with the river of the ſame name, which flows into the Caſpian,) and *Medus*, which run into each other, and the *Cyrus*. Their courſe is into the Perſian Gulf. The *Oxus*, Gihon, or Amu, was one of the boundaries of Perſia; the country within it was Iran, thoſe beyond it were called Aniran.

Eaſtward lay the province of *Carmania*, Kerman; divided into *Deſerta*, the northern part, and *Vera*, the ſouthern, towards the Arabian Sea. The chief towns were: *Carmana*, *Harmozia*, Ormus.

Gedroſia, extended from *Carmania* to India: it now anſwers to Mekran. The coaſt of it was occupied by the *Ichthyophagi*; the greater part of this country was deſert, and has proved fatal to the armies of ſeveral princes.

Aria, the name of a particular province, when applied to ſeveral of the adjoining countries, was called *Ariana*. *Aria Proper* anſwers to the country now called Choraſan and Sabluſtan. In its more extenſive uſe it contained *Regio Parapameſadum*, Candahar, and the eaſt part of Sabluſtan; *Drangiana*, part of which was occupied by the *Ariaſpæ Evergetæ*, Sigiſtan; *Arachoſia*, extending from *Drangiana* to the *Indus*.

Hyrcania, lay to the north of *Aria*, from which it was ſeparated by the high ridge of mountains called *Parapamiſus*, and which were ſometimes, but improperly, called *Caucaſus*. It extended to the Caſpian Sea, to part of which it gave name: it now anſwers to the north of Choraſan.

To the north of *Hyrcania* lay *Margiana*, inhabited by the *Meſſagetæ*, whoſe queen Tomyris is ſaid to have cut off Cyrus; *Bactriana* and *Sogdiana*, now Uſbeck Tartary, or the Great Bucharia and Balk.—The rivers of this country were: *Margus*, the Morgah; *Oxus*, the Gihon or Amu; *Polytimetus*, *Iaxartes*, the Sirr or Sehoon, *Rymnicus*, *Daix*. Of theſe and others it is difficult to ſay whether their names are proper, or the appellatives of ſeveral.

The South of Asia.—The ſouthern part of Aſia conſiſted of *India intra Gangem*; *India extra Gangem*; *Sinarum Regio*; and *Inſulæ Maris Indici*. The firſt of theſe, *India intra Gangem*, whoſe capital was *Palibothra*, Alihabad, or, according to others, Patna, lay between the two great rivers Indus and Ganges. Beſides other countries, it comprehended the kingdoms of Porus and Taxiles, and a great part of the country of the *Praſii* or *Gangaridæ*, whoſe chief town was *Ganga*. It was very imperfectly known to the ancients. The ſame obſervation is with more reaſon applied to *India extra Gangem*, the farther India, and *Sinarum Regio*, Cochin-China; the northern part of which was *Serica*, Cathai, and China; by others it is thought to be no more than Siam, and *Serica* to have been Tongut.

Taprobane, called alſo *Salice* and *Sielediba*, is thought to be the iſland of Ceylon or Selandib; the ancients thought this a very extenſive country, and conſidered it as the Antipodes or Antichthones of their hemiſphere: *Aurea Cherſoneſus*, Malacca, according to others, Pegu; *Ophir*, the farther peninſula (but of this there are various conjectures), it was alſo called *Argentea Regio*, part of it *Aurea Regio*; *Sabaracus Sinus*, probably was the Gulf of Martaban, and *Beſyngetis*, Pegu; *Promontorium Magnus*, Cape Romania, preceded by *Perimulicus Sinus*, the Straits of Malacca, leading to *Sinus Magnus*, the Gulf of Siam, beyond which the ancients ſeem to have been quite in the dark: *Bonæ Fortunæ Inſulæ*, Great Andaman; *Maniolæ*, the Little Andaman; *Jabadii Inſulæ*, Sumatra; *Sindæ*, the Celebes.

Of the few towns on theſe coaſts, mentioned by ancient geographers, *Patala*, on the *Indus*, built by Alexander, is thought to be Tatta; *Barygaza* on *Namadus*, the river Nerbuddah, Baroach; *Muſiris*, Merjee; *Nigama* anſwers to Negapatam; *Meſolia*, Maſulipatam, was at the mouth of *Meſolus*, the Kiſtnah; *Arcati*, Arcat; *Palura*, Balaſor; *Chaberis Fl.* was the river Cauvery, and *Tyndis*, the Godaveri; the *Magnum Oſtium* of the Ganges anſwers to Hoogli. Several *Emporia*, or factories, are alſo mentioned. The Romans appear to have been better acquainted with this country than the Greeks. There is no reaſon, however, for thinking that the one or the other ſailed round Malacca, or went as far as China.

Many of the ancient names carry with them a marked coincidence to the modern ones; ſuch as, *Dachanos* or *Dachanades*, the Deccan, or country to the ſouth of the Nerbuddah; *Agora*, Agra; *Male*, Malabar; *Comaria Promontorium*, Cape Comorin, the terminating point of the Hither Peninſula, of the projection of which the ideas of the ancients were ſo deficient, that they made its bearing eaſt and weſt, inſtead of ſouth and north. Between it and Ceylon was *Sinus Colchicus*, and *Colymbeſis Pinici*, the pearl-fiſhing coaſt. *Modura* anſwers to Madura.—See further particulars, and Map of Ancient Asia, vol. ii. p. 262.

ANCIENT AFRICA, or LIBYA.

This diviſion of the world is parted from Aſia by the Iſthmus of Suez and the Red Sea; on the other ſides it is waſhed by the Ocean, and the Mediterranean. The parts of it chiefly known to the ancients were Egypt, and the country on the coaſt of the Mediterranean.

Mizraim, or Egypt, is a narrow vale on each ſide of the Nile, widening where the river branches off, before it empties itſelf into the Mediterranean. It was divided into *Inferior et Superior*, Lower and Upper.

Lower Egypt extended along the coaſt from *Plinthines Sinus*, the Gulf of the Arabs, to the *Lacus Sirbonis*, Lake Bardoil, towards Paleſtine. It included the *Delta*, and ſtretched ſouthward as far as *Heptanomis*. It was divided into the four following provinces:

Mareotis Nomos, towards Libya, took its name from the Lake *Marea*, Birk-Mariout, and was famous for its wines.—Mentemque lymphatam Mareotico. *Horace.*

Alexandrina Regio, between the Lake *Marea* and the weſtern branch of the Nile. Its chief town was *Alexandria*, famous for its commerce and opulence, built by Alexander, where the town of *Rhacotis* had ſtood, and the reſidence of the Ptolemies. It was called by the Jews *No*, and is now Scanderik. It was joined by a mole to the oppoſite iſland of *Pharos*, on which was erected a light-houſe, reckoned one of the wonders of the world.

The *Delta*, was comprehended between the eaſtern and weſtern branches of the Nile and the Mediterranean. Of the channels of the Nile there were ſeven large, and five ſmall. Theſe began to branch off near *Memphis*, and their extreme points on the Mediterranean were the towns of *Canopus*, Bekir or Aboukir to the weſt, and *Peluſium*, Damietta, to the eaſt, which gave name to the contiguous channels:

——Luxuria, quantum ipſe notavi,
Barbara famoſo non cedit Turba Canopo. *Juvenal.*

The intermediate channels took their names from thoſe towns which ſtood towards their mouths; *Tanis*, alſo called Zoar; *Mendes*, *Sebennytus*, *Bolbetyne*, &c. On the Canopic branch ſtood *Metelis*, now Roſetta. On the eaſtern ſide of the Delta were, *Magdolum*, *Bubaſtus*, *Babylon*, the Land of *Goſhen*, *Heroopolis*, Kalaat-Agerud; *Arſinöe*, Suez; *Caſius*, with a mountain of the ſame name, at the bottom of which ſtood Pompey's tomb. Near this town was the Lake *Sirbonis*, into which Typho is fabled to have thrown himſelf after the murder of Oſiris. *Rhinocolura*, on the Jewiſh frontier, an intermediate ſtation between Tyre and the Red Sea, long convenient to the Phœnicians, is now Faramina: the ſandy deſerts on this ſide of Egypt rendered the invaſion of it from Aſia difficult. The *Delta*, as indeed all Egypt, was divided into various nomes or præfectures: of theſe there were in all fifty-three.

Upper Egypt commenced at the ſouthern point of the Delta, and was generally divided into *Heptanomis*, and *Thebais*.—*Heptanomis* was ſo called from the ſeven *Nomoi* or governments into which it was divided. The chief of theſe was that of *Memphis*, long the capital of all Egypt, on the weſtern bank of the Nile. Not far from its ruins are the Pyramids, ſuppoſed to have been the burial-places of the kings of Egypt. The largeſt of theſe covers about eleven acres of ground, and is above five hundred feet in height. Near the pyramids are the mummy-pits or ſubterranean vaults, in which the embalmed bodies were depoſited. Grand Cairo, on the oppoſite ſide of the river, has ſucceeded to a part of its conſequence. The canals which ſeparated Memphis from the burying-grounds, according to ſome, ſuggeſted to the poets the ideas of the infernal rivers of *Styx*, *Acheron*, *Cocytus*, and *Lethe*.

In the nome of *Arſinöe*, or the City of the Crocodiles, now Feyyum, was *Mœris Lacus*, Lake Kein, dug to receive the overflowing of the Nile. On the banks of it ſtood the famous labyrinth, conſtructed by twelve princes who ruled Egypt at the ſame time; it is ſaid to have conſiſted of twelve palaces and three thouſand apartments; *Heracleopolis*, *Oxyrinchus*, ſo called from the worſhip of a fiſh of this name, now Bohneſe; *Hermopolis Magna*, Aſhmouneim; *Beſa*, afterwards *Antinöe*, in honour of the favourite of Adrian, now Enſene.

In this diviſion of Egypt lay the Greater and the Smaller *Oaſis*; diſtricts of dangerous acceſs, on account of the moving ſands with which they were ſurrounded. They lay to the ſouth-weſt, and near one of them was the temple of Jupiter Ammon.

Thebais, which took its name from the ancient Thebes, now Said, extended from *Heptanomis* to Æthiopia. Its chief towns and nomes on the weſt of the Nile were: *Lycopolis*, Oſiot; *Hypſele*, Sciot; *Thin*, *Ptolemais*, Menſhié; *Dioſpolis Parva*, How; *Tentira*, Dendera; the town and iſland of *Elephantine*, near which was the laſt cataract of the Nile. The people who lived near the cataracts were called *Catadupæ*.

On the eaſtern ſide were thoſe of *Antæopolis*, Kau; *Panopolis*, *Coptos*, Keft, from which a great trade was carried on to *Berenice*, on the Red Sea; *Thebæ* or *Dioſpolis Magna*, now Luxor, a very great city, ſaid to have had a hundred gates:

Dimidio magicæ reſonant ubi Memnone chordæ,
Atque vetus Thebe centum jacet obruta portis. *Juvenal.*

Syene, Aſuan, under the Tropic of Cancer:

—— Quis ad exuſtam, Cancro torrente, Syenem
Ibit, et umbrifera ſiccas ſub Pleiade Thebas? *Lucan.*

Philæ, an iſland and town above the cataract; and *Metacompſo*, which, with *Elephantine*, were the ſouthern boundaries of Egypt.—See the article EGYPT, vol. vi. p. 353.

Beſides the towns of *Heroopolis*, Kalaat-Agerud; *Arſinöe*, Suez; and *Berenice*, founded by Seleucus for the Indian trade; there were, on the Egyptian ſide of the Red Sea, *Cly ſma*, now Kolſum; *Myos-Hormos* or *Aphrodytes*, Suſany-ul-Bahri; *Philoteræi Urbs*, Coſſeir.

Theſe coaſts were inhabited by ſavage tribes of *Ichthyophagi*, and *Troglodytæ*, who lived in caves; they are now part of Abyſſinia: the higher parts of the Nile were occupied by the *Nobatæ*, in whoſe country was the greater cataract; by the *Blemmyes*, ſaid to have been of monſtrous ſhape; the *Sebridæ*, *Auxumitæ*, *Nubæ*, *Ethiopes*, different tribes of Nubians and Abyſſinians. The rivers *Aſtaboras* and *Aſtapus* form, with the Nile, the iſland or peninſula of Meröe. The *Aſtaboras* receives for its modern appellation the name of Tacaze; the *Aſtapus*, that of Abawi.

The next diviſion of Africa, between Egypt and the Greater Syrtes, included *Marmarica*, *Cyrenaica* or *Pentapolis*, and *Libya*. This laſt name was alſo extended to them all, and even to the whole of Africa, by the Greeks, to whom this part of it was beſt known. Under the Ptolemies theſe countries were ſubject to Egypt; they now form the kingdom of Barca. A conſiderable declivity in the country, called the *Catabathmus Magnus*, ſeparated *Cyrenaica* from *Marmarica*. It was alſo made by ſome a line of diviſion between Africa and Aſia, ſo as to include Egypt in Aſia.—The chief towns were: *Cyrene*, Curin; *Berenice*, Bernic; *Ptolomais*, Tolometa; *Arſinöe*, Teukira; *Barce*, Barca, and the temple of Jupiter Ammon. At *Berenice* are thought to have been the gardens of the Heſperides:

Maſſylæ gentis monſtrata ſacerdos,
Heſperidum templi cuſtos, epulaſque draconi
Quæ dabat, et ſacros ſervabat arbore ramos. *Virgil.*

Among other tribes inhabiting this country, were the *Naſamones*, infamous for their cruelty to thoſe wrecked on the Syrtes; and the *Pſylli*, who, by certain charms, poſſeſſed power over the moſt venomous ſnakes:

Natura locorum
Juſſit ut immunes mixti ſerpentibus eſſent. *Lucan.*

Libya Deserta had no towns. It is now chiefly the Defert of Barca. The country extending from Libya weſtward to the Atlantic Ocean, contained *Africa Propria*, *Numidia*, and *Mauritania*. The Greater *Syrtes*, now the Gulf of Sidra, a bay full of dangerous ſhoals, parted it from *Cyrenaica*. The ſmaller *Syrtes*, now the Gulf of Gabes, lay to the weſt of the bay. *Phycus Promontorium*, Cape Raſat, bounded it to the eaſt, and *Cephalæ Prom.* Cape Meſrata, to the weſt. Another mark of ſeparation was the *Philenorum Aræ*, monuments in honour of the two Phileni, brothers who devoted themſelves to death to extend the territories of their country, Carthage:

Per inhoſpita Syrtis
Litora, per calidas Libyæ ſitientis arenas. *Lucan.*

The country lying between the two Syrtes was called *Syrtica Regio*, and anſwers to the preſent kingdom of Tripoli. The three towns of *Sabrata*, Sabart; *Oea*, Tripoli, and *Leptis Magna*, Libada, gave to one diviſion of it the name of Tripoli. It was bounded on the eaſt and weſt by the rivers *Cinyps*, Macre; and *Triton*, Capès. Minerva is thought to have taken her name from the laſt of theſe.

The iſland of *Meninx* or *Girba*, on this coaſt, now Zerbi, was alſo called *Lotophagitis*, from the *lotos*, a ſweet intoxicating fruit, the chief article of food to ſeveral tribes of the *Regio Syrtica*.

The next diviſion of the country weſtward, from the Leſſer Syrtes to Numidia, was *Africa Propria*, now the kingdom of Tunis. It was divided into the two regions of *Byzacene*, and *Zeugitana*. The former of theſe took its name from the town of *Byzacium*, now Bighni. It extended from the Leſſer Syrtes to *Adrumetum*. It alſo contained *Tacape*, Capès, near the mouth of the *Triton*; *Adrumetum*, now Mahometta, its chief town; *Macomades Minores*, now El Mahres; *Taphrura*, Sfakes; *Tyſdrus*, El Jem; *Tapſus*, a place of note in Cæſar's wars, now Demſas; *Thenæ*, Taineh; *Leptis Minor*, Lemta. This diviſion, on account of its great fertility, was alſo called *Emporia*.

Of the towns of *Zeugitana*, which commenced at *Adrumetum*, and extended to *Numidia*, from which it was ſeparated chiefly by the river *Tuſca*, Guadelbarbar; *Neapolis* is now Nabel; *Curubis*, Gurbes; *Clypea*, Aklibia, near *Hermæi* or *Mercurii Promontorium*, Cape Bona; *Tunis* or *Tunetum*, Tunis, become, ſince the fall of Carthage, a great city; *Carthago*, called alſo *Carthada* and *Carchedon*, Carthage, was built by the Phœnicians, deſtroyed by Scipio, reſtored by Auguſtus, and finally ruined by the Saracens, towards the end of the ſeventh century. Its citadel was called *Byrſa*. The principal harbour was formed by the iſland *Cothon*, which had ranges of docks for ſhips all round it.

Utica, where Cato died, now Satcor, ſtood near the mouth of the *Bagradas*, now Megrada; *Hippo Zarytos* is now Benzert; *Tabraca*, Tabarca; and *Vacca*, Vegjo:

Quales umbriferos ubi pandit Tabraca Saltus,
In vetula ſcalpit jam mater ſimia bucca. *Juvenal.*

On the banks of the *Bagradas* Regulus met the enormous *boa* ſnake, againſt which he was obliged to employ his military engines. See BOA, vol. iii. 134.—The chief inland towns of this diviſion were: *Taburda*, *Sicca Venerea*, Kef; *Tucca*, Tugga; *Zama*, where Scipio defeated Hannibal; *Capſa*, Cafsa, a ſtrong-hold of Jugurtha's in the Defert; *Telepte*.

The bay lying between *Mercurii* and *Apollinis Promontorium*, Cape Bona and Cape Negro, is now the Bay of Tunis; *Prom. Candidum*, Cape Mabra, formed with *Prom. Apollinis*, the Bay of Bona, formerly *Sinus Hipponenſis*.

Numidia, which takes its name from the Nomades, now the kingdom of Algiers, extended from *Tuſca*, the river Guadelbarbar, to the *Mulucha* or *Molocath*, now the Mulvia. The river *Ampſaga*, Wad-el-Kirbir, the Great River, and *Tretum Promontorium*, Cape Sefarous, divided it into *Numidia Propria* or *Maſſylorum*, to the eaſt, and *Numidia Maſſæſylorum* to the weſt, which was generally conſidered as part of Mauritania. The former was ſubject to Maſſiniſſa, the latter to Syphax. They became one kingdom in the family of Maſſiniſſa, on account of his attachment to the Romans, and were afterwards made over to Bocchus for betraying Jugurtha. Being divided in his family, the eaſtern part was called the kingdom of Bocchus, and the weſtern the kingdom of Bogud. The river *Malva* was the common boundary of this diviſion. The chief towns were: *Hippo Regius*, the epiſcopal ſeat of St. Auguſtine, now Bona, near which was Mount *Pappua*, the retreat of Gelimar, after his defeat by Beliſarius, now Edoug. On the *Sinus Numidicus*, the Gulf of Stora, was *Ruſicade*, Sgegada; *Cirta*, the reſidence of the kings of Numidia, is now Conſtantina; *Tagaſte*, Tajelt; *Tebeſte*, Tebeſs.

To the ſouth of this country, and of Mauritania, was *Gætulia*, a diſtrict of which was named *Zaba*, from a river which flowed through it. The people of this country, in a ſubſequent period, were the *Bereberes*, from whom Barbary has taken its name.

Mauretania, ſo called from its people the *Mauri*, lay behind *Numidia Maſſæſylorum*, and ſtretched from the river *Ampſaga* to the Ocean: it contained, with part of Algiers and Biledulgerid, the kingdoms of Fez and Morocco. That part of Numidia which was annexed to Mauretania by Auguſtus, was called *Mauretania Cæſarienſis*. The other part, the ancient *Mauretania*, was diſtinguiſhed by the name of *Tingitana*, and extended to the Atlantic.

In the firſt of theſe were the following towns: *Igilgilis*, Tigel; *Saldæ*, Tedles; *Tubuſuphis*, *Cartenna*, Tenez; *Cæſarea*, ſo called by Juba, its preceding name being *Iol*, now thought by ſome to be Algiers, and by others to be Serſel; *Portus Magnus*, Arzeu; *Portus Divini*, Oran and Marz-al-Kibir; *Siga*, for ſome time the reſidence of Syphax, now Ned-Roma. Upon the river *Molocath* was *Calaa*, now Calaat-el-Wad; *Sitifi*, an inland town, now Setif, gave name to the diſtrict of *Cæſarea Sitifenſis*.—The ſea-coaſt of theſe countries was planted with many Roman colonies.

Tingitana, or *Mauretania Proper*, extended from the *Molocath* to the Atlantic, and took its name from its chief town, *Tingis*, now Tangier: it nearly anſwers to the preſent kingdom of Fez. The people were the *Mauri* and *Mauruſii*. Part of it, under the Weſtern Empire, was ranked under a diviſion of Spain, and was called *Hiſpania Tranſretana*.

The promontories on this coaſt were: *Metagonium*, Cape Three Forks, which is by ſome ſuppoſed to have been *Ruſadir Promontorium*; *Abyla*, Apes Hill, one of Hercules's pillars; *Septem Fratres*, the Promontory, and *Septum*, the town of, Ceuta; *Ampeluſia Cotes*, Cape Spartel. *Arſenarium Prom.* Cape Bojador, according to others Cape Verd. Θεων Οχημα, the Chariot of the Gods, probably the mountains of Sierra Leone. Of the towns, beſides *Tingis*, Tangier, already mentioned, the moſt remarkable were *Ruſadir*, Melilla; *Parietina*, Velez; *Tœnia Longa*, Targa; *Jagath*, Tetuan. On the Ocean, *Zilis* is now Azzilia; *Lixus*, the abode of *Anteus*, l'Arais or l'Arache; *Volubilis*, Gualili. The chief rivers on this ſide are *Lixus*, the Lucos; *Subur*, the Subou, the ſources of which, as alſo of the *Gir*, perhaps now the Niger, are in the ranges of Mount Atlas:

—— Quanto ſublimior Atlas
Omnibus in Libya ſit montibus. *Juvenal.*

—— Cælifer Atlas
Axem humeris torquet ſtellis ardentibus aptum. *Virgil.*

Beſides the *Gætuli*, already mentioned, and the *Melano Gætuli*, towards the deſerts, lived the *Naſamones*, the *Mazices*, the *Daræ*, who gave name to the Defert of Zarah Saharrah; the *Garamantes*, *Libyes*, *Æthiopes*, &c.

Weſt

Weſt of the coaſt were *Inſulæ Purpurariæ*, the chief of which was *Cerné Atlantica*, the Madeiras; *Inſulæ Fortunatæ*, the Canaries; one of which, *Nivaria*, is ſuppoſed to be Teneriffe; *Inſulæ Heſperides et Gorgonum*, the Cape Verd Iſlands; *Cerne Æthiopica*, perhaps Madagaſcar. The accounts, however, of theſe are thought to be fabulous, as alſo of Plato's *Atlantis*, which by ſome has been ſuppoſed to be America. How far to the ſouth the weſt coaſt of Africa was known to the ancients, is not aſcertained; but many are of opinion that the circumnavigation of it was not unknown to them. For more particulars, and Map of ANCIENT AFRICA, ſee vol. i. p. 144.

SUMMARY OF MODERN GEOGRAPHY.

The epoch or period unto which the ancient geography has been brought up, and at which that of the modern muſt have taken its riſe, would ſeem to be about the middle of the fifth century of the Chriſtian era. The notices we have of geography from the pens of thoſe who are termed "ancient or claſſical authors," extend not in any eſſential degree beyond the above-mentioned time; and the diſcovery of the continent of America, or New World, by Chriſtopher Columbus in 492, is deciſive of the period at or about which our reſearches in modern geography ought to commence. This department, therefore, embraces an inveſtigation, from that period, of the ſtate of all thoſe countries or diſtricts contained in what have been vaguely termed "the four quarters of the globe," namely, Europe, Aſia, Africa, and America; and alſo of thoſe newly-diſcovered regions which ſome late French geographers denominated "the *fifth* and *ſixth quarters* of the world;" but which the generality of modern writers have agreed to diſtinguiſh by the names of AUSTRALASIA and POLYNESIA. Of each of theſe diviſions of the earth we ſhall briefly treat in their reſpective order; and for an elucidation of their geographical poſitions, we refer the reader to the annexed map of the Eaſtern and Weſtern Hemiſpheres.

EUROPE.

This portion of the globe, though not the largeſt, is nevertheleſs the moſt celebrated for its progreſs in arts, ſciences, and literature. It is in the modern, what Aſia was in the ancient, geography,—the moſt enlightened part of the civilized world. It is ſituated between ten degrees weſt and ſixty-five degrees eaſt longitude from Greenwich, and between thirty-ſix and ſeventy-two degrees of north latitude. By recent calculation it is ſaid to be about three thouſand miles in length, from Cape North to the ſouth of Spain, or Italy; and about two thouſand five hundred miles in breadth, from Cape Finiſtre to the river Don; being bounded on the north by the Icy or Frozen Sea, on the ſouth by the Mediterranean, by Aſia on the eaſt, and the Atlantic Ocean on the weſt; and it is by ſome writers divided into *north*, *middle*, and *ſouth*.

North Europe compriſes Lapland, Denmark, Norway, Greenland, Iceland, Sweden, and Ruſſia.

Middle Europe contains Pruſſia, Poland, Holland, Germany, Bohemia, Hungary, Tranſilvania, Sclavonia, Croatia, Flanders, France, Swiſſerland, Savoy, Piedmont, England, Scotland, and Ireland.

South Europe includes Spain, Portugal, Italy, and what is uſually called Turkey in Europe.—See the map of Modern Europe, vol. vii. p. 84.

LAPLAND.—This region of the arctic circle is divided into Daniſh, or North Lapland; Swediſh, or South Lapland; and Ruſſian, or Eaſt Lapland.—North Lapland, which is under the dominion of his Daniſh majeſty, lies between the Northern Sea, the river Pais, and the lake Enarak, and is included in the government of Wardhus. South Lapland comprehends all the country from the Baltic to the mountains that ſeparate Norway from Sweden, and it is divided into ſix diſtricts, diſtinguiſhed by the names of rivers, as Una, Peta, Torna, &c.—Eaſt Lapland is ſituated been the lake Enarack and the White Sea; it is divided into three prefectures or lepories: that towards the north is called Mournanſkoi; in this is the port of Kola: Terſkoi Leporie is one on the coaſt of the White Sea: the other is inland, and is called Bellamoreſkoi Leporie.

Lapland is bounded on the north and eaſt by the Northern and White Sea, and on the ſouth and weſt by Sweden and Norway. It is covered with immenſe foreſts, chiefly of pine or fir.

The whole of Lapland extends from North-Cape, in latitude ſeventy-one degrees and a half, to the White Sea under the Arctic Circle; its ſurface may contain from ſeventy to eighty thouſand ſquare miles; but its population cannot be aſcertained with any degree of accuracy. The chief towns are, Kola and Tornea.

In the higheſt part of Lapland the ſun is abſent for about ſeven weeks; the ſtars are viſible at noon, and the moon ſhines without intermiſſion. In the ſummer, on the contrary, the ſun never ſets for ſeven weeks together, and the moon and ſtars are never ſeen.

DENMARK.—This kingdom extends from the river Elbe in the ſouth, to the northern extremity of Daniſh Lapland. It is ſurrounded on the north, eaſt, and weſt, by the ſea: and on the ſouth by the Duchy of Holſtein, part of which belongs to Denmark. Within theſe limits, Norway is included, as well as Denmark Proper; which of itſelf is but a ſmall territory, containing only the peninſula of Jutland, and the iſlands of Zealand, Funen, &c. at the entrance of the Baltic. Its chief town, Copenhagen, is in the iſland of Zealand. At Elſinore, all foreign ſhips that trade to the Baltic pay toll. That part of the ſea ſituated between Zealand and Funen, is called the *Great Belt*; and that which divides Funen from the continent of Denmark, is called the *Little Belt*.

Excluſive of the iſlands in the Baltic, theſe countries lie between fifty-four and fifty-eight degrees north latitude; and between eight and eleven degrees eaſt longitude. The whole ſurface of the two countries united, may be reckoned at 19000 ſquare miles; and the population is computed at two millions and a half.

NORWAY, the appendage to Denmark, is divided into four general governments, viz. Aggerhus, Bergen, Drontheim, and Wardhus. The chief town of Norway is Chriſtiana. It is one of the moſt mountainous countries in the world; and the rivers and cataracts, which interſect the mountains, render travelling exceedingly dangerous. The inhabitants have neither corn-fields nor gardens, but ſubſiſt chiefly by hunting and fiſhing. On this coaſt is the famous vortex of the ſea called the *Maelſtroom*: it is heard at a great diſtance, and forms a whirlpool of vaſt depth and extent, and ſo violent, that, if a ſhip comes near it, it is drawn in and ſhattered to pieces. The chief wealth of Norway lies in its white and yellow deals, with which foreign nations are ſupplied. It poſſeſſes quarries of excellent marble, and mines of various metals.

GREENLAND.—Weſt-Greenland, as well as the Ferroe iſlands, is alſo ſubject to the king of Denmark. It is the moſt remote tract of land towards the north-pole that has yet been diſcovered; being ſituated between the meridian of the obſervatory at Greenwich and fifty degrees of weſt longitude; and between ſixty and ſeventy-ſix degrees of north latitude. Its extent has never yet been calculated with any degree of preciſion: but it is ſaid to be inhabited as far as ſeventy-ſix degrees of north latitude: the Daniſh ſettlements, however, have never extended beyond ſeventy-three degrees. The whole number of its inhabitants does not

probably exceed eight thouſand. Its coaſt has been long famous for the whale fiſhery.

Eaſt Greenland, or Spitſburgen, and Weſt Greenland, are ſuppoſed to be a continuation of the ſame country; but this fact cannot be determined until their boundaries towards the north pole ſhall have been aſcertained; which will probably never happen, on account of the impoſſibility of navigating the frozen ocean.

ICELAND.—This frozen iſland is likewiſe under the dominion of Denmark. It is ſituated in the North Atlantic Ocean, between Norway and Scotland, lying between ſixty-three and ſixty-eight degrees of north latitude, and between fifteen and twenty-five degrees of eaſt longitude. The extent of it may be about one hundred thouſand ſquare miles, and the number of inhabitants is eſtimated at from ſixty to ſeventy thouſand. This iſland is celebrated for the volcano of mount Hecla.

SWEDEN.—The kingdom of Sweden is ſituated at the north of Europe, and is of very conſiderable extent, reaching from the ſouthern promontory of Scone, to the northern extremity of Swediſh Lapland, more than eleven hundred Britiſh miles in length; and from the Norwegian Alps to the Ruſſian dominions, about ſix hundred miles in breadth. The country is included between fifty-five and ſeventy degrees of north latitude, and between the twelfth and thirty-ſecond degrees of longitude eaſt from Greenwich. It is bounded by the Baltic Sea, the Sound, and the Scaggarac, on the ſouth; by the mountains of Norway on the weſt; by Norwegian Lapland on the north, and by Ruſſia on the eaſt. The extent of Sweden has been computed at more than two hundred thouſand ſquare miles; and the number of inhabitants has been eſtimated at nearly three millions.

This kingdom, including the greateſt part of ancient Scandinavia, is divided into Sweden Proper, Gothland, Finland, Swediſh Lapland, and the Swediſh iſlands. The chief towns are Stockholm, the capital, which ſtands on ſeven rocky iſlands, united by wooden bridges; Upſal, famous for its univerſity; Gothenburg, in Gothland; Tornea, in Lapland; and Abo, in Finland. The chief wealth of this country ariſes from its mines of ſilver, copper, lead, and iron. The mines are very ſpacious, afford commodious habitations for numerous families, and ſeem to form a ſubterraneous world.

Sweden is a mountainous country, and is celebrated for the number and extent of its lakes; its rivers are numerous, but not navigable: almoſt all of them riſe from the mountains in Norway. Its iſlands, about the lakes and gulfs on the coaſt of the Baltic, are ſo numerous, that ſeveral thouſands of them are reckoned to be inhabited, and the reſt are deſert rocks. In the Baltic Sea there are no tides; and a current is always running into the German ocean.

RUSSIA.—The Ruſſian empire is perhaps the moſt extenſive that ever exiſted: the length is computed at more than nine thouſand miles, and the breadth at two thouſand four hundred. It is ſituated partly in Europe, and partly in Aſia. European Ruſſia extends from forty-four degrees, to nearly ſixty-nine degrees north latitude, and from twenty-three degrees to ſixty-eight degrees eaſt longitude. It is bounded by the Frozen Ocean on the north, by Aſiatic Ruſſia on the eaſt, Tartary and Turkey on the ſouth, and the dominions of Sweden, Auſtria, and Pruſſia, on the weſt. The extent of ſurface of European Ruſſia is reckoned at nearly a million and a quarter of ſquare miles, and the population is eſtimated at thirty-three millions.

By the partition of Poland, in 1772 and 1793, Ruſſia acquired two-thirds of that country, and about ſix millions of ſubjects. In ſome parts of Ruſſia the climate is ſo ſevere, that icicles are frequently ſeen hanging to the eye-laſhes, and the drivers of carriages are often found frozen to death on their ſeats. The principal towns are Peterſburgh, the capital, on the Gulf of Finland; Moſcow; Archangel, on the borders of the White Sea; Cherſon, on the Black Sea; Aſtrachan, near the Caſpian; and Tobolſk, the capital of Siberia. Peterſburgh, built ſince 1700, contains about 150,000 inhabitants. The principal lakes are Ladoga and Onega.

Ruſſia is moſtly a level country; from Peterſburgh to Pekin in China there is ſcarcely a hill; the ſame may be ſaid of the road from Peterſburgh to the north of France. The principal rivers are the Wolga, which, after winding a courſe of three thouſand miles, diſcharges itſelf into the Caſpian Sea by more than ſeventy mouths; the Don, or Tanais, the Nieper, and Nieſter. By theſe means the inland navigation is very extenſive; goods may be conveyed by water from Peterſburgh to China, with an interruption of only ſixty miles. Ruſſia is alſo celebrated for its timber and flax trade, its iron and copper mines in the Uralian mountains, and its fiſheries.

Among the natural curioſities of this northern region muſt be mentioned the rocks of ice, of many miles in extent, and aſtoniſhing height, adorned like cathedrals with pinnacles which reflect every variety of colours in the ſun, and preſent themſelves all along the Frozen Ocean.

PRUSSIA.—Excluſive of ſmall detached territories, this kingdom extends from Hornburg and the river Oder, in the country of Halberſtadt, the fartheſt weſtern connected diſtrict, to the river Memel. It is bounded on the north by the Baltic Sea; on the eaſt and ſouth by parts of Ruſſia, and Auſtria, and on the weſt by the German States. It is ſituated chiefly between fourteen and twenty-four degrees eaſt longitude, and between fifty and fifty-five degrees north latitude.

Pruſſia, in its moſt flouriſhing era, was ſuppoſed to contain about 150,000 ſquare miles, and its population may amount to 8,000,000, including the margraviate of Anſpach and Bayreuth, (ſince lopped off by Napoleon Bonaparte,) and the acquiſitions from Poland. The chief towns are Berlin, on the river Spray; Konnigſberg, Breſlaw, Warſaw, and Dantzick. Potzdam is a recent city; it is ſituated on an iſland amidſt lakes and canals; its caſtle was built in 1663, and has ſince been a favourite reſidence of the Pruſſian monarchs.

This territory is divided into Royal Pruſſia, and Ducal Pruſſia. Royal Pruſſia lies on the weſt ſide of the Viſtula, and Ducal Pruſſia on the eaſt.—What may be the extent of this kingdom, or whether it will exiſt at all, after the preſent war with France, (1806,) time alone muſt develope.—The chief rivers are the Viſtula, the Pregel, and the Memel.

HOLLAND.—The republic of Holland, or Batavia, but now the kingdom of Holland under Louis Bonaparte, conſiſts of what were formerly called, Seven United Provinces, viz. Groningen, Grieſland, Overyſſel, Holland, Utrecht, Guelderland, and Zealand. Theſe provinces extend from the north of Groningen to the ſouthern boundary along Flanders and Brabant, about 150 Britiſh miles; and in breadth from the North Sea to the circle of Weſtphalia, about one hundred miles. It is bounded on the north by the German Ocean, on the weſt by the Britiſh Channel, on the eaſt by the German Ocean, and on the ſouth by ſome of the newly-acquired dominions of France. It is ſituated between three and ſeven degrees eaſt longitude, and between fifty-one and fifty-four degrees of north latitude. The whole country has been eſtimated at 10,000 ſquare miles, and the number of inhabitants at about 3,000,000.

The chief towns in the kingdom of Holland are, Amſterdam, Leyden, Rotterdam, and Haarlem. The Hague is the largeſt, and was the richeſt, *village* in the world; it is thirty miles from Amſterdam; and was, before the revolution, the ſeat of government, and the reſidence

reſidence of the principal people. Amſterdam, the capital, is curiouſly built upon wooden piles. Leyden is famous for its univerſity. The ſtreets have canals running through them, the borders of which are planted with rows of trees. The principal rivers are the Rhine, the Maeſe, and the Scheldt. The canals are very numerous, and ſerve the ſame purpoſes as roads in other countries, viz. travelling, and the conveyance of goods.

GERMANY AND AUSTRIA.—Germany is ſituated in the middle of Europe; it conſiſts of a number of inferior ſtates, and of the dominions of Auſtria, which comprehend part of Germany, Hungary, and a large portion of what was formerly called Poland. According to its modern limits, it is bounded on the north by the German Ocean, Denmark, the Baltic, and part of Pruſſia. It includes Tranſylvania on the eaſt; on the ſouth it extends to Turkey in Europe; and its confines on the weſt are ſeveral departments of France.

This extenſive country is included between the eighth and twenty-ſixth degrees of eaſt longitude from London; and between forty-five and fifty-three degrees north latitude. The whole Auſtrian dominions have been eſtimated at more than 184,000 ſquare miles, with a population of 20,000,000; and the other German ſtates are more than equal to theſe, both in extent and number of inhabitants. Germany is compriſed under nine great diviſions, called circles: three northern, Weſtphalia, Lower Saxony, and Upper Saxony: three in the middle, Lower Rhine, Upper Rhine, and Franconia: and the three ſouthern, Swabia, Bavaria, and Auſtria. Theſe circles are ſubdivided into principalities, duchies, electorates, biſhoprics, &c. Beſides theſe there are a number of free cities, which are ſovereign ſtates; and ſome of them are ſtyled imperial towns.

The emperor is (or was) elected, by ten electors, for life, under the title of Emperor of Germany and King of the Romans. The emperor Francis is alſo, in his own right, Emperor of Auſtria and King of Bohemia. The ten electors are: the king or elector of Bohemia; the king or elector of Bavaria; the elector of Saxony; the elector of Brandenburgh (king of Pruſſia); the elector of Hanover (king of England); the elector archchancellor of the empire, whoſe reſidence is at Ratiſbon; the elector of Saltſburgh; the elector of Baden; the king or elector of Wirtemburgh; and the elector of Heſſe.

The electors of Saxony and Brandenburgh have been regarded as the principal potentates in the north of Germany; and the king of Bavaria and the king of Wirtemburgh in the ſouth. Pruſſia and Auſtria are conſidered as independent powers. Almoſt every prince in Germany, of which there were about two hundred, was arbitrary in the government of his own eſtate; but together they form a great confederacy, governed by political laws. The head of all theſe petty ſovereigns was the emperor; but ſoon after the Confederation of the Rhine was formed by Bonaparte, (July 12, 1806,) which drew all the princes in the ſouth of Germany from their allegiance to the emperor, and placed them under his own controul, Francis II. formally renounced the title of Emperor of Germany, (Aug. 6, 1806,) and at preſent his title is Francis I. Emperor of Auſtria.

The chief towns are: Vienna, the reſidence of the preſent emperor. Dreſden, the reſidence of the elector of Saxony, famous for its gallery of pictures, its various collections in the fine arts, and its porcelain manufactory. Berlin, which is the capital of the Pruſſian dominions. Hamburgh, ſituated on the Elbe, and one of the firſt commercial cities in Europe. Leipſic and Frankfort, famous for their fairs. Gottingen, Jena, Leipſic, and Halle, celebrated for their univerſities. Beſides Hanover, Munich, Manheim, Wirtemburgh, Heidelburgh, Augſburgh, Conſtance, and Prague. The principal rivers of Germany are; the Danube, the Rhine, the Maine, and the Elbe.

The Auſtrian dominions comprehend Auſtria, Bohemia, Hungary, and part of Poland; and contain upwards of twenty millions of inhabitants. By the partition of Poland, Auſtria acquired one-ſixth part of that country, and more than four millions of ſubjects.

The capital of this compact military empire is Vienna, where the emperor is conſidered as the ſucceſſor of Auguſtus. The other chief towns are Venice, Prague, Preſburg, Buda, Cracow, and Trieſte.—The principal mountains are the Tyroleſe, the Alps, and the Carpathian mountains, under and amongſt which numerous and extenſive foreſts ſpread themſelves in every direction.

By the treaty of Luneville, in 1801, the Rhine from Swiſſerland to Holland having been ſettled as the line of limitation between Germany and France, all that part of the German territory which lay to the weſt of the Rhine was ceded to France. The princes who ſuffered from this ceſſion, were ultimately to be indemnified by exchanges, and by ſeculariſing many of the eccleſiaſtical ſtates. This indemnification, however, has not yet taken place.

POLAND.—Though this kingdom has been annihilated by the rapacity of its neighbours, yet it is expedient that the former ſtate of its exiſtence ſhould ſtand upon record. Its geographical ſituation was E. lon. 16. 34. N. lat. 46. 57. Length, 700 miles; breadth, 680; and its capital was Warſaw. It was bounded by the Baltic and Ruſſia, north; Hungary and Turkey, ſouth; Ruſſia, eaſt; Germany, weſt. It contained the provinces of Courland, Poliſh Livonia, Samogitia, Poliſh or Royal Pruſſia, Lithuania, Polachia, Poleſia, Volhinia, Podolia, Red Ruſſia, Great Poland, Little Poland, and Mazovia.

There belonged to Poland 230 towns, and 2377 villages. Its rivers are, Lower Dwina, Niemen, Viſtula, Bog, Nieper or Boriſthenes, and Nieſter. The population was ſuppoſed to amount to 11,000,000. The government was a limited and elective monarchy. An attempt was made in 1792, to improve and render it hereditary; but it ended in the deſtruction of the monarchy, and of the independence of the kingdom.

By the firſt partition of Poland in 1772, Ruſſia having ſeized great part of Lithuania, the emperor great part of Red Ruſſia and Little Poland, and the king of Pruſſia that part of Poland which borders on his dominions, the revenue, population, and extent of this country were then much diminiſhed; ſo that but a weak reſiſtance could be made to the ſecond partition in 1793, when the remaining part was divided between Ruſſia and Pruſſia.

TURKEY IN EUROPE.—This fine and fertile country is bounded on the north by Ruſſia and Auſtria; on the eaſt by the Black Sea and the Sea of Marmora; on the ſouth by the Archipelago and the Mediterranean; and on the weſt by the Gulf of Venice and Dalmatia. Its geographical poſition is between ſeventeen and thirty degrees of eaſt longitude, and between thirty-ſix and forty-eight degrees of north latitude; and is computed to contain more than 180,000 ſquare miles, and the population is eſtimated at 8,000,000.

Turkey in Europe includes GREECE, which anciently was the moſt celebrated region in the world. It comprehended Macedonia, Albania, Epirus, Theſſaly, Achaia, the Morea, together with numerous iſlands on its coaſt, and in the Archipelago. It was bounded on the north by Bulgaria and Servia, on the eaſt by the Archipelago, on the weſt by the Gulf of Venice, and on the ſouth by the Mediterranean. The government is under the Grand Seignior, who is maſter of the lives and properties of his ſubjects. He aſſumes the titles of God upon earth, the ſhadow of God, the brother of the ſun and moon, &c.

The northern provinces of Turkey in Europe are, Moldavia, Beſſarabia, Walachia, Servia, Boſnia, and Dalmatia; thoſe in the middle are, Bulgaria, Romania, Macedonia, Albania, and Epirus; the ſouthern part,

or remnant of Greece, contains Theſſaly, Achaia, and the Morea.

The metropolis of Turkey is Conſtantinople, finely ſituated between the Sea of Marmora and the Black Sea, and ſtill one of the moſt conſiderable cities in Europe. Adrianople is the ſecond city in the Turkiſh empire, and was formerly the capital. The principal rivers are, the Danube, the Save, and the Nieſter. The chief mountains are, Pindus and Olympus, which ſeparate Theſſaly from Epirus; Parnaſſus, in Livadia; Athos, and Hæmus. Athos is celebrated for its loftineſs, and is now inhabited by thouſands of monks and hermits.

The iſlands belonging to Turkey are very numerous. The chief are Rhodes, and Candia, in the Mediterranean. Zante, Cephalonia, Corfu, and others of the Ionian iſles, lying weſt of Turkey, form the new republic of the "Seven Iſlands."

France.—This is one of the moſt weſterly kingdoms of Europe. Its boundaries are, the Britiſh Channel and Holland on the north; Germany, Swiſſerland, and part of Italy, on the eaſt; the Mediterranean and Spain on the ſouth; and the Atlantic Ocean on the weſt. It is ſituated between forty-two and fifty-two degrees north latitude, and between five degrees weſt and eight degrees eaſt longitude. Since the late acquiſitions made to France, its extent of ſurface cannot be leſs than 200,000 ſquare miles, and the population is probably under-rated at 32,000,000.

France was anciently divided into provinces; but ſince the revolution, it has, with the Netherlands, and various other territories acquired by the revolutionary war, been divided into 115 departments.

Paris, the capital of France, is, next to London, the largeſt and moſt conſiderable city in Europe. It contains about 500,000 inhabitants, and has lately been enriched with immenſe collections of works of art, the ſpoil of conquered countries. The other principal towns are, Lyons, Marſeilles, Bourdeaux, Liſle, and Geneva, formerly an independent ſtate.

The principal mountains in France are, the Alps, which anciently divided it from Italy; and the Pyrenées, which divide it from Spain. The principal rivers are, the Rhone, the Garonne, the Loire, the Seine, and the Somme. The Rhine forms the boundary between France and Germany. The canals are very numerous; the chief work of this kind is the canal of Languedoc, about 180 miles in length. Near Toulon are the iſles of Hyeres, which are the ſame as Homer's iſle of Calypſo. The iſle of Rhé is oppoſite Rochelle. Belleiſle has been repeatedly attacked by the Engliſh. The iſle of Uſhant is well known as the moſt weſterly headland in France.

Swisserland.—This romantic country is ſituated among the Alps, between France, Germany, and Italy; being bounded on the north by Germany, on the weſt by France, and on the ſouth and eaſt by Italy. Its geographical poſition is between five and eleven degrees eaſt longitude, and between forty-five and forty-eight degrees north latitude. The ſurface of Swiſſerland is eſtimated to be nearly equal to 15,000 ſquare miles, and the population is reckoned at 2,000,000.

Swiſſerland is remarkable for its mountains and glaciers, as well as for the ſimple character of its inhabitants. It is divided into thirteen cantons; Zurich, Berne, Underwalden, Zug, Schweitz, Baſil, Glaris, Soleure, Uri, Appenzel, Lucerne, Fribourg, and Schaffhauſen. The three principal towns are Baſil, Berne, and Zurich.

The ſources of the Rhine and the Rhone, two of the grandeſt rivers in Europe, are to be found in the mountains of Swiſſerland. The lakes of Conſtance and Geneva have been long celebrated for their beauty. The Alps, which divide Swiſſerland from Italy; the mountains of St. Gothard, in the canton of Uri; and Mont Blanc, on the borders of Savoy; form the moſt majeſtic ſcenery in Europe.

Italy.—This rich and fertile country is ſituated in the ſouth of Europe, extending far into the Mediterranean; and is uſually conſidered under three diviſions, the ſouthern, the central, and the northern. The ſouthern part comprehends the kingdom of Naples; the central diviſion conſiſts of the dominions of the church, and the kingdom of Etruria; and the northern diviſion comprehends what has been called "the Ciſalpine or Italian Republic."—Its boundaries are the Adriatic and Mediterranean ſeas, and the grand barrier of the Alps, which ſeparate it from France, Swiſſerland, and Germany.

Italy, properly ſo called, including Sicily, lies between the ſeventh and nineteenth degrees of eaſt longitude, and between the thirty-ſixth and forty-ſeventh degrees of north latitude. The length of this country from Mount Roſa, the higheſt ſummit of the Italian Alps, to the Cape de Leuca, is about 670 Britiſh miles, while the mean breadth between the Gulf of Venice and the Mediterranean is about 100 miles; but from the Adige, the breadth is about 200 miles. The population is eſtimated at 13,000,000.

Italy has always been conſidered as the garden of Europe, and the parent of the arts and of civilization. Once the miſtreſs of the world, it ſtill remains a fine, populous, and intereſting, country, but inhabited by a race of people who are degenerated by ſuperſtition and political ſlavery. It is ſubdivided into the kingdom of Italy; the kingdom of Etruria; the Roman States; and the kingdom of Naples.

The Apennines form a grand chain of mountains, which run through almoſt the whole extent of Italy. Mount Veſuvius, near Naples, is a celebrated volcanic mountain. But Veſuvius, compared with Etna in Sicily, is only a ſmall hill: the circuit of Veſuvius is only 30 miles, that of Etna is 180.

Rome is the principal city of the pope's dominions, the preſent capital of Italy, and once the capital of the civilized world. Its population was formerly very great, but does not now exceed one hundred thouſand. Milan was the capital of the Italian republic, but now of the new-made (May 26, 1805,) kingdom of Italy.

Sicily, the largeſt of the Italian iſlands, is ſeparated from the ſouth-weſt part of Naples by the ſtrait of Meſſina. This ſtrait was famous for the Scylla and Charybdis of the ancients, the former being a rock, the latter a whirlpool, both very dangerous to the navigators of that period. The chief towns are Palermo, Meſſina, and Syracuſe.

Sardinia, another large, but ſterile, iſland, is ſituated almoſt in the centre of the Mediterranean: the principal town is Cagliari.

Corſica is ſeparated from the northern parts of Sardinia by the Strait of Bonafacio; its chief town is Baſtia.

The iſland of Malta lies about ſixty miles ſouth of the iſland of Sicily, and is celebrated for the ſtrength of its fortifications, which are now garriſoned by the troops of Great Britain. Candia, to the ſouth of Greece, is famous for Mount Ida. Both Malta and Candia are renowned for withſtanding ſieges by the Turks, who in the former loſt 30,000 men, and in the latter 180,000.

Rhodes, north-eaſt of Candia, is famous for its coloſſal ſtatue, between the legs of which ſhips ſailed into the harbour. In its right hand was a light-houſe for the direction of mariners. It was deſtroyed ſeveral ages ſince by an earthquake.—The principal rivers are the Po, the Tiber, the Var, and the Adige.

Spain.—This country forms the moſt weſterly part of the continent of Europe; and from its weſtern ſituation, the ancients called it *Heſperia*. It is bounded on the north by the Bay of Biſcay, and the Pyrenean mountains, which ſeparate it from France; on the eaſt by the Mediterranean ſea, on the ſouth by the Straits of Gibraltar,

raltar, and on the weſt by Portugal and the Atlantic Ocean. It is ſituated between the thirty-ſixth and forty-fourth degrees of north latitude and between the ninth degree weſt longitude, and the third degree of eaſt longitude. It contains nearly 150,000 ſquare miles of ſurface, and the number of its inhabitants is equal to about 11,000,000.

Spain is remarkable for its immenſe and valuable poſſeſſions in South America, and for the national inactivity and ſupineneſs which thoſe poſſeſſions have created. From having been one of the firſt powers in Europe, it now does not rank above thoſe of the ſecond order. It is divided into fourteen diſtricts, or provinces, viz. Aſturia, Biſcay, Navarre, Galicia, Leon, Old Caſtile, Arragon, Catalonia, Valencia, New Caſtile, Eſtramadura, Andaluſia, Murcia, and Granada.

Its chief towns are Madrid, the capital; Barcelona, Seville, Corunna, and Cadiz, ſometimes called Cales. The principal rivers are the Ebro, the Tagus, and the Douro, all of which have their riſe in Spain.

On an elevated promontory, in the ſouth of Spain, ſtands Gibraltar, which has been in the poſſeſſion of the Engliſh for above a century; and is ſo defended by nature and art, as to be conſidered impregnable.—The chief iſlands circumjacent to Spain, are Majorca, Minorca, and Ivica.

Portugal.—This kingdom repoſes on the breaſt of Spain, by which it is bounded on the north and eaſt; and on the ſouth and weſt it is waſhed by the Atlantic Ocean. It is ſituated between the eighth and tenth degrees weſt longitude, and between the thirty-ſeventh and forty-ſecond degrees of north latitude. Its ſurface is ſuppoſed to contain 27,000 ſquare miles, with a population of nearly 2,000,000 of inhabitants.

Portugal, like Spain, has been enervated by its foreign poſſeſſions, and is now one of the moſt abject powers in Europe. The people are debaſed by indolence and ſuperſtition. The country is divided into ſeveral provinces, as Eſtramadura, Entre-Minho, Douro, Alentejo, &c.

The chief towns are Liſbon, the capital; and Oporto, famous for its exports of wine. Liſbon, the foundation of which is fabulouſly aſcribed to Ulyſſes, was deſtroyed by an earthquake in 1755, but has ſince been rebuilt in an elegant manner. The Azores belong to Portugal; they are ſituated at an equal diſtance from that country and Newfoundland.

Great Britain and Ireland.—Great Britain, which conſiſts of England, Wales, and Scotland, is ſituated weſt of the continent of Europe; and Ireland is conſiderably to the weſt of Great Britain.—England is bounded on the eaſt by the German Ocean; on the ſouth by the Engliſh Channel; on the north by the Cheviot Hills; and on the weſt by St. George's Channel. Scotland is ſeparated from England by the Cheviot Hills; and its other boundaries are the North Seas. Ireland lies in the Atlantic; but its eaſtern boundary is in St. George's Channel.

The whole United Kingdom lies between fifty and fifty-nine degrees north latitude, and between one degree eaſt and a little more than ten degrees weſt longitude. The extent of ſquare miles in the United Kingdom is equal to nearly one hundred and five thouſand; of which forty-nine thouſand four hundred and fifty belong to England and Wales, and the reſt is divided in nearly equal parts between Scotland and Ireland. The population is equal to about fifteen millions; more than ten of which are in England and Wales, and the reſt in Ireland and Scotland, of which Ireland has nearly double the number of thoſe in Scotland. The three capitals are London, Edinburgh, and Dublin.

Great Britain has the happineſs of being the undiſputed miſtreſs of the ſeas, which are every where covered with her ſhips. Her wealth, the value of her manufactures, and the extent of her commerce, are unequalled. The induſtry and intelligence of her inhabitants, the excellent form of her political conſtitution the juſt adminiſtration of her laws, and the independence ariſing from her inſular ſituation, combine to render her an object of pride to her own inhabitants, and of admiration to all other nations.

England contains forty counties or ſhires, ſituated in the following order, taken from north to ſouth:

1. Northumberland, ſeventy-four miles long, and forty-five broad; has forty pariſhes, and five market towns; and ſends eight members to parliament.

2. Cumberland, ſeventy-five miles long, and twenty-ſeven broad; has fifty-eight pariſhes, and twelve market towns; and ſends ſix members to parliament.

3. Weſtmoreland, forty miles long, and twenty-four broad; has twenty-ſix pariſhes, and eight market towns; and ſends four members to parliament.

4. Durham, thirty-five miles in length, and twenty-four in breadth; has one hundred and eighteen pariſhes, and ſix market towns; and ſends four members to parliament.

5. Yorkſhire, the largeſt county in England, is about ninety miles in length, and ſeventy-five in breadth; it contains five hundred and ſixty-three pariſhes, and fifty-eight market towns; and ſends thirty members to parliament.

6. Lancaſhire, ſeventy miles long, and thirty broad; has ſixty-ſix pariſhes, and twenty-three market towns; and ſends fourteen members to parliament.

7. Cheſhire, fifty miles long, and thirty-three broad; has twenty-ſix pariſhes, and thirteen market towns; and ſends four members to parliament.

8. Derbyſhire, fifty-four miles long, and twenty-four broad; has one hundred and ſix pariſhes, and nine market towns; and ſends four members to parliament.

9. Staffordſhire, forty-four miles long, and twenty-ſeven broad; has one hundred and thirty pariſhes, and ſixteen market towns; and ſends ten members to parliament.

10. Warwickſhire, forty-ſeven miles long, and twenty-ſeven broad; has one hundred and fifty-eight pariſhes, and ſeventeen market towns; and ſends ſix members to parliament.

11. Worceſterſhire, thirty-five miles long, and twenty-ſeven broad; has one hundred and fifty-two pariſhes, and eleven market towns; and ſends nine members to parliament.

12. Shropſhire, borders on Wales; is forty-eight miles long, and twenty-eight broad; has one hundred and ſeventy pariſhes, and thirteen market towns; and ſends twelve members to parliament.

13. Herefordſhire, forty miles long, and twenty-ſeven broad; has one hundred and ſeventy-ſix pariſhes, and thirteen market towns; and ſends eight members to parliament.

14. Monmouthſhire, thirty-three miles long, and twenty-two broad; has one hundred and twenty-ſeven pariſhes, and ſeven market towns; and ſends three members to parliament.

15. Glouceſterſhire, ſixty-five miles long, and thirty-two broad; has two hundred and eighty pariſhes, and twenty market towns; and ſends eight members to parliament.

16. Oxfordſhire, forty-ſeven miles long, and twenty-nine broad; has an Univerſity, conſiſting of twenty colleges, and five halls; has two hundred and eighty pariſhes, and twelve market towns; and ſends ten members to parliament.

17. Buckinghamſhire, forty miles long, and about eighteen broad; has one hundred and eighty-five pariſhes, and fifteen market towns; and ſends fourteen members to parliament.

18. Bedfordſhire, about twenty-four miles long, and ſixteen broad; has one hundred and ſixteen pariſhes, and ten market towns; and ſends four members to parliament.

19. Huntingdonſhire, about twenty-five miles in length, and ſeventeen in breadth; has ſeventy-nine pariſhes, and ſix market towns; and ſends four members to parliament.

20. Northamptonſhire, about forty miles long, and twenty broad; has three hundred and twenty-ſix pariſhes, and eleven market towns; and ſends nine members to parliament.

21. Rutlandſhire, the ſmalleſt county in England, about fifteen miles in length, and eleven in breadth; has forty-eight pariſhes, and two market towns; and ſends two members to parliament.

22. Leiceſterſhire, thirty-three miles long; has one hundred and ninety-three pariſhes, and twelve market towns; and ſends four members to parliament.

23. Nottinghamſhire, thirty-eight miles long, and twenty broad; has one hundred and ſixty-eight pariſhes, and eight market towns; and ſends eight members to parliament.

24. Lincolnſhire, fifty-five miles long, and thirty-ſix broad; has ſix hundred and thirty pariſhes, and twenty-four market towns; and ſends twelve members to parliament.

25. Norfolk, ſixty miles long, and thirty-four broad; has ſix hundred and ſixty pariſhes, and twenty-ſeven market towns; and ſends twelve members to parliament.

26. Suffolk, fifty miles long, and twenty-five broad; has five hundred and ſeventy-two pariſhes, and twenty-eight market towns; and ſends ſixteen members to parliament.

27. Cambridgeſhire, forty-ſeven miles long, and eighteen broad; has one hundred and ſixty-three pariſhes, and nine market towns; has alſo an Univerſity, conſiſting of twelve colleges, and four halls; and ſends ſix members to parliament.

28. Hertfordſhire, about thirty-one miles long, and twenty-eight broad; has one hundred and twenty pariſhes, and eight market towns; and ſends ſix members to parliament.

29. Middleſex, twenty miles long, and fourteen broad; has one hundred and twenty-ſix pariſhes, and four market towns, beſides London; and ſends eight members to parliament.

30. Eſſex, forty-four miles long, and forty-two broad; has four hundred and fifteen pariſhes, and twenty-ſeven market towns; and ſends eight members to parliament.

31. Kent, fifty-eight miles in length, and forty-eight in breadth; has four hundred and eight pariſhes, and twenty-ſeven market towns; and ſends ten members to parliament.

32. Surry, thirty-ſix miles long, and twenty-three broad; has one hundred and fifty pariſhes, and ſeven market towns; and ſends fourteen members to parliament.

33. Suſſex, eighty miles long, and twenty-four broad; has three hundred and twelve pariſhes, and thirteen market towns; and ſends twenty members to parliament.

34. Hampſhire, a moſt opulent maritime county, is forty miles long, and thirty-five broad; has two hundred and fifty-three pariſhes, and twenty market towns; and ſends twenty-ſix members to parliament.

35. Berkſhire, forty miles long, and twenty-four broad; has one hundred and forty pariſhes, and twelve market towns; and ſends nine members to parliament.

36. Wiltſhire, fifty-four miles long, and thirty-three broad; has three hundred and four pariſhes, and twenty market towns; and ſends thirty-four members to parliament.

37. Dorſetſhire, fifty-two miles long, and twenty-ſeven broad; has two hundred and forty-eight pariſhes, and fifteen market towns; and ſends twenty members to parliament.

38. Somerſetſhire, fifty-ſix miles long, and twenty-eight broad; has three hundred and eighty-five pariſhes, and thirty-five market towns; and ſends eighteen members to parliament.

39. Devonſhire, ſeventy-three miles long, and fifty-three broad; has three hundred and ninety-four pariſhes, and twenty-eight market towns; and ſends twenty-ſix members to parliament.

40. Cornwall, ſeventy-five miles long, and twenty-ſix miles over where broadeſt; has one hundred and ſixty-one pariſhes, and twenty market towns; and ſends forty-four members to parliament.—See a topographical deſcription, with a correct map of each county, under their alphabetical arrangement, in this Encyclopædia.

London, the capital of the Britiſh dominions, contains nearly a million of inhabitants, is twenty miles in circumference, and is the largeſt, moſt opulent, and moſt flouriſhing, city in the world.—The principal towns, famous for their reſpective manufactures, are Birmingham and Sheffield, for cutlery and hardware; Manchester, for cotton goods; and Leeds, Wakefield, Froome, Trowbridge, and Bradford, for woollen cloth. The great commercial ſea-ports, beſides London, are Liverpool, Briſtol, Hull, Newcaſtle, Whitehaven, Yarmouth, and Poole.—The dock-yards for the navy are Portſmouth, Plymouth, and Chatham.

The principal rivers in England are the Severn, the Thames, the Humber, the Merſey, the Trent, and the Medway.

The principal lakes, are thoſe in Cumberland, and Winander Mere in Weſtmoreland.

The Iſle of Wight, on the ſouth of Hampſhire, is famous for its cultivation; Jerſey and Guernſey are near the coaſt of France. The Iſle of Man is in the Iriſh Sea. The Scilly iſlands are rocks which ſtretch beyond the promontory of Cornwall, from which they are viſible in fair weather.

Wales, inhabited by the invincible deſcendants of the ancient Britons, is divided into twelve counties, which are as follow:

1. Flintſhire, twenty-nine miles long, and eighteen wide; has twenty-one pariſhes, and two market towns; and ſends two members to parliament.

2. Denbighſhire, thirty-nine miles long, and fifteen broad; has fifty-ſeven pariſhes, and four market towns; and ſends two members to parliament.

3. Montgomeryſhire, thirty-five miles long, and thirty-four broad; has ſixty-eight pariſhes, and ſix market towns; and ſends two members to parliament.

4. Angleſea, twenty-four miles long, and fourteen broad; has ſeventy-four pariſhes, and two market towns; and ſends one member to parliament.

5. Carnarvonſhire, fifty miles long, and thirteen broad; has ſixty-eight pariſhes, and ſix market towns; and ſends two members to parliament.

6. Merionethſhire, forty-ſeven miles long, and twenty-five broad; has thirty-ſeven pariſhes, and five market towns; and ſends one member to parliament.

7. Radnorſhire, about thirty miles in length, and twenty-five in breadth; has fifty-two pariſhes, and four market towns; and ſends two members to parliament.

8. Brecknockſhire, thirty-nine miles long, and twenty-ſeven broad; has ſixty-one pariſhes, and four market towns; and ſends two members to parliament.

9. Glamorganſhire, twenty-ſeven miles long, and twenty-five broad; has one hundred and eighteen pariſhes, and nine market towns; and ſends two members to parliament.

10. Pembrokeſhire, about thirty-ſeven miles long, and eighteen broad; has one hundred and forty-five pariſhes, and five market towns; and ſends three members to parliament.

11. Cardiganſhire, about forty-two miles long, and twenty broad; has ſixty-four pariſhes, and four market towns; and ſends two members to parliament.

12. Carmarthenſhire, forty-eight miles long, and twenty-five broad; has one hundred and forty-five pariſhes, and eight market towns; and ſends two members to parliament.

Angleſea is an iſland. The common paſſage from England

England to Ireland is from Holyhead in this iſland; from whence packets ſail regularly for Dublin.

SCOTLAND, the northern diviſion of Great Britain, is inhabited by a valiant, hardy, induſtrious, well-informed, and temperate, race of people. It is divided into thirty-three ſhires or counties, viz. 1. Orkney, including Shetland. 2. Caithneſs. 3. Sutherland, including Strathnaver. 4. Roſs. 5. Inverneſs. 6. Cromartie. 7. Nairn. 8. Elgin, including Murray. 9. Bamff. 10. Aberdeen. 11. Kincardin, or Mearns. 12. Forfar, including Angus. 13. Perth. 14. Fife. 15. Kinroſs. 16. Clacmanan. 17. Stirling. 18. Dumbarton. 19. Argyle. 20. Bute. 21. Renfrew. 22. Lanerk, or Clydeſdale. 23. Air. 24. Kircudbright, or Eaſt Galloway. 25. Wigton, or Weſt Galloway. 26. Dumfries. 27. Peebles, or Tweedale. 28. Selkirk. 29. Roxborough. 30. Merſe, or Berwick. 31. Haddington, or Eaſt Lothian. 32. Linlithgow, or Weſt Lothian. 33. Edinburgh, or Mid Lothian.

The moſt conſiderable mountains in Scotland are the Grampian, Pentland, Lammermuir, Tiviot, Ben Nevis, Ben Lomond, and Fergus.

The moſt conſiderable towns in Scotland are Edinburgh, Glaſgow, and Aberdeen, famous for their univerſities: Glaſgow is no leſs ſo for its extenſive commerce. Berwick-upon-Tweed lies between England and Scotland, and is diſtinguiſhed from both, by having its own peculiar privileges, and a ſmall territory within its juriſdiction.

The iſlands belonging to Scotland are the Shetland, the Orkney, and the Hebrides, or Weſtern Iſlands.—The principal rivers are the Forth, the Tay, the Dee, and the Don.—The moſt conſiderable lakes are Loch Tay; Loch Lomond, which contains ſeveral iſlands; and Loch Neſs, in Inverneſshire.

IRELAND, for many ages a kingdom of itſelf, is divided into four large provinces: viz. Ulſter northward, Leinſter eaſtward, Munſter ſouthward, and Connaught weſtward. Theſe provinces contain the following thirty-two counties:

1. ULSTER compriſes the counties of Donnegal, Londonderry, Antrim, Tyrone, Fermenagh, Armagh, Down, Monaghan, and Cavan.

2. LEINSTER, comprehends the counties of Louth, Eaſt Meath, Weſt Meath, Longford, Dublin, Kildare, King's County, Queen's County, Wicklow, Carlow, Wexford, and Kilkenny.

3. MUNSTER, contains the counties of Clare, Limerick, Kerry, Cork, Waterford, and Tipperary.

4. CONNAUGHT, includes the counties of Leitrim, Roſcommon, Mayo, Sligo, and Galway.

The chief towns are Dublin, the capital; Cork, Londonderry, and Belfaſt. Cork is a flouriſhing commercial city, and remarkable for its fine harbour.—The principal rivers are the Shannon, the Blackwater, the Boyne, and the Liffy.

Before the union with Great Britain, the government was veſted in a houſe of peers, and a houſe of commons, conſiſting in the whole of three hundred members. The king ſtill continues to be repreſented by a viceroy ſent from England. The commons of Ireland are now repreſented by a hundred members in the Britiſh parliament; the lay lords, by twenty-eight peers, and the ſpiritual, by one archbiſhop and three biſhops.

See particulars at large of all theſe European ſtates, with correct maps of the ſame, under their proper titles in this Encyclopædia.

ASIA.

This diviſion of the earth extends, in length, from the Helleſpont to what is called the Eaſt Cape; or from about the 26th degree of longitude eaſt from Greenwich or London, into the other hemiſphere to near 190° of eaſt longitude, or 170° weſt from London; being no leſs than 164°, or (taking the degree at a medial latitude) more than 6500 geographical miles. From the ſouthern cape of Malacca to the cape of Cevero Voſtochnoi, which bounds the Icy or Arctic ocean, the breadth extends from about 2° of northern latitude to about 77°, or nearly 4500 geographical miles. If, for the ſake of a comparitive calculation, one ſixth part be added for the difference between the ſtatute and geographical mile, the length of Aſia would be about 7583 Britiſh miles, and the breadth 5250.

Of the real extent of Aſia, the ancients entertained moſt indiſtinct ideas; and in fact the diſcovery of the remoter parts of this great diviſion of the world may be ſaid to have commenced with the travels of Marco Polo, the Venetian, in the end of the thirteenth century; and it was not completed, with regard to the eaſtern extremities, till the recent travels were publiſhed in Ruſſia, and the voyages of Beering, Cook, and La Perouſe. It is now well known that Aſia is limited, on the eaſt, by a ſtrait which divides it from America; and which in honour of the diſcoverer is called Beering's ſtrait. The northern and ſouthern boundaries are the Arctic and Indian oceans, in which laſt many large iſlands, particularly that of New Holland, which forms part of *Auſtralaſia*, afford a new line of boundary to this diviſion of the globe. The weſtern limits of Aſia have Europe, Africa, the Mediterranean, and the Black Sea, for their boundaries.

The population of Aſia is by all authors allowed to be wholly primitive and original; if we except that of the Techuks or Tchuktchi, who, by the Ruſſian travellers and Mr. Tooke, are ſuppoſed to have paſſed from the oppoſite coaſt of America. A few colonies have migrated from Ruſſia to the northern parts, as far as the ſea of Kamtſchatka: and there are European ſettlements in Hindooſtan, and the iſles to the ſouth-eaſt; but the firſt ſerious attempt to colonize what is called a part of Aſia, was the recent ſettlement at Port Jackſon. With theſe trifling exceptions, Aſia preſents a very extraordinary inſtance of original population.

The conqueſts of the famous Zingis, or Genghis Khan, in the beginning of the thirteenth century, firſt opened the diſcovery of the diſtant parts of Aſia; the Moguls, or Monguls, whoſe ſovereign he was, being ſituated to the eaſt of the Huns, who had before diffuſed terror over Europe. The firſt feat of the Monguls was in the mountains which give ſource to the river Onon; and at a ſhort diſtance to the ſouth-weſt was Kara-kum, or Karacum, the firſt capital of the Mongul empire. The victories of Zingis extended from Cathai, or the northern part of China, to the river Indus; and his ſucceſſors extended them over Ruſſia, while their inroads reached Hungary and Germany. This widely-diffuſed power of the Monguls naturally excited an attention and curioſity, never ſtimulated by petty tribes; and at the ſame time it facilitated the progreſs of the traveller, who, as in Africa, had been impeded by the enmities of diminutive potentates. By force of arms the Monguls alſo firſt opened the obſcure receſſes of Siberia. Sheibani Khan, A. D. 1242, led 15,000 families into thoſe northern regions; and his deſcendants reigned at Tobolſkoy above three centuries before the Ruſſian conqueſt of that country.

After the diſcovery of America, and the Cape of Good Hope, the maritime parts and iſlands of Aſia began to be ſucceſſively diſcloſed. Yet the modern voyages of the Ruſſian navigators, of our immortal Cook, and of the unfortunate La Perouſe, evince that much remained to be done; and concerning the interior of Siberia ſcarcely any ſolid information aroſe, till Peter the Great, after the battle of Pultowa, ſent many Swediſh priſoners into that region; and Strahlenberg, one of the officers, publiſhed an account of Siberia. This knowledge has been greatly improved and increaſed by the travels of Dr. Pallas, and others. Yet our knowledge of Aſia is far from being perfect, eſpecially

in

in reſpect to Daouria, and other regions near the confines between the Ruſſian and Chineſe empires; not to mention central Aſia in general, Thibet, and ſome more ſouthern regions; nor had even the geography of Hindooſtan been treated with tolerable accuracy, till Major Rennell publiſhed his excellent memoir.

Though Aſia cannot vie with Europe in the advantages of inland ſeas, yet beſides its ſhare of the Mediterranean, it poſſeſſes the Red Sea, the Arabian Sea, and Gulph of Perſia; the bays of Bengal and Nankin; and other gulphs, which diverſify the coaſts much more than thoſe of Africa or America, and have doubtleſs contributed greatly to the early civilization of this celebrated diviſion of the world. The Red Sea, or the Arabian Gulph of antiquity, conſtitutes the grand natural diviſion between Aſia and Africa; but its advantages have chiefly been felt by the latter, which is entirely deſtitute of other inland ſeas; Egypt and Abyſſinia, two of the moſt civilized countries in that diviſion, having derived great benefits from that celebrated gulph, which from the ſtraits of Babelmandel to Suez, extends about 21 degrees, or 1470 Britiſh miles; terminating not in two equal branches, as delineated in old maps, but in an extenſive weſtern branch, while the eaſtern aſcends little beyond the parallel of Mount Sinai. The Perſian Gulph is another noted inland ſea, about half the length of the former, being the grand receptacle of thoſe celebrated rivers the Euphrates and the Tigris.

The Caſpian Sea is properly a lake of Aſia, extending about 10°, or 700 miles in length, and from 100 to 200 in breadth. This lake ſeems at one period to have ſpread further to the north, where the deſerts are ſtill ſandy and ſaline, and preſent the very ſame ſhells that are found in the Caſpian: but the chain of mountains which branches from the weſt of the Urals to the north of Orenburg, and reaches to the Volga, muſt, in all ages, have reſtricted the northern bounds of thoſe waters. To the eaſtward, this remarkable ſea, in the opinion of moſt geographers, extended at no very remote period quite to the lake of Aral; the deſerts on that ſide preſenting the ſame materials as thoſe to the north; though there be now an elevated level between the ſea of Aral and the Caſpian, occaſioned perhaps by the quantity of ſand rolled down by the Gihon, the Sirr, and other rivers which now flow into the Aral. The northern ſhores are low and ſwampy, often overgrown with reeds; but in many other parts the coaſts are precipitous, with ſuch deep water that a line of 450 fathoms will not reach the bottom. This ſea is the receptacle of many rivers, as the Jemba, the Ural or Jaik, and the Volga from the north: the Kuma, Terek, Kur, and Kizil Ozen, from the weſt: from the eaſt the Caſpian is ſuppoſed ſtill to receive the Tedjen; and the Gihon, or Oxus of antiquity, flowed into the Caſpian, at leaſt by one or two branches, till it was forced northward, and driven into the ſea of Aral.

Beſides the Caſpian, Aſia alſo poſſeſſes the ſea or lake of Aral, which is about two hundred miles in length, and about ſeventy miles in breadth; receiving the rivers anciently called Iaxartes, and Oxus; or the Sirr, and Gihon, abovementioned. The ſea of Aral, being ſurrounded with ſandy deſerts, has been but little explored. Another remarkable ſea is that of Baikal in Siberia, or Aſiatic Ruſſia, extending from about the fifty-firſt to the fifty-fifth degree of north latitude, being about three hundred and fifty Britiſh miles in length, but its breadth not above thirty-five. The water is freſh and tranſparent, yet of a green tinge, commonly frozen in the latter end of December, and clear of ice in May. The Baikal is, at particular periods, ſubject to violent and unaccountable ſtorms, whence, as terror is the parent of ſuperſtition, probably ſprings the Ruſſian name of *Svetoie More*, or the Holy Sea. The chief river flowing into Baikal is the Selinga, from the ſouth; while from the north it emits the Angara, which joins the extenſive ſtream of the Yeniſei.—The chief rivers of Aſia are the Kian-Ku and Hoan-Ho, the Lena, the Yeniſei, and the Ob, ſtreams which rival in the length of their courſe any others on the globe. The Volga has been named among the rivers of Europe, to which the principal part of its courſe belongs. Next are the Amur, and the Maykaung of Laos, the Sampoo or Barrampooter, and the Ganges.

Of the Aſiatic mountains, the Altaian chain may be claſſed among the moſt extenſive, reaching from about the ſeventieth to the one hundred and fortieth degree of eaſt longitude from Greenwich, or about five thouſand miles, thus rivalling in length the Andes of South America. The Altaian chain, beyond the ſources of the Yeniſei, is called the mountains of Sayanſk; and from the ſouth of the ſea of Baikal the mountains of Yablonnoy: branches of which extend even to the country of the Techuks, or extreme boundaries of Aſia. To the ſouth of the Altaian ridge extends the deſert of Cobi or Shamo, running in a parallel direction from eaſt to weſt; and the high region of Thibet forms a part of this central prominence of Aſia. The chain of Alak may perhaps be regarded as a part of the Altaian, branching to the ſouth, while the Taurus, now known by various names in different countries, was by the ancients regarded as a range of great length, reaching from cape Kelidoni on the weſt of the gulph of Satalia, through Armenia, even to India. The other mountains of Aſia are Bogdo, Changai, Belur, thoſe of Thibet, the eaſtern and weſtern Gauts of Hindooſtan; and the Caucaſian chain between the Euxine and Caſpian ſeas.

The principal governments or diviſions of Aſia are the following; Tartary, including Thibet; Ruſſian Tartary, or Ruſſia in Aſia; Turkey; Arabia Perſia; India within the Ganges, or Hindooſtan; India beyond the Ganges; which includes the Birmah empire, and the empire of China.

TARTARY.—The limits of this country are not correctly aſcertained; but it is ſuppoſed to be about 3000 miles in length, and 2000 in breadth. It is bounded by the Frozen Ocean, north; Pacific Ocean, eaſt; Ruſſia in Europe, weſt; China, India, and Perſia, ſouth. Part of it belongs to Ruſſia, part to China, part to Perſia, and part of it is independent.

The principal Tartar tribes, or hordes, are, the Samoieda, Siberian, Tatar properly ſo called, Bucharian, Elut or Kalmuc, Oſtiac, Circaſſian, Turcoman, Uſbec, Kirgus, Tibetian, Mongul, Cathai, Tunguſian or Manſhur, Bratſki, Jakutſkoi, and Kamtſchatka, Tartars. Of theſe the moſt powerful are the Kalmucs, the Kirguſes, the Uſbecs, and the Bucharians. Some ſuppoſe the Tatars, Monguls, and Tunguſi, to be the radical tribes.

Their cities and towns are few, owing to their wandering life. The moſt conſiderable of them are, Samarcand, which was the reſidence of Tamerlane, in Great Bucharia, or Uſbec Tartary; Bokhara, Balk, Zouf, Urghentz, Haſhar, Hazaraſp, Karacum, the capital of the Monguls.

The rivers of Tartary are, the Wolga, Jaik, Tobol, Oby, Irtis, Geneſa, Lena, Anadir, Argun, the Amu or Gihon, which receives the Sogd, on the banks of which ſtands Samarcand, the Sirr or Sihon.

Their princes are called khans, as ours are kings or emperors. The moſt of them, as alſo the Great Mogul, and the emperor of China, are deſcended from Tamerlane the Great.

The Delai, or Grand Lama, in Thibetian Tartary, is not only ſovereign pontiff, but alſo receives adoration as a deity. The khans, who do not affect being independent, pay tribute to one or other of the powerful neighbouring empires. Thibet is diſtinguiſhed into *upper*, *lower*, and *middle*. The greater part of it is under Chineſe influence.

RUSSIAN TARTARY, or RUSSIA IN ASIA.—This immenſe portion of the Ruſſian dominions extends almoſt the

the whole length of Aſia. It is bounded on the north by the Arctic Ocean, on the eaſt by the ſeas of Kamtſchatka and Ochotſk; the weſtern frontiers correſpond with thoſe between Aſia and Europe; on the ſouth, the river Cuban, and part of the Caucaſian chain of mountains, divide the Ruſſian territory from Turkey and Perſia; the Altain mountains ſeparate it from the Chineſe empire; and farther to the eaſt the boundaries of Ruſſia, the river Amour, and the Noblonnoy mountains. By geographical poſition it extends from the thirty-ſeventh degree of longitude eaſt of Greenwich, to one hundred hundred and ſeventy degrees of weſtern longitude. Almoſt the whole of this empire lies north of fifty degrees of latitude. The chief towns are, Aſtracan, at the mouth of the Wolga; Azof, on the Aſiatic ſide of the Don; Tobolſk, the capital of Siberia; Kolywan, famous for its ſilver mines; and Irkutſk, the chief mart between Ruſſia and China.

The general appellation of this country was Siberia; the population of the whole of it not exceeding three millions and a half. The kingdoms of Cazan and Aſtracan were added to the Ruſſian empire in the ſame century as Siberia. The population of all Ruſſian Aſia is calculated at about five millions.

Siberia is divided into two great governments; that of Tobolſk in the weſt, and Irkutſk in the eaſt; which again are ſubdivided into ſmaller. Tobolſk and Aſtracan are the two metropolitan ſees of Ruſſian Aſia. Irkutſk, Zuruchaita, and Kiachta, are the principal ſeats of the commerce between Ruſſia and China.—The Kurilian iſlands belong to Aſiatic Ruſſia; they extend from Kamtſchatka to Jeſſo.

Kamtschatka.—This part of Aſiatic Ruſſia is a large peninſula on the north-eaſtern part of Aſia. It is bounded on the eaſt and ſouth by the ſea of Kamtſchatka, on the weſt by the ſeas of Ochotſk and Penſhinſk, and on the north by the country of the Koriacs. It lies between fifty-one and ſixty-two degrees of north latitude, and between one hundred and ſeventy-three and one hundred and eighty-two degrees of eaſt longitude. The natives are divided into Kamtſchatkans or Kamtſchadales, Koreki, and Kuriles; but all together do not amount to above five thouſand people.

Nova Zembla is a region on the north of Aſiatic Ruſſia, in the Frozen Ocean; but whether it be an iſland, or part of a great continent, has not yet been ſatisfactorily determined by any geographers or navigators. And ſo little is known concerning this inhoſpitable country, that it ſeems wholly uncertain whether there be any conſtant inhabitants reſiding there or not. Towards the end of the ſixteenth century ſome Dutch ſeamen wintered in Nova Zembla, and with great difficulty kept themſelves alive, though conſtantly inured to a cold climate.

Turkey in Asia.—This region extends from the ſhores of the Archipelago, to the confines of Perſia; a ſpace of more than a thouſand miles. It is bounded on the north by the Black Sea and the Caucaſian mountains; on the eaſt by the Caſpian Sea and Perſia; and on the ſouth and weſt by the Red Sea, Arabia, and the Mediterranean. Its geographical poſition lies between twenty-ſix and forty-three degrees of eaſt longitude, and between thirty-three and forty-three degrees of north latitude. The whole of the Turkiſh empire in Aſia is eſtimated at nearly five hundred thouſand ſquare miles, and the population is reckoned at ten millions. Turkey is divided into ſeveral provinces, as follows:

1. Natolia, or Aſia Minor, which includes Natolia, properly ſo called; Amaſia, Aladulia, and Caramania. The principal towns of which are, Smyrna, Burſa, Amaſia, Trapezond, Sinope, Ajazzo, Marat, and Satalia.

2. Syria; the principal towns of which are Aleppo, Damaſcus, Said or Old Sidon, Tripoli; alſo Balbec, anciently Heliopolis; and Palmyra, anciently Tadmor.

3. Paleſtine; the capital of which is Jeruſalem.

4. Turcomania, or Turkiſh Armenia; the capital of which is Erzerum.

5. Diarbec, Algezira, or Meſopotamia; the chief towns of which are, Diarbec, and Mouſoul.

6. Irak-Arabi, or Chaldea; the chief towns of which are, Buſſora, and Bagdat.

7. Curdiſtan, or Aſſyria; the chief towns of which are, Nineveh, and Betlis.

8. Choriſtan; the chief town of which is Buſſorah.

9. Circaſſia, or Tſherkeſs; part being under the protection of Turkey, part under Ruſſia, and part under Perſia.

10. Georgia; the principal town of which is Teflis.

11. Mingrelia; and, 12. Imiretta; the principal town of which is Cotalis.

The Turkiſh kingdom of Roum extended from the Euphrates to the Helleſpont, and from the Euxine to Syria.

In Natolia, or Aſia Minor, were the ſeven churches of Aſia, mentioned in the book of Revelation; viz. Pergamos, Laodicea, Philadelphia, Thyatira, Sardis, Epheſus, and Smyrna; but theſe places, excepting Smyrna, are now moſtly in ruins.

South of Natolia is that part which is uſually called the *Holy Land*, on account of its having witneſſed the ſacred miſſion of Jeſus Chriſt. It is alſo called *Judea*, from the patriarch Judah. The river Jordan is now a very ſmall ſtream that empties itſelf into the Red Sea, near the ſpot where Sodom and Gomorrah once ſtood.

Armenia is alſo ſtyled Turcomania. The ancient Meſopotamia, between the Tigris and Euphrates, correſponds with Diarbec or Algezira. Syria, or the ancient Canaan, is ſituated on the eaſtern extremities of the Mediterranean.

The principal river in Aſiatic Turkey is the Euphrates; next to this is the Tigris.—The mountains in this country have always been celebrated; theſe are Taurus, Libanus, and Ararat; on the laſt Noah's ark reſted after the flood.

The chief iſlands of Aſiatic Turkey are, Mytelene, Scio, Samos, Cos, Rhodes, and Cyprus, which produce cotton, ſilk, oil, fruits, and wines. Turkey is alſo famous for its carpets and rhubarb.

Of the Turkiſh cities in Aſia, the moſt populous are, Aleppo, containing about two hundred and fifty thouſand inhabitants; Damaſcus, about one hundred and eighty thouſand; and Smyrna, about one hundred and twenty thouſand. Burſa or Pruſa is very populous, and was the capital of the Turkiſh empire, till they paſſed over to Conſtantinople, in Europe.

Arabia.—This country is bounded by Turkey, north; the Indian Ocean, ſouth; the Red Sea, weſt; and the Perſian Gulf, eaſt. Its geographical poſition lies in eaſt longitude thirty-five degrees ſixty minutes; north latitude twelve degrees thirty minutes. It is in length, one thouſand three hundred miles; and in breadth, one thouſand two hundred. The capital is Mecca.

It is divided into three provinces, viz. 1. Arabia Petræa; the chief town of which is Suez, anciently Arſinoe. 2. Arabia Deſerta, including Hajaz, a ſmall tract on the Red Sea; the chief towns of which are, Anna, Mecca, Giodda or Gedda, the port of Mecca, and Medina. 3. Arabia Felix, or Yemen; the chief towns of which are, Sanaa, Mocha, Aden, Hadramut, Maſcate, and Oman.

To Arabia Deſerta belongs Neged, the interior mountainous country inhabited by the Bedouins, divided into Ared eaſt, and Kirjé weſt. The chief towns of it are, Aijana, the birth-place of a late prophet named Waheb; and Munfoha, in Ared; and Imama, and Salemia, in Kirjé. It extends eaſtward to Oman, on the Gulf of Ormus, and Lahſa or Ahſor, on the Perſian Gulf.—Oman is by ſome conſidered as the name of a province, of which Maſkat is the chief town.

To this diviſion of Aſia belongs the Red Sea, Perſian Gulf, or Gulf of Baſſora, and the Gulf of Ormus; alſo the Straits of Babelmandel and Ormus.

The two moſt noted Arabian iſlands are, Socotra, famed for its aloes; and Bahrin, in the Perſian Gulf, for its pearl fiſhery. The government is under xeriffs, emirs, imans, ſheiks, cadis, &c. moſt of whom are tributary to the Turks, though ſome of them are independent. Yemen, which is part of Arabia Felix, is a conſiderable and hereditary principality. Bahrein, a tract on the Perſian Gulf, is ſubject to Perſia. Its chief town is Gerra, or Katif.

PERSIA.—The Perſian empire is bounded by Circaſſia, the Caſpian Sea, and Tartary, on the north; the Gulfs of Perſia and Ormus, on the ſouth; Turkey, on the weſt; and India, on the eaſt. It is ſituated in eaſt longitude forty-four degrees ſeventy minutes; north latitude twenty-five degrees forty-five minutes. In length, it is one thouſand three hundred miles; breadth, one thouſand one hundred. Its capital is Iſpahan.

Perſia is divided into the following provinces, viz. 1. Dagiſtan, and part of Georgia or Gurgiſtan; the chief town, Teflis. 2. Sherwan; chief town, Derbent. 3. Aderbeitzin; chief town, Tauris. 4. Ghilan; chief town, Reſht. 5. Mazanderan; chief town, Mazanderan. 6. Chorazan; chief town, Meſched. 7. Sableſtan; chief town, Roſt. 8. Candahar, Cabuliſtan, Caſhmir, the kingdom of Eaſtern Perſia, or Perſia in India; chief towns, Candahar, Cabul, and Caſhmir. 9. Sigiſtan; chief town, Sigiſtan. 10. Mecran; chief town, Kidg. 11. Sirjam or Kerman; chief towns, Gombroon, and Ormus. 12. Fars or Farſiſtan; chief towns, Schiras, near which are the ruins of Perſepolis; and Iſtaker. 13. Chuſiſtan; chief town, Souſter. 14. Irak Agem, being part of Diarbec; chief towns, Iſpahan, and Ecbatana.

Part of Curdiſtan, and part of Armenia, alſo belong to the Perſians. The chief town of Perſian Armenia is Erivan.

The rivers of Perſia are, the Kur and Aras, which run into the Caſpian; the Oxus, Gihon or Amu, into Lake Aral; and the Tigris, and Euphrates, into the Perſian Gulf.

The Parapamiſus, or Mountains of Gaur, are ranges which cut the country in every direction. The deſerts alſo are very extenſive. The government of Perſia is abſolute, under a ſophi or emperor, who takes the title of ſhah, and alſo thoſe of khan, and ſultan. The population is ſaid to be about ten millions. The inhabitants of Iſpahan about ſix hundred thouſand.

HINDOOSTAN, OR INDIA WITHIN THE GANGES.—*The Empire of the Great Mogul.*—This country, fertile in gold and diamonds, is bounded by Tartary, on the north; Thibet, and the Bay of Bengal, on the eaſt; the Indian Ocean, on the ſouth; and Perſia, on the weſt. Its geographical ſituation lies in eaſt longitude ſixty-ſix degrees ninety-two minutes; north latitude ſeven degrees forty minutes. Its length is two thouſand miles; its breadth, one thouſand five hundred; and its capital is Dehli.

It is ſometimes divided into Hindooſtan Proper, to the north of the Nerbudda; and the Deccan, or the country to the ſouth of that river. But the name of Deccan has been limited to a ſmaller extent of country, lying to the north of the Kiſtna, while that to the ſouth is diſtinguiſhed by the general name of *Carnatic*.

This extenſive country is divided into the following provinces and chief towns: Cachemir, Cachemir; Atok, Atok; Penjab, Lahore; Multan, Multan; Bankitch, Banou; Nagracut, Nagracut; Siba, Siba.—Belonging to the Rohillas: Ghor, Ghor; Jeſuat, Rajapour; Necbal, Catmandur; Dehli, Dehli; Agra, Agra; Bando, Bando; Tatta or Sindi, Tatta.—Belonging to the Rajpoots: Bhakor, Bhakor; Bundelcund, Callinger, and the Purna Diamond Mines; Jeſſelmere, Jeſſelmere; Agimere, Agimere; Soret, Soret.—Belonging to the Mahrattas, in the Deccan: Candiſh, Burhampour; Balagate, Aurengabad; Berar, Nagpour; Chitur, Chitur; Malwa, Ratipour; Gualeor, Gualeor.—Belonging to the Nabob of Oude: Rotas, Rotaſgur; Halebas, Alehabat; Oude, Lucknow and Oude; Benares, Benares, where there is a Gentoo univerſity; Bahar, Patna.—Belonging to Bengal: the province of Burdwan; chief towns, Muſcadabat, Burdwan, Caſimbajar, Hoogli, Chandenagore, Calcutta, and Midnapour. Province of Dacca; Dacca, and Chittagong.

Hither Peninſula of Deccan, in the Eaſtern Coaſt, or Coromandel.—Province of Orixa; chief towns, Orixa, Baliſore, Cattock, and Jaggernaut, where there is a famous pagoda.—Province of Telingana; chief towns, Golconda, Hyderabad or Bagnagur, and Dowlatabad.—The Northern Circars, of the ſame name, for the moſt part, as their chief towns; which are, Gangam, Chicacol, Rhajamandri, Maſulipatnam, Kondovir or Condour.

Carnatic, in the Eaſtern Coaſt, or Coromandel.—Province of Jaghire; chief towns, Conjevetam, and Madras or Fort St. George; Arcot, Arcot, Velore, and Paliconda; Pondicherry; Trichinopoly, Trichinopoly; Tanjour, Tranquebar, Negapatam, and Tanjour; Dindigul, Dindigul; Madura, Madura; Marawa, Ramnad, and Shevigunga; Tinevelli, Palamcotta.—Carnatic, in the Weſtern Coaſt, or Malabar.—Province of Travancore, Travancore; Cochin, Cochin; Calicut (to the zamorin), Calicut, Tellicherry, and Cannanore; Miſore (Tippoo's country), Myſore, Seringapatam, Bangalore, Adoni, Condanore, Rachori, and Cuddapah; Canara, Mongalor.—In the Deccan, and Concan.—Province of Viſiapour; Goa, Viſiapour, Rajapour, and Bombay; Cambay or Guzerat, part belonging to the Mahrattas, Surat, Cambaya, Amedabad, and Dieu.

Cape Comorin, is the moſt ſouthern part of the Hither Peninſula.

The principal rivers are, the Indus or Sinda, in the higher part of its courſe called the Attuck; Ganges, Gagra, Jumma, Burrampooter or Sanpoo, Nerbudda, Andi, Ganga or Goadaveri, Mahanada, Kriſna, Coleroon or Tanjore river, Caveri; of which the Indus, Ganges, and Kriſna, are reckoned by the natives *holy rivers*.

The mountains are, the Gauts or Balagate; Naugracut; Sewalick, where the Ganges deſcends into the plains of Hindooſtan; Himmaleh, under which the Ganges paſſes, and then riſes at the cavern called the Cow's Mouth; Kentaiſſo, on the oppoſite ſides of which the Ganges and Burrampooter are thought to take their riſe; the Bootan mountains.

The population is ſaid to be as follows: the Mahometans or Moors, about ten millions; the Indians, Hindoos, or Gentoos, about one hundred millions.

The Gentoos are divided into four great tribes: 1. Brahmins, the prieſts and philoſophers of the nation. 2. The Khatry Caſt, conſiſting of ſoldiers, who are alſo their civil magiſtrates in peace. 3. The Bhyſe, conſiſting of huſbandmen and merchants. And laſtly, the Soodera, or artiſans and ſervants. Theſe are ſubdivided into about eighty-four inferior tribes or caſts. There are various other diviſions of them, as Talingas, Malabars, Mahrattas, Canaras, Malleallums, Rajahpoots, Nyars, &c. The Pariars or Chandalas are the outcaſts, the moſt degraded of all.

The Gentoo prieſts are called *Brahmins*. Their doctrines are contained in the *Shaſtah*, which is a commentary on the *Vidam*, their ſacred book, which has been long loſt. The Shaſtah is written in the Shanſcrit, a dead language, underſtood by the Brahmins alone; but lately reſtored by the indefatigable ſir William Jones.

Of their various mendicant ſects, the Faquirs are generally Mahometans, though many of them alſo are Hindoos, and the Joghis are idolaters. The Banyans profeſs

profeſs the Gentoo religion, and act as brokers to the Europeans.

Government.—The Great Mogul is an abſolute prince; but his viceroys, called nabobs, rajahs, ſubahs, &c. have little more than a nominal dependence on him. The preſent Mogul, (1806,) is Shah Allum.

Hindooſtan, ſoon after the Mahometan conqueſt of it, was divided into eleven ſoubahs or provinces. Theſe were again divided into circars, and the circars into purgunnahs. The eleven ſoubahs were, Lahore, Moultan (including Sindy), Agimere, Dehli, Agra, Oude, Allahabad, Bahar, Bengal, Malwa, and Guzerat. A twelfth was added towards the weſt fources of the Indus, called Cabul: it included Candahar. Three more were added from conqueſts in the Deccan, Berar, Candiſh, Amednagur; fifteen in all.

Invaſions and revolutions, however, have altered many of theſe diviſions. Caſhemir and Sindy are tributary to the king of Candahar. The poſſeſſions of the ſheiks extend from the Indus to the neighbourhood of Dehli; and from Caſhmere and Thibet to Bakhor, on the Indus, including Atoc, Multan, and Lahore. Dehli is the reſidence of the Great Mogul, who, after long being dependent on a Mahratta chief, has lately been delivered from this thraldom by the Britiſh arms.

There are two Mahratta ſtates or empires: the Poonah or Weſtern, and the Berar or Eaſtern, Mahrattas. Their poſſeſſions extend from eaſt to weſt, acroſs the wideſt part of the peninſula, from Guzerat to Bengal; and from Agra northward, to the Kriſna ſouthward, and are about one thouſand miles in length, and ſeven hundred in breadth.

The Weſtern Mahratta chiefs acknowledge the ram-rajah to be their ſovereign, and the peiſhwah to be his vicegerent. The ram-rajah reſides at Sattarah, and the peiſhwah reſides at Poonah, not far from Bombay.

Berar, the other diviſion, though very extenſive, is leſs powerful. The nabob of it lives at Nagpour. To him alſo belongs the greater part of Orixa.

The Rajpoots are uſually divided into the two tribes or claſſes of Rathore and Chohan. Their prince is ſometimes called *Rana*.

The nabob of Oude poſſeſſes, under the protection of the Engliſh, extenſive dominions; the ſoubah of Oude, Allehabad, the Douab or country between the Ganges and Jumma towards their junction, Benares, and the eaſtern parts of Agra and Dehli. His principal city is Lucknow. His revenue is thought to amount to two millions and a half; the population of his dominions to near twenty millions.

The nizam or ſoubah of the Deccan, though he poſſeſſes extenſive dominions, is tributary to the Mahrattas. His capital, Hyderabad, is near Golconda.

The five northern circars, ſo called as lying to the north of Madras, and extending to Oriſſa, are Cicacole, Rajamundry, Ellore, Condapilly, in poſſeſſion of the Engliſh, and Guntoor, called alſo Condovir, belonging to the nizam.

The dominions of the nabob of the Carnatic, extend from Guntoor and the Kriſna to Cape Comorin, including the dependencies of Tanjore, Madura, &c. His reſidence is at Arcot, from which he takes the title of "Nabob of Arcot." Four of the circars, the Jaghire, and Cuddalore, depend on Madras.

Hyder Ali and Tippoo Sultan's territories touched upon Viſiapour and Guntoor to the north; Madura and Travancore to the ſouth; the mountains of Sautgud and Attore to the eaſt; and the ſea on the weſt. They included Myſore, Bednore, Canara, Condanore, &c. Seringapatam was his capital. His revenue was ſuppoſed to amount to five millions ſterling, and his army to three hundred thouſand men. In 1792 and 1799 the Engliſh became maſters of theſe dominions, and appointed a deſcendant of the race which had been dethroned by Tippoo, rajah of the Myſore.

The Polygars and Colleries are ſome Indian tribes, who maintain a ſort of wild independence in the mountains chiefly towards the ſouthern extremity of the peninſula. The Sheiks, Jets, and Afgans, are to the north. Lahore is the capital of the Sheiks.

The general revenues of Hindooſtan, in the time of Aurungzebe, were eſtimated at thirty-two millions ſterling; ſuppoſed equal to five times that ſum, according to the preſent value of money. The number of his ſubjects has been calculated at ſixty millions, which is indeed ſuppoſed to be the preſent population of what then formed his empire. The population of Calcutta is ſuppoſed to be half a million.

The revenue of the Engliſh poſſeſſions in Bengal, Bahar, and Orixa, is about five millions and a half ſterling. Calcutta is their principal ſettlement. The Madras revenue is above one million. At Bombay and Bencoolen, the expences have much exceeded the receipts. The population ſubject to Great Britain is calculated from twelve to fourteen millions.

INDIA BEYOND THE GANGES.—The countries lying between Hindooſtan and China, occupy what is called *the Farther Peninſula*. Its geographical poſition is in eaſt longitude ninety-two degrees one hundred and nine minutes; north latitude one degree thirty minutes. Its length is about two thouſand miles; and its breadth about one thouſand. It is bounded by Thibet and China, on the north; Straits of Malacca, on the ſouth; Bay of Bengal, and Hindooſtan, on the weſt; and China, and the Chineſe Sea, on the eaſt. It contains the following kingdoms.—1. Part of Upper, Middle, and Lower, Thibet; chief towns, Tonkar, called alſo Boronthala, Laſſa, and Putala.—2. Napaul and Bootan, the ſouthern part of Thibet; chief towns, Baſſaſudon, and Catmandu.—3. The Birman Empire, compriſing Azem or Achem; whoſe chief towns are, Chamdara, Tipera, Kirganu, or Ghargan; Aracan or Reccan, Aracan; Ava or Burma, Ava, Ummerapoora; Pegu, Pegu; Martaban, Martaban; Siam, Siam, Bankok.—4. Tonquin China, chief town, Cacao or Keccio.—5. Laos, Langtſhang.—6. Cochin-China, Toanhoa.—7. Cambodia, Camboja.—8. Siampa, Padram.—9. Peninſula of Malaya, Malacca.

The chief rivers are, Sampoo or Burrampooter, or Thibet river, which riſes near the Ganges, and joins it at its mouth, though in their courſe they become more than a thouſand miles aſunder; Domea, Pegu, Mecon, Menan, Anan, Iratoady, on which is built the capital, Ummerapoora, Holi Kian.

The Birmans are only ſeparated from the Hindoos by a very narrow range of mountains; yet the diſpoſitions of the two people are extremely different. The Birmans are a lively inquiſitive race, iraſcible and impatient. The Birman empire is divided from Aſam on the north; and on the weſt a range of mountains ſeparate it from the Britiſh dominions in Bengal.

Ava is of conſiderable extent, though obviouſly tending to ruin and decay. Pegu, ſouth of Ava, is ſuppoſed to be the golden Cherſoneſus of the ancients. The Birmans, like the Chineſe, have no coin; but ſilver in bullion, and lead, are current among them.

The foreſts in this empire are large and numerous; the teek-tree is pre-eminent over them, and ſaid to be ſuperior to the European oak.

Malaya, or Malacca, contains ſeveral kingdoms and provinces. The inhabitants are called *Malays*, or *Malayans*; and the country is celebrated for its numerous wild elephants. Oppoſite to this coaſt are the iſlands of Andaman and Nicobar. On a barren iſle to the eaſt of the Andamans is a volcano, which emits ſhowers of red-hot ſtones. A Britiſh ſettlement has been formed on the greater Andaman, for convicts from Bengal.

Siam is ſituated in a large vale, between two ridges of mountains; and its river, Meinam, which ſignifies the *mother of waters*, is celebrated among the oriental ſtreams.

The elephants of Siam are diſtinguiſhed for ſagacity and beauty. The trees on the banks of the Meinam are finely illuminated with ſwarms of fire-flies, which emit and conceal their light as uniformly and alternately as if it proceeded from a machine of the moſt exact contrivance.

Cambodia is celebrated for the camboge gum. The chief river in Tonquin-China is Holi-Kian, which paſſes by Keſho, the capital.

The Birman empire, lately eſtabliſhed by the chief Alombra, conſiſts of Achem, Aracan, Ava, part of Pegu, Martaban and Siam. The population of it is ſuppoſed to be about ſixteen millions. The capital town is Ummerapoora.

The countries bordering on China are ſaid to pay tribute to the Chineſe. The others are independent. They are all of them in a very barbarous ſtate.

Chinese Empire.—The Chineſe empire extends from thoſe parts of the Chineſe and Japannic ſeas to the rivers Saraſon and Sihon in the weſt, a ſpace of nearly five thouſand Britiſh miles; and from the Uralian mountains in the north to the moſt ſouthern parts, it extends more than two thouſand miles. This vaſt empire conſiſts of three principal diviſions: 1. That of China Proper. 2. Chineſe Tartary, or the territory of the Monguls or Manſhurs. 3. The region of Thibet.

China Proper.—This is bounded on the eaſt and ſouth by the ſea; on the north by the great wall, and the deſert of Shamo; and on the weſt by Thibet. It lies between twenty and forty-one degrees north latitude, and between ninety-nine and one hundred and twenty-one degrees eaſt longitude from London. The population is eſtimated at three hundred and thirty-three millions; and the ſquare miles of ſurface at more than one million and a quarter.

Chinese Tartary.—This portion of the Chineſe empire extends from the ſeventy-ſecond degree of eaſt longitude to the one hundred and forty-fifth; and the breadth, from the northern frontier of Thibet to the Ruſſian confines, is ſomething more than twelve hundred Britiſh miles. It is bounded on the ſouth by the great wall of China, and the northern limits of Thibet; on the eaſt by the ſea; on the north it is ſeparated from Ruſſia, and the weſtern boundary is ſupplied by the mountains of Belur Tagg or the Cloudy Mountains, which divide the Chineſe empire from Balk and the Greater Backaria; while the range on the weſt of the lake Palkati ſeparates the Calmucs ſubject to China from the Kirguſes of Independent Tartary.

Thibet.—The boundaries of this part of the Chineſe empire are not by any means diſtinctly marked; they ſeem to be, Tartary on the north, China Proper on the eaſt, the Birman and the Mogul empires on the ſouth and weſt. According to the moſt recent maps, Thibet extends from the ſeventy-fifth to the one hundred and firſt degrees of eaſt longitude, and from the twenty-ſeventh to the thirty-fifth degrees of north latitude. Its population is not eſtimated at more than half a million.

China is celebrated for its immenſe and induſtrious population; for the variety of its manufactures and peculiar productions; for the excellence of its inland navigation; and for the jealous policy of its government towards other nations.

The Chineſe wall, though built theſe two thouſand years, is in a high ſtate of preſervation; it is fifteen hundred miles long, and broad enough for five horſemen to travel abreaſt.

The chief cities of China Proper are Pekin, Nankin, and Canton. Pekin contains two millions of inhabitants, and the others not leſs than one million each.—The imperial canal interſects China Proper from north to ſouth, and employed thirty thouſand men forty-three years for its conſtruction.—Corea is ſubject to China, and is conſidered as a part of it.

The largeſt of the Chineſe iſlands, which are very numerous, and ſcattered along the ſouthern and eaſtern coaſts, are Formoſa and Hainan. The iſles of Leookeoo, which conſiſt of thirty-ſix in number, between Formoſa and Japan, conſtitute a ſmall civilized kingdom, ſubject to China.

The Chineſe empire poſſeſſes rich mines of all the precious metals. It produces abundance of corn, rice, and fruit.

Chineſe Tartary is inhabited chiefly by the Eaſtern and Weſtern Moguls; the former conquered China in 1644, under whoſe government the empire ſtill continues. It produces corn, rice, and valuable ſkins. The iſland of Segalien, or Tehoka, belongs to Chineſe Tartary.

Thibet is included between China and Hindooſtan. The chief town is Laſſa.—The iſlands contiguous to the Chineſe empire, beſide thoſe already noticed, are as follow: Japan, forming an extenſive, rich, and remarkable, empire, the population of which is calculated at thirty millions. The largeſt iſland is Niphon; and the chief towns are, Jeddo, Miaco, the ſpiritual capital, and Nagaſaki. Theſe iſlands trade only with the Dutch and Chineſe. The Jeſſo iſlands, to which the Danes trade for furs; and the iſland of Macao, which lies in the Bay of Canton, and belongs to the Portugueſe.—Beſides theſe, there are many ſmall iſlands dependent on Japan; among which is Fatſiſio, the place of exile for the diſgraced grandees.

The principal rivers of the Chineſe empire are, Yamour, Argun, Hoan-ho, Kian-ku, otherwiſe called Whambo or the Yellow River, and Kiam or Blue River. Theſe rivers, in their ſources, their ſeparation, and their junction, reſemble the Ganges and Burrampooter, but much exceed them in length of courſe. They receive many tributary ſtreams.

The revenue of China is calculated at ſixty-ſix millions.—The population of Pekin is calculated at three millions; that of Nankin is ſaid to be greater. Canton is thought to contain a million and a half. This empire in the whole is ſaid to contain four thouſand four hundred walled cities.—See the article China, with correſponding map, vol. iv. p. 435.

Eastern Archipelago.—This contains, 1. The iſlands of Sunda, or the Sumatran chain, which compriſe Sumatra, Java, Balli, Lombock, Florez, and Timor, with ſeveral others of leſs importance. 2. Borneo, and ſome ſmaller ſurrounding iſlands. Borneo is, excepting New Holland, the largeſt iſland in the world. 3. The Manillas, or Philippine iſlands, including Luzon, Mindanoo, Palawa, Mindora, Pany, Negros, Zebu, Leyta, Samar, and ſeveral hundred ſmaller iſlands. 4. The Celebezian iſles, viz. Celebes, Boutan, and the ſurrounding ſmall iſlands. Boutan is governed by a Mahometan ſultan. 5. The Spice iſlands, including the Moluccas: theſe are Gilola, Ceram, Bouro, Oby, Amboyna, Banda, Tidore, Ternate, &c. Theſe famous iſlands produce nutmegs, cloves, and all the valuable ſpices.

AFRICA.

This diviſion of the world is the third in ſize; but in political and ethical eſtimation it is the meaneſt and moſt uncivilized of what are called the four quarters of the earth. From the ſouthern extremity to the Mediterranean are about ſeventy degrees of latitude, or four thouſand two hundred geographical miles. The breadth, from eighteen degrees weſt to fifty-one degrees eaſt, may be aſſumed on the equator at four thouſand one hundred and forty geographical miles. The name is ſuppoſed to have ſpread by degrees from a ſmall province, in the north, over the reſt of the continent. In the central parts on the ſouth the population appears to be indige-

nous

nous and peculiar, these being the native regions of the negroes, whose colour, features, and hair, distinguish them from all the other races of mankind. In the northern parts there have been many successions of different inhabitants, the Egyptians and Abyssinians being of Arabian extract; while further to the west the Carthaginians passed from Syria: and according to Sallust, other maritime parts were peopled by the Medes, Persians, and Armenians. The original inhabitants of the northern parts appear to have been, in all ages, radically distinct from the negro race, from whom they were divided by the great desert of Sahara; and in the eastern parts the latter were yet further repelled, by the Arabian colony which settled in Abyssinia.

The Romans appear to have explored the north of Africa as far as the river Niger; and they established flourishing colonies in many parts. Upon the fall of their empire the Vandals of Spain passed into Africa, A. D. 429, and established a kingdom which lasted till A. D. 535. In the following century the Mahometan Arabs subdued the north of Africa; and under the name of Moors constitute a great part of the present population. There have been recently discovered in the interior some nations or tribes of a copper colour, with lank hair; but the geography of this country is yet too imperfect to admit of a precise illustration of the interior nations.

The climate of Africa, towards the north, is intensely hot; but it is rather more moderate in the southern extremity, the antarctic cold being more powerful than that of the other pole. In the centre it is said there is a prodigious ridge of mountains, extending from those of Kong in the west, to those of Kumri or of the moon, and those of Abyssinia, in the east; the whole range being about north latitude ten degrees. And from this another chain seems to extend, about longitude thirty degrees east from Greenwich, in a southern direction.

In Africa, the want of inland seas is not supplied, as in South America, by large navigable rivers; and the remarkable deficiency of both may be regarded as a radical cause of the striking want of civilization, as well as of the slow progress of African geography. Inland seas, or navigable rivers, would have naturally invited commercial intercourse and foreign settlements, on a far larger scale than the small factories now established on the coast; and the more southern parts might easily have rivalled the settlements on the Mediterranean, and the Red Sea. But these grand inlets are rather the boundaries than parts of Africa: and there are no navigable waters whatever at present known that can diffuse commerce and industry from the shores to the centre.—See the article AFRICA, and corresponding maps, vol. i. p. 184.

The following is a brief statement of those parts of Africa at present known:

Empire of Morocco, including Fez, Suez, and Tafilet. The chief towns are, Fez, Morocco, Taradant, Mequinez, Sallee, Larache, Tangier, and Ceuta, belonging to Spain.—Republic of Algiers; chief towns, Tremesan, Oran, and Algiers.—Republic of Tunis; chief towns, Tunis and Sfax.—Republic of Tripoli; chief town, Tripoli.—Kingdom of Barca; chief town, Tolemeta.

The above are the states of Barbary, which, as well as Egypt, are in a vague manner tributary to the grand seignior. They are all addicted to piratical practices.

Principal divisions.—Biledulgerid; chief town, Dara. Zaara, or Sahara; chief town, Tegessa. Fezzam; Mourzook. Tombuctoo; Tombuctoo and Houssa. Gonja; Gonja. Soudan; Cashna and Agadez. Bornou; Bornou. Fur; Darfur.—Upper Egypt; chief towns, Girge, Sayd or Thebes, Coffir, and Assuan or Syene.—Lower Egypt; chief towns, Suez, Alexandria, Rosetta, Damietta, and Cairo.—Upper Ethiopia; includes Abyssinia; chief towns, Ambamargen, Gondar, Axum, and Mazua. Nubia; chief towns, Sennar, Dongala, with cognominal states. And Abex; chief town, Swakin.—Lower or inland Ethiopia; no town known.—Negroland; chief town, Mandinga.—Upper Guinea; including the Grain Coast, Ivory Coast, Gold Coast, Whydah, and Benin; chief towns, Benin, and Cape Coast Castle.—Lower Guinea, includes Macoko; chief town, Macoko. Loango; Loango. Congo; St. Salvador. Angola; Loanda. Benguela; Benguela. Mataman; no towns. Ajan; Brava, Adel, and Magadoxa. Zanguebar; Melinda, Quiola, Mosambique, Sofala; with some cognominal countries. Monomugi; Merango. Monomotapa; Zimbaou. Terra de Natal; no towns. Caffraria, or Country of the Hottentots, near the Cape of Good Hope.

AFRICAN ISLANDS.—Babelmandel; chief town, Babelmandel. Zocotora; Tamara. Almirante; no town. Comorra Islands, the chief of which is Joanna. Madagascar, one of the largest islands in the world; chief town, St. Augustine. Belonging to France: Bourbon; Bourbon. Mauritius, or the Isle of France; Mauritius. St. Helena; chief town, St. Helena; belonging to England. Ascension. Annobon; Annobon. St. Thomas; St. Thomas. Prince's Island. Fernandopo. St. Matthew; St. Matthew.

The *Cape Verd Islands* belong to Portugal.—The *Canary Islands* belonging to Spain; and are as follow: Canary; chief town, Palma. Teneriffe; St. Christopher's. Ferro; Palma, &c.—The *Madeira Islands* belong to Portugal; chief town, Funchal, &c. The *Azores*, or *Western Islands*, belong to Portugal. They are: Tercera; chief town, Angra. St. Maria; chief town, Fayal.

The principal headlands are: Cape Gardafui, Cape of Good Hope, Cape Verd, Cape Bojador, Cape Spartel, Cape Three Forks.

The mountains are: Atlas, the Mountains of the Moon, Sierra Leona, the Peak of Teneriffe, 15,396 feet high; the Peak of the Azores, also very high; and Table Mount, at the Cape of Good Hope.

Sahara, or the Great Desert, extends from the shores of the Atlantic to the vicinity of Egypt, 2,500 miles in length, and 720 in breadth.—See the article DESERT, vol. v. p. 758.

The principal rivers are: the Nile, receiving the Abawi or Astapus, and the Tacuz or Astaboras, and formerly forming at their confluence the Isle of Meroe; the Niger, the Gir, the Senegal, and the Gambia, supposed by some to be a branch of the Senegal.—The lakes are: Maravi, Tzana or Dembea, and Bournou.

The general population is supposed to be one hundred and fifty millions; but by some writers restricted to a much lower amount.—The prevailing religion is Mahometanism, and gross Paganism; except in Abyssinia, where a corruption of Christianity is professed.

Abyssinia, Monomotapa or Mocorango, and Monomugi, as well as Morocco, are called empires; but in so degraded a state are these countries, that, though in extent little inferior to France or Germany, their topography and history are equally obscure.

The emperor or king of Morocco pretends to be descended from the Saracen princes called *xerifs*. The chiefs of the republics of Algiers, Tunis, and Tripoli, are called *deys*. The grand seignior, or emperor of Turkey, has a viceroy or bashaw in Egypt; but whose power is so much limited by the mamaluke beys, sheiks, and inferior governors, as to give to the government of this country the appearance of a republic.—See the article EGYPT, vol. vi. p. 289.—See also all the different countries of Africa under their respective names or titles, in this Encyclopædia; and the map of modern Africa, vol. i. p. 184.

AMERICA.

The popular division of the wide continent, or New World, into two parts, called North and South America,

rica, has not only been in long and general acceptation, but is ſtrongly marked by the hand of nature, in an iſthmus more narrow than that which ſeparates Aſia from Africa, and by a great diverſity in the languages and manners of the original inhabitants. The ſouthern limit of the American continent is clearly eſtimated from the ſtrait of Magellan. But the northern extent is not aſcertained with equal preciſion. But amidſt every geographical uncertainty, it will be ſufficient to eſtimate the length of America from the ſeventy-ſecond degree of north latitude to the ſtrait of Magellan, or the fifty-fourth degree of ſouth latitude; a ſpace of one hundred and twenty-ſix degrees, or ſeven thouſand five hundred and ſixty geographical miles. In South America the greateſt breadth is from Cape Blanco in the weſt, to that of St. Roque in the eaſt; which, according to the beſt maps, is forty-eight degrees, or two thouſand eight hundred and eighty geographical miles. But in the north the breadth may be computed from the promontory of Alaſka to the moſt eaſtern point of Labrador, or even of Greenland, which would add more than a third part to the eſtimate. In Britiſh miles the length of America may be eſtimated at eight thouſand eight hundred; and ſuppoſing the breadth of North America three thouſand eight hundred and forty geographical miles, it will, in Britiſh miles, be about four thouſand four hundred.

North America includes the United States, Spaniſh America, Britiſh America, and the independent Indian nations. The inland ſeas of North America are the gulfs of Mexico, California, and St. Lawrence; with Hudſon's Bay, and Davis's Straits.

The gulf of St. Lawrence is cloſed by the iſland of Newfoundland, and the great ſand bank, about four hundred miles in length, celebrated for the cod fiſhery. The Lakes Superior, Michigan, Huron, Wennipeg, and Slave lake, are the grandeſt in the world, and might, with propriety, be denominated ſeas. The rivers are alſo on a grand and extenſive ſcale. Of theſe, the principal are the Miſſouri or Miſſiſſippi, the Ohio, and the St. Lawrence.

The moſt celebrated mountains are the Apalachian, paſſing through the territory of the United States. Among theſe the Ohio has its riſe. Excepting the Apalachian, all the mountains in North America lie weſt of the United States.

United States.—Theſe are ſituated on the eaſtern part of North America; and are bounded on the eaſt by the Atlantic, and on the weſt by the river Miſſiſſippi: on the northern boundaries are the river St. Lawrence and the lakes; and on the ſouth the United States are bounded by the Floridas. Louiſiana has lately been united to theſe ſtates by purchaſe. Before the ceſſion of Louiſiana, the United States lay between the ſixty-fifth and ninetieth degrees weſt longitude. The ſquare acres have been eſtimated at ſix hundred and forty millions, including fifty-one millions of acres of water. The population is eſtimated at ſix millions.

The United States are celebrated for the excellence of their conſtitution, which provides for political liberty and individual ſecurity. The inhabitants are juſtly famed for their ardent love of freedom, for their hoſpitality and induſtry, and for the great attention which they pay to agriculture and commerce. Their ample territory is divided into northern, middle, and ſouthern. The northern ſtates are Vermont, New Hampſhire, Maſſachuſetts, Connecticut, and Rhode Iſland. The middle ſtates are New York, New Jerſey, Pennſylvania, Delaware, and the territory on the north-weſt of the Ohio. The ſouthern ſtates are Maryland, Virginia, Kentucky, North Carolina, Georgia, and the country ſouth of Kentucky. The chief cities and towns are Waſhington, the capital, Philadelphia, New York, Boſton, Baltimore, and Charleſtown.

Theſe ſtates are in a very flouriſhing and improving condition, and promiſe eventually to become one of the moſt powerful and happy communities in the world. They export to Europe iron, copper ore, timber, pitch, potaſh, ſkins, corn, tobacco, rice, cotton, &c.

British America.—Theſe poſſeſſions conſiſt of Canada, New Brunſwick, Nova Scotia, Cape Breton, Newfoundland, and the Bermudas or Somer Iſlands. Canada, the principal part of Britiſh America, is divided into Upper and Lower; the former is the weſtern diviſion, on the north of the great lakes; while the lower diviſion is on the river St. Lawrence towards the eaſt. They are ſituated between forty-five and ſixty-five degrees north latitude, and between ſeventy and one hundred and forty weſt longitude.

Thoſe parts of North America which belong to Great Britain, are very extenſive; but the population cannot be eſtimated at more than two hundred thouſand ſouls, of which, in the year 1784, that of Canada amounted to one hundred and thirteen thouſand. The chief towns are Quebec and Montreal.

This part of North America is mountainous and barren; abounding, however, with lakes, rivers, and bays, that afford plenty of fiſh. The fur trade and fiſheries render theſe colonies exceedingly valuable to Great Britain.

Spanish Dominions in North America.—Theſe conſiſt of Eaſt and Weſt Florida; New Mexico; and Old Mexico, or New Spain. This territory is ſituated between ſeven and thirty-eight degrees of north latitude, and between ſeventy-nine and one hundred and twenty degrees weſt longitude. Its population is eſtimated at ſix millions, of whom the greater part are native Indians. The chief towns are Mexico, Acapulco, and Santa Fe.

The leaſt fertile part of theſe dominions is ſaid to produce two crops of corn in a year; the valleys are extremely rich, and produce ſpontaneouſly fruits and vegetables common to the moſt fruitful parts of the United States. Mexico is the capital of all Spaniſh America. The chief river in Spaniſh North America, is Rio Bravo, and the principal lake is Nicaragua.

West Indies.—The moſt important of theſe iſlands are Cuba, and Porto-Rico, Spaniſh; St. Domingo, or Hipaniola, at preſent an independent black empire, called *Hayti*; and Jamaica, Engliſh. North of St. Domingo and Cuba, are the Bahamas, the principal of which is Providence Iſland. The Caribbee iſlands extend from Tobago in the South, to the Virgin iſlands in the north. Thoſe belonging to Great Britain are Barbadoes, Antigua, St. Chriſtopher's, St. Vincent, Dominica, Grenada, and Trinidad, Montſerrat, Nevis, and the Virgin iſles.

The French Caribbee iſlands are Martinique, Guadaloupe, St. Lucie, and Tobago. The two laſt (1806) are in the poſſeſſion of the king of England.

The Danes poſſeſs St. Croix and St. Thomas. St. Bartholomew belongs to the Swedes, and Euſtatia to the Dutch. From theſe iſlands are procured ſugar, rum, cotton, indigo, ſpices, cocoa, and coffee.

South America.—This diviſion of the New World is beſt known for its gold and ſilver mines, which have been wonderfully productive to Spain. The choiceſt gums and drugs are likewiſe found in various parts of this immenſe continent.

South America comprehends Terra Firma, Guiana, Amazonia, Peru, Brazil, Paraguay, Chili, and Patagonia.

Amazonia and Patagonia are not under the dominion of any European power; they are divided into ſeveral kingdoms, each of which has its chief. The inhabitants worſhip the images of their departed heroes, but have no temples or prieſts. This country boaſts of no

inland ſea, but the river Amazon and that of La Plata are celebrated as the largeſt in the world. They both have their riſe among the Andes.

The mountains of South America are the loftieſt on the whole ſurface of the globe, and are intermixed with volcanos of the moſt ſublime and terrific deſcription. The Andes follow the windings of the coaſt, and extend four thouſand ſix hundred miles. The higheſt are four miles high, and are covered with perpetual ſnow.

The Spaniſh dominions in South America are Buenos Ayres, (taken by the Engliſh in 1806,) Peru, Chili, and New Grenada. Peru and Chili are famous for their gold and ſilver mines. In Chili it never rains, the ſky is ſeldom cloudy, but the dews of night ſupply the want of rain.

The Portugueſe territory of Brazil is perhaps equal in extent to the Spaniſh, compenſating by its breadth for its deficiency in length. Guiana belongs partly to the French, and partly to the Dutch. Cayenne conſiſts of a conſiderable territory on the continent, and of an iſland of the ſame name.

The ſouthern extremity of South America is Patagonia, a deſolate country inhabited by ſavage Indians, ſome of whom are of great ſtature.

The iſlands contiguous to South America are Trinidad, the Falkland iſlands, Terra del Fuego, Chiloe, and Juan Fernandez. The Gallipago iſlands are near the equator, and the Pearl iſlands lie in the bay of Panama.—See the article AMERICA, and the correſponding Map, vol. i. p. 435.

AUSTRALASIA.

The diviſion of the world called Auſtralaſia, contains the following iſlands: 1. New Holland or Notaſia, and all the iſlands between twenty degrees weſt, and between twenty and thirty degrees eaſt, of it. New Holland is about three-fourths as large as Europe. 2. Papue or New Guinea, and the Papuan iſles. 3. New Britain, New Ireland, and the Solomon iſles. 4. New Caledonia, and the New Hebrides. 5. New Zealand. 6. Van Dieman's Land, which is ſeparated from New Holland by Baſſe's Strait or channel, and is about thirty leagues wide.

POLYNESIA.

The diviſion of the earth called Polyneſia, conſiſts of 1. The Pelew iſlands. 2. The Ladrone or Marian iſlands, the principal of which are Guan and Tinian. 3. The Carolines, the largeſt of which are Hogolen and Yap. 4. The Sandwich iſlands, diſcovered by captain Cook; at one of which, Owhyhee, he loſt his life. 5. The Marqueſas, which are very numerous. 6. The Society iſlands are about ſixty or ſeventy in number; Otaheite is the largeſt. 7. The Friendly iſlands and the Fejee iſlands. 8. The Navigator's iſlands, the principal of which is Maouna. The largeſt iſland in Polyneſia is Owhyhee, about one hundred miles in length.—See particulars of theſe iſlands under their reſpective titles in this Encyclopædia.

OF THE SEAS AND COASTS OF THE KNOWN WORLD.

Recent diſcoveries have evinced, that more than two-thirds of this globe are covered with water; and theſe waters, whether oceans, ſeas, lakes, or rivers, are contained in hollow ſpaces, more or leſs large, which the modern French geographers have ſtyled *baſſins*. They may perhaps with more propriety be called *concavities*; while, on the other hand, the chief *convexities* or protuberances of the globe, by the French ſtyled *plateaux*, conſiſt of uplands, hills, and mountains. Long chains of mountains commonly proceed from thoſe chief convexities, branching off in various directions; and from theſe the principal rivers of the world proceed, or have their ſource.

The grandeſt concavity of this globe is filled by the Pacific Ocean, occupying nearly half of its ſurface, from the eaſtern ſhores of New Holland to the weſtern coaſt of America; and diverſified with ſeveral groups of iſlands, which ſeem as it were the ſummits of vaſt mountains emerging from the waves. This chief concavity, ſeparately conſidered, receives but few rivers, the chief being the Amur from Tartary, and the Hoan-Ho, and Kian-Ku, from China; while the principal rivers of America run towards the eaſt.

The next grand concavity is that of the Atlantic Ocean, between the ancient continent and the new. A third is the Indian Ocean. The ſeas between the arctic and antarctic circles and the poles, are ſtyled the Arctic and Antarctic Oceans; the latter having ſupplanted the Terra Auſtralis, and being in fact only a continuation of the Pacific, Atlantic, and Indian, Oceans; while the Arctic Sea is partly embraced by continents, and receives many important rivers. Such are the principal concavities of the globe, while others are filled by more ſubordinate ſeas, as the Mediterranean, the Baltic, and others of yet ſmaller extent, till we deſcend to the inland lakes, and freſh-water ſtreams.

Out of this vaſt expanſe of oceanic waters, ariſes in the ancient hemiſphere, that wide continent, which contains Aſia, Europe, and Africa; and in the modern hemiſphere or New World, the continent of America, now diſcovered to be divided by a ſtrait only of the ſea from the ancient continent.

However prevalent it may have been to ſpeak of the Atlantic Ocean generally, as comprehending the ſea or ocean between the weſtern coaſts of Europe and Africa as its *eaſtern* limit, and the eaſtern coaſts of North and South America as its *weſtern* limit; we feel a pleaſure in ſtating that it is now a rule in modern geography to diſtinguiſh theſe into the North Atlantic Ocean on the *north* ſide of the equator, and the South Atlantic Ocean on its *ſouth* ſide. This laſt has been ſometimes called the Ethiopic or Southern ocean, but we are inclined to favour the diſtinction of South Atlantic. Theſe diſtinctions form an additional means of impreſſing upon the mind the true ſituation of any coaſt or particular place in either ocean, ſo as to point out more readily or communicate more forcibly the idea of their being in north or ſouth latitude. To the Pacific Ocean, the ſame obſervations are equally applicable; and the diſtinction between the North and South Pacific Oceans is as neceſſary and important as in the Atlantic.—See the Map of the World, on Mercator's Projection, hereunto annexed.

In like manner, it may be obſerved, of the ocean to the eaſtward of the Cape of Good Hope, that it is frequently known by the general name of the Indian Ocean, from that point of Africa to the ſouth-weſt point of the extenſive iſland of New Holland, which latter is not three degrees more to the ſouth than the former. The ſmall iſlands of Amſterdam and St. Paul, are only about a degree to the ſouthward of the fairway, between theſe two points, and one of them not quite ſo much, and but a few degrees to the weſtward of the middle diſtance. Yet the Arabian Sea, which waſhes the ſouth coaſt of Arabia, between the Straits of Babelmandel and the weſtern coaſt of India, has been deſcribed in many works under the general name of the Indian Ocean. It will alſo occur in many books of geography, that iſlands, ports, or places, which are ſituated to the eaſtward of Sunda and Malacca Straits, as far as to Endeavour Straits between the north point of New Holland and the ſouth coaſt of New Guinea, are deſcribed as lying in the eaſtern Indian ocean, in that tract of ſea or ocean which has commonly been known by the name of the Dutch Eaſt Indies. This is uſually confined to about ten degrees to the ſouthward of the equator, and to nearly as much on the north, excepting to the north-eaſt along the continent from the ſtraits of Malacca, which is known by the name of the Chineſe Sea.

It is almoſt needleſs to mention that the ocean, ſuppoſed to be near the North Pole, is ſometimes called the North.

North Frozen Ocean, Arctic or Icy Sea, as that near the oppoſite pole has been called the Antarctic Icy Sea, or South Frozen Ocean. But the latter is not conſidered as affording any thing inviting to navigation; and the former is more commonly underſtood by the name of the Greenland ſeas. This laſt name, however, is confined to thoſe parts of it which lie to the north and north-weſt from Europe; whereas the general name of Arctic Sea comprehends all the ſea to the north of Siberia, along the north coaſts of Aſia quite to the opening of the ſtraits between Aſia and America, and extending eaſtward as far as into one hundred and five degrees of weſt longitude. Of the coaſt of this ſea, from about ten degrees of weſt longitude, and about ſeventy-eight degrees of north latitude on the eaſt coaſt of Old or Weſt Greenland, to this point, in longitude one hundred and five degrees weſt, and about ſeventy-one degrees of north latitude, which is not more than about twenty-three degrees weſt from the weſt ſide of Baffin's Bay, and the direction it takes, is a matter ſtill unknown to European navigators.

The Engliſh Channel, along the ſouth coaſt of England; the Britiſh Ocean, ſometimes called the German Ocean, to the north of the Straits of Dover; and the North Sea, between the eaſt coaſt of Scotland, including ſome of the Engliſh countries to the Humber, and the coaſts of Germany, Denmark, and Norway; are too well known to require any further illuſtration here.

Of the ſmaller parts of the ocean, known by the name of ſeas, ſtraits, and bays, we have ſpoken already. The Mediterranean and Baltic Seas, the Euxine or Black Sea, to the northward of the ſtraits of Conſtantinople, and the Sea of Azoph to the north-eaſt from that, may be conſidered as inland ſeas. Of this laſt deſcription is the Caſpian Sea of Aſia; and the Red Sea and Perſian Gulf can ſcarcely be entitled to any other character. It may not be improper here to notice the Bay of Bengal on the ſouth, with the Kang or Yellow Sea of China, the Gulf of Korea, and the Sea of Kamſchatka, or Ochotſk, all upon the weſtern coaſt of what may be deemed the North Pacific Ocean, or the eaſt coaſt of Aſia. On the coaſt of America, we may reckon, Davis's Straits, and Baffin's Bay, with Hudſon's Straits and Bay to the weſtward from the former, and the Gulf of St. Lawrence on the weſt ſide of the iſland of Newfoundland. The Gulf of Mexico, between North and South America, may alſo be noticed, and the Gulf of California, on the North Pacific Ocean, acroſs the Iſthmus, nearly to the weſt of it. Of parts of the ocean ſtill ſmaller, or ſubdiviſions ſtill more minute, it cannot be neceſſary to make mention here.

Of the COASTS of EUROPE.

Beginning with Great Britain, we muſt of courſe take England as our firſt object; for the coaſts of which the reader is referred to the article ENGLAND, vol. vi. p. 532. We are next to advert to thoſe of Scotland; beginning at the Frith where they meet the Engliſh coaſt, and running along the weſt ſide of the kingdom, they come round by the north down the eaſtern ſhore, till they terminate at Berwick.

The ſhire of Dumfries is the moſt eaſterly county on the north ſide of Solway Frith. The river Nid, which falls into the Frith below the town of Dumfries, ſeparates it from Kircudbrightſhire on the weſt, as that again is divided from Wigtonſhire on its weſt by Wigton Bay. The Mull of Galloway is the extreme ſouth-weſt point of Scotland, from whence the coaſt turns north to Loch Ryan, within Fairland point, which divides this ſhire from Airſhire on the north; which county extends at north by eaſt along the eaſt ſide of the Frith of Clyde. The two iſlands of Bute and Arran are on the weſt ſide of the Frith. To the weſt of the laſt is Cantire, the ſouth point of which is called the Mull of Cantire, being the ſouth part of Argyleſhire, and is nearly ſouth-weſt from Arran Iſle. The coaſt, along its weſt ſide, runs due north to the Sound of Jura, on the weſt ſide of which ſound are the iſlands called Iſla and Jura. Mull iſland, and the Sound of Mull, are to the north and north-weſt from the north end of this ſound, and the weſternmoſt land of Argyleſhire. Round a point in about fifty-ſeven degrees north, the land trends in to the eaſt, where it forms a boundary to the large ſhire of Invernefs, extending quite acroſs the kingdom to the Murray Frith. As in other parts of this ſea, here are ſeveral iſlands to the weſtward from the coaſt; but the Sky iſlands, which run off to the north-weſt from that point of the county, are the moſt conſiderable. The limit is nearly due weſt, a little ſouth, from the Murray Frith on the oppoſite coaſt. Roſsſhire is the next county on the north, which firſt inclines to the north-weſt within the Sky iſlands; and then paſſes away to the north-north-eaſt to Calvo Bay, where it divides on the coaſt from Sutherlandſhire; the coaſt of which laſt ſhire extends to Cape Wrath on the extreme point to the north-weſt, and then due eaſt or nearly ſo, with intermediate lochs and bays to Strathy Bay, where it joins Caithneſsſhire. This laſt county forms the north-eaſt part of the kingdom of Scotland, unleſs we are to include the Orkney and Shetland iſlands. Ord Head, near the mouth of Henkſdale River, is the ſouthern limit of this ſhire, in the direction of about ſouth-ſouth-weſt from Dungſby Head, the extreme north-eaſt point. Sutherlandſhire coaſt then comes in again here to the bottom of Dornock Frith; and the peninſula of the eaſt ſide of Dornock Frith is a part of Roſsſhire, which alſo extends to the eaſtern coaſt of the kingdom, where it ſtretches down to Murray Frith, except that the ſmall ſhire of Cromartie, which it ſurrounds on all ſides but to ſeaward, comes in along the coaſt. The ſhire of Nairn, which joins to Inverneſsſhire, on the weſt of Fort George, then goes eaſt in the direction of the coaſt, to the mouth of Findorne river; and to the eaſt of that is Murrayſhire, extending to Spey river. Bamffſhire coaſt extends from Spey due eaſt to Dovern river; and Aberdeenſhire ſtretches eaſt to Kinnaird's Head, and thence ſouth-eaſt to Peterhead, and then ſouth-ſouth-weſt to the river Dee at Aberdeen. Mearnsſhire extends from Aberdeen at about ſouth-ſouth-weſt to the North Eſk river; and Angusſhire in the ſame direction nearly to the Frith of Tay. Fifeſhire then comprehends the peninſula between this frith and the Frith of Forth, extending along the eaſt coaſt at about ſouth-ſouth-eaſt to Fifeneſs, and then weſt-ſouth-weſt along the north ſhore of the Frith. On the ſouth coaſt of the Frith is Edinburghſhire, and to the eaſt of that is Haddingtonſhire, at the extreme north-eaſt point of which ſhire is North Berwick. Muſſelburgh is ſituated near the limit between the two laſt-mentioned counties; and between Dunbar and St. Abb's head on the ſouth-eaſt, is the boundary between Haddingtonſhire and Berwickſhire. It is almoſt needleſs to ſay, that the town of Berwick is the extent of the laſt, and the limit between Scotland and England.

The coaſt of Ireland may begin with Dublin, the capital of the kingdom; after which the county of its name will follow. To Dublin, on the eaſt coaſt of the kingdom, ſucceeds to the northward Eaſt Meath, Louth, Down, and Antrim, at the north-eaſt extremity; on the weſt of which laſt, along the north coaſt, are Londonderry and Donegal counties; after which, on the weſt coaſt, and to the ſouth-weſt of the laſt, is Sligo, Mayo, and Galway, then Clare and Kerry, which comes down near to the ſouth-weſt extremity. To the eaſtward, along the ſouth coaſt, are Cork and Waterford; then Wexford at the ſouth-eaſt; and to the north of that is Wicklow, or the next county on the ſouth, and along the eaſt coaſt of Ireland again, to the county of Dublin.

Proceeding hence to the continent of Europe, we ſhould begin with Norway, at the North Cape; but this

'ORS PROJECTION.

August 14th 1807 by J. Wilkes

The WORLD, on MERCATORS PROJECTION.

London Pub.d as the Act directs August 24.th 1807 by J. Wilkes

Neele sc Strand

this coaſt is ſo far north, and ſo very little frequented, that it will abundantly ſuffice to mention two or three places in ſucceſſion to the ſouthward, as Surroy, Maelſtroom, Drontheim, and Chriſtianſund, Staten Land, Bergen, and the Naze, at the entrance of the Scaggerac Sea, or the ocean which leads to the Cattegatte and the opening into the Baltic Sea.

As we ſhall not have another opportunity of mentioning it in this general view, it is here to be noted that the iſland of Spitzbergen, or Eaſt Greenland, is conſidered as belonging to Europe. We may here alſo briefly ſtate the coaſts of the Baltic from the Naze Point, within which to the north-eaſt is the coaſt of Aggerhuys, and on the eaſt coaſt to the ſouthward that of Bahus. Weſt Gothland and Schonen follow to Falſterborn Point, or the opening to the Baltic, round which, to the north-eaſt or the weſt coaſt of the Baltic, are the coaſts of Biekinga, Eaſt Gothland, Sudermania, Upland. To theſe on the north are Geſtricia, Helſinga, and Medelpadia, on the weſt ſhore of the Gulf of Bothnia, as far as to ſixty-three degrees of north latitude. Eaſt Bothnia and Finland are on the eaſt coaſt of the ſame gulf; and a part of the Finland coaſt, with Nyland and Carelia, from the north coaſt of the Finland Gulf, as far as to Peterſburgh, to the ſouth-weſt of which is Ingria. Livonia on the weſt not only forms the ſouth coaſt of the Finland Gulf, but extends ſouthward round the weſternmoſt point to the bottom of Riga Gulf. Courland is to the weſtward of that, comprehending the weſt coaſt of that gulf, and alſo trending ſoutherly from the point on the eaſt coaſt of the Baltic; a ſmall extent of Samogitia ſucceeds to it, nearly to Memel, and next the coaſt of Pruſſia, including Dantzic Gulf. On the ſouth-weſt is the coaſt of Pomerania, as far as Stralſund, and then Holſtein, as far as to the ſouthward of Funen Iſland. From hence Sleſwick and Jutland run up north to the point of the Scaw, which forms the ſouth ſide of the entrance from the Scaggerac into the Cattegatte Sea.

To the ſouth of the entrance to the Scaggerac Sea, is the peninſula of Jutland, Sleſwick, and Holſtein, the laſt of which is limited by the river Elbe; and on the ſouth ſide of it is the diſtrict of Bremen in Germany, being bounded by the river Weſer on the ſouth-weſt, in which direction nearly the coaſt trends away towards the mouth of the Ems river, and the entrance to Embden and the Dollart Sea, at the north-eaſt extremity of the Low Countries. The coaſt then turns weſt along Groningen and Weſt Frieſland to the opening into the Zuyder Zee within the Texel iſlands; along the outſide of theſe the coaſt turns again nearly ſouth to the mouth of the Maeſe, and thence ſouth-weſt without the iſlands of Zealand as far as Sluys. The coaſt goes on in that direction nearly to Calais, oppoſite to Dover on the Engliſh ſhore. Being now come to the north coaſt of France, or the ſouth ſhore of the Engliſh channel, it trends off ſouth, a very little weſterly to Dieppe, and from thence to Havre de Grace, at the mouth of the Seine. The coaſt afterwards turns weſt and north of weſt to Cape de la Hogue, and again turns ſouth a little eaſt to Cancale bay, where it once more trends to the weſt, with ſome variation, till it bends ſouth-weſt towards the iſland of Uſhant, off the north-weſt extremity of France. What is called the weſt coaſt of France, extends from hence to the bottom of the Bay of Biſcay near Bayonne, in the direction of about ſouth by eaſt.

The coaſt from hence turns due weſt, or a little north of weſt, to Cape Ortegal, and may either be called the north coaſt of Spain, or the ſouth ſhore of the Bay of Biſcay. It then changes ſouth-weſt to Cape Finiſterre, and afterwards to Minho river, due ſouth, which divides Spain from Portugal. Theſe coaſts comprehend Biſcay, beginning from the eaſtward, with Aſturias and Galicia. With a ſmall bow the coaſt of Portugal is ſouth to the mouth of the Tagus or the river of Liſbon, which direction it continues nearly to Cape St. Vincent; from whence it changes due eaſt to the mouth of Guadiana river, which here again divides Portugal from Spain. From hence to the Straits of Gibraltar, the coaſt trends about ſouth-eaſt by ſouth, paſſing along near Cadiz, and is called the coaſt of Andaluſia; near which, on the 21ſt of October, 1805, the immortal Nelſon gained the completeſt victory over the combined fleets of France and Spain, that was ever recorded in the annals of the world.

To continue the European coaſt, the northern ſhore of the Mediterranean, within Gibraltar Straits, extends variably towards the north-eaſt; having firſt the coaſt of Granada as far as to Portilla, at north-north-eaſt from Cape Gates, and then Murcia, extending round the point to the eaſtward of Carthagena. Valencia, ſometimes called the kingdom of Valencia, extends from hence northward nearly to Sofa Bay; and Catalonia ſtretches away at north-eaſt to Cape Creux to the northward of Roſa Bay. The ſouthern coaſt of France now again comes in, when the coaſt of Rouſillon ſtretches north, a little weſterly towards Narbonne; this ſea being uſually called the Gulf of Narbonne. The inlet or lake between Salce and Leucate, to the north of Perpignan, is the limit between Rouſillon and Languedoc; the coaſt of this laſt extends again to the north-eaſt by Montpellier, as far as the mouths of the river Rhone. On the eaſt ſide of that river is Provence, now the department of the Var, which ſtretches by a circular coaſt to Toulon and the Hieres, and thence to Nice, which forms the boundary of Italy at the mouth of the Var.

Piedmont poſſeſſes a ſmall ſpace of coaſt to the eaſtward of Nice as far as Ventimiglia; after which Genoa, round the gulf of its name, poſſeſſes a long extent of coaſt, as far as the Gulf de Mayre or Maſſa. Lucca next poſſeſſes a ſmall ſpace of coaſt; and Tuſcany, which commences to the north-weſt of Leghorn, ſtretches away to the ſouth-eaſt nearly to Orbitello. Here the coaſt on this ſide commences belonging to that diſtrict which, till the French revolution, has been called the States of the Church of Rome, extending as far as to Terracina on the eaſt of Mount Cercelli, in the direction of ſouth-eaſt. The kingdom of Naples next ſucceeds, which comprehends all the extremity of Italy on both coaſts, and as far to the north-weſt on the coaſt of Italy in the Gulf of Venice, as to Fronto river. On this ſide, the States of the Church extend to the mouth of the river Po, where the coaſt of Venice commences, which then begins to turn round to the north and north-eaſt, as far nearly as to Aquileia.

Next commences the Gulf of Trieſte, in the north-eaſt angle at the bottom of the Gulf of Venice or the Adriatic Sea; the coaſt being called by the name of *Carniola*, on the ſouth-eaſt of which is the peninſula of Iſtria. To the laſt ſucceeds on the ſouth-eaſt the Gulf of Quarnero, in which are ſeveral iſlands running parallel to the ſhore, being long and narrow, and the coaſt known by the name of *Morlachia*, which belongs to Turkey in Europe. Dalmatia ſucceeds to this alſo on the ſouth-eaſt; and Albania in the ſame direction from that. Epirus, Achaia, and the Morea, ſucceſſively follow to Cape Matapan, or the extreme ſouth point of the peninſula of Greece. The coaſt doubles round by Cape St. Angelo on the eaſt ſide towards the north, to the Gulf of Napoli and the Gulf of Engia or Angia, ſometimes called the Gulf of Corinth. From the bottom of this gulf to that of Lepanto on the weſt ſide is but a very narrow iſthmus, the land to the ſouth forming the peninſula of the Morea. The Archipelago ſea is on the eaſt between Greece and the coaſt of Aſia; but the land of Greece ſtill inclines round the capes to the north-eaſt as far as to the ſouth-eaſt extremity of the large iſland of Negropont, when it runs up to the north-weſt to the Gulf of Salonichi. From thence it trends north-eaſt, or more eaſterly, to the Gulf of Conteſſa; from the bottom of

which the coaſt changes eaſt to the Gulf of Caridia, to the ſouth of which is the opening of the ſtrait of the Dardanelles into the ſea of Marmora up to Conſtantinople. From the Gulf of Corinth hither has been comprehended under the general name of Romelia; but, more diſtinctly conſidered, Athens; the eaſt coaſt of Achaia, and Theſſaly, ſucceed on the weſt ſide of the Archipelago, Macedonia on the north-weſt, and Romania, or the ancient Thrace, on the north.

The weſt and north coaſts of the Black Sea, through the ſtraits of Conſtantinople, are alſo in Europe; where we meet with the eaſtern limits of Romania, Bulgaria, and Beſſarabia, belonging to Turkey, extending to the river Dnieſter, to which Budziac Tartary, and Little Tartary, with the peninſula of the Crimea, ſucceed on the north coaſt of that ſea; the coaſt of Little Tartary forming alſo the north-weſt coaſt of the ſea of Azoph, which is alſo within the limits of Europe. Theſe ſeas are at preſent but little known to any except the Ruſſians and Turks.

WESTERN COASTS OF ASIA.

Commencing our view of the coaſts of Aſia, we may begin with the Sea of Azoph and the Black Sea, on the eaſt coaſts of which we meet with Circaſſia; to which ſucceeds Armenia on the ſouth of the latter ſea, and Natolia or Anatolia on the weſt and ſouth-weſt of it, along the eaſt coaſt of the ſtraits of Conſtantinople, to the ſouthward from the Dardanelles. Caramania ſucceeds to this to the ſouth, and extends eaſtward towards Scanderoon at the north-eaſt angle of the Levant coaſt. The coaſt from hence turns due ſouth again, forming the eaſtern extreme coaſt of the Mediterranean, or the weſt part of Syria; to which ſucceeds Paleſtine, changing a little to the weſt of ſouth, as far as the mouth of the river Nile in Egypt, or the eaſternmoſt branch of it below Peluſium, now called Damietta. This is the extent of Aſia in this ſea.

COASTS OF AFRICA.

Leaving therefore, for a time the coaſts of Aſia, which here ſeem to forſake us, we run weſtward along the north coaſt of Africa, where Egypt, the firſt country on the eaſtward, ſalutes us. But we have no knowledge of the coaſt farther weſt than to Alexandria, though the coaſt of Egypt is ſaid to extend to Alberton to the weſtward of Cape Carabea, where the coaſt of Tripoli commences, conſidered as one of the ſtates of Barbary by geographers. This comprehends a great extent of coaſt, as far to the weſtward as the Gulf of Cabes, which is nearly due ſouth from Cape Bona. The coaſt of Tunis, another of the Barbary ſtates, runs northward from this Gulf to Cape Bona, and thence weſterly as far as the Seven Capes, in about eight degrees of eaſt longitude. Here commences the coaſt of Algiers, another of the Barbary ſtates, which ſtretches along to the weſt and ſouth-weſt, to the bottom of the gulf, in which near the coaſt are the Zaffarine iſlands, at ſouth-eaſt from Cape Three Points, or De Tres Forcas. The coaſt of Morocco or Fez there begins, and ſtretches to the ſtraits of Gibraltar, by Ceuta and Tangier, and to the ſouth-weſt without the ſtraits as far as Cape Non; this is the moſt weſterly of the Barbary ſtates. The deſert of Zanhaga is to the ſouthward of this; and to the ſouth of that is Senegambia, which begins at the iſland and fort of St. Louis. The coaſt of the kingdom of Mandingho is farther to the ſouth, on which is the ſettlement of Sierra Leone. To this ſucceeds, as the coaſt trends to the eaſtward, being known by the general name of the coaſt of Upper Guinea, the Grain coaſt, the Ivory Tooth coaſt, the Gold coaſt, and the Slave coaſt, extending as far as to the Gulf of Guinea. To theſe ſucceed towards the ſouth-eaſt, the kingdoms of Benin, comprehending Calabar and Calbongos; and to the ſouth of the equator are Loango, Congo, Angola, and Benguela, the coaſt trending a little to the eaſt of ſouth, which laſt reaches to about fifteen degrees of ſouth latitude. From thence to the ſouth is the coaſt of the Cimbebas, after which the coaſt is deſert, and little known till the approach to the Cape of Good Hope, on each ſide of which the country is called the coaſt of the Hottentots.

Being now advanced into the eaſtern ocean, the coaſt of Monomotapa ſucceeds, including Natal, Fumos, Inhambane, and Sofala; after which Mozambique, Zanguebar, Ajan or Samhar, and Adel, follow, to the entrance of the ſtraits of Babelmandel, where the coaſt of Africa, facing the Eaſtern or Indian ocean, terminates. Of the large and extenſive iſland of Madagaſcar we need only ſay, that it runs almoſt parallel to this coaſt, about north-north-eaſt off the coaſts of Monomotapa and Mozambique, from four to ſeven degrees of longitude on the eaſtward; the ſpace between is frequently called the channel of Mozambique.

SOUTH AND EAST COASTS OF ASIA.

The coaſt of Arabia Felix extends in the direction of north-eaſt by eaſt from the mouth of the Red Sea to the opening of the Perſian gulf; the ſouth coaſt of Perſia then turns nearly eaſt to the River Indus, which is the boundary to the country of Hindooſtan. This runs down to the ſouth-eaſt by the Gulfs of Cutch and Cambaya, and then more ſouth by Bombay and Goa along the Malabar coaſt of the peninſula of India to Cape Comorin; from whence, round the iſland of Ceylon, the coaſt runs up north and north-eaſt along the coaſt of Coromandel with Golconda, the Five Circars, Oriſſa, and Bengal, on the weſt ſide of the bay of Bengal, at the bottom of which it paſſes the mouths of the Ganges. The coaſts of Chittigong, Aracan, and Ava, in the kingdom of Pegu, are on the eaſt ſide of the bay, with Martaban, Tanas, Sarim, and Quedah, in the long and narrow peninſula of Malacca; the laſt being along the coaſt within the ſtraits of Malacca into the Eaſtern Indian Ocean. The large and extenſive iſland of Sumatra forms the other ſide of theſe ſtraits on the ſouth-weſt, and runs out to the ſtraits of Sunda, between the ſouth-eaſt end of Sumatra Iſland, and the weſt end of Java Iſland.

Being advanced into the Eaſtern Indian Ocean, we ſhall only obſerve of the large and numerous iſlands here, that they form various ſtraits and channels, of which we cannot in this place take notice. See the annexed Map on Mercator's Projection. Turning up the coaſt, therefore, from the ſouth-eaſt extremity of the Malacca Straits, the eaſtern coaſt of the peninſula of Malacca turns to the north-north-weſt into the Gulf of Siam, of which, after running up from one degree to fourteen degrees of north latitude, it forms an eaſt coaſt down to Point Camboja in about nine degrees, where it again trends to the north-eaſt to Cape Avarilla. The bottom of the gulf may be called the coaſt of Siam, and this laſt-mentioned coaſt is known by the name of Cambodia, from the mouths of that river which here diſcharge its waters into the China Sea. Hereabouts commences the coaſt of Cochin-china, which turns north-north-weſt; then Quinam ſucceeds, and afterwards Tonquin, along the bottom of the Gulf of Tonquin, where the coaſt again paſſes to the north-eaſt. After doubling the iſland of Hainan, Canton ſucceeds to the north-eaſt; then Fokien, Chekien, and Shanton; which laſt forms the weſt coaſt of the opening to the Yellow Sea, which runs up into a gulf towards Pekin. The peninſula of Korea is on the eaſt of this ſea, and on its eaſt ſide the Gulf of Korea, within the iſlands of Japan on the north-weſt. Jeſſo Iſles, which form the ſtraits ſo called, between them and the coaſt of Eaſt Tartary, are to the north eaſt, along which coaſt to the north-eaſt and north is the courſe to the large and open ſea of Ochotſk, in the north and north-weſt parts of which are the Koriaks. The peninſula of Kamtſchatka makes the

the eaſt boundary of this ſea, to the point of which the Jeſſo and Kurile Iſlands form a chain from Japan. The coaſt from this point runs north-eaſt by the ſea of Kamtſchatka, along to the Gulf of Anadir, the country between belonging alſo to the Koriaks in this eaſtern part: the north coaſt of which gulf turning to the eaſt and ſouth of eaſt, afterwards trends about to the northward to Eaſt Cape, which is the point of Beering's Strait on the weſt ſide between the eaſternmoſt point of Aſia and the weſternmoſt point of America. Here, therefore, terminate the coaſts of Aſia.

EAST COASTS OF NORTH AMERICA.

Beginning from the north, we can only obſerve in general, that the large peninſula to the eaſt of Davis's Straits and Baffin's Bay, is known by the general name of Greenland, and ſometimes its eaſt coaſt is called Old Greenland. For the dreary country on the north of Cumberland Straits round Cape Walſingham, we have no diſtinct name; but that to the ſouth-eaſt from Hudſon's Straits to the ſtraits of Belleiſle, at the north end of Newfoundland, is known by the name of the Labrador Coaſt, as well as the north coaſt of the Gulf of St. Lawrence. Sometimes, however, this laſt is called the coaſt of Eſquimaux, and extends northward without the ſtrait as far as to Cape Harriſon, the north point of the entrance into the great bay of Eſquimaux. On the main continent, on the weſt ſide of the Gulf of St. Lawrence, is the country or coaſt of New Brunſwick, on the ſouth of Chaleurs Bay, and Nova Scotia eaſtward of the bay of Fundy, running up to the north-eaſt nearly to Cape Breton Iſland. The extenſive coaſt of New England ſucceeds to New Brunſwick on the ſouth-weſt; in which are comprehended the coaſts of New Hampſhire, Maſſachuſett's, Rhode Iſland State, and Connecticut. To theſe on the weſt ſucceeds New York, which has but a ſmall extent of coaſt, to the eaſtward of the city and iſland of its name, and that is up the Eaſt River, or paſſage into Long Iſland Sound. On the weſt and ſouth is the coaſt of New Jerſey, as far as to Cape May, the northern point of the entrance into the River Delaware. The coaſt of Maryland then ſtretches along ſoutherly to Cape Charles, the north point of the entrance into the Cheſapeak River or Bay; but ſome diviſions of the country make the coaſt down the weſt ſide of the Delaware River by Cape Hinlopen, and two or three leagues to the ſouth of Rehoboth Bay, to belong to Pennſylvania, which diminiſhes the extent of the Maryland Coaſt, as juſt repreſented. Virginia next ſucceeds from Cape Henry, the ſouth point of the Cheſapeak, which has but a very ſmall extent of coaſt, as far as to Currituck Inlet, or the northern part of Currituck Sound; after which North Carolina ſtretches along to the ſouth and ſouth-weſt to the weſtward of Cape Fear, near Little River, where the coaſt of South Carolina begins, and ſtretches away to Savannah River. This is the boundary, for a long way up the country, to Georgia, the coaſt of which extends to the ſouth as far as Fort St. George, to the north of St. Auguſtine. Here the coaſt of Eaſt Florida begins, which comprehends the peninſula, and here forms the weſt ſhore of the channel of Bahama or Gulf of Florida, from Cape Canaveral to Cape Sable, or the ſouth point. The other coaſt of the peninſula forms the eaſt boundary of the Gulf of Mexico, and in the very bight of the gulf, in the north-eaſt angle, comes in the ſmall river of St. Mark into Apalachy Bay, which is the limit on the coaſt between Eaſt and Weſt Florida. This extends weſtward to the mouths of the Miſſiſſippi, on the weſt ſide of which is Louiſiana or New Orleans, as far as to Cape North, and to that New Mexico ſucceeds; and on the weſt end of the gulf, new Leon is to the ſouth-weſt and ſouth, and Panuco or Guaſteco to the ſouth of that. The coaſt of Tlaſcala next ſucceeds, near the ſouth-weſt angle of the gulf, and to the eaſtward of it, at the bottom of the bay of Campeachy, are the coaſts of Guaxaca and Tabaſco. The peninſula of Yucatan then ſucceeds to the north-eaſt, ſtretching firſt nearly north to Cape Condecedo, then eaſt to Cape Catoche, and then ſouth-ſouth-weſt into the bight or bay of Guanacos, in the bottom of the great bay of Honduras. Here commences the coaſt of Vera Paz, and of Honduras to the eaſt of it, round the cape of its name to Cape Gratios a Dios. The coaſt of Nicaragua commences a little to the ſouth, in the direction of the land from this cape; to which ſucceeds Coſta Rica, and Veragua to the ſouth-eaſt and eaſt of that. This nearly completes the coaſt of North America on the eaſt ſide, and round the Gulf of Mexico.

COAST OF SOUTH AMERICA.

Having now approached the Iſthmus of Darien, where the limits of North and South America commence, the coaſt falls away from thence to the ſouth-eaſt into the Gulf of Darien. The coaſt of Carthagena then trends from the gulf to the north eaſt to Cape Galera, and of St. Martha from thence eaſt nearly to Coquibacoa, or the weſt point of the entrance into the Gulf of Venezuela, within which, and to the eaſtward from Cape St. Roman, the eaſt point of that entrance, is the coaſt ſo called. To this ſucceed the coaſts of Caraccas and Comana, and to the ſouthward of Trinadad Iſle is Paria. All theſe, from Carthagena hither, are known by the general name of the coaſt of Terra Firma.

New Comana, on the ſouth of the Oroonoko River and Iſlands, next ſucceeds; and to the ſouth-eaſt are Dutch Guiana, French Guiana, and Portugueſe Guiana ſucceſſively, to the north coaſt of the River of the Amazons. From hence eaſtward to Cape St. Roque is called the North Coaſt of Brazil; from Cape St. Roque ſouthward to Cape St. Thome is the Eaſt Coaſt of Brazil; and from Cape St. Thome to the Iſle of St. Catherine, in the direction of ſouth-weſt is the South Coaſt of Brazil. From hence the coaſt of Portugueſe Paraguay ſtretches along to ſouth-ſouth-weſt to the River La Plata. To the ſouthward the coaſt trends a little weſterly, which is called the Deſert Coaſt, as far as to Patagonia, in approaching the Straits of Magellan; on the ſouth of which is the iſland of Terra del Fuego, and on its eaſt is Le Maire Strait and Staten Iſland. The coaſt of Patagonia extends northward on the weſt coaſt or South Pacific Ocean as far as to the Chiloe Iſlands, where the coaſt of Chili begins, and goes north to the River Salada, beyond which on the ſouth of Cobija, in about twenty-three degrees of latitude ſouth, is the limit. Here the coaſt of Peru commences, and extends to about two degrees of north latitude. From hence northward the coaſt of Popayan ſtretches to the eaſt part of Panama Bay, and Darien to the north of that bay; near which is the termination of the South American coaſt.

WEST COASTS OF NORTH AMERICA.

From Panama Bay the coaſt begins to turn weſtward, and is known by the name of the Veragua Coaſt, as on the ſouth coaſt of the Caribbean Sea; to which on the north-weſt is Coſta Rica, Nicaragua, and Guatimala, as far as to the bay of Tecoantepec. Then ſucceed Guaxaca, Tlaſcala, Mexico Proper, Mechoacan, Zaliſco, and Guadalajara. Navarra is to the north-weſt of the laſt, within the Gulf of California; and the peninſula of California is on the weſt ſide of the gulf, parallel to Navarra. To that ſucceeds the coaſt of New Albion; and the coaſt trends to the weſt of north to Cape Flattery and Nootka Sound, without any particular name. It then trends about north-weſt to Nepean's Sound, and ſo on to Prince William's Sound in latitude ſixty degrees north; and then turns ſouth-weſt to the mouth of Cook's River, and ſtretches on in the ſame direction to the point of Oonalaſhka or Oenemac, or the ſouth-eaſt ſide of the peninſula of Alāſka. Briſtol Bay is on

the

the north-weſt ſide of the peninſula, and the coaſt then nearly makes good a northerly direction to a bay between Cape Stephens and Cape Rodney. It turns from thence about north-weſt to Cape Prince of Wales, which is the moſt weſterly point of the whole continent of North America; this, with the Eaſt Cape on the coaſt of Aſia, diſtant only about fourteen leagues from each other, form Beering's Straits, which is the paſſage from the North Pacific Ocean to the Arctic Sea, as was obſerved in concluding our account of Aſia. Thus is completed a connected ſketch of all the ſeas and ſea-coaſts hitherto navigated upon the ſurface of the globe.

With reſpect to the meaſurement or dimenſions of the *dry* land contained in the whole world, M. Mentelle, member of the national inſtitute of France, in his *Geographie Statiſtique*, publiſhed at Paris in 1806, has ſtated it to be nearly as follows:

"It is not poſſible to calculate with *exactneſs* the quantity of dry land which the ſurface of the globe contains; becauſe we are not acquainted with the limits of America towards the pole; becauſe we are not ſure that the interior of Africa does not contain ſome great lakes, and that New Holland is not diminiſhed by Mediterranean ſeas and gulfs; in ſhort, becauſe ſome little tracts of unknown land may exiſt towards the two poles, and a frozen continent near the ſouth pole, though this is not very probable. Let us ſuppoſe the unknown parts to be equal to 1,000,000 of ſquare leagues. However this may be, we may reckon the extent of the *old* continent at 4,160,000 ſquare leagues, of which Europe contains 500,000, Aſia 2,100,000, Africa 1,560,000, and that of the *new* at 2,100,000 ſquare leagues, (and perhaps at 100,000 more,) of which South America contains 960,000, and North America at leaſt 1,240,000; New Holland might meaſure 400,000; and all the iſlands, not compriſed in the five parts of the globe above enumerated, make 300,000 more. So that the ſurface of all the regions of the earth, with which we are acquainted, will by this calculation amount to nearly 6,960,000 ſquare leagues, being about 100,000 ſquare leagues more than a quarter of the whole ſurface of the globe. Thus does the quantity of water ſo greatly ſurpaſs that of the dry land on the earth's ſurface!"

The whole population of the earth, is ſtated by this author at 1,080,000,000. He has alſo preſented us with diſtinct ſtatements of the extent of territory, and comparative population, of the two grand empires of France and Great-Britain, for which ſee the article GREAT BRITAIN in this volume.

GEOGRAPHY is repreſented in painting and ſculpture, by a majeſtic female, crowned with turrets, having a terreſtrial globe ſtanding by her, in her right hand a compaſs, in her left a ſquaring rule.

GEOL'OGY, *ſ.* [from γη, the earth, and λογος, a diſcourſe.] The doctrine of the earth; the knowledge of the ſtate and nature of the earth.

Notwithſtanding the wonderful progreſs made of late years in the analyſis of mineral bodies, and in the knowledge of the different ways in which they are found diſpoſed in ſeveral parts of the globe, the tracts on general geology, which have been given to the public, continue to be rather fanciful hypotheſes, than ſober philoſophical lucubrations. This prevalent fault we rather aſcribe to the haſty impatience of writers, than to the abſtruſeneſs of the ſubject; though it is no doubt one of the moſt complicated of natural ſciences. If the writers of theſe works would confine themſelves to proceeding ſtep by ſtep, drawing only immediate and neceſſary conſequences from accurate obſervations, and leaving to future ages the care of advancing farther in proportion to the knowledge thus acquired, the real progreſs of geology would be greater; and many general facts would be better aſcertained by this ſafe and impartial method, than they now are by the continual attempts of theſe authors to ſquare them to their fanciful ſyſtems. From the impatience to give general theories before ſolid foundations have been laid for them, airy hypotheſes are ſucceſſively obtruded on the public; each deſtroying the former, and itſelf enlarging but little, if at all, the boundaries of real ſcience. The only advantages, perhaps, reſulting from theſe wild attempts, conſiſt chiefly in the objections againſt the preceding ſyſtems, and occaſionally in ſome fortunate obſervation, or conjecture; which deſerves to be kept in ſtore, even after the illuſory viſion, which it is made to prop, has vaniſhed and ſunk into oblivion. Theſe reflections are peculiarly applicable to M. Bertrand's new theory of the earth; which, from the neologic and figurative expreſſions frequently uſed by the author, and from the incoherence of his reaſoning, is in ſome meaſure rather darkened than illuſtrated by his explanations. In order to convey his theory with more clearneſs to our readers, we ſhall divide it into epochs.

1ſt Epoch. Motion, heat, light, and life, are not neceſſary companions of matter, but local temporary accidents: immobility, cold, and darkneſs, are on the contrary the moſt natural ſtate of things throughout the immenſity of ſpace. Beſides thoſe heavenly bodies which now enjoy light and life, an infinite number of other worlds exiſt; reſting inviſible in darkneſs and inactivity, and waiting for ſome favourable circumſtance which may bring to them light and motion. Water, according to this author, is the original ſubſtance of our planetary world, and undoubtedly of any other world: but this water, before motion and heat are communicated to it, is only a ſolid maſs of ice. Gravitation being the only force adherent to matter, when it acts alone, as it does in theſe frozen dead worlds, it tends only to keep the parts of matter united and motionleſs; every other motion, which may ſet them in activity, muſt be aſcribed to mechanic impulſion and projection.

2d Epoch. It is difficult to conceive that a comet, of the order of thoſe which move round our ſun, could be ſtrong enough to impart this principle of motion and life to our globe, and to the others of our planetary ſyſtem. M. Bertrand ſuppoſes the exiſtence of comets of a ſuperior and unknown order; which, wandering about a great many worlds, finally end their career, and fulfil their deſtination, by ſtriking one of the dead and frozen; breaking it in pieces; and mixing their materials with thoſe of the till then lethargic maſs. Theſe fragments acquire, by this impulſion, a common projectile motion in the ſame plane, and in the ſame direction. The light, heat, and life, brought by this energetic comet, mixing with the original ice, form new combinations; afford cauſes of inteſtine motions; and begin by theſe means a new order of things: which M. Bertrand calls vital and organic conſtitution, and which he ſuppoſes to be different in every planet, ſince their denſity is not the ſame.

3d Epoch. The ice, by the medium of heat as a diſſolvent, being reduced to primordial matter, all ancient combinations were deſtroyed, to give room to new combinations of a different order. The firſt, perhaps the *only*, converſion of this regenerated element was the calcareous earth; the ſpecies of earth from which, in his opinion, every other earth is originally formed. This depoſition of calcareous matter, being equal every where, could not but produce a regular nucleus in our globe; and this nucleus being equally covered by water, the ſtructure of our planet was far different from what it now is. No ſpot of ground could be out of the water; no mountains, no valleys, could be formed by ſuch an homogeneous equal depoſition. How, then, were they produced?

4th Epoch. A new comet of high degree approached our globe, near enough to influence its deſtinies; changed and ſlackened both the annual and diurnal motions of the

the planet; diſplaced the axis and the equator; altered likewiſe the points at which the ſpheroid was compreſſed or elevated; and, by theſe means diſplacing the waters, occaſioned the ſudden immerſion of the firſt continents. The ſurface of theſe was already marked by declivities and valleys; the firſt occaſioned by the general change of level; the ſecond by the ſudden retreat of the waters. Theſe continents, however, being all compoſed of calcareous matter, what events cauſed the formation of the other foſſil ſubſtances which now exiſt?

5th Epoch. The firſt action of atmoſpherical powers, and of the ſolar rays on the virgin ſoil, occaſioned a ſudden eruption of all the vital forces, ſo long ſuſpended and concentered. In this exploſion of life, every particle of native ſoil was vivified; and numberleſs races of vegetables and animals were produced, of ſuch ſizes and in ſuch numbers, that putrefaction and fermentation enſued. Some meteoric phenomenon having ſet fire to this monſtrous heap of putrefied bodies, the horrid conflagration extended every where, even under the ſea, and was the cauſe of moſt tremendous earthquakes; which broke all the ſtrata, that till then had been horizontal, and lifted them up in every direction, even perpendicularly: thus giving riſe to the chains of mountains, and all their different forms. The aſhes of this almoſt general combuſtion, being the moſt ſaline of the then exiſting ſubſtances, formed a lixivium; which, filtering through the interſtices of the broken ſtrata that were yet of a ſoft conſiſtence, produced the quartz and other ſimilar ſubſtances which now compoſe them. Wherever this lixivial and quartzeous flux depoſed large quantities of matter, the granite was formed. From the mixture of this flux with looſe aſhes, the gneiſs originated; and, by ſeveral ſuch mixtures, the corneous, micaceous, and other, ſchiſts, were formed. The different ſorts of lixivial fluxes and vitreous ſalts, combined with other ſalts, and with the original calcareous ſubſtances, gave riſe to new earths; which, though generally reckoned primitive, both by chemiſts and mineralogiſts, are nevertheleſs, according to M. Bertrand, ſo many natural amalgams, which defy the preſent powers of chemiſtry; ſuch are magneſia, barytes, argill, &c. The reſiduum of the putrefied organic bodies, not being thoroughly burnt and converted into aſhes, experienced only different degrees of fire and decompoſition, and was turned into coals and bitumens. Such, according to this author, was the proceſs by which nature, from this enormous putrefied maſs, formed nearly all the foſſil ſubſtances, except only the calcareous.

6th Epoch. The general combuſtion, by which in the preceding period ſo many wonders were effected, prepared alſo the way to another revolution. The fire, extending under the ſea to an immenſe depth, conſuming and volatilizing the earths, occaſioned hollows and caverns of incalculable dimenſions; which, being laid open by ſome violent ſhock, were filled by the waters of the ocean; and, by this ſudden retreat of the watery element, vaſt portions of our globe were left dry and expoſed to the atmoſphere, while part of the old continents fell into the hollows, and diſappeared.

M. Bertrand deems it very probable that a ſecond change of the axis of our planet was the cauſe of this cataſtrophe; becauſe the foſſil organized bodies, found in different countries, ſeem to prove that a change of zones and climates has taken place, ſince the moment at which they were firſt inhabited by terreſtrial vegetables and animals. This, according to M. Bertrand, is the epoch in which we now live; and in which Nature, fatigued and haraſſed by her firſt gigantic efforts, has loſt much of her former energy. The organized bodies of this epoch are all new ſpecies, by no means comparable either in ſize, numbers, or prolific quality, to the firſt inhabitants of the globe. The means of deſtruction are likewiſe as much weakened as thoſe of production. Our preſent earthquakes, and our volcanoes, are microſcopic objects in compariſon with thoſe of the former epochs. Thoſe firſt earthquakes ſhook the globe, diſplacing and overthrowing every thing; the firſt conflagrations were, in the author's words, 'bottomleſs and boundleſs ſeas of fire;' while our actual volcanoes he compares to chimneys.

He next aſſerts, that the actual ſtate of the globe has already laſted longer than any other of the former ſtates; and that it is very probable, from the exhauſted condition of nature, that it will continue to decay in peace till the planet is again cold, lifeleſs, and dry: but this is a mere probability, becauſe, if partial nature be liable to decline, univerſal nature is always in full activity; and ſome new change of the axis of the earth may ſink part of the exiſting continents, and may expoſe to the ſolar rays, and to the vivifying action of the atmoſphere, the bottom of the Southern and of the Pacific Oceans.

If M. Bertrand, like his predeceſſors in the ſame career, has been unſucceſsful in eſtabliſhing a plauſible theory of the earth, he has like them furniſhed, in many inſtances, valuable arguments againſt the hypotheſis moſt in vogue when he compoſed his book. M. La Metherie's theory of the earth, which has been the moſt faſhionable, and in many reſpects deſerving the reputation that it enjoyed, is attacked by this author in every point; and indeed the greateſt part of this volume is avowedly intended as a refutation of that learned writer's ſyſtem of the general cryſtallization of mineral ſubſtances in the primitive ocean. The vaſt erudition diſplayed by M. La Metherie, and the air of candour and ſcepticiſm adopted by him in the diſcuſſion of many important queſtions, have perhaps contributed to give more popularity to his ſyſtem, than a ſimple expoſition of it, diveſted from theſe acceſſories, would have acquired. As far as his arguments tend to prove the Neptunian origin of the greateſt part of the known mineral ſubſtances, and the general ſtate of ſubmerſion in which the ſolid part of our globe has exiſted in former periods, they ſeem to us unanſwerable: but the retreat of the waters, the formation of mountains and valleys, and the phenomena which they preſent either in their forms or in the poſition of the materials in or about them, require, in order to be explained, ſome other agent than the primitive ocean; ſome other operations than mere cryſtallization and depoſition. Though M. Bertrand's hypotheſes do not afford any ſatisfactory ideas to account for theſe phenomena, ſtill ſome of the arguments which he employs, to ſhew the inſufficiency of the ſyſtem of general cryſtallization, appear to deſerve the candid attention of the learned on this very intereſting branch of natural philoſophy.

In this view, the ingenious Mr. R. Kirwan, in his Geological Eſſays, publiſhed in 1801, has endeavoured to collect the principal facts and opinions which relate to the ſtructure of the globe, from the beſt writers. He points out the diſtinction between primary and ſecondary mountains, as one of the moſt important events in the progreſs of geological ſcience; he expoſes the futility of the theory of Buffon, which repreſented all the primary mountains to have originated out of a ſtate of igneous fuſion; names with deſerved approbation thoſe philoſophers who have ſubſtituted mineralogical and chemical inveſtigation for haſty conjecture in their attempts to trace the formation of the earth, and the changes which have happened in the arrangement of its ſtrata; and profeſſes the object of his work to be, to vindicate the divine authority of Revelation, by proving the account given by Moſes of the origin of the terreſtrial globe, to agree, in the moſt remarkable manner, with the preſent ſtate and condition of the earth.

In his firſt Eſſay, he obſerves that the earth could not have aſſumed the form of a ſpheroid compreſſed at the poles, if its ſuperficial parts had not originally been, to a certain depth, in a ſoft or liquid ſtate; and that

the lower ſtrata of primitive calcareous rocks being, in proportion to their depth, continually thinner than thoſe which reſt upon them, equally evince the whole to have been formerly in a ſoft ſtate, and to have yielded to compreſſion while they were dried and hardened. He therefore ſuppoſes the ſuperficies of the globe to have been univerſally fluid, its interior compoſition ſolid and cavernous, at the time when the preſent laws began to operate upon it. The ſuperficial fluid he conceives to have been heated at leaſt to 33° Fahr. Diſſolved or ſuſpended in it were portions of the eight generic earths, of all the known metallic ſubſtances, of all the ſimple ſalts, and of all inflammable matters ſolid and liquid. Siliceous earth and iron were of all the ſolid materials in the mixture the moſt copious. Calcareous earth muſt even then have exiſted; for it is a component part in many primitive rocks. As the fluid maſs was moved; as its heat paſſed into new combinations; as the elective attractions of its various materials began reciprocally to operate; the ſolidifiable materials were precipitated in the order of their affinities, ſomewhat diſturbed by the mechanical agency, which at the ſame time neceſſarily affected them. In their precipitation they were univerſally cryſtallized. Where ſiliceous and argillaceous earths chiefly abounded, quartz, feldſpar, and mica, were confuſedly depoſited in ſtrata of granite and gneiſs. One depoſition ſucceeded another till vaſt uniform blocks were formed. Carbon, iron, and others of the ſolidifiable materials of the chaotic flood, were unavoidably involved with the ſubſiding ſtony particles. Where the materials were intermingled in different proportions, other ſorts of primitive rock, ſuch as ſiliceous ſchiſtus, ſiliceous porphyries, jaſpers, &c. were produced. In the confuſed agitation of all parts of the flood, ſulphur and metallic ſubſtances encountering, formed pyrites; while pit-coal was alſo compoſed by the aſſociation of petrol with carbon. After the formation of combuſtible compounds ſo eaſily decompoſable, heat ſufficient for their combuſtion was ſoon afforded from the inceſſant ſolidification of matters which had been hitherto fluid. A decompoſition of water, by means of heated iron, was one of the firſt effects from the riſing intenſity of the general heat. The combuſtible matters were generally inflamed, and many volcanic fires burſt out from the boſom of the abyſs. Gas-azot, gas-oxygen, and afterwards carbonic acid gas, were, in great quantities, evolved from the conflagration, and diffuſed into an atmoſphere ſurrounding the earth and waters. The eruptions of the fires naturally diſordered the depoſitions of the rocky ſtrata, and puſhed up many vertical or inclined elevations through the layers which might otherwiſe have been, in general, nearly horizontal. Such was the origin of the loftieſt primitive mountains, the Alps, the Andes, and thoſe elevated ranges which occupy ſo extenſive a ſpace in the north of Aſia. Plains were formed by the depoſition of ſtony particles from the chaotic flood in the intervals between the mountains, and with a diffuſion too looſe to admit of their being united in cryſtals as they were depoſited. The volcanic eruptions, by which the firſt mountains were elevated, could not but ſcoop out excavations to receive the ſubſiding waters of the ſea. The caverns of the primitive nucleus of the globe were even laid open by thoſe fires; and into them the ſuperficial waters ſhrunk, till a conſiderable extent of dry and ſolid ſurface was left bare under the atmoſphere. At a level of between 8500 and 9000 feet above that at which it now ſtands, the ocean became for a while ſtationary. It was ſoon after furniſhed with fiſhes. The diſintegration of the primary rocks, the depoſition of animal exuviæ, and the continued precipitation of the ſolid matters ſuſpended in the waters of the ſea, then compoſed thoſe ſtrata of rocks which, from their containing animal remains, are denominated *ſecondary*. The earth was about the ſame time clothed with vegetation, and made the reſidence of the ſpecies of animals. The matter of the ſecondary rocks was, by the known laws of gravitation and reſiſtance, rather fixed in ſtrata upon the primary rocks, than precipitated to the bottom of the great abyſs. The retreat of the ſea from the ſurface to the interior caverns of the globe, however, ſtill continued; and the dimenſions of the habitable earth were thus continually enlarged.—Such is the ſubſtance of the firſt of theſe Eſſays, which contains the author's theory of the formation of the earth. He compares this account with that of Moſes, and ſhews that they perfectly coincide.

The Deluge is the ſubject of the ſecond Eſſay. From the ſhells found on the heights of the primitive mountains; from the remains of animals natives of hot climates diſcovered in cold ones, which thoſe animals cannot be ſuppoſed to have ever voluntarily inhabited; from the diſperſion of marine exuviæ on ſhores far remote from the ſeas where we now meet with the ſpecies of living animals to which they muſt have belonged; Mr. Kirwan infers, that the general deluge commemorated in the Holy Scriptures muſt certainly have taken place as Moſes relates. That the axis of the earth was originally parallel to the ecliptic, producing in every latitude perpetual ſpring, is a poſition of which aſtronomy has ſufficiently demonſtrated the falſehood. The nutation of the poles is, every nine years, retrogreſſive, and never exceeds ten degrees; ſo that the equator can never have been, by this cauſe, where the poles are now. The whole ſtrata of this earth are of ſuch nature that they cannot have originally been, as M. de Buffon ſuppoſes, in a ſtate of igneous fuſion, the heat from which might have long kept up a genial warm temperature even in the regions the neareſt to the poles. The phenomena ſufficiently evince that the ſeas and continents of the earth cannot have mutually changed places, as has been ſuppoſed by Mr. Edward King. Mr. Kirwan, therefore, ſuppoſes the ſouthern ocean to have been in the general deluge driven, by ſome unknown means, with mighty force towards the poles. The character of the exotic remains found in the northern regions; the immenſity of waters collected in the ſouthern ocean; the traces which ſo many countries bear of having ſuffered ſome mighty ſhock from the ſouth; and the very figures of the great continents, ſharpened towards the ſouth, where they are waſhed by the ſouthern ocean, are ſo many grand facts concurring to give probability to that ſuppoſition. The waters from the central abyſſes of the globe might burſt forth to complete the cataſtrophe. In their progreſs northward, and in their retroceſſion, the waters of the deluge muſt have greatly broken, ravaged, and tranſpoſed, the ſuperficial ſtrata of the earth: many of the mountains were broken down to powder, and other inconſiderable fragments: the beds of the Euxine and Caſpian ſeas might be then ſcooped out: baſaltic rocks and beds of coal might be formed: a confuſion in the arrangement of the exterior ſtrata of ſecondary and primary rocks would be here and there produced: all terreſtrial animals, ſave ſuch as were preſerved by ſupernatural means, muſt have neceſſarily periſhed. Every rational inference, therefore, from preſent appearances, entirely coincides with the Moſaic hiſtory of the deluge.

In the third Eſſay Mr. Kirwan ſtates, that, beſides effecting ſo many important and immediate changes on the exterior ſtrata of the globe, the deluge, likewiſe, became the remote cauſe of various great convulſions, which were at ſubſequent times to enſue upon its parts at different places of the ſurface: that the total ſeparation of Aſia from America, the coarctation of the Baltic, the opening of the Thracian Boſphorus, and the diſruption of the iſthmus which once divided the Atlantic Ocean from the Mediterranean Sea, the entire ſeparation of Great Britain from the continent, and various other ſimilar alterations, are to be numbered among

thoſe great changes poſterior to the deluge, for which the deluge had, however, prepared the ſuperficial ſtrata of the globe: that all theſe changes muſt have been accompliſhed chiefly by extraordinary agitations of the waters of the ocean, and at the diſtance of at leaſt three thouſand ſix hundred years from the preſent time.

The fourth Eſſay explains the phenomena of *lapidification*. Stones conſiſt of earths conglomerated. A lump of any earth of which the parts, though cohering, are diviſible merely by the nail of the finger, is called but *indurated earth*: if its coheſion firmly reſiſt the action of the nail, it is to be denominated *ſtone*. Stones are *hard* which cannot be eaſily filed, or cut into pieces. Thoſe are *firm* which ſtrongly reſiſt percuſſion. Some ſtones appear to have been formed by cryſtalliſation arranging all their parts, internal and external, in a regular form. It is effected from either aqueous or igneous ſolution. All ſolidifiable matters are ſuſceptible of it. Even thoſe ſiliceous matters, which are now almoſt inſoluble in water, might be eaſily ſoluble in this menſtruum in their original ſtate of extreme diviſion, and were probably cryſtalliſed by depoſition from water. Nay, in ſpite of whatever Dr. Black and others may have affirmed to the contrary, numerous facts may be produced to ſhow that, even ſtill, water may be made to take up a certain proportion of this earth. Some ſtones appear to have been formed by the mere concretion of particles, which, in their primary compoſition, are probably of different figures, and which therefore diſplay not in their coheſion the uniform order of cryſtalliſation. Other ſtones are formed by the cementation of exceedingly ſmall nodules, or even of larger ones, by the depoſition of ſtill particles amongſt them, and the coheſion of whole maſſes, partly by mechanical force, and in part by the reciprocal chemical attractions of the different parts. Many of the ſmaller nodules, which are found imbedded in rocks not of the ſame nature with themſelves, have been formed by an infiltration, in which water or ſome other fluid carried their particles through the ſuperficial ſtrata, but depoſited them after penetrating the interior layers only to a certain depth. Thoſe ſtones which we call *petrifactions*, have been formed by the gradual ſubſtitution of ſtony particles into the places which were occupied by animal or vegetable matters that decay while the lapideous depoſition takes place. Theſe are the different modes of lapidification. They are exemplified in all the different fragments, columns, and ſtrata of rock, which the earth preſents to the obſervation of men.

In the fifth Eſſay, the *diſintegration*, reducing them into ſands and larger fragments, is explained, as having been often produced by the abſorption of water, and by its congelation or rarefaction while it was diffuſed within them. The known external cauſes of the entire decompoſition of ſtony matters are repreſented to be only water, carbon, and carbonic acid gas, which enter into new combinations with the ſaline matters, the ſulphur, the ferruginous oxyds, the manganeſe, the lime, and other conſtituent parts of the ſtones with which they come into contact.

Mountains are the ſubjects of the ſixth of theſe Eſſays. The author deſcribes the *primitive* mountains as containing within them no animal nor vegetable remains; as compoſing all the loftieſt extremities of the earth; as never covering nor leaning upon thoſe which are called *ſecondary*; as exiſting ſometimes in ſtrata, but oftener in huge rocks; as variouſly compoſed, of granite and granitic compounds, gneiſs, ſchiſtoſe mica, ſiliceous ſchiſtus, baſanite, jaſper, pitchſtone, hornblende, hornblende ſlate, indurated lithomarga, argillite, trap, ſerpentine and potſtone, porphyry, hornſlate, ſchiſtoſe porphyry, ſandſtone, rubble-ſtone, farcilite, granular limeſtone, marlite, gypſum, fluor, and topaz-rock. Of each of theſe ſorts of ſtone he gives, in part, the mineralogical geography. The *ſecondary* mountains are next deſcribed, as being either marigenous or alluvial; as containing in their ſtructure various remains of animals and vegetables, terreſtrial and aquatic; as always incumbent on primary rocks, or inveſting them; as ſtratified or columnar, unigenous or polygenous; as variouſly compoſed of limeſtone, ſwineſtone, oviform limeſtone, porous limeſtone, marlites, and calcareous ſandſtones, chalk, gypſum, argillite, indurated clay, ſhale, bituminous ſhale, indurated lithomarga, ſlate, argillaceous ſandſtone, porphyry, trap, and baſalt; hornblende, argillaceous and calcareous breccias, hornſtone, jaſper, ſiliceous breccias, and ſiliceous ſandſtone. By an ample induction of facts it is proved, that all theſe different ſorts of ſtone have been found in circumſtances in which they could not be but of ſecondary formation.

In the ſeventh Eſſay, Mr. Kirwan deſcribes volcanic mountains as being generally of a conical form, of no exceedingly ancient origin, burning with no extraordinary intenſity of internal heat, and not half ſo numerous as ſome theoretic mineralogiſts have ſuppoſed them to be.

In the eighth Eſſay, Mr. Kirwan endeavours to explain the internal arrangement of mountains. He here relates that their materials are diſpoſed either in irregular heaps, or in beds, or ſtrata, horizontal, varying from that poſition by an angle of from five degrees to forty, or ſometimes even almoſt vertical. Sometimes the ſtrata run in the direction of the declivity of the mountains they compoſe, and ſometimes their courſe is directly oppoſite to this. Mountains of primitive limeſtone are often in irregular piles, but often, too, horizontally ſtratified. Of ſecondary calcareous ſtrata, the ſtructure is commonly horizontal. The ſtrata of ſecondary mountains, for the moſt part, aſcend towards the primary.—Theſe are ſome of the leading truths of this curious inveſtigation.

Coal-mines form the ſubject of the ninth Eſſay. Pit-coal is a compound of bitumen with carbon: its ſpecific gravity is from 1·23 1·500. The ſoils within which beds of coal uſually occur, are argillaceous, arenilitic, trappoſe, or calcareous. Theſe are diſpoſed in ſtrata over the coal, or in alternation with the ſtrata. The thickneſs of the ſtrata, or ſeams of coal, varies from half an inch even to eighty feet. Shale, bituminous ſhale, or ſandſtone, are the ſtones which generally form both the *roof* and *floor* to *ſeams* of pit-coal. Sometimes theſe ſeams are in their diſpoſition horizontal. They riſe at times to angles of from twenty-five degrees to forty-five with the horizon. It cannot be true that, as has been ſuppoſed by Genſanne, pit-coal is nothing but argillaceous matter impregnated with petrol or aſphalt; nor that this coal is entirely of vegetable origin; nor that it is formed from the fat and unctuoſity of the animals of the ocean. The ſtrata of this mineral ſeem rather to have been formed in conſequence of the diſintegration of many of the primitive mountains by the homogeneous union of the petrol and carbon which were by that diſintegration liberated out of the compoſition into which they had originally entered. Coal is therefore to be ſought, with probability of ſucceſs, only on the ſides of primitive mountains, in the vicinity of mountains of argillaceous porphyry, amidſt ſandſtone and ſhale bearing the impreſſions of vegetables, under alternating ſtrata of limeſtone and ſandſtone, or amidſt ſtrata of trap, or whin with ſandſtone or clay.

Common ſalt and its mines are made the ſubjects of the tenth Eſſay. The ſea is repreſented as owing its ſaltneſs to ſimple ſaline ſubſtances held in ſolution in it ever ſince the creation. The mines of rock-ſalt which have been in different places diſcovered, are ſaid to have all originated from the detenſion and evaporation of ſea-water. Salt-ſprings and lakes are related to contain and pour forth, from time to time, quantities of ſaline matter, which, when ſubjected to calculation, cannot but, by their magnitude, excite the greateſt aſtoniſhment.

Theſe

Theſe general facts are unfolded by an exceedingly curious and intereſting diſplay of particulars.

The eleventh Eſſay is on the ſubject of metallic mines. It relates, that all the metals muſt have exiſted perfect and uncontaminated in the chaotic flood. Gold is found naturally pure oftener than any of the other metals. Silver is much more frequently mineraliſed by ſulphur, and alloyed with copper, antimony, lead, mercury, tin, or biſmuth. Nature preſents ſtill leſs of pure copper than of pure ſilver: the ores of copper are ſcarcely ever free from ſulphur. Of pure native iron there are few or no ſpecimens, except certain maſſes found in Siberia and Peru, which ſeem to have been originally agglutinated by petrol, and left bare by the diſſolution of the maſſes of other matters which once ſurrounded them. Native biſmuth accompanies the grey and the bright white ores of cobalt. Native arſenic is found only in the veins of primeval mountains: native mercury occurs in clay in mountains of ſecondary formation; ſulphurated ores have been formed at a time when ſulphur, as well as metals, were in a ſtate of extreme ſubdiviſion, in which they were much more ſoluble in fluids than they are at preſent. The cryſtalliſation of metallic ores was the conſequence, in ſome inſtances, of the diminution of the watery menſtruum, in others of ſlow precipitation. The veins of metals ſeem to have been, for the moſt part, formed by depoſition from water among the rifts and amid the ſtrata of the ſofter rocks. It is in oxyds, in mineraliſation by ſulphur, in mixture with different earths, and in amalgamation with one another, that all the metals are the moſt commonly found.

The twelfth Eſſay is profeſſedly to controvert what the late Dr. Hutton, of Edinburgh, had taught, that from eternity, this globe had continued to paſs through a ſeries of revolutions, in which the land was ſtill deſtroyed by external influences, and, in its ruins, propelled into the ocean; while, on the other hand, internal fires were conſtantly elevating new mountains under the ocean, and conglomerating the materials driven into it; till, at laſt, the ocean changed its bed, that which had been dry land became ſea, that which had been ſea became dry land, and the deſtruction of the new continents, and the working of the volcanic fires under the new ſeas, were again renewed. Mr. Kirwan attacks this theory as unphiloſophical. Dr. Hutton defended his own ſyſtem. In this concluding eſſay, however, Mr. Kirwan, in reply to Dr. Hutton's defence, demonſtrates, that igneous fuſion cannot have produced thoſe phenomena which the doctor aſcribes to it; affirms that volcanic fires are comparatively few and weak in their action; and maintains, that the compoſition of the ſuperficial ſtrata of our preſent continents, is ſuch as could not poſſibly be formed at the bottom of the ſea.—See Dr. Hutton's theory refuted, under the article EARTH, vol. vi. p. 177–201.

Upon the whole, it ſeems generally allowed that Mr. Kirwan has exhibited a more conſiſtent ſcheme of the facts, and analogies of geology, than any that has been before preſented to the world. If ſubſequent geologiſts ſhall continue to improve the ſcience as Mr. Kirwan has done, the world may, perhaps, at ſome future period, form a correct and faultleſs theory of the earth.

GE'OMANCER, *ſ.* [γη and μαντις.] A fortuneteller; a caſter of figures, who pretends to foretel futurity by other means than the aſtrologer.—Fortune-tellers, jugglers, *geomancers*, and the incantory impoſtors, though commonly men of inferior rank, daily delude the vulgar. *Brown.*

GE'OMANCY, *ſ.* [γη and μαντια; *geomance*, Fr.] The act of caſting figures; the act of foretelling by figures what ſhall happen.—According to ſome there are four kinds of divination; hydromancy, pyromancy, acromancy, and *geomancy*. *Ayliffe.*

GEOMAN'TIC, *adj.* Pertaining to the act of caſting figures:

Two *geomantic* figures were diſplay'd
Above his head, a warrior, and a maid;
One when direct, and one when retrograde. *Dryden.*

GEO'METER, *ſ.* [γεωμετρης, Gr. *geometre*, Fr.] One ſkilled in geometry; a geometrician.—He became one of the chief *geometers* of his age. *Watts.*

GEO'METRAL, *adj.* [*geometral*, Fr.] Pertaining to geometry.

GEOME'TRIC, or GEOMETRICAL, *adj.* [γεωμετρικος; *geometrique*, Fr.; from *geometry*.] Pertaining to geometry.—A *geometrical* ſcheme is ſet in by the eyes, but the demonſtration is diſcerned by reaſon. *More.*—Preſcribed or laid down by geometry.—Muſt men take the meaſure of God juſt by the ſame *geometrical* proportions that he did, that gathered the height and bigneſs of Hercules by his foot? *Stillingfleet.*

Does not this wiſe philoſopher aſſert,
That the vaſt orb, which caſts ſo fair his beams,
Is ſuch, or not much bigger than he ſeems?
That the dimenſions of his glorious face
Two *geometric* feet do ſcarce ſurpaſs? *Blackmore.*

Diſpoſed according to geometry.—*Geometric* jaſper ſeemeth of affinity with the *lapis ſanguinalis* deſcribed by Boetius; but it is certainly one ſort of *lapis cruciformis*. *Grew.*

GEOMETRICAL CURVE, called alſo *algebraical one*, is that in which the relations between the abſciſſes and ordinates may be expreſſed by a finite algebraical equation. See ALGEBRA.

GEOMETRICAL LINES, as obſerved by Newton, are diſtinguiſhed into claſſes, orders, or genera, according to the number of the dimenſions of the equation that expreſſes the relation between the ordinates and abſciſſes; or, which amounts to the ſame thing, according to the number of points in which they may be cut by a right line.

GEOMETRICAL LOCUS, called alſo ſimply *Locus*, or *Place*, is the path or track of ſome certain geometrical determination, in which it always falls.

GEOMETRICAL METHOD OF THE ANCIENTS. The ancients eſtabliſhed the higher parts of their geometry on the ſame principles as the elements of that ſcience, by demonſtrations of the ſame kind; and they were careful not to ſuppoſe any thing done, till by a previous problem they had ſhewn that it could be done by actually performing it. Much leſs did they ſuppoſe any thing to be done that cannot be conceived; ſuch as a line or ſeries to be actually continued to infinity, or a magnitude diminiſhed till it become infinitely leſs than what it is. The elements into which they reſolved magnitudes were finite, and ſuch as might be conceived to be real. Unbounded ſeries have of late been introduced; by which geometry, which ought to be perfectly clear, is filled with myſteries.

GEOMETRICAL PROGRESSION, a progreſſion in which the terms have all ſucceſſively the ſame ratio: as 1, 2, 4, 8, 16, &c. where the common ratio is 2. The general and common property of a geometrical progreſſion is, that the product of any two terms, or the ſquare of any one ſingle term, is equal to the product of every other two terms that are taken at an equal diſtance on both ſides from the former.

GEOMETRICAL PROPORTION, called alſo ſimply *Proportion*, is the ſimilitude or equality of ratios. Thus, if $a : b :: c : d$, or $a : b = c : d$, the terms a, b, c, d, are in geometrical proportion, alſo 6, 3, 14, 7, are in geometrical proportion, becauſe $6 : 3 :: 14 : 7$, or $6 : 3 = 14 : 7$.

GEOMET'RICALLY, *adv.* According to the laws of geometry.—'Tis poſſible *geometrically* to contrive ſuch an artificial motion as ſhall be of greater ſwiftneſs than the revolutions of the heavens. *Wilkins.*—All the bones, muſcles,

muſcles, and veſſels of the body are contrived moſt *geometrically*, according to the ſtricteſt rules of mechanics. *Ray.*

GEOMETRI'CIAN, *ſ.* [γεωμετρης.] One ſkilled in geometry; a geometer.—How eaſily does an expert *geometrician*, with one glance of his eye, take in a complicated diagram, made up of many lines and circles! *Watts.*

To GEO'METRIZE, *v. a.* [γεωμετρεω.] To faſhion or form according to the laws of geometry.—We obtained good ſtore of cryſtals, whoſe figures were differing enough, though prettily ſhaped, as if nature had at once affected variety in their figuration, and yet confined herſelf to *geometrize*. *Boyle.*

GEO'METRY, *ſ.* [*géometrie*, Fr. *geometria*, Lat. γεωμετρια, Gr. of γη, the earth, and μετρεω, to meaſure.] The art of meaſuring the earth, and of determining any diſtances or dimenſions contained within it; and it is alſo uſed to denote the ſcience of local extenſion, quantity, or magnitude, abſtractedly conſidered, without any regard to matter. Hence to this ſcience might be referred the conſideration not only of lines, ſurfaces, and ſolids; but alſo of time, velocity, number, weight, &c. inſomuch that with the aid of arithmetic or algebra, geometry now forms the chief foundation of the mathematics.

Herodotus, Diodorus, Strabo, and Proclus, aſcribe the invention of geometry to the Egyptians, and aſſert that the annual inundations of the Nile gave occaſion to it; for thoſe waters bearing away the bounds and land-marks of eſtates and farms, covering the face of the ground uniformly with mud, the people, ſay they, were obliged every year to diſtinguiſh and lay out their lands by the conſideration of their figure and quantity; and thus by experience and habit they formed a method or art, which was the origin of geometry. A farther contemplation of the draughts of figures of fields thus laid down, and plotted in proportion, might naturally lead them to the diſcovery of ſome of their excellent and wonderful properties; which ſpeculation continually improving, the art continually gained ground, and made advances more and more towards perfection. Joſephus, however, ſeems to aſcribe the invention to the Hebrews: and others of the ancients make Mercury the inventor. *Polyd. Virgil, de Invent. Rer. lib.* 1, *cap.* 18.

From Egypt this ſcience paſſed into Greece, being carried thither by Thales; where it was much cultivated and improved by himſelf, as alſo by Pythagoras, Anaxagoras of Clazomene, Hippocrates of Chios, and Plato, who teſtified his conviction of the neceſſity and importance of geometry to the ſucceſsful ſtudy of philoſophy, by this inſcription over the door of his academy, *Let no one ignorant of geometry enter here.* Plato thought the word *geometry* too limited a term for this ſcience, and ſubſtituted inſtead of it the more extenſive name of *Menſuration*; and after him others gave it the title of *Pantometry*. But theſe are now become too ſcanty in their import, fully to comprehend its extent; for it not only inquires into, and demonſtrates, the quantities of magnitudes, but alſo their qualities, as the ſpecies, figures, ratios, poſitions, tranſformations, deſcriptions, diviſions, the finding of their centres, diameters, tangents, aſymptotes, curvature, &c. Some again define it as the ſcience of inquiring, inventing, and demonſtrating, all the affections of magnitude. And Proclus calls it the knowledge of magnitudes and figures, with their limitations; as alſo of their ratios, affections, poſitions, and motions of every kind.

About fifty years after Plato, lived Euclid, who collected together all thoſe theorems which had been invented by his predeceſſors in Egypt and Greece, and digeſted them into fifteen books, called the "Elements of Geometry;" demonſtrating and arranging the whole in a very accurate and perfect manner. The next to Euclid, of thoſe ancient writers whoſe works are extant, is Apollonius Pergæus, who flouriſhed in the time of Ptolemy Euergetes, about two hundred and thirty years before Chriſt, and about one hundred years after Euclid. He was author of the firſt and principal work on Conic Sections; on account of which, and his other accurate and ingenious geometrical writings, he acquired from his patron the emphatical appellation of *The Great Geometrician*. Contemporary with Apollonius, or perhaps a few years before him, flouriſhed Archimedes, celebrated for his mechanical inventions at the ſiege of Syracuſe, and not leſs ſo for his very many ingenious geometrical compoſitions.

We can only mention Eudoxus of Cnydus, Archytas of Tarentum, Philolaus, Eratoſthenes, Ariſtarchus of Samos, Dinoſtratus, the inventor of the quadratrix, Menechmus, his brother, and the diſciple of Plato, the two Ariſteus's, Conon, Thracidius, Nicoteles, Leon, Theudius, Hermotimus, Hero, and Nicomedes, the inventor of the conchoid: beſides whom, there are many other ancient geometricians, to whom this ſcience has been indebted.

The Greeks continued their attention to it, even after they were ſubdued by the Romans. Whereas the Romans themſelves were ſo little acquainted with it, even in the moſt flouriſhing time of their republic, that Tacitus informs us they gave the name of mathematicians to thoſe who purſued the chimeras of divination and judicial aſtrology. Nor does it appear they were more diſpoſed to cultivate geometry during the decline, and after the fall, of the Roman empire. But the caſe was different with the Greeks; among whom are found many excellent geometricians ſince the commencement of the Chriſtian era, and after the tranſlation of the Roman empire. Ptolemy lived under Marcus Aurelius; and we have ſtill extant the works of Pappus of Alexandria, who lived in the time of Theodoſius; the commentary of Eutocius the Aſcalonite, who lived about the year of Chriſt 540, on Archimedes's menſuration of the circle; and the commentary on Euclid, by Proclus, who lived under the empire of Anaſtaſius.

The conſequent inundation of ignorance and barbariſm was unfavourable to geometry, as well as to the other ſciences; and the few who applied themſelves to this ſcience, were calumniated as magicians. However, in thoſe times of European darkneſs, the Arabians were diſtinguiſhed as the guardians and promoters of ſcience; and from the ninth to the fourteenth century, they produced many aſtronomers, geometricians, geographers, &c. from whom the mathematical ſciences were again received into Spain, Italy, and the reſt of Europe, ſomewhat before the year 1400. Some of the earlieſt writers after this period are, Leonardus Piſanus, Lucas Paciolus or De Burgo, and others between 1400 and 1500. And after this appeared many editions of Euclid, or commentaries upon him: thus, Orontius Finæus, in 1530, publiſhed a commentary on the firſt ſix books; as did James Peletarius, in 1557; and about the ſame time Nicholas Tartaglia publiſhed a commentary on the whole fifteen books. There have been alſo the editions, or commentaries, of Commandine, Clavius, Billingſly, Scheubelius, Herlinus, Daſypodius, Ramus, Herigon, Stevinus, Saville, Barrow, Taquet, Dechales, Furnier, Scarborough, Keill, Stone, and many others; but the completeſt edition of all the works of Euclid, is that of Dr. Gregory, printed at Oxford 1703, in Greek and Latin: the edition of Euclid by Dr. Robert Simſon of Glaſgow, containing the firſt ſix books, with the eleventh and twelfth, is much eſteemed for its correctneſs. The principal other elementary writers, beſides the editors of Euclid, are, Borelli, Pardies, Marchetti, Wolfius, Simpſon, &c. And among thoſe who have gone beyond Euclid in the nature of the elementary parts of geometry, may be chiefly reckoned, Apollonius, in his Conics, his Loci Plani, De Sectione Determinata, his Tangencies, Inclinations, Section of a Ratio, Section of a Space, &c.; Archimedes, in his treatiſes of the Sphere and Cylinder, the Dimenſion of the Circle, of Conoids and Spheroids, of Spirals, and the Quadrature of the Parabola; Theodoſius, in his Spherics; Serenius, in his Sections of the Cone and Cylinder; Kepler's Nova Stercometria; Cavalerius's Geo-

metria Indiviſibilium; Torricelli's Opera Geometrica; Viviani, in his Divinationes Geometricæ, Exercitatio Mathematica, De Locis Solidis, De Maximis & Minimis, &c.; Vieta, in his Effectio Geometrica, Supplement. Geometriæ, Sectiones Angulares, Reſponſum ad Problema, Apollonius Gallus, &c.; Gregory St. Vincent's Quadratura Circuli; Fermat's Varia Opera Mathematica; Dr. Barrow's Lectiones Geometricæ; Balliald de Lineis Spiralibus; Cavalerius; Schooten and Gregory's Exercitationes Geometricæ, and Gregory's Pars Univerſalis, &c.; De Billy's treatiſe De Proportione Harmonica; La Lovera's Geometria veterum promota; Sluſius's Meſolabium, Problemata Solida, &c.; Wallis, in his treatiſes De Cycloide, Ciſſoide, &c. De Proportionibus, De Sectionibus Conicis, Arithmetica Infinitorum, De Centro Gravitatis, De Sectionibus Angularibus, De Angulo Contactus, Cuno-Cuneus, &c. &c.; Hugo De Omerique, in his Analyſis Geometrica; Paſcal on the Cycloid; Step. Angeli's Problemata Geometrica; Alex. Anderſon's Suppl. Apollonii Redivivi, Variorum Problematum Practice, &c.; Baronius's Geomet. Prob. &c.; Guido Grandi Geometr. Demonſtr. &c.; Ghetaldi Apollonius Redivivus, &c.; Ludolph van Colen or a Ceulen, de Circulo et Adſcriptis, &c.; Snell's Apollonius Batavus, Cyclometricus, &c.; Herberſtein's Diotome Circulorum; Palma's Exercit. in Geometriam; Guldini Centro-Baryca; with ſeveral others equally eminent, of more modern date, as Dr. Rob. Simſon, Dr. Mat. Stewart, Mr. Tho. Simpſon, &c. Since the introduction of the New Geometry, or the Geometry of Curve Lines, as expreſſed by algebraical equations, in this part of geometry, the following names, among many others, are more eſpecially to be reſpected, viz. Des Cartes, Schooten, Newton, Maclaurin, Brackenridge, Cramer, Cotes, Waring, &c. But in Practical Geometry, the chief writers are, Beyer, Kepler, Ramus, Clavius, Mallet, Tacquet, Ozanam, Wolfius, Gregory, with innumerable others.

Geometry is diſtinguiſhed into Theoretical or Speculative, and Practical. *Theoretical* or *Speculative Geometry*, treats of the various properties and relations in magnitudes, demonſtrating the theorems, &c. And *Practical Geometry*, is that which applies thoſe ſpeculations and theorems to particular uſes in the ſolution of problems, and in the meaſurements in the ordinary concerns of life.—Speculative Geometry again may be divided into Elementary and Sublime: *Elementary* or *Common Geometry*, is that which is employed in the conſideration of right lines and plane ſurfaces, with the ſolids generated from them. And the *Higher* or *Sublime Geometry*, is that which is called "the method of *indiviſibles*, or *infiniteſimals*;" and is employed in the conſideration of curve lines, conic ſections, and the bodies formed of them. This part has been chiefly cultivated by the aſſiſtance of the improved ſtate of algebra, and the modern analyſis of fluxions.

Geometry is hence valued for its extenſive uſefulneſs; but it has been moſt admired for its evidence; mathematical demonſtration being ſuch as has been always ſuppoſed to put an end to diſpute, leaving no place for doubt or cavil. It acquired this high character by the great care of the old writers, who admitted no principles but a few ſelf-evident truths, and no demonſtrations but ſuch as were accurately deduced from them. The ſcience being now vaſtly enlarged, and applied with ſucceſs to philoſophy and the arts, it is of greater importance than ever that its evidence be preſerved perfect. But it has been objected on ſeveral occaſions, that the modern improvements have been eſtabliſhed for the moſt part upon new and exceptionable maxims, of too abſtruſe a nature to deſerve a place amongſt the plain principles of the ancient geometry: and ſome have proceeded ſo far as to impute falſe reaſoning to thoſe authors who have contributed moſt to the late diſcoveries, and have at the ſame time been moſt cautious in their manner of deſcribing them.

In the method of indiviſibles, lines were conceived to be made up of points, ſurfaces of lines, and ſolids of ſurfaces; and ſuch ſuppoſitions have been employed by ſeveral ingenious men for proving the old theorems, and diſcovering new ones, in a brief and eaſy manner. But as this doctrine was inconſiſtent with the ſtrict principles of geometry, ſo it ſoon appeared that there was ſome danger of its leading them into falſe concluſions: therefore others, in the place of indiviſible, ſubſtituted infinitely ſmall diviſible elements, of which they ſuppoſed all magnitudes to be formed; and thus endeavoured to retain, and improve, the advantages that were derived from the former method for the advancement of geometry. After theſe came to be reliſhed, an infinite ſcale of infinites and infiniteſimals (aſcending and deſcending always by infinite ſteps) was imagined and propoſed to be received into geometry, as of the greateſt uſe for penetrating into its abſtruſe parts. Some have argued for quantities more than infinite; and others for a kind of quantities that are ſaid to be neither finite nor infinite, but of an intermediate and indeterminate nature.

This way of conſidering what is called the ſublime part of geometry has ſo far prevailed, that it is generally known by no leſs a title than the *Science* or *Geometry of Infinites*. Theſe terms imply ſomething lofty, but myſterious; the contemplation of which may be ſuſpected to amaze and perplex, rather than ſatisfy or enlighten the underſtanding, in the proſecution of this ſcience; and, while it ſeems greatly to elevate geometry, may poſſibly leſſen its true and real excellency, which chiefly conſiſts in its perſpicuity and perfect evidence; for we may be apt to reſt in an obſcure and imperfect knowledge of ſo abſtruſe a doctrine, as better ſuited to its nature, inſtead of ſeeking for that clear and full view we ought to have of geometrical truth; and to this we may aſcribe the inclination which has appeared of late for introducing myſteries into a ſcience wherein there ought to be none.

There were ſome, however, who diſliked the making much uſe of *infinites* and *infiniteſimals* in geometry. Of this number was ſir Iſaac Newton (whoſe caution was almoſt as diſtinguiſhing a part of his character as his invention), eſpecially after he ſaw that this liberty was growing to ſo great a height. When the certainty of any part of geometry is brought into queſtion, the moſt effectual way to ſet the truth in a full light, and to prevent diſputes, is to deduce it from axioms or firſt principles of unexceptionable evidence, by demonſtrations of the ſtricteſt kind, after the manner of the ancient geometricians. This is our deſign in the following treatiſe. But, before we proceed, it may be of uſe to conſider the ſteps by which the ancients were able, in ſeveral inſtances, from the menſuration of right-lined figures, to judge of ſuch as were bounded by curve lines; for, as they did not allow themſelves to reſolve curvilineal figures into rectilineal elements, it is worth while to examine by what art they could make a tranſition from the one to the other: and as they were at great pains to finiſh their demonſtrations in the moſt perfect manner, ſo by following their example, as much as poſſible, in demonſtrating a method ſo much more general than their's, we may beſt guard againſt exceptions and cavils, and vary leſs from the original foundations of geometry.

They found, that ſimilar triangles are to each other in the duplicate ratio of their homologous ſides; and, by reſolving ſimilar polygons into ſimilar triangles, the ſame propoſition was extended to theſe polygons alſo. But when they came to compare curvilineal figures, that cannot be reſolved into rectilineal parts, this method failed. Circles are the only curvilineal plane figures conſidered in the elements of geometry. If they could have allowed themſelves to have conſidered theſe as ſimilar polygons of an infinite number of ſides, (as ſome have done who pretend to abridge their demonſtrations,) after proving that any ſimilar polygons inſcribed

ſcribed in circles are in the duplicate ratio of the diameters, they would have immediately extended this to the circles themſelves; and would have conſidered the ſecond propoſition of the twelfth book of the Elements as an eaſy corollary from the firſt. But there is ground to think that they would not have admitted a demonſtration of this kind. It was a fundamental principle with them, that the difference of any two unequal quantities, by which the greater exceeds the leſs, may be added to itſelf till it ſhall exceed any propoſed finite quantity of the ſame kind: and that they founded their propoſitions concerning curvilineal figures upon this principle in a particular manner, is evident from the demonſtrations, and from the expreſs declaration of Archimedes, who acknowledges it to be the foundation upon which he eſtabliſhed his own diſcoveries, and cites it as aſſumed by the ancients in demonſtrating all their propoſitions of this kind. But this principle ſeems to be inconſiſtent with the admitting of an infinitely little quantity or difference, which, added to itſelf any number of times, is never ſuppoſed to become equal to any finite quantity whatſoever.

They proceeded therefore in another manner, leſs direct indeed, but perfectly evident. They found, that the inſcribed ſimilar polygons, by increaſing the number of their ſides, continually approached to the areas of the circles; ſo that the decreaſing differences betwixt each circle and its inſcribed polygon, by ſtill further and further diviſions of the circular arches which the ſides of the polygons ſubtend, could become leſs than any quantity that can be aſſigned: and that all this while the ſimilar polygons obſerved the ſame conſtant invariable proportion to each other, viz. that of the ſquares of the diameters of the circles. Upon this they founded a demonſtration, that the proportion of the circles themſelves could be no other than that ſame invariable ratio of the ſimilar inſcribed polygons; of which we ſhall give a brief abſtract, that it may appear in what manner they were able, in this inſtance, and ſome others of the ſame nature, to form a demonſtration of the proportions of curvilineal figures, from what they had already diſcovered of rectilineal ones. And that the general reaſoning by which they demonſtrated all their theorems of this kind may more eaſily appear, we ſhall repreſent the circles and polygons by right lines, in the ſame manner as all magnitudes are expreſſed in the fifth book of the Elements.

Suppoſe the right lines AB and AD to repreſent the two areas of the circles that are compared together; and let AP, AQ, repreſent any two ſimilar polygons inſcribed in theſe circles. By further continual ſubdiviſions of the circular arches which the ſides of the polygons ſubtend, the areas of the polygons increaſe, and may approach to the circles AB and AD ſo as to differ from them by leſs than any aſſignable meaſure; the triangle which is ſubducted from each ſegment at every new ſubdiviſion being always greater than the half of the ſegment. The polygons inſcribed in the two circles, as they increaſe, are ever in the ſame conſtant proportion to each other; and this invariable ratio of theſe polygons muſt alſo be the ratio of the circles themſelves. For, if it is not, let the ratio of the polygons AP and AQ to each other be, in the firſt place, the ſame as the ratio of the circle AB to any magnitude AE leſs than the circle AD; ſuppoſe the ſubdiviſions of the arches of the circle AD to be continued till the difference betwixt the circle and inſcribed polygon become leſs than ED, ſo that the polygon may be repreſented by Aq, greater than AE; and let Ap repreſent a polygon inſcribed in the circle AB, ſimilar to the polygon Aq. Then, ſince AP is to AQ as AB is to AE by the ſuppoſition, and the polygon Ap is to the ſimilar polygon Aq as AP is to AQ; it follows, that AB is to AE as Ap is to Aq; and that the circle AB being greater than Ap, a polygon inſcribed in it, AE, muſt be greater than Aq. But Aq is ſuppoſed to be greater than AE; and theſe being repugnant, it follows, that the polygon AP is not to the polygon AQ as the circle AB is to any magnitude (as AE) leſs than the circle AD. For the ſame reaſon, AQ is not to AP as AD is to any magnitude (as AF) leſs than AB. From which it follows, that we cannot ſuppoſe AP to be to AQ as AB is to any magnitude Ae greater than AD; becauſe if we take AF to AB as AD is to Ae, AF will be leſs than AB, and AP will be to AQ as AF leſs than AB to AD; againſt what has been demonſtrated. It follows, therefore, that AP is not to AQ as AB is to any magnitude greater or leſs than AD; but that the ratio of the circles AB and AD to each other, muſt be the ſame as the invariable ratio of the ſimilar polygons AP and AQ inſcribed in them, which is the duplicate of the ratio of their diameters.

In the ſame manner the ancients have demonſtrated, that pyramids of the ſame height are to each other as their baſes; that ſpheres are as the cubes of their diameters, and that a cone is the third part of a cylinder on the ſame baſe and of the ſame height. In general, it appears from this demonſtration, that when two variable quantities, AP and AQ, which always are in an invariable ratio to each other, approach at the ſame time to two determined quantities, AB and AD, ſo that they may differ leſs from them than by any aſſignable meaſure, the ratio of theſe limits AB and AD muſt be the ſame as the invariable ratio of the quantities AP and AQ: and this may be conſidered as the moſt ſimple and fundamental propoſition in this doctrine, by which we are enabled to compare curvilineal ſpaces in ſome of the more ſimple caſes.—This general principle may ſerve for demonſtrating many other propoſitions, beſides the elementary theorems already mentioned.

By many other obſervations and demonſtrations, Archimedes has highly diſtinguiſhed himſelf amongſt the geometricians, and has done the greateſt honour to this part of learning. He has not, however, eſcaped the cenſures of ſome writers, who being unable to reconcile their own conceits with his demonſtrations, have repreſented him as in an error, and miſleading mathematicians by his authority. But though mathematicians may be grateful, authority has not any place in this ſcience; and no geometrician ever pretended, from the higheſt veneration for Archimedes, ſir Iſaac Newton, or others, to reſt on their judgment in a matter of geometrical demonſtration. The purſuit of general and eaſy methods may have induced ſome to make uſe of exceptionable principles; and the vaſt extent which the ſcience has of late acquired, may have occaſioned their propoſing incomplete demonſtrations. They may have alſo ſometimes fallen into miſtakes: but it will be found difficult to aſſign one falſe propoſition that has been ever generally received by geometricians; and it is hardly poſſible, that accuſations of this nature can be more miſplaced.

In what Archimedes had demonſtrated of the limits of figures and progreſſions, there were valuable hints towards a general method of conſidering curvilineal figures; ſo as to ſubject them to menſuration by an exact quadrature, an approximation, or by comparing them with others of a more ſimple kind. Such methods have been propoſed of late in various forms, and upon different principles. The firſt eſſays were deduced from a careful attention to his ſteps. But that his method might be more eaſily extended, its old foundation was abandoned, and ſuppoſitions were propoſed which he had avoided. It was thought unneceſſary to conceive the figures circumſcribed or inſcribed in the curvilineal area, or ſolid, as being always aſſignable and finite; and the

precautions

precautions of Archimedes came to be conſidered as a check upon geometricians, that ſerved only to retard their progreſs. Therefore, inſtead of his aſſignable finite figures, indiviſible or infinitely ſmall elements were ſubſtituted; and theſe being imagined indefinite, or infinite, in number, their ſum was ſuppoſed to coincide with the curvilineal area, or ſolid.

It was, however, with caution that theſe ſuppoſitions were at firſt employed in geometry by Cavalerius, the ingenious author of the method of indiviſibles, and by others. He diſcovered a method, which he found to be of a very extenſive uſe, and of an eaſy application, for meaſuring or comparing planes and ſolids; and would not deprive the public of ſo valuable an invention. In propoſing it, he ſtrove to avoid the ſuppoſing magnitude to conſiſt of indiviſible parts, and to abſtract from the contemplation of infinity; but he acknowledged, that there remained ſome difficulties in this matter which he was not able to reſolve. Therefore he ſubjoined more unexceptionable demonſtrations to thoſe he had deduced from his own principles; and the diſputes which enſued (the firſt of any moment that were known between geometricians) juſtified his precautions. Afterwards, infinitely ſmall elements were ſubſtituted in place of his indiviſibles; and various improvements were made in this doctrine. The method of Archimedes, however, was often kept in view, and frequently appealed to as the ſureſt teſt of every new invention. The harmony betwixt the concluſions that aroſe from the old and new methods contributed not a little to the credit which the latter at firſt acquired; till being more and more reliſhed, they came at length to be generally admitted on their own evidence, and ſeemed to merit ſo favourable a reception, by the great advantages that were derived from them for reſolving the moſt difficult problems, and demonſtrating the moſt general theories, in a brief and eaſy manner.

But when the principles and ſtrict method of the ancients, which had hitherto preſerved the evidence of this ſcience entire, were ſo far abandoned, it was difficult for the geometricians to determine where they ſhould ſtop. After they had indulged themſelves in admitting quantities, of various kinds, that were not aſſignable, in ſuppoſing ſuch things to be done as could not be poſſibly effected (againſt the conſtant practice of the ancients), and had involved themſelves in the mazes of infinity; it was not eaſy for them to avoid perplexity, and ſometimes error, or to fix the bounds to theſe liberties when they were once introduced. Curves were not only conſidered as polygons of an infinite number of infinitely little ſides, and their differences deduced from the different angles that were ſuppoſed to be formed by theſe ſides; but infinites and infiniteſimals were admitted of infinite orders, every operation in geometry and arithmetic applied to them with the ſame freedom as to finite real quantities, and ſuppoſitions of this nature multiplied, till the higher parts of geometry (as they were moſt commonly deſcribed) appeared full of myſteries.

From geometry the infinites and infiniteſimals paſſed into philoſophy, carrying with them the obſcurity and perplexity that cannot fail to accompany them. An actual diviſion, as well as a diviſibility, of matter *in infinitum*, is admitted by ſome. Fluids are imagined conſiſting of infinitely ſmall particles, which are compoſed themſelves of others infinitely leſs; and this ſubdiviſion is ſuppoſed to be continued without end. Vortices are propoſed, for ſolving the phenomena of nature, of indefinite or infinite degrees, in imitation of the infiniteſimals in geometry; that, when any higher order is found inſufficient for this purpoſe, or attended with an inſuperable difficulty, a lower order may preſerve ſo favourite a ſcheme. Nature is confined in her operations to act by infinitely ſmall ſteps. Bodies of a perfect hardneſs are rejected, and the old doctrine of atoms treated as imaginary, becauſe in their actions and colliſions they might paſs at once from motion to reſt, or from reſt to motion, in violation of this law. Thus the doctrine of infinites is interwoven with our ſpeculations in geometry and nature. Suppoſitions, that were propoſed at firſt diffidently, as of uſe for diſcovering new theorems in this ſcience with the greater facility, and were ſuffered only on that account, have been indulged, till it has become crowded with objects of an abſtruſe nature, which tend to perplex it and the other ſciences that have a dependence upon it.

They who have made uſe of infinites and infiniteſimals with the greateſt liberty, have not agreed as to the truth and reality they would aſcribe to them. The celebrated Mr. Leibnitz owns them to be no more than fictions. Others place them on a level with finite quantities, and endeavour to demonſtrate their reality from magnitudes being ſuſceptible of augmentation and diminution without end, from the properties of the progreſſions of numbers that may be continued at pleaſure, and from the infinity which ſome geometricians have aſcribed to the hyperbolic area. But in theſe arguments they ſeem to *ſuppoſe* the infinity which they would *demonſtrate*.

It was a principle of the ancient geometricians, that any given line may be produced, and its parts ſubdivided, at pleaſure: but they never ſuppoſed it to be produced till it ſhould become infinitely great; or to be ſubdivided, till its parts ſhould become infinitely ſmall. It does not neceſſarily follow, that, becauſe any given right line may be continued further, it can be produced till it become actually infinite, or that we are able to conceive ſuch a line to be deſcribed, ſo as to admit it in geometry. In general, magnitude is capable of being increaſed without end; that is, no term or limit can be aſſigned or ſuppoſed beyond which it may not be conceived to be further increaſed. But from this it cannot be inferred, that we are able to conceive or ſuppoſe magnitude to be really infinite: or, if we are able to join infinity to any ſuppoſed idea of a determinate quantity, and to reaſon concerning magnitude actually infinite, it is not ſurely with that perſpicuity that is required in geometry. In the ſame manner, no magnitude can be conceived ſo ſmall, but a leſs than it may be ſuppoſed; but we are not therefore able to conceive a quantity infinitely ſmall. A given magnitude may be ſuppoſed to be divided into any aſſignable number of parts; but it cannot therefore be conceived to be divided into a number of parts greater than what is aſſignable. The parts of a given line may be ſuppoſed to be continually biſected till they become leſs than any line that is propoſed; and this is ſufficient for completing the demonſtrations of the ancients. But it is acknowledged by thoſe who have treated the doctrine of infinites in the fulleſt manner, that "there is ſomething inconceivable in ſuppoſing an infinitely great or infinitely ſmall number or figure to be produced or generated; and that the paſſage from finite to infinite is obſcure and incomprehenſible:" and therefore it is better for us, in treating of ſo ſtrict a ſcience as geometry, to abſtract from theſe ſuppoſitions. The abſtruſe conſequences that have been deduced from them by ingenious men, may the rather induce us to beware of admitting them as neceſſary principles in this ſcience, and to adhere to its ancient principles.

Mr. Locke, who wrote his excellent Eſſay, "that we might diſcover how far the powers of the underſtanding reach, to what things they are in any degree proportionate, and where they fail us," obſerves, "that whilſt men talk and diſpute of infinite magnitudes, as if they had as complete and poſitive ideas of them as they have of the names they uſe for them, or as they have of a yard, or an hour, or any other determinate quantity, it is no wonder if the incomprehenſible nature of the thing they diſcourſe of, or reaſon about, leads them into perplexities and contradictions; and their minds be overlaid by an object too large and mighty to be ſurveyed

and managed by them." Mathematicians indeed abridge their computations by the ſuppoſition of infinites; but when they pretend to treat them on a level with finite quantities, they are ſometimes led into ſuch doctrines as verify the obſervation of this judicious author. To mention an inſtance or two: the progreſſion of the numbers 1, 2, 3, 4, 5, &c. in their natural order, is ſuppoſed to be continued to infinity, till by the continual addition of units an infinite number is produced, which is conceived to be the termination of this ſeries. This infinite number is ſuppoſed to be ſtill capable of augmentation and diminution; and yet it is ſaid, "that it is neither increaſed nor diminiſhed by the addition or ſubtraction of the ſame units from which it was ſuppoſed to be generated." In a progreſſion of this kind, the number of terms is always equal to the laſt or greateſt term, and is finite when the laſt term is finite. If the number of terms be ſuppoſed infinite, the laſt term cannot be finite; and yet it is ſaid, "that in ſuch a progreſſion continued to infinity there is an infinite number of finite terms." It is evident, that no finite number can become infinite by the addition of unit, or of any other finite number; and yet "a greateſt finite ſquare number is ſuppoſed in ſuch a progreſſion, the next to which (though it exceed that finite number by an unit only) is ſuppoſed infinite." From theſe ſuppoſitions it is inferred, "that in ſuch a progreſſion continued to infinity there are finite numbers whoſe ſquares become infinite;" though it ſeems very evident, that a finite number taken any finite number of times can never produce more than a finite number. We may perceive from theſe inſtances, that it is not by founding the higher geometry on the doctrine of infinites we can propoſe to avoid the apparent inconſiſtencies that have been objected to it; and ſince an excellent author, who has always diſtinguiſhed himſelf as a clear and acute writer, has had no better ſucceſs in eſtabliſhing it on theſe principles, it is better for us to avoid them. Theſe ſuppoſitions however may be of uſe, when employed with caution, for abridging computations in the inveſtigation of theorems, or even for proving them where a ſcrupulous exactneſs is not required; and we would not be underſtood to affirm, that the methods of indiviſibles and infiniteſimals, by which ſo many unconteſted truths have been diſcovered, are without a foundation. We acknowledge further, that there is ſomething marvellous in the doctrine of infinites, that is apt to pleaſe and tranſport us; and that the method of infiniteſimals has been proſecuted of late with an acuteneſs and ſubtlety not to be paralleled in any other ſcience. But geometry is beſt eſtabliſhed on clear and plain principles; and theſe ſpeculations are ever obnoxious to ſome difficulties. If the greateſt accuracy has been always required in this ſcience, in reaſoning concerning finite quantities, we apprehend that geometricians cannot be too ſcrupulous in admitting or treating of infinites, of which our ideas are ſo imperfect. Philoſophy probably will always have its myſteries. But theſe are to be avoided in geometry: and we ought to guard againſt abating from its ſtrictneſs and evidence, the rather, that an abſurd philoſophy is the natural product of a *vitiated* geometry.

It is juſt at the ſame time to acknowledge, that they who firſt carried geometry beyond its ancient limits, and they who have ſince enlarged it, have done great ſervice, by deſcribing plainly the methods which they found ſo advantageous for this purpoſe (though they might appear exceptionable in ſome reſpects), that others might proceed with the ſame facility to improve it. Some of them have been ſo cautious as to verify their diſcoveries by demonſtrations in the ſtricteſt form; and others were able to have done this, had they not choſe rather to employ their time in extending the ſcience. At firſt, the variation from the ancient method was not ſo conſiderable, but that it was eaſy to have recourſe to it, when it ſhould be thought neceſſary for the ſatisfaction of ſuch as required a ſcrupulous exactneſs. The geometricians in the mean time made great improvements. They had the accurate method and examples of Archimedes before them, by which they might try their diſcoveries. Theſe ſerved to keep them from error, and the new methods facilitated their progreſs. Thus their views enlarged; and problems, that appeared at firſt ſight of an inſuperable difficulty, were afterwards reſolved, and came at length to be deſpiſed as too ſimple and eaſy. The menſuration of parabolas, hyperbolas, ſpirals of all the higher orders, and of the famous cycloid, were amongſt the earlieſt productions of this period; ſome of which ſeem to have been diſcovered by ſeveral geometricians almoſt at the ſame time. It is not neceſſary for our purpoſe to deſcribe more particularly what diſcoveries were made by Torricelli, Meſſrs. de Fermat, and de Roberval, Gregory à Sto. Vincentio, &c. by whom the theorems of Archimedes were continued, and applied to the menſuration of various figures.

The *Arithmetica Infinitorum* of Dr. Wallis was the fulleſt treatiſe of this kind that appeared before the invention of the method of fluxions. Archimedes had conſidered the ſums of the terms in an arithmetical progreſſion, and of their ſquares only, (or rather the limits of theſe ſums deſcribed above,) theſe being ſufficient for the menſuration of the figures he had examined. Dr. Wallis treats this ſubject in a very general manner, and aſſigns like limits for the ſums of any powers of the terms, whether the exponents be integers or fractions, poſitive or negative. Having diſcovered one general theorem that includes all of this kind, he then compounded new progreſſions from various aggregates of theſe terms, and enquired into the ſums of the powers of theſe terms, by which he was enabled to meaſure accurately, or by approximation, the areas of figures without number. But he compoſed this treatiſe (as he tells us) before he had examined the writings of Archimedes, and he propoſes his theorems and demonſtrations in a leſs accurate form. He ſuppoſes the progreſſions to be continued to infinity, and inveſtigates, by a kind of induction, the proportion of the ſum of the powers to the product that would ariſe by taking the greateſt power as often as there are terms. His demonſtrations, and ſome of his expreſſions, (as when he ſpeaks of quantities more than infinite,) have been excepted againſt. But it was not very difficult to demonſtrate the greateſt part of his propoſitions in a ſtricter method; and this was effected afterwards by himſelf and others in various inſtances. He choſe to deſcribe plainly a method which he had found very commodious for diſcovering new theorems; and it muſt be owned, that this valuable treatiſe contributed to produce the great improvements which ſoon followed after. A like apology may be made for others who have promoted his doctrine ſince his time, but have not given us rigid demonſtrations. In general, it muſt be owned, that if the late diſcoveries were deduced at length, in the very ſame method in which the ancients demonſtrated their theorems, the life of man could hardly be ſufficient for conſidering them all: ſo that a general and conciſe method, equivalent to their's in accuracy and evidence, that comprehends innumerable theorems in a few general views, may well be eſteemed a valuable invention.

Cavalerius was ſenſible of the difficulties, as well as the advantages, that attended his method. He ſpeaks as if he foreſaw that it ſhould be afterwards delivered in an unexceptionable form, that might ſatisfy the moſt ſcrupulous geometrician; and leaves this *Gordian knot*, as he expreſſes himſelf, to ſome Alexander. Its form, indeed, was ſoon altered, and many improvements were made by the mathematicians who proſecuted it ſince his time, that deſerve to be mentioned with eſteem. But the method ſtill remained liable to ſome exceptions, and was thought to be leſs perfect than that of the ancients on ſeveral grounds.

Sir Iſaac Newton accompliſhed what Cavalerius wiſhed for,

for, by inventing the method of fluxions, and propoſing it in a way that admits of ſtrict demonſtration, which requires the ſuppoſition of no quantities but ſuch as are finite, and eaſily conceived. The computations in this method are the ſame as in the method of infiniteſimals; but it is founded on accurate principles, agreeable to the ancient geometry. In it, the premiſſes and concluſions are equally accurate; no quantities are rejected as infinitely ſmall, and no part of a curve is ſuppoſed to coincide with a right line. The excellency of this method has not been ſo fully deſcribed, or ſo generally attended to, as it ſeems to deſerve; and it has been ſometimes repreſented as on a level in all theſe reſpects with the method of infiniteſimals. Our deſign has been to ſhow its advantages in a clearer and fuller light, and to promote the object of the great inventor, by eſtabliſhing the higher geometry on plain principles, perfectly conſiſtent with each other, and with thoſe of the ancient geometricians.

In a late treatiſe aſcribed to a celebrated French author, juſtly eſteemed for his various writings, ſeveral arguments are propoſed, for admitting magnitude actually infinite: not that kind which has no limits, comprehends all, and can receive no addition, which he calls *metaphyſical*; but that which he defines to be greater than any finite magnitude, which he diſtinguiſhes from the former, and calls *geometrical*. *Puiſque la grandeur eſt ſuſceptible d'augmentation ſans fin, on la peut concevoir ou ſuppoſer augmentée une infinité de fois, c'eſt-à-dire, qu'elle ſera devenuë infinie. Et, en effet, il eſt impoſſible que la grandeur ſuſceptible d'augmentation ſans fin ſoit dans le même cas que ſi elle n'en etoit pas ſuſceptible ſans fin. Or, ſi elle ne l'etoit pas, elle demeureroit toujours finie; donc etant ſuſceptible d'augmentation ſans fin, elle peut ne demeurer pas toujours finie, ou, ce qui eſt le même, devenir infinie.* Elem. de la Geom. de l'Infini, 83.—Becauſe magnitude is ſuſceptible of augmentation without end, the author concludes, that we may ſuppoſe it augmented an infinite number of times. But, by being ſuſceptible of augmentation without end, we underſtand only, that no magnitude can be aſſigned or conceived ſo great but it may be ſuppoſed to receive further augmentation, and that a greater than it may ſtill be aſſigned or conceived. We eaſily conceive that a finite magnitude may become greater and greater without end, or that no termination or limit can be aſſigned of the increaſe which it may admit: but we do not therefore clearly conceive magnitude increaſed an infinite number of times. Mr. Locke acknowledges, that we eaſily form an idea of the infinity of number, to the end of whoſe addition there is no approach: but he diſtinguiſhes betwixt this and the idea of an infinite number; and ſubjoins, that, how clear ſoever our idea of the infinity of number may be, there is nothing more evident than the abſurdity of the actual idea of an infinite number.

The latter part of the argument amounts to this: "It is impoſſible that magnitude, being ſuſceptible of augmentation without end, can be in the ſame caſe as if it was not ſuſceptible of augmentation without end. But if it was not ſuſceptible of augmentation without end, it would remain always finite. Therefore, ſince it is ſuſceptible of augmentation without end, the contrary muſt be allowed: that is, it may not always remain finite, or it may become infinite." The force of which argument ſeems to be taken off, by conſidering, that, if magnitude was not ſuſceptible of augmentation without end, it would not only remain always finite, but there would neceſſarily be a term, limit, or degree, of magnitude, which could never be exceeded, or there might be a greateſt magnitude. And, by allowing that there is no ſuch term or limit, magnitude is not ſuppoſed to be in the ſame caſe as if it were not ſuſceptible of augmentation without end, though we ſhould refuſe that it may become infinite. What is oppoſite to the ſuppoſing magnitude ſuſceptible of augmentation without end, is not the ſuppoſing it always finite, (for finite magnitude is capable of being increaſed without end,) but the ſuppoſing it ſuſceptible of no augmentation at all, or of an augmentation that has a limit or end.

The ſeries of numbers, 1, 2, 3, 4, &c. in their natural order, may be continued without end; and it is ſaid, that "we never come nearer the end of the progreſſion, how great ſoever the number may be to which we arrive; which is a character that cannot belong to a ſeries of a finite number of terms. Therefore this natural ſeries has an infinite number of terms." And it is added, that "though we can go over a finite number of terms only, yet all the terms of this infinite progreſſion are equally real." But if we can conceive this ſeries to have any end, it ſeems to be evident, that we muſt approach to this end as we proceed from the beginning towards it; and that, while we advance, the diſtance of any term from the end muſt decreaſe (whether this diſtance be called finite or infinite) by the ſame quantity as the diſtance from any ſubſequent term decreaſes, or the diſtance from the beginning of the ſeries increaſes. If we cannot conceive the ſeries to have an end, then we can have no idea of its laſt term. If we ſuppoſe this ſeries to be continued to infinity, it would indeed be abſurd, after ſuch a ſuppoſition, to ſay that the number of its terms is finite. But, in treating this ſcience ſtrictly, it may, perhaps, be better to avoid this ſuppoſition. For if it is only a finite number of terms we can clearly conceive, how ſhall we judge of the reality of the reſt? or wherein ſhall we place the reality of thoſe which it is impoſſible for us to aſſign? of which two kinds are ſaid to be in this ſame ſeries, each infinite in number; the firſt of which are ſaid to be finite, but indeterminable; the latter, actually infinite.

The argument from the infinity of the hyperbolic area is much inſiſted on. "The hyperbolic area (*Elem. de la Geom. de l'Infin. pref.*) is as really infinite, as a determined parabolic area is two-thirds of the circumſcribed parallelogram. It is trifling to ſay, that the one can be actually deſcribed, and the other cannot. Geometry is entirely intellectual, and independent of the actual deſcription and exiſtence of the figures whoſe properties it diſcovers. All that is conceived neceſſary in it has the reality which it ſuppoſes in its object. Therefore the infinite which it demonſtrates is as real as that which is finite," &c. And the learned author, after inſiſting on this ſubject, concludes, that, "not to receive infinity as it is here repreſented, with all its neceſſary conſequences, is to reject a geometrical demonſtration; and that he who rejects one, ought to reject them all." But though the actual deſcription of the figures which are conſidered in geometry be not neceſſary, yet it is requiſite that we ſhould be able clearly to conceive that they may exiſt; and a diſtinct idea of the manner how they may be ſuppoſed to be deſcribed or generated is neceſſary, that they may have a place in this ſcience. Principles that are propoſed as of the moſt extenſive uſe, and as the foundation of all the ſublime geometry, ought to be clear and unexceptionable. If this ſcience is entirely intellectual, or if the reality of its objects is to be conſidered as having a dependence on their being conceived by the mind, it would ſeem, that there muſt be a difference betwixt the reality of finite aſſignable lines or numbers, and the reality we can aſcribe to infinite lines or numbers, which are not aſſignable, and cannot be ſuppoſed to be produced or generated but in a manner that is allowed to be inconceivable. As for what is ſaid of the parabolic and hyperbolic areas, we can conceive any portion of the parabola to be accurately deſcribed, and its area to be determined, though no exact figure of this kind ſhould ever exiſt. We can alſo conceive, that the hyperbola and its aſymptote may be produced to any aſſignable diſtance: but we do not ſo clearly conceive that they may be produced to a diſtance greater than what is aſ-

ſignable;

ſignable; and we may well be allowed to heſitate at ſuch a ſuppoſition in ſtrict geometry. Any finite ſpace being propoſed, the hyperbolic area (terminated by the curve, the aſymptote, and a given ordinate) will exceed it by producing the curve and aſymptote to an aſſignable diſtance; and there is no aſſignable limit in this, as in ſome other caſes, which the area may not ſurpaſs in magnitude. See the article FLUXIONS. Therefore it is ſaid, that this area would be infinite, if the curve and aſymptote could be infinitely produced. But no argument for admitting magnitude actually infinite can be deduced from this, which does not more eaſily appear from hence, that a parallelogram of a given height would be infinite if it could have an infinite baſe; from which it cannot be inferred that ſuch a baſe or parallelogram can actually exiſt. It is often ſaid, that a rectangle of a given height on an imaginary baſe, as the analyſts ſpeak, is imaginary: but we cannot thence infer, that an imaginary line or rectangle can exiſt. It is not, however, our intention to maintain the impoſſibility of infinite magnitude; but to ſhew, that ſuch doctrines are not neceſſary conſequences of the received principles of this ſcience, and not very proper to be admitted as the groundwork of the high geometry.

In the ſame treatiſe (ſect. 196,) a proof is offered, to ſhew that, in the infinite ſeries of numbers proceeding in their natural order, there are finite numbers whoſe ſquares become infinite, which are called indeterminable, and are ſuppoſed to occupy the obſcure paſſage from the numbers that are aſſignable to thoſe that are infinite. A greateſt finite ſquare is ſuppoſed in this progreſſion, and repreſented by nn; all that precede it are finite, and all that follow after it are ſuppoſed infinite. The numbers in this progreſſion between n and nn, being leſs than nn, are finite; but being greater than n, their ſquares are greater than nn, and therefore, by the ſuppoſition, are infinite. But how can we admit the ſuppoſition of a greateſt finite ſquare number, ſuch as is here expreſſed by nn? The number nn, being finite, is not the next to it in the progreſſion (which exceeds it by unit only) alſo finite? Should we allow that a finite number becomes infinite by adding unit to it, or even by ſquaring it, how ſhall we diſtinguiſh finite from infinite? We commonly conceive finite magnitude to be aſſignable, or to be limited by ſuch as are aſſignable, and to be ſuſceptible of further augmentation: and therefore infinite magnitude would ſeem to imply, either that which exceeds all aſſignable magnitude, or that which cannot admit of any further augmentation; theſe being directly oppoſite to what we moſt clearly conceive of finite magnitude. But neither of theſe conſtitute the idea of infinite magnitude, as it muſt be underſtood in that treatiſe. The former is applicable to thoſe numbers which the author calls finite and indeterminable; which, being ſuppoſed to produce infinite ſquares, muſt therefore exceed all aſſignable numbers whoſe ſquares are aſſignable and finite. The latter is aſcribed to that infinite only which he calls *metaphyſical*, and excludes from geometry. We are at a loſs to form a diſtinct idea even of finite itſelf as it is here underſtood; and it would ſeem, that the more art and ingenuity is employed in penetrating into the doctrine of infinites, it becomes the more abſtruſe.

A proof is offered *à poſteriori*, (ſect. 393,) to ſhew, that there are finite fractions in the ſeries, 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, &c. whoſe ſquares become infinitely little in the ſeries 1, $\frac{1}{4}$, $\frac{1}{9}$, $\frac{1}{16}$, $\frac{1}{25}$, &c. The ſum of the firſt ſeries correſponds with the area included betwixt the common hyperbola and its aſymptote; and is ſaid to be infinite when the ſeries is ſuppoſed to be continued to infinity. The ſum of the latter ſeries correſponds with the area of an hyperbola of a higher order, and is ſaid to be finite, even when the ſeries is ſuppoſed to be continued to infinity; becauſe there is a limit which this ſum can never equal, to which however it continually approaches, as we have already deſcribed. This being allowed, it is ſuppoſed farther, that there is an infinite number of finite terms in the firſt progreſſion; and it is thence demonſtrated, that there are finite fractions in the firſt ſeries whoſe ſquares become infinitely little in the ſecond, thus: "If it ſhould be pretended, that all the finite terms in the firſt ſeries have their ſquares finite in the ſecond, there would be an infinite number of finite terms in the ſecond as well as in the firſt; and the ſums of both would be infinite; ſo that the contrary of an undoubted truth, that is univerſally received, would be demonſtrated." If we could allow that there is an infinite number of finite terms in the firſt ſeries, this argument might have ſome weight. But this is a ſuppoſition we cannot admit. For the denominator of any fraction in the firſt ſeries is always equal to the number of terms from the beginning, and muſt be ſuppoſed infinite when the number of terms is ſuppoſed infinite; but a fraction that has unit for its numerator, and is ſuppoſed to have an infinite number for its denominator, cannot be ſuppoſed finite, but infinitely little: ſo that we cannot ſuppoſe an infinite number of terms in the firſt ſeries to be finite. It is often ſaid in this treatiſe, that there is an infinite number of finite terms in the natural ſeries 1, 2, 3, 4, 5, &c. continued to infinity. But we are at a loſs to conceive how this can be admitted; ſince, in any ſuch progreſſion, the laſt or greateſt term is always equal to the number of terms from the beginning, and cannot be ſuppoſed finite when the number of terms is ſuppoſed infinite. There is an aſſignable limit which the ſum of the terms of the ſecond ſeries never amounts to; but there is no aſſignable limit which the ſum of the firſt ſeries may not ſurpaſs; and the ſum of the terms of the firſt is greater than the ſum of the correſponding terms of the ſecond, in a ratio that, by continuing the terms, may exceed any aſſignable ratio of a greater magnitude to a leſs: and as this is eaſily underſtood and demonſtrated, ſo there is no neceſſity for having recourſe to ſuch abſtruſe principles in order to account for it.

It is of no uſe to cite authorities on this ſubject, but as they may juſtify us in eſtabliſhing ſo noble a part of geometry for avoiding principles that are ſo much conteſted. What Ariſtotle taught of infinite magnitude is well known. Mr. Leibnitz, who for obvious reaſons cannot be ſuſpected of any prejudice againſt the doctrine of infinites, expreſſes himſelf thus: *On s'embaraſſe dans les ſeries des nombres qui vont à l'infini. On conçoit un dernier terme, un nombre infini, ou infiniment petit; mais tout cela ne ſont que des fictions. Tout nombre eſt fini & aſſignable, toute ligne l'eſt de même.* Eſſai de Theodicée, diſc. prelim. ſect. 70.

We have ſubjoined theſe remarks, in order to ſhow why we have not followed an author who has merited ſo well of mathematicians, and who on every other occaſion has been juſtly applauded for his clear and diſtinct way of explaining the abſtruſe geometry. They who treated of infinites before him proceeded, as he obſerves, with a timorouſneſs which the contemplation of ſuch an object naturally inſpires: *Quand on y etoit arrivé* (ſays he), *on s'arreſtoit avec une eſpece d'effroy & de ſainte horreur—on regardoit l'infini comme un miſtere qu'il falloit reſpecter, & qu'il n'etoit pas permis d'approfondir.* They ſtopped when they came to infinity with a ſort of holy dread, and reſpected it as an incomprehenſible myſtery. He adventures farther, in order to diſcover the ſource, and penetrate into the firſt principles, of geometrical truth. Infinity, according to him, is the great trunk from which its various branches are derived, and to which they all lead. In this great purſuit he diſplays infinite and finite with a freedom that puts us in mind of the ancient poet and his gods, whom he repreſents with the paſſions of men, and mingles in their battles. We doubt not, that, if a full and perfect account of all that is moſt profound in

in the high geometry could have been deduced from the doctrine of infinites, it might have been expected from this author: but our ideas of infinites are too obſcure and inadequate to anſwer this end; and there are many things advanced by all thoſe who have applied them with great freedom in geometry, that give ground to a remark like to Mr. de St. Evremond's, when he obſerves, that "it is ſurpriſing to find the ancient poets ſo ſcrupulous to preſerve probability in actions purely human, and ſo ready to violate it in repreſenting the actions of the gods." Some have not only admitted infinites and infiniteſimals of infinite orders, but have diſtinguiſhed even nothings into various kinds: and if ſuch liberties continue, it is not eaſy to foreſee what abſurdities may be advanced as diſcoveries in what is called the "ſublime geometry."

Of the ELEMENTS of GEOMETRY.

Definitions and Principles.

1. Geometry is a ſcience which treats of the deſcriptions, properties, and relations, of magnitudes in general: that is, of things in which length, or length and breadth, or length, breadth, and thickneſs, are conſidered.

2. A *point* is that which has neither parts nor dimenſions. It has been objected to this definition, that it contains only a negative, and that it is not convertible, as every good definition ought certainly to be. That it is not convertible is evident, for though every point is unextended, or without magnitude, yet every thing unextended, or without magnitude, is not a point. To this it is impoſſible to reply; and therefore it becomes neceſſary to change the definition altogether, which is accordingly done by Playfair; a point being defined to be, "that which has poſition, but not magnitude." Here the affirmative part includes all that is eſſential to a point, and the negative part excludes every thing that is not eſſential to it.

3. A *line* is length without breadth: it is called a *right line*, when it lies in the ſame direction, as A——B: or a *curved line*, when it does not lie in the ſame direction, but as C⌒D.—(A line is uſually denoted by two letters; viz. one at each end, as A B or C D).—After this definition, Euclid has introduced the following, "the extremities of a line are points." Now this is certainly not a definition, but an *inference*, from the definitions of a point and of a line. That which terminates a line can have no breadth, as the line in which it is has none; and it can have no length, as it would not then be a termination, but a part of that which it is ſuppoſed to terminate. The termination of a line can therefore have no magnitude, and having neceſſarily poſition, it is a point. Euclid has defined a ſtraight line to be a line which "lies evenly between its extreme points." This definition is obviouſly faulty, the word *evenly* ſtanding as much in need of an explanation as the word *ſtraight*, which it is intended to define. In the original, however, it muſt be confeſſed, that this inaccuracy is at leaſt leſs ſtriking than in our tranſlation; for the word which we render *evenly* is εξισου, *equally*, and is accordingly tranſlated *ex æquo*, and *equaliter*, by Commandine and Gregory. The definition, therefore, is, that a ſtraight line is one which lies *equally* between its extreme points; and if by this we underſtand a line that lies between its extreme points, ſo as to be related exactly alike to the ſpace on the one ſide of it, and to the ſpace on the other, we have a definition that is perhaps too metaphyſical, but which certainly contains in it the eſſential character of a ſtraight line.

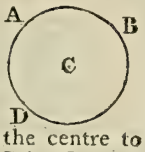
4. A *ſuperficies*, or *ſurface*, is that magnitude which has only length and breadth, and is bounded by lines.

5. A *ſolid*, is that magnitude which has length, breadth, and thickneſs.

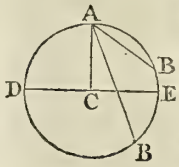
6. A *figure*, is a bounded ſpace, the limits or bounds of which may be either lines or ſurfaces.

7. A *plane*, or a *plane figure*, is a ſuperficies which lies evenly, or perfectly flat, between its limits, and may be bounded by one curve line; but not with leſs than three right lines.

8. A *circle* is a plain figure, bounded by an uniformly curved line, called the circumference, as A B D, which is every where equally diſtant from one point, as C within the figure called the *centre*.



9. A *radius* is a right line drawn from the centre to the circumference, as C A, C D, or C E.—All the radii of the ſame circle are equal.



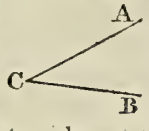
10. An *arc* is any part of the circumference.—As the arc A B, or the arc A D.

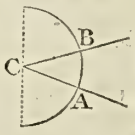
11. A *chord* is a right line joining the ends of an arc, as A B, and is ſaid to ſubtend that arc; it divides the circle into two parts, called *ſegments*.

12. A *diameter* is a chord paſſing through the centre, as D E, and divides the circle into two equal parts, called *ſemicircles*.

13. The *circumference* of every circle is ſuppoſed to be divided into three hundred and ſixty equal parts, called *degrees*; each degree into ſixty equal parts, called *minutes*; each minute into ſixty equal parts, called *ſeconds*, &c.

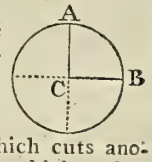
14. A *plane angle*, is the inclination of two lines on the ſame plane meeting in a point, as A C B.—A right-lined angle is formed by two right lines. The point where the lines meet is called the *angular point*, as C.—The lines which form the angle are called *legs*.—Thus C A and C B are the legs of the angle A C B.—(An angle is uſually marked by three letters, viz. one at the angular point, and one at the other end of each leg; but that at the angular point is always to be read the middle letter, as A C B, or B C A.)



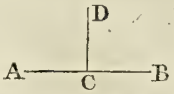


15. The meaſure of a right-lined angle is an arc, as B A, contained between the legs C B, C A, including the angle, the angular point C being the centre of that arc.

16. A *right angle* is that, the meaſure of which is a fourth part of the circumference of a circle, or ninety degrees. Thus the angle A C B is a right angle.



17. A *perpendicular* is that right line which cuts another at right angles; or which makes equal angles on both ſides. Thus D C is perpendicular to A B, when the angles D C A and D C B are equal, or are right angles.



18. An *acute angle*, is that which is leſs than a right angle.

19. An *obtuſe angle*, is that which is greater than a right angle.—Acute and obtuſe angles are called *oblique angles*.

20. *Parallel lines*, are right lines in the ſame plane, which do not incline to one another.

21. A *triangle* is a plane figure bounded by three lines.

22. An *equilateral triangle*, is that in which the three ſides are equal.

23. An *iſoſceles triangle*, is that which has two equal ſides.

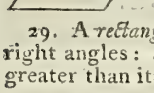
24. A *right-angled triangle*, is that which has one right angle.

25. An *obtuſe-angled triangle*, has one obtuſe angle.

26. An

26. An *acute-angled triangle*, has all its angles acute.

27. A *quadrangle*, or *quadrilateral*, is a plane figure bounded by four right lines, or ſides.—A quadrangle is uſually expreſſed by letters at the oppoſite angles.

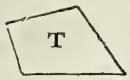


28. A *parallelogram*, is a quadrangle, the oppoſite ſides of which are parallel and equal, as P.

29. A *rectangle*, is a parallelogram with right angles: and in which the length is greater than its breadth, as R.

30. A *ſquare*, is a parallelogram having four equal ſides and right angles, as S.

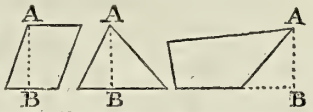
31. A *trapezium*, is a quadrangle, the oppoſite ſides of which are not parallel, as T.



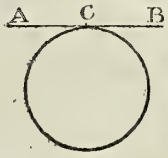
32. The *diagonal* of a quadrangle, is a line, as A B, drawn from one angle, to its oppoſite angle.

33. The *baſe* of a figure, is the line it is ſuppoſed to ſtand on.

34. The *altitude* or *height* of a figure, is the perpendicular diſtance A B, between the baſe and the vertex, or part moſt remote from the baſe.

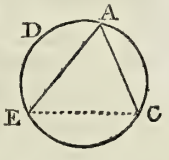


35. *Congruous figures*, are thoſe which agree, or correſpond, with one another, in every reſpect.



36. A *tangent* to a circle, is a right line, as A B, touching its circumference, but not cutting; and the point C, where it touches, is called the *point of contact*.

37. An *angle*, E A C, *in a ſegment*, C A D E, is, when the angular point is in the circumference of the ſegment, and the legs including the angle paſs through the ends E and C, of the chord of the ſegment.—Such an angle is ſaid to be in a circumference; and to ſtand on the arc E C, included between the legs A E and A C, of the angle.



38. Right-lined figures, having more than four ſides, are called *polygons*; and have their names from the number of their angles, or ſides; as thoſe of five ſides are called *pentagons*; of ſix ſides, *hexagons*; of ſeven ſides, *heptagons*; of eight ſides, *octagons*, &c.

39. A *regular* polygon is a figure with equal ſides and equal angles.

40. A *figure* is ſaid to be *inſcribed* in a circle, when all the angles of that figure are in the circumference of the circle.

41. A *figure* is ſaid to *circumſcribe* a circle, when every ſide of the figure is touched by the circumference of the circle.

42. A *propoſition*, is ſomething propoſed to be conſidered; and requires either a ſolution or anſwer, or that ſomething be made out, or proved.

A *problem* is a practical propoſition, in which ſomething is propoſed to be done, or effected.

A *theorem*, is a ſpeculative propoſition, or rule, in which ſomething is affirmed to be true, and requires demonſtration.

A *corollary*, is ſome concluſion gained from a preceding propoſition.

A *ſcholium*, is a remark on ſome propoſition; or an exemplification of the matter which it contains.

An *axiom*, is a ſelf-evident truth, or principle, that every one aſſents to upon hearing it propoſed.

A *poſtulate*, is a principle, or condition, requeſted; the ſimplicity or reaſonableneſs of which cannot be denied.

In mathematics, the following poſtulates and axioms are ſome of the principal ones that are generally taken for granted.—When a propoſition, from ſuppoſed premiſes, aſſerts ſuch and ſuch conſequences; and ſubjoins, *And the contrary*: it is to be underſtood, that if the conſequences be aſſumed as premiſes; then what were firſt taken as premiſes, would become conſequences. Thus, in article 95, it is premiſed, "that if two parallel right lines are cut by another right line," there reſults this conſequence; "the alternate angles are equal." And the contrary means, that "where equal alternate angles are made by a right line cutting two other right lines, the right lines ſo cut are parallel lines."

POSTULATES.

43. A right line may be drawn from any given point to another given point.

44. A given right line may be continued, or lengthened, at pleaſure.

45. From a given point, and with any radius, a circle may be deſcribed.

Theſe Poſtulates muſt be granted, at leaſt in idea, or all geometry falls at once to the ground; for, if there cannot be a plane, a right line, and a circle, the whole elements of geometry are to no purpoſe; as it will be impoſſible to form a conſtruction, whereby we may demonſtrate the eſſential properties of figures in general; conſequently, if no demonſtration can be given, there is an end of the ſcience, having no data to build on.

In every mathematical or phyſical ſcience, there is a neceſſity for ſome data or firſt principles to be given, whereon to frame hypotheſes, in order to demonſtrate the Theorems; and the more ſimple thoſe principles are, the better; becauſe there is leſs cauſe to diſpute them. But, nevertheleſs, if they are diſputed, they are more difficult to demonſtrate, for being the moſt ſimple; becauſe, there is no reverting back to any thing more ſo; and conſequently, no demonſtration can be given. That the thing is ſo, of itſelf, is arbitrary, notwithſtanding there is no poſſibility of denying it; therefore, the more ſimple the firſt principles are, the readier the aſſent will be given; and demonſtration of the moſt complex propoſition will be eaſier obtained, more firmly ſupported, and, conſequently, the whole ſcience, which is built on thoſe principles, more ſolid and permanent, and more ſecurely eſtabliſhed.

AXIOMS.

46. Things equal to the ſame thing, are equal to one another.

47. If equal things are added to equal things, the ſums or wholes will be equal. But if unequals be added, the ſums are unequal.

48. If equal things are taken from equal things, the remainders, or differences, are equal: but are unequal, when unequals are taken.

49. Things are equal which are double, triple, quadruple, &c. or half, third part, &c. of one and the ſame thing, or of equal things.

50. Things which have equal meaſures, are equal. And the contrary.

51. Equal circles have equal radii.

52. Equal arcs in equal circles have equal chords, and are the meaſures of equal angles. And the contrary.

53. Parallel right lines have each the ſame inclination to a right line cutting them.

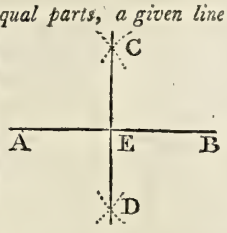
In what follows it is to be underſtood, that right lines (viz. ſtraight lines) are drawn by the edge of a ſtraight ruler: circles or arcs, are deſcribed with one

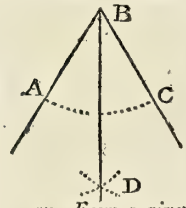
foot of a pair of compaſſes, the other foot reſting on the point which is taken for the centre; and the diſtance of the feet, or points, of the compaſſes is taken as the radius: alſo, that the point marked out by a letter is to be underſtood, when the reference is made to that letter.

54. It is alſo taken for granted, that a line or diſtance can be taken between the compaſſes, and may be tranſferred or applied from one place to another. Alſo, that one figure can be applied to or laid upon another, or conceived to be ſo applied.—In any problem, when a line, angle, or figure, is ſaid to be given; that line, angle, or figure, muſt be made, before any part of the operation is performed.

PROBLEMS.

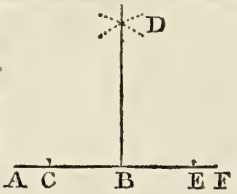
55. *To biſect, or divide into two equal parts, a given line* A B.—Operation. From the ends A and B, with one and the ſame radius, greater than half A B, deſcribe arcs cutting in C and D, as in article 45.—Then a line drawn from C to D, gives E, the middle of A B, as required.— The proof of this operation depends on articles 101, 99.



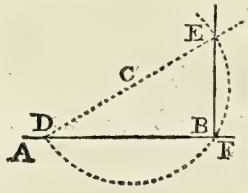


56. *To biſect a given right-lined angle* A B C.—From B, deſcribe an arc A C. From A and C, with one and the ſame radius, deſcribe arcs cutting in D. Then a right line drawn from B to D will divide the angle into two equal parts, as required.— The proof depends on article 101.

57. *From a given point* B, *in a given right line* A F, *to draw a right line perpendicular to the given line, when* B *is near the middle of the line.*—On each ſide of B, take the equal diſtances B C and B E. On C and E deſcribe, with the ſame radius, arcs cutting in D. Then a right line drawn through B and D will be the perpendicular required.—The proof depends on article 103.

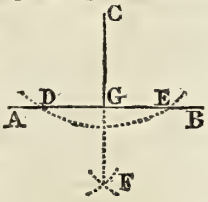


58. *When* B *is at or near the end of the given line.*—On any convenient point C, taken at pleaſure, with the diſtance, or radius, C B, deſcribe an arc D B E, cutting A F in D and B. A line drawn through D and C will cut this arc in E. Then a right line drawn through B and E will be the perpendicular required.—This depends on article 130.

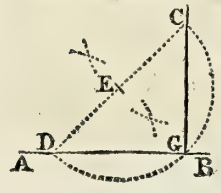


59. *To draw a line perpendicular to a given right line* A B, *from a point* C *without that line.*

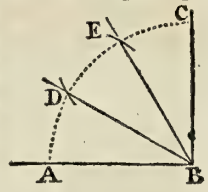
Caſe I. *When the point is nearly oppoſite to the middle of the given line.*—On C, with one radius, cut A B in D and E. On D and E, with one radius, deſcribe arcs cutting in F. Then a line drawn from C to F will be the perpendicular required.—This depends on articles 101, 99.



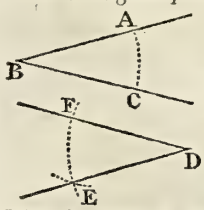
60. Caſe II. *When* C *is nearly oppoſite to one end of the given line* A B.—To any point D in A B, draw the line C D. Biſect the line C D in E. On E, with the radius E C, cut A B in G. Then C G being drawn, will be the perpendicular required. This depends on article 130.



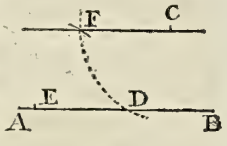
61. *To triſect, or divide into three equal parts, a right angle* A B C.—From B, with any radius B A, deſcribe the arc A C, cutting the legs B A, B C, in A, C. From A, with the radius A B, cut the arc A C in E, and from C, with the ſame radius, cut A C in D. Draw B E, B D, and the angle A B C will be divided into three equal parts.—This depends on article 193.



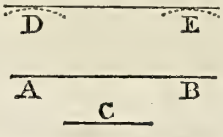
62. *At a given point* D, *to make a right-lined angle equal to a given right-lined angle* A B C.—From D and B, with the ſame radius, deſcribe the arcs E F and A C, cutting the legs of the given angle in the points A, C. Transfer the diſtance A C to the arc E F, from F to E. Then lines drawn from D, through E and F, will form the angle E D F equal to the angle A B C.—This depends on article 101.



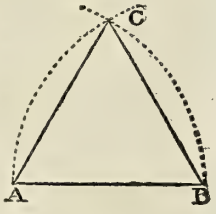
63. *To draw a line parallel to a given right line* A B.—Caſe I. *When the parallel line is to paſs through a given point,* C.—From C, with any convenient radius, deſcribe an arc D F, cutting A B in D. Apply the radius C D from D to E; and from E, with the ſame radius, cut the arc D F. Then a line drawn through F and C will be parallel to A B.—This depends on articles 101, 95.

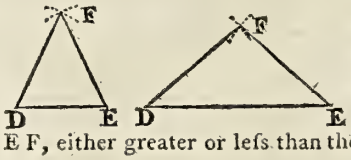


64. Caſe II. *When the parallel line is to be at the given diſtance* C *from* A B.—From the points A and B, with the radius C, deſcribes arcs D and E. Then lay a ruler to touch the arcs D and E, and a line drawn in that poſition is the parallel required.—This operation is mechanical.



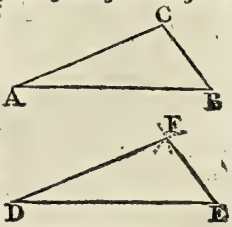
65. *Upon a given line* A B, *to make an equilateral triangle.*—From the points A and B, with the radius A B, deſcribe arcs cutting in C. Draw C A, C B, and the figure A B C is the triangle required.—The truth of this operation is ſelf evident; for the ſides are radii of equal circles.



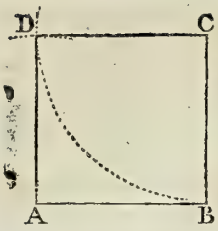


66. By a like operation, an iſoſceles triangle D E F may be conſtructed on a given baſe D E, with the given equal legs D F, E F, either greater or leſs than the baſe D E.

67. *To make a right lined triangle, the ſides of which ſhall be reſpectively equal, either to thoſe of a given triangle* A B C, *or to three given lines, provided any two of them taken together are greater than the third.*—Draw a line D E equal to the line A B. On D, with a radius equal to A C, deſcribe an arc F. On E, with a radius equal to B C, deſcribe another arc, cutting the former arc in F. Then draw F D, F E, and the triangle D F E will be that required.

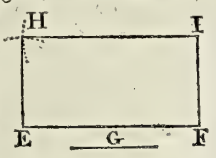


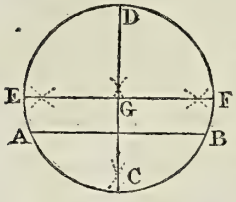
68. *Upon*



68. *Upon a given line* A B, *to describe a square.*—Draw B C perpendicular, and equal, to A B. On A and C, with the radius A B, describe arcs cutting in D. Then draw D C, D A; and the figure A B C D is the square required.—This depends on articles 101, 104, 95, 30.

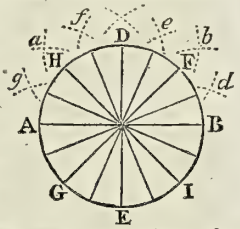
69. *To describe a rectangle whose length shall be equal to a given line,* E F, *and breadth equal to another given line* G.—At E and F erect two perpendiculars, E H and F I, each equal to the given line G. Draw H I, and the figure E F I H will be the rectangle required.—This depends on articles 29, 101, 104, 95.



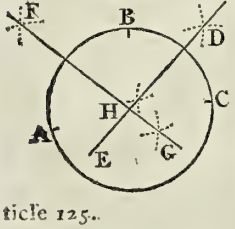


70. *To find the centre of a circle.*—Draw any chord A B. Bisect A B with the chord C D. Bisect C D with the chord E F, and their intersection G will be the centre required.—This depends on article 105.

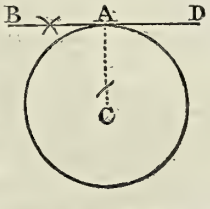
71. *To divide the circumference of a circle into two, four, eight, sixteen, thirty-two, &c. equal parts.*—A diameter A B divides the circle into two equal parts. A diameter D E, perpendicular to A B, divides the circumference into four equal parts. On A, D, B, describe arcs cutting in *a*, *b*; then by the intersections *a*, *b*, and the centre, the diameters F G, H I, being drawn, divide the circumference into eight equal parts; and so on by continual bisection.—For at each operation, the intercepted arcs are bisected, and the parts doubled.

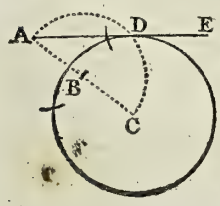


72. *To describe a circle, the circumference of which shall pass through three given points* A B C, *provided they do not lie in one right line.*—Bisect the distance C B with the line D E. Bisect the distance A B with the line F G. On H, the intersection of these lines, with the distance to either of the given points, describe the circle required. This depends on article 125.



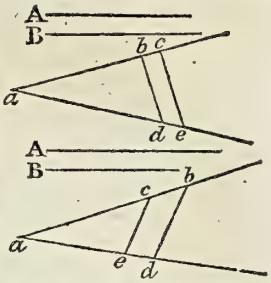
73. *To draw a tangent to a given circle, that shall pass through a given point* A.—Case I. *When* A *is in the circumference of the circle.* From the centre C, draw the radius C A. Through A draw B D perpendicular to C A, (58,) and B D is the tangent required.—This depends on article 126.



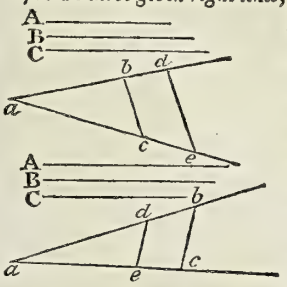


74. Case II. *When the given point* A *is without the given circle.*—From the centre C, draw C A, which bisect in B. On B, with the radius B A, cut the given circumference in D. Through D, the line A E being drawn, will be the tangent required.—This depends on articles 130, 126.

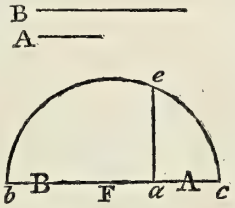
75. *To two given right lines,* A, B, *to find a third proportional.*—Draw two right lines making any angle, and meeting in *a*. In these lines, take *a b* = first term, and *ac*, *a d*, each equal to the second term. Draw *b d*, and through *c*, draw *c e*, parallel to *b d*; then *a e* is the third proportional sought. And *ab* : *ac* : : *ad* : *ae*.—This depends on article 165.



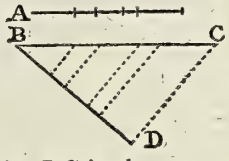
76. *To three given right lines,* A, B, C, *to find a fourth proportional.*—Draw two right lines making any angle, and meeting in *a*. In these lines take *a b* = first term, *ac* = second term, and *a d* = third term. Draw *b c*, and parallel to it, through *d*, draw *d e*; then *a e* is the fourth proportional required. And *ab* : *ac* : : *ad* : *ae*.—This depends on article 165.



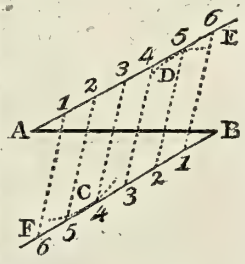
77. *Between two given right lines,* A, B, *to find a mean proportional.*—Draw a right line, in which take *ac* = A, *ab* = B. Bisect *b c* in F (55); and on F, with the radius F *b*, describe a semicircle *b e c*. From *a* draw *a e* perpendicular to *b c* (57); then *a e* is the mean proportional required. And *ac* : *ae* : : *ae* : *ab*.—This depends on article 171.



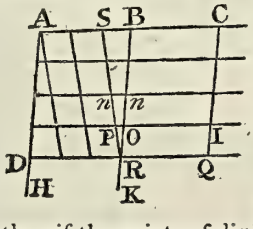
78. *To divide a given line* B C, *in the same proportion as a given line* A *is divided.*—From one end B of B C draw B D, making any angle with B C. In B D apply from B the several divisions of A; so B D will be equal to A, and alike divided. Draw C D; then lines drawn parallel to C D through the several divisions of B D, will divide the line B C in the manner required.—This depends on article 165.



79. *To divide a given right line* A B *into a proposed number of equal parts, (suppose* 7.)—From A, one end of A B, draw A E to make any angle with A B; and from B, the other end, draw B F, making the angle A B F equal to the angle B A E. Begin at A and B, and set off, on these lines, as many equal parts, except one, as A B is to be divided into, viz. 1, 2, 3, 4, 5, 6. Then lines drawn from 1 to 6, 2 to 5, 3 to 4, &c. will divide A B, as was required.—This depends on article 165.



80. Hence is derived the method of making diagonal scales. Let a scale be constructed to 12ths of the line A B.—Having divided A B into three equal parts, draw two parallel lines A H, B K, making any convenient angles with A B: in those lines take four equal distances, suppose from A to D, and from B to R; and through the points of division draw four lines parallel to A B; next divide D R into three equal parts: then if the points of division in A B and D R are joined diagonally,

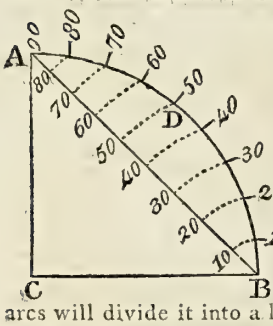


diagonally, the ſcale is conſtructed.—For by ſimilar triangles, R B : B S :: R O : O P; therefore R O being $\frac{1}{4}$ of R B; O P will be $\frac{1}{4}$ of B S, or $\frac{1}{4}$ of $\frac{1}{3}$ (or $\frac{1}{12}$) of B A: and the next diviſion *n n* is $\frac{2}{12}$, &c.

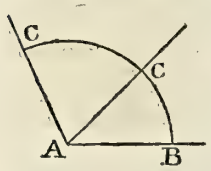
If Q R = C B = B A is the ſcale for a foot, O P is an inch, *n n* = 2 inches, I P = 13 inches, &c. But if we divide A B into four equal parts, only three muſt be taken in A H and B K to make 12ths of A B (becauſe 4 × 3 = 12).

Generally, reſolve the number to which the diviſions are to be extended, into two factors, then divide the given line (A B) into as many equal parts as there are units in one factor, and take as many equal parts in the other lines (A H, B K,) as there are units in the other. Thus if A B is divided into three equal parts, and five are taken in A H, B K; or if A B is divided into five, and three are taken in A H, B K, in either caſe the ſcale gives 15ths of A B. On the common plain ſcales, the equal parts in each line are ten, which give the diviſions in 100ths.—A line divided into equal parts, and one of the parts ſubdivided, is called a *line* or *ſcale of equal parts*. A variety are to be found on the common plain ſcale belonging to a caſe of inſtruments.

81. A line of chords is made by transferring the diviſions on the arc of a quadrant to its chord. Thus, ſuppoſe A B C is a quadrant, and the right line B A the chord of its arc B D A. Let this arc be divided into 90 equal parts or degrees: then if one foot of a pair of compaſſes be kept on the point B, and arcs ſucceſſively deſcribed with the other, from each of the 90 diviſions in B D A to meet B A, thoſe arcs will divide it into a line of chords.

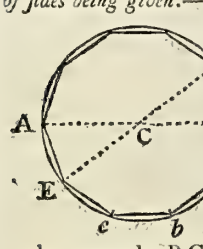


82. *To make an angle of a propoſed number of degrees.*—Take the firſt 60° from the ſcale of chords, and with this radius deſcribe an arc B C, the centre of which is A. Take the chord of the propoſed number of degrees from the ſcale, reckoning from its beginning, and apply this diſtance to the arc B C, from B to C. Then lines drawn from A, through the points B and C, will form an angle B A C, the meaſure of which is the degrees propoſed.—If the angle exceed 90°, take half the number of degrees, and ſet it off twice, from B to C, and from C to C.



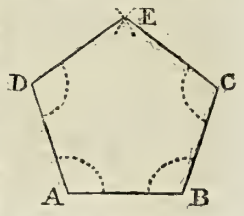
83. *To meaſure a given angle* B A C.—From the angular point A, with the chord of 60°, deſcribe the arc B C, cutting the legs in the points B and C. Then the diſtance B C being applied to the chords, from the beginning, will ſhew the degrees which meaſure the angle B A C.

84. *In a given circle to inſcribe a regular polygon, the number of ſides being given.*—Divide 360° by the number of ſides, and the quotient will be the degrees which meaſure the angle at the centre of the circle ſubtended by a ſide of the polygon. For there will be as many equal angles at the centre as there are equal ſides. And the whole circumference meaſures the ſum of all the angles at the centre.—Draw the radius C B, make an angle B C D equal to thoſe degrees, and draw the chord D B; then will D B be the ſide of the polygon required; which applied to the circumference from B to *a*, *a* to *b*, *b* to *c*, &c. will give the points to which the ſides of the polygon are to be drawn.

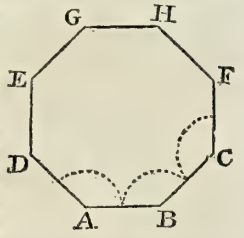


85. If the polygon has an even number of ſides, draw the diameter A B; and divide half the circumference, as before; then lines drawn from theſe points through the centre, as E D, will give the remaining points, in the other ſemicircumference.

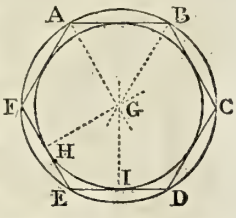
86. *On a given right line* A B, *to conſtruct a regular polygon of any aſſigned number of ſides.*—Divide 360° by the number of ſides; ſubtract the quotient from 180°, the remainder will be the degrees which meaſure the angle made by any two adjoining ſides of that polygon, and is called the angle of the polygon. For each ſide of the polygon, with radii drawn to its ends, form an iſoceles triangle. Then the angle of the polygon is derived from articles 85, 96, 104.—At the ends A, B, of the line A B, make angles A B C, B A D, equal to the angle of the polygon. Make A D, B C, each equal to A B. Then at the points C, D, make angles equal to that of the polygon as before; and let the ſides including thoſe angles be each equal to A B; and thus proceed until the polygon is conſtructed.



In figures of any number of ſides, the two laſt ſides D E, C E; or E G, H G; are readieſt found by deſcribing arcs from C and D, or from E and H, with the radius A B, interſected in E, or in G.—Or, in figures of an even number of ſides, having drawn half the number, A D, A B, B C, C F, by means of the angles; the remaining ſides may be found, by drawing through the points D and F the lines D F, F H, parallel and equal to their oppoſite ſides C F, A D; and ſo of the reſt.

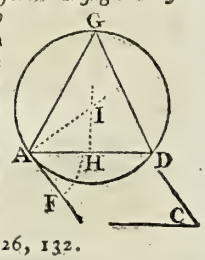


87. *About a given regular polygon, to circumſcribe a circle: or within that polygon to inſcribe a circle.*—Biſect any two angles F A B, C B A, with the lines A G, B G; and the point G, where they interſect one another, will be the centre of the polygon. A circle deſcribed from G, with the radius G A, will circumſcribe the given polygon.—This depends on articles 85, 96, 104.



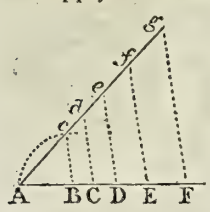
88. Again, biſect any two ſides, F E, E D, in the points H and I; and draw H G, I G, at right angles to F E, E D; then the point G, where they interſect each other, will be the centre of the polygon.—A circle deſcribed from G, with the radius G H, will be inſcribed in the given polygon.—This depends on article 126.

89. *On a given right line* A D, *to deſcribe a ſegment of a circle, that ſhall contain an angle equal to a given right-lined angle* C.—Make an angle D A F equal to the given angle C. From H, the middle of A D, draw H I at right angles to A B, and from A draw A I at right angles to A F, cutting H I in I. From I, with the radius I A, deſcribe a circle. Then will the ſegment A G D contain an angle A G D equal to the given angle C.—This depends on articles 125, 126, 132.



90. *To divide a right line in continued proportion, in the ratio of two given right lines* A B, A C.—From B, with the radius A B (the antecedent) deſcribe an arc A *c*. In that arc

arc apply (the consequent) A C from A to c; draw A c, and apply c A from c to D. Apply the following lines in the order directed, viz. A D from A to d, and from d to E; A E from A to e, and from e to F; A F from A to f, and from f to G; A G from A to g, and from g to H, &c. Then will the proportional lines be A B, AC, AD, AE, AF, AG, &c. And

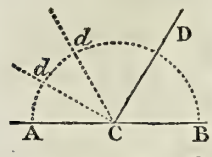


AB:AC::(Ac=)AC:(Ad=)AD.
AB:AC::(Ad=)AD:(Ae=)AE.
AB:AC::(Ae=)AE:(Af=)AF,
&c.—This depends on articles 104, 95, 165.

THEOREMS.

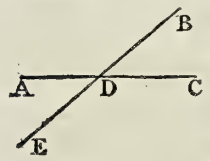
Of Right Lines and Planes.

91. *When one right line* C D *ſtands upon another right line* A B, *they make two angles* B C D, A C D, *which together are equal to two right angles.—Demonſtration.* For, deſcribing a ſemicircle A D B, on C (45); then the arc D B meaſures the angle B C D (15); and the arc D A meaſures the angle A C D (15); but the arcs D B and A D together meaſure two right angles (13, 16); therefore B C D and A C D together, are equal to two right angles (50).



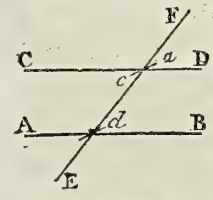
92. *Corollary.* Hence if any number of right lines C d ſtands on one point C, on the ſame ſide of another right line A B; the ſum of all the angles are equal to two right angles; or are meaſured by 180°.

93. *If two right lines,* AC, EB, *interſect each other in* D, *the oppoſite angles are equal, viz.* ∠ C D B = ∠ A D E, and ∠ C D E = ∠ A D B. For the angles A D E and A D B together make two right angles (91); and the angles C D B and A D B together make two right angles (91); therefore the ſum of A D E and A D B = ſum of C D B and A D B (46); conſequently the ∠ C D B is equal to the ∠ A D E (48).

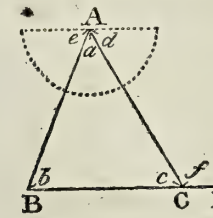


94. *Corol.* Hence if any number of right lines croſs each other in one point, the ſum of all the angles which they make about that point, is equal to four right angles; or is meaſured by 360°.

95. *If a right line* F E *cut two parallel right lines,* A B, C D; *then is the outward angle a equal to the inward and oppoſite angle d; and the alternate angles, c, d, are equal: and the contrary.*—Becauſe C D and A B are parallel by ſuppoſition; then F E has the ſame inclination to C D and A B; and this inclination is expreſſed by the ∠ a or ∠ d; therefore the outward ∠ a is equal to the inward and oppoſite ∠ d. Now the ∠ a is equal to the ∠ c. And ſince the ∠ a is equal to the ∠ d; therefore the alternate angles c and d are equal.



96. *In any right-lined triangle* A B C, *the ſum of the three angles a, b, c, is equal to two right angles: And if one ſide* B C *be continued, the outward angle f is equal to the ſum of the two inward and oppoſite angles a, b.*—Through A, draw a right line parallel to B C, making with A B the ∠ e, and with A C the ∠ d.

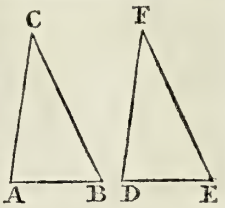


Now ∠ e = ∠ b; and ∠ d = ∠ c, being alternate.
And two right angles meaſure the ∠ e + ∠ a + ∠ d.
Therefore ∠ b + ∠ a + ∠ c = ∠ e + ∠ a + ∠ d.
Conſequently ∠ b + ∠ a + ∠ c = two right angles.
Moreover ∠ c + ∠ f = two right angles.
Therefore ∠ b + ∠ a = ∠ f.

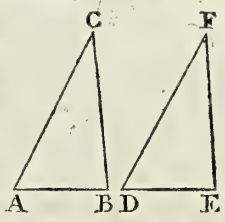
97. Hence, if one angle is right or obtuſe, each of the other is acute.

98. If two angles of one triangle are equal to two angles of another triangle, the remaining angles are equal. And if one angle in one triangle is equal to one angle in another triangle, then is the ſum of the remaining angles in one, equal to the ſum of the remaining angles in the other.

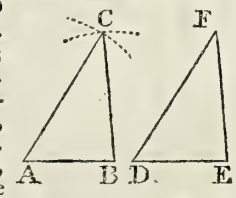
99. *If two ſides* A B, A C, *and the included angle* A, *in one triangle* A B C, *are reſpectively equal to two ſides* D E, D F, *and the included angle* D, *of another* D E F, *each to each; then are thoſe triangles congruous.*—Apply the point D to the point A, and the line D E to A B. Now as D E = A B (by ſuppoſition); therefore the point E falls on B. But ∠ D = ∠ A (by ſup.); therefore D F will fall on A C. And ſince D F = A C (by ſup.); therefore the point F falls on C. Conſequently F E will fall on C B; therefore the triangles A C B, D F E, are congruous, ſince every part agrees.



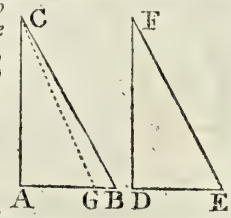
100. *If two triangles* A B C, D E F, *have two angles* A, B, *and the included ſide* A B, *in one, reſpectively equal to two angles* D, E, *and the included ſide* D E, *in the other, each to each; then are thoſe triangles congruous.*—Apply the point D to A, and the line D E to A B. Now as D E = A B (by ſup.); therefore the point E falls on B. And as ∠ D = ∠ A (by ſup.); therefore the line D F falls on A C. Now if the line A C is leſs or greater than the line D F; then the line F E not falling on C B, makes the ∠ B leſs or greater than ∠ E. But ∠ B = ∠ E (by ſup.); therefore A C is neither leſs nor greater than D F. Or the line A C = D F; conſequently F E = C B; therefore the triangles are congruous.



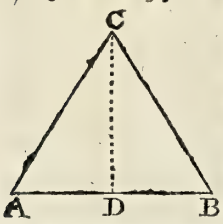
101. *Two triangles,* A B C, D E F, *are congruous, when the three ſides in the one are equal to the three ſides in the other, each to each.*—Apply the point D to A, and the line D E to A B. Now as D E = A B (by ſup.); therefore the point E falls on B. On A, with the radius A C, deſcribe an arc. Then as D F = A C, the point F will fall in that arc. Alſo on B, with the radius B C, deſcribe another arc, cutting the former in C. And ſince E F = B C, the point F will fall in this arc alſo. But if the point F can fall in both theſe arcs, it can be only where they interſect, as in C. Conſequently the triangles are congruous, or identical.



102. *Two triangles* A B C, D E F, *are congruous, when two angles* A, B, *and a ſide* A C *oppoſite to one of them, in one triangle, are reſpectively equal to two angles* D, E, *and a ſide* D F *oppoſite to a like angle in the other triangle, each to each.*—Apply the point D to A, and the line D F to A C. Now as D F = A C (by ſup.); therefore the point F falls on C. And as ∠ D = ∠ A (by ſup.); the line D E will fall on the line A B. And if the point E does not fall on B, it muſt fall on ſome other point G. Draw C G. Then the angle A G C is equal to the angle D E F. And the angle A B C = (D E F =) A G C, which is not poſſible; therefore the point E can fall no where but on the point B. Conſequently the triangles are congruous.



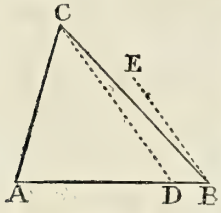
103. *In the iſoſceles or equilateral triangle* ACB; *a line drawn from the vertex* C *to the middle of the baſe* AB *is perpendicular to the baſe, and biſects the vertical angle: and the contrary:* that is, if a line drawn perpendicular to the baſe of a triangle biſects the vertical angle; then that triangle muſt be iſoſceles, and the perpendicular is drawn from the middle of the baſe.—The triangles ADC, BDC,



are congruous; ſince CA=CB (23); CD=CD, and AD=DB by ſuppoſition: therefore ∠A=∠B, ∠ACD =∠BCD, ∠ADC=BDC (101); conſequently CD is at right angles to AB.

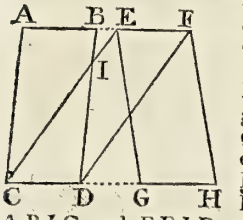
104. *Corol.* Hence in any right-lined triangle where there are equal ſides, or angles; the angles A, B, oppoſite to equal ſides BC, AC, are equal; and the ſides BC, AC, oppoſite to equal angles, A, B, are equal.

105. *In every right-lined triangle* ABC, *the greater angle* C *is oppoſite to the greater ſide* AB. —In the greater ſide AB, take AD=AC; draw CD, and through B draw BE parallel to CD; then the angles ADC, ACD, are equal, (104); and ∠ADC=∠ABE; therefore ∠ACD = ∠ABE; that is, a part of the angle ACB is greater than the angle ABC: conſequently the ∠C is greater than the ∠B; and in the ſame manner it may be proved to be greater than the ∠A, if the ſide AB be greater than CB.

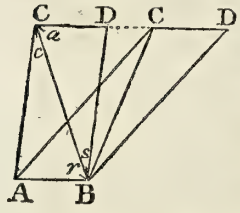


106. *Corol.* Hence in every right-lined triangle, the greater ſide is oppoſite to the greater angle.

107. *Parallelograms* ACDB, ECDF, EGHF, *ſtanding on the ſame baſe* CD, *or on equal baſes* CD, GH, *and between the ſame parallels,* CH, AF, *are equal.*—For AB=EF, being each equal to CD; to each add BE, and AE=BF; now AC= BD, and CE=DF; the triangles ACE, BDF, are therefore congruous, (101). Now if from each of the triangles, ACE and BDF, be taken the triangle BIE, the remaining trapeziums ABIC and FEID, are equal: then if to each of the trapeziums ABIC, FEID, be added the triangle CID, their ſum will be the parallelograms AD and DE, which are equal. And in like manner it may be ſhewn, that the parallelogram EH is equal to the parallelogram ED=AD.



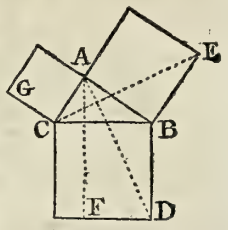
108. *A triangle* ABC *is the half of a parallelogram* AD, *when they ſtand on the ſame baſe* AB, *and are between the ſame parallels* AB, CD.—AC is equal to DB, and AB to DC; alſo BC is a ſide common to both the triangles ABC and DCB: theſe triangles are therefore congruous, (101.) Conſequently the triangle ABC is half the parallelogram AD.



109. *Corol.* 1. Hence every parallelogram is biſected by its diagonal.

110. *Corol.* 2. Alſo, triangles ſtanding on the ſame baſe, or on equal baſes, and between the ſame parallels, are equal; they being the halves of equal parallelograms under like circumſtances.

111. *In every right-angled triangle* BAC, *the ſquare on the ſide* BC *oppoſite to the right angle* A *is equal to the ſum of the ſquares of the two ſides* AB, AC, *containing the right angle.*—On the ſides AB, AC, BC, conſtruct the ſquares AG, AE, CD, (68;) draw AD, CE; and draw AF parallel to BD; then the triangles ABD, EBC, are congruous. For the ∠ABE = ∠CBD, being right angles; to each add the angle ABC, then ∠EBC and ∠ABD are equal; therefore EB, BC, ∠EBC, are reſpectively equal to AB, BD, ∠ABD. Alſo the triangle EBC is half the parallelogram AE, (108;) for they ſtand upon the ſame baſe EB, and are between the ſame parallels EB and AC; BA making right angles with BE and CA continued. Likewiſe the triangle ABD is half the parallelogram BF; for they ſtand upon the ſame baſe BD, and are between the ſame parallels BD, AF; therefore, as the halves of the parallelograms FA and BF are equal, conſequently the parallelogram BF is equal to the ſquare AE.



In the ſame manner may it be ſhewn, that the parallelogram CF is equal to the ſquare AG: but the parallelograms BF and CF together, make the ſquare CD; therefore, the ſquare CD is equal to the ſquares EA and AG.

112. *Corol.* 1. Hence if any two ſides of a right angled triangle are known, the other ſide is alſo known.—For BC = ſquare root of the ſum of the ſquares of AC and AB.

AC = ſquare root of the difference of the ſquares of BC and AB.

AB = ſquare root of the difference of the ſquares of BC and AC.

113. Or thus, making the quantities $\overline{BC}^2$, $\overline{AB}^2$, $\overline{AC}^2$, to ſtand for the ſquares made on thoſe lines. And the mark $\surd$ to ſtand for the ſquare root of ſuch quantities as ſtand under the line joined to the top of this mark.

Then $BC = \surd\overline{AC}^2 + \overline{AB}^2$;

$AC = \surd\overline{BC}^2 - \overline{AB}^2$;

$AB = \surd\overline{BC}^2 - \overline{AC}^2$;

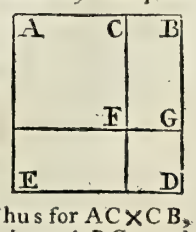
Scholium. The lines of the lengths 5, 4, 3, (or their doubles, triples, &c.) will form a right-angled triangle. For $5^2 = 4^2 + 3^2$; or $25 = 16 + 9$.

114. *Corol.* 2. Of all the lines drawn from a given point to a given line, the perpendicular is the ſhorteſt.

115. *Corol.* 3. The ſhorteſt diſtance between two parallel right lines, is a right line drawn from one to the other perpendicular to both.

116. *Corol.* 4. Parallel right lines are equidiſtant; and the contrary: for two oppoſite ſides of a rectangular parallelogram are equal (28); and each is the ſhorteſt diſtance between the other ſides.

117. *If a right line* AB, *be divided into any two parts* AC, CB; *then will the ſquare on the whole line be equal to the ſum of the ſquares on the parts, together with two rectangles under the two parts.*—That is,



$\overline{AB}^2 = \overline{AC}^2 + \overline{CB}^2 + 2 \times AC \times CB$.

The rectangle under two lines is generally expreſſed by three letters; the firſt two letters ſtand for one line, and the laſt two for the other line. Thus for AC×CB, is written ACB: for AB×BC, is written ABC; and for 2×AC×CB, is written 2ACB.—Let AD, AF, be

be ſquares on AB, AC; then will FG, and GD, be each equal to CB; hence FD is a ſquare on a line equal to CB; alſo FB and FE are rectangles on lines equal to C, CB; but the ſquares AF, FD, and the rectangles FB, FE, fill up the ſquare AD, or are equal to AD.

118. *Corol.* 1. Hence the ſquare of AC, the difference between two lines AB, CB, is equal to the ſquare of the greater AB, leſſened by the ſquare of the leſs CB, and by two rectangles under the ſmaller line CB, and the ſaid difference:

That is, $\overline{AB-BC}^2=\overline{AB}^2-\overline{BC}^2-2BC\times AC$.

For $AB-BC=AC$.

Then $\overline{AC}^2=\overline{AB}^2-\overline{BC}^2-2BC\times AC$.

119. *Corol.* 2. The difference between the ſquares on two lines AB, AC, is equal to the rectangle under the ſum AB+BC and difference AB—BC of thoſe lines.

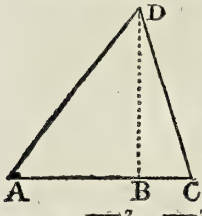
That is, $\overline{AB}^2-\overline{AC}^2=\overline{AB+BC}\times\overline{AB-AC}$.

For $\overline{AB}^2-\overline{AC}^2=\overline{CB}^2+2\overline{AC}\times\overline{CB}$.

$=\overline{CB+AC}+\overline{AC}\times\overline{CB}$.

$=\overline{AB+AC}\times(CB=)\overline{AB-AC}$.

120. *In every triangle* ADC, *the ſquare of a ſide* CD *ſubtending an acute angle* A, *is equal to the ſquares of the ſides* AD, AC, *about that angle, leſſened by two rectangles under one of thoſe ſides* AC, *and that part* AB *contained between the acute angle and the perpendicular* DB *drawn to that ſide* AC *from its oppoſite angle* D.



That is, $\overline{DC}^2=\overline{AD}^2+\overline{AC}^2-2CAB$.

$\overline{DC}^2-\overline{BC}^2=(\overline{DB}^2=)\overline{AD}^2-\overline{AB}^2$ (111).

And $\overline{AC}^2=2ABC+\overline{BC}^2+\overline{AB}^2$ (117).

Then $\overline{DC}^2-\overline{BC}^2-\overline{AC}^2=\overline{AD}^2-\overline{BC}^2-2\overline{AB}^2-2ABC$.

And $\overline{DC}^2=\overline{AD}^2+\overline{AC}^2-2\overline{AB}^2-2ABC$, by adding $\overline{BC}^2+\overline{AC}^2$.

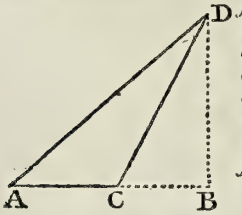
$(-AB\times 2AB-BC\times 2AB)$

$(-\overline{AC+BC}\times 2AB\quad)$

Then $\overline{DC}^2=\overline{AD}^2+\overline{AC}^2-(AC\times 2AB=)2CAB$.

121. *Corol.* Hence $AB=\dfrac{\overline{AD}^2+\overline{AC}^2-\overline{DC}^2}{2CA}$.

122. *In an obtuſe-angled triangle* ACD, *the ſquare of the ſide* AD *oppoſite to the obtuſe angle* C *is equal to the ſum of the ſquares of the ſides* AC, CD, *about the obtuſe angle; together with two rectangles under one ſide* AC, *and the continuation* CB *of that ſide to meet a perpendicular* DB *drawn to it from the oppoſite angle* D.



That is, $\overline{AD}^2=\overline{AC}^2+\overline{CD}^2+2AC\times CB$.

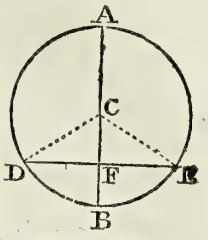
For $\overline{AD}^2-\overline{AB}^2=(\overline{DB}^2=)\overline{CD}^2-\overline{CB}^2$.

And $\overline{AB}^2=2ACB+\overline{AC}^2+\overline{CB}^2$.

Then $\overline{AD}^2=\overline{AC}^2+\overline{CD}^2+2ACB$.

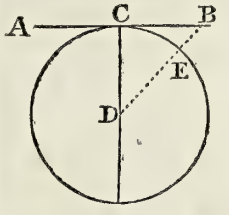
123. *Corol.* Hence $CB=\dfrac{\overline{AD}^2-\overline{AC}^2-\overline{CD}^2}{2AC}$.

124. *In any circle, a diameter,* AB, *drawn perpendicular to a chord* DE, *biſects that chord and its ſubtended arc* DBE.—From the centre C, draw the radii CD, CE, to the extremities of the chord DE; then the triangles CFE, CFD, are congruous (102). For CF being at right angles to DE, the $\angle CFD=\angle CFE$; and the triangle CDE being iſoſceles (23), the $\angle D=\angle E$ (104). Alſo CF is common; therefore DE=FE, and the arc DB=BE; for thoſe arcs meaſure the equal angles FCE, FCD.

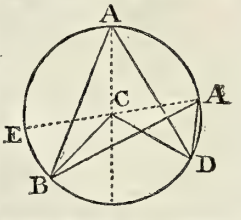


125. *Corol.* Hence, in a circle, a right line drawn through the middle of a chord at right angles to it, paſſes through the centre of that circle; and the contrary.

126. *A tangent* AB, *to a circle, is perpendicular to a diameter* DC, *drawn to the point of contact* C.—If it be denied that DC is perpendicular to AB, then from the centre D, let ſome other line DB, cutting the circle in F, be drawn perpendicular to AB. Now the angle DBC being right, the angle DCB is acute; conſequently DC is greater than DB. But DC=DE (9); therefore DE is greater than DB, which is abſurd. Therefore no other line paſſing through the centre can be perpendicular to the tangent, but that which meets it at the point of contact.



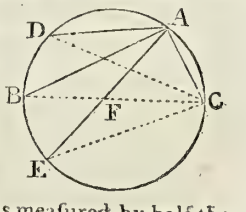
127. *An angle* BCD, *at the centre of a circle, is double of the angle* BAD, *at the circumference, when thoſe angles ſtand on the ſame arc* BD.—Through the point A draw the diameter AE; then the angle $ECD=\angle CAD+\angle CDA$; but the $\angle CAD=\angle CDA$; therefore the $\angle ECD$ is equal to twice the angle CAD. In the ſame manner it may be ſhewn, that the angle BCE is equal to twice the angle BAE; conſequently the angle BCD ($=\angle ECD+\angle BCE$) is equal to twice the angle BAD ($=\angle EAD+\angle BAE$).



128. *Corol.* 1. Hence an angle, BAD, at the circumference, is meaſured by half the arc, BD, on which it ſtands; for the angle at the centre BCD is meaſured by the arc BD; conſequently the angle BAD = half the angle BCD, is meaſured by half the arc DB.

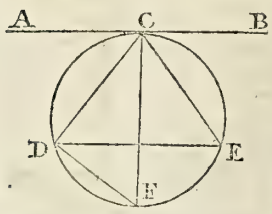
129. *Corol.* 2. All angles in the circumference, and ſtanding on the ſame arc, are equal.

130. *An angle,* BAC, *in a ſemicircle, is a right one. An angle,* DAC, *in a ſegment leſs than a ſemicircle, is obtuſe. An angle,* EAC, *in a ſegment greater than a ſemicircle, is acute.*—For the angle BAC is meaſured by half the ſemicircle arc BEC, or is meaſured by half of 180°; that is, by 90°. And $\angle DAC$ is meaſured by half the arc DEC, greater than 180°; alſo $\angle EAC$ is meaſured by half the arc EC, leſs than 180°; therefore theſe angles are reſpectively equal to, greater, or leſs, than 90°.

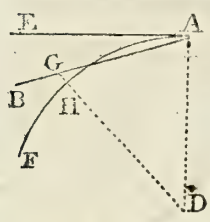


131. *Cor.* Hence in a right-angled triangle BAC, the angular point A of the right angle, and the ends B, C, of the oppoſite ſide, are equally diſtant from F, the middle of that ſide; that is, a circle will always paſs through the right angle, and the ends of its oppoſite ſide taken as a diameter.

132. *The angle* ACD, *formed by a tangent* AB, *to a circle* CDE, *and a chord* CD, *drawn from the point of contact* C, *is equal to an angle* CED *in the alternate segment; and is measured by half the arc* DC *of the included segment.*—Draw the diameter FC, and join DF. The $\angle^s$AFC and CDF are both right; therefore the $\angle^s$DCF and DFC are together = a right $\angle$. But the $\angle^s$ACD and DCF are together = a right $\angle$; consequently the $\angle$ DCF and DFC = the $\angle^s$ ACD and DCF. Take the $\angle$ DCF from each, and the $\angle$ DFC = the $\angle$ ACD; but the $\angle^s$DFC and DEC are equal; consequently the $\angle^s$ DEC and ACD are equal alſo.



133. *Between a circular arc* AHF, *and its tangent* AE, *no right line can be drawn from the point of contact* A.—For if any other right line can be drawn, let it be the right line AB. From D, the centre of AHF, draw DG perpendicular to AB, cutting AB in G, and the arc in H. Now as $\angle$DGA is right, therefore DA is greater than DG; but DA = DH (9); therefore DH is greater than DG, which is abſurd; conſequently no right line can be drawn between the tangent AE and the arc AHF.

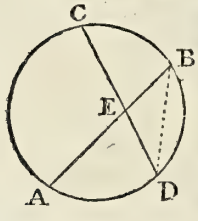


134. *Corol.* 1. Hence the angle DAH, contained between the radius DA and an arc AH, is greater than any right-lined acute angle; for a right line AB muſt be drawn from A, between the tangent AE and radius AD, to make an acute angle. But no ſuch right line can be drawn between AE and the arc AH (133).

135. *Corol.* 2. Hence the angle EAH, between the tangent EA and arc AH, is leſs then any right-lined acute angle.

136. *Corol.* 3. Hence it follows, that at the point of contact the arc has the ſame direction as the tangent, and is at right angles to the radius drawn to that point.

137. *If two right lines* AB, CD, *interſect any how* (*in* E) *within a circle; their inclination,* AED, *or* CEB, *is meaſured by half the ſum of the intercepted arcs,* AD, CB.—For, drawing DB (43); the $\angle$AED = $\angle$EDB + $\angle$EBD, (90.) But the $\angle$EDB is meaſured by $\frac{1}{2}$ arc CB (128); and the $\angle$EBD is meaſured by $\frac{1}{2}$ arc AD (128); conſequently the $\angle$AED is meaſured by half the arc CB, together with half the arc AD.



Of GEOMETRICAL PROPORTION.

Definitions and Principles.

138. One quantity A, is ſaid to be meaſured or divided by another quantity B, when A contains B ſome number of times, exactly.—Thus, if A = 20, and B = 5; then A contains B four times. A is called a multiple of B; and B is ſaid to be a part of A.

139. If a quantity A (= 20) contains another B (= 5) as many times as a quantity C (= 24) contains another D (= 6); then A and C are called like multiples of B and D. B and D are called like parts of A and C; and A is ſaid to have the ſame relation to B, as C has to D. Or, like multiples of quantities are produced, by taking their rectangle, or product, by the ſame quantity, or by equal quantities. The rectangle or product of quantities, A and B, is expreſſed by writing this mark × between them. Thus, A×B, or B×A, expreſſes the rectangle contained by A and B.

140. *When two quantities of a like kind are compared together, the relation which one of them has to the other, in reſpect to quantity, is called* ratio.—The firſt term of a ratio, or the quantity compared, is called the *antecedent*; and the ſecond term, or the quantity compared to, is called the *conſequent*. A ratio is uſually denoted by ſetting the antecedent above the conſequent, with a line drawn between them. Thus $\frac{A}{B}$ ſignifies, and is thus to be read, the ratio of A to B. The multiple of a ratio $\frac{A}{B}$, is the product of each of its terms by the ſame quantity, or by equal quantities. Thus $\frac{A \times C}{B \times C}$ is the ratio $\frac{A}{B}$ taken C times. The product of two or more ratios, $\frac{A}{B}, \frac{C}{D}$, is expreſſed by taking the product of the antecedents for a new antecedent, and the product of the conſequents for a new conſequent. Thus $\frac{A \times C}{B \times D} = \frac{A}{B} \times \frac{C}{D}$.

141. *Equal ratios are thoſe where the antecedents are like multiples or parts of their reſpective conſequents.*—Thus in the quantities A, B, C, D; or 20, 5, 24, 6. In the ratio of A to B, or of 20 to 5, the antecedent is a multiple of its conſequent four times. And in the ratio of C to D, or 24 to 6, the antecedent is a multiple of its conſequent four times. That is, the ratio of A to B is the ſame as the ratio of C to D. And this equality of ratio is thus expreſſed, $\frac{A}{B} = \frac{C}{D}$.

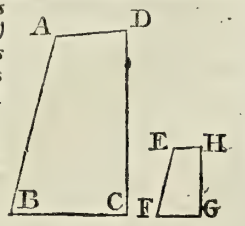
142. *Ratio of equality is, when the antecedent is equal to the conſequent.*—Thus when A = B, then $\frac{A}{B}$, or $\frac{A}{A}$, or $\frac{B}{B}$, is a ratio of equality.

143. *Four quantities are ſaid to be proportional, which, when compared together by two and two, are found to have equal ratios.*—Thus, let the quantities to be compared be A, B, C, D; or 20, 5, 24, 6. Now in the ratio of A to B, or of 20 to 5; A contains B four times. And in the ratio of C to D, or of 24 to 6; C contains D four times. Then the ratios of A to B, and of C to D, are equal; or $\frac{A}{B} = \frac{C}{D}$ (141). And their proportionality is thus expreſſed, A : B :: C : D (75). Alſo in the ratio of A to C, or of 20 to 24; C contains A, once and $\frac{4}{5}$. And in the ratio of B to D, or of 5 to 6; D contains B, once and $\frac{4}{5}$. Where the ratios are likewiſe equal, viz. $\frac{A}{C} = \frac{B}{D}$. And theſe are alſo proportional, A : C :: B : D.

144. So that when four quantities of the ſame kind are proportional, the ratio between the firſt and ſecond is equal to the ratio between the third and fourth; and this proportionality is called *direct*.

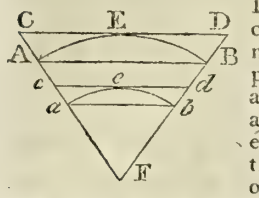
145. Alſo the ratio between the firſt and third is equal to the ratio between the ſecond and fourth; and this proportionality is called *alternate*.

146. *Similar, or like, right-lined figures, are thoſe which are equiangular, (that is, the ſeveral angles of which are equal one to the other;) and alſo the ſides about the equal angles proportional.*—Thus if the figures AC and EG are equiangular, and AB : BC :: EF : FG; or BC : CD :: FG : GH; then are thoſe figures called ſimilar, or like, figures. And the like in triangles, or other figures.



147. *Like*

147. *Like arcs, chords, or tangents, in different circles, are thoſe which ſubtend, or are oppoſite to, equal angles at the centre.*—



Let F be the centre of two concentric arcs A E B, *a e b*, terminated by the radii F *a* A, F *b* B, produced; A B, *a b*, their chords, and C D, *c d*, their tangents. Then as the angle C F D is meaſured either by the arc A E B, or *a e b*, thoſe arcs are ſaid to be alike, or ſimilar; that is, the arc *a e b* is the ſame part of its whole circumference, as the arc A E B is of its whole circumference.

148. *Quantities, and their like multiples, have the ſame ratio.*—That is, the ratio of A to B is equal to the ratio of twice A to twice B, or thrice A to thrice B, &c. Or thus, $\frac{A}{B}=\frac{2A}{2B}=\frac{3A}{3B}$, &c. $=\frac{C\times A}{C\times B}$; that is, equal to the ratio of C times A to C times B.

Demonſtration.—For the ratio of A to B muſt either be equal to the ratio of like multiples of A and B, or to the ratio of unlike multiples of them. Now ſuppoſe the ratio of A to B is equal to the ratio of their unlike multiples, C times A, D times B; that is, $\frac{A}{B}=\frac{C\times A}{D\times B}$. Then A : B :: C×A : D×B (143). And A : C×A :: B : D×B (145). Therefore $\frac{A}{C\times A}=\frac{B}{D\times B}$. Where the conſequents are unequal multiples of their antecedents, by ſuppoſition. But $\frac{A}{C\times A}=$ is not equal to $\frac{B}{D\times B}$. Then A : C×A :: B : D×B is not true. Alſo A : B :: C×A : D×B is not true. Conſequently $\frac{A}{B}$ is unequal to $\frac{C\times A}{D\times B}$. Therefore the ratio of unlike multiples of two quantities, is not equal to the ratio of thoſe quantities. Conſequently the ratio of two quantities, and the ratio of their multiples, are the ſame. Or $\frac{A}{B}=\frac{C\times A}{C\times D}$.

149. *Cor.* 1. In any ratio, if both terms contain the ſame quantity or quantities; the value of the ratio will not be altered by omitting or taking away thoſe quantities. For $\frac{C\times A}{C\times B}=\frac{A}{B}$, by taking away C.

150. *Cor.* 2. Quantities, and their like parts, have equal ratios. For A and B are like parts of C×A and C×B.

151. *Cor.* 3. Quantities, and their like multiples, or like parts, are proportional. For A : B :: C×A : C×B. And C×A : C×B :: A : B (148).

152. *Cor.* 4. If quantities are equal, their like multiples, or like parts, are alſo equal. For if A = B; and $\frac{A}{B}=\frac{C\times A}{C\times B}$; then are the antecedents and conſequents in a ratio of equality.

153. *Cor.* 5. If the parts of one quantity are proportional to the parts of another quantity, they are like parts of their reſpective quantities. For only like parts are proportional to their wholes.

154. *Cor.* 6. Ratios, which are equal to the ſame ratio, are equal to one another. For the ratio of $\frac{A}{B}=\frac{C\times A}{C\times B}=\frac{D\times A}{D\times B}$, &c.

155. *Cor.* 7. Proportions, which are the ſame to the ſame proportion, are the ſame to one another. If A : B :: C : D; and A : B :: E : F; then C : D :: E : F. For $\frac{A}{B}=\frac{D}{C}$; and $\frac{A}{B}=\frac{E}{F}$ (144). Then $\frac{C}{D}=\frac{E}{F}$.

156. *Cor.* 8. If two ratios or products are equal, their like multiples, either by the ſame or by equal quantities, or by equal ratios, are alſo equal.

That is, if $\frac{A}{B}=\frac{C}{D}$: Then $\frac{A\times E}{B\times E}=\frac{C\times E}{D\times E}$.

And if E = F: Then $\frac{A\times E}{B\times E}=\frac{C\times F}{D\times F}$.

And if $\frac{E}{F}=\frac{G}{H}$: Then $\frac{A\times E}{B\times F}=\frac{C\times G}{D\times H}$.

For in either caſe, the ratios may be conſidered as quantities.

157. *Equal quantities,* A *and* B, *have the ſame ratio or proportion to another quantity* C. *And any quantity has the ſame ratio to equal quantities.*—That is, if A = B: Then A : C :: B : C. And C : A :: C : B. Since A = B; then C is the like multiple, or part, of B, as it is of A. And A : B :: C : C (151). Therefore A : C :: B : C. Alſo C : C :: A : B (151). Therefore C : A :: C : B.

158. *Cor.* 1. Hence, when the antecedents are equal, the conſequents are equal; and the contrary.

159. *Cor.* 2. Quantities are equal, which have the ſame ratio to another quantity: or to like multiples or parts of another quantity. Thus, if A : C :: B : C. Then A = B.

160. *Cor.* 3. Since A : C :: B : C; and C : A :: C : B. Therefore, when four quantities are in proportion, As antecedent is to conſequent, ſo is antecedent to conſequent. Then ſhall the firſt conſequent be to its antecedent, as the ſecond conſequent to its antecedent: and this is called *the inverſion of ratios.*

161. *In two, or more, ſets of proportional quantities, the rectangles under the like terms are proportional.*—That is, If A : B :: C : D; and E : F :: G : H.
Then A×E : B×F :: C×G : D×H.

Since $\frac{A}{B}=\frac{C}{D}$; and $\frac{E}{F}=\frac{G}{H}$.

Therefore $\frac{A\times E}{B\times F}=\frac{C\times G}{D\times H}$.

Conſequently A×E : B×F :: C×G : D×H.

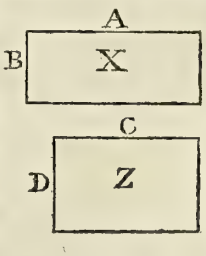
162. *In four proportional quantities* A : B :: C : D. *Then the rectangle or product of the two extremes is equal to the rectangle or product of the two means.*—That is, A×D = B×C.
Since A : B :: C : D, by ſuppoſition;

Therefore $\frac{A}{B}=\frac{C}{D}$ (144).

And $\frac{A}{B}=\frac{A\times D}{B\times D}$ (156). Alſo $\frac{C}{D}=\frac{C\times B}{D\times B}$ (156).

Therefore $\frac{A\times D}{B\times D}=\frac{C\times B}{D\times B}$ (46), where the conſequents are equal. Conſequently A×D = C×B (158).

163. Hence, if the rectangle or product of two quantities is equal to the rectangle or product of other two quantities; thoſe four quantities are proportional. Thus, ſuppoſe the two rectangles, X, Z, are equal; where A, C, are their lengths, and B, D, their breadths. Then A×B = C×D by ſuppoſition. Therefore A : C :: D : B. That is, As the length of X is to the length of Z, ſo the breadth of Z is to the breadth of X. In ſuch caſes the lengths are ſaid to be to one another reciprocally, as their breadths. Or that proportion A : C :: D : B is reciprocal, when A×B = C×D.



164. *If four quantities are proportional, then will either of the extremes, and the ratio of the product of the means to the other extreme,*

extreme, be in the ratio of equality: and either mean, and the ratio of the product of the extremes to the other mean, will be also in a ratio of equality.—That is, if A : B :: C : D;

Then $A=\frac{B\times C}{D}$. And $B=\frac{A\times D}{C}$.

Since A : B :: C : D, by supposition;

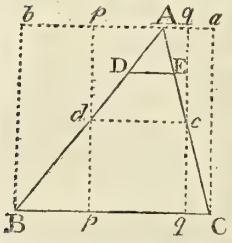
Therefore $A\times D=B\times C$ (162).

And $\frac{A\times D}{C}=\frac{B\times C}{C}$ (157). Also $\frac{B\times C}{D}=\frac{A\times D}{D}$ (157).

But $B=\frac{B\times C}{C}$ (149). And $A=\frac{A\times D}{D}$ (149).

Therefore $\frac{A\times D}{C}=B$. And $\frac{B\times C}{D}=A$ (46).

165. *In any plane triangle,* ABC, *any two adjoining sides,* AB, AC, *are cut proportionally by a line* DE, *drawn parallel to the other side* BC, *viz.* AD : DB :: AE : EC.



Through B and C draw B*b*, C*a*, at right angles to BC, meeting *ba*, drawn through A, parallel to BC: Through *p*, *q*, the middles of A*b*, A*a*, draw *pp*, *qq*, parallel to B*b* or C*a*, meeting AB, AC, in the points *d*, *c*, and join *dc*. Now the triangles A*dp*, B*dp*, and A*cq*, C*cq*, are congruous.

Therefore A*d*=B*d*, A*c*=C*c*, *pd*=*pd*, *qc*=*qc*.

But *pp*=*qq* (116). Therefore *pd*=*qc*.

And *dc* is parallel to BC.

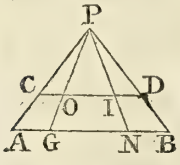
In the same manner it may be shewn, that lines parallel to B*b*, drawn through the middles of A*p*, *pb*; A*q*, *qa*; will also bisect A*d*, B*d*; A*c*, C*c*; and that lines joining these points of bisection will also be parallel to BC. And the same may be proved at any other bisections of the segments of the lines AB, AC. Also the like may be readily inferred at any other divisions of the lines A*b*, A*a*. Therefore lines parallel to BC, cut off like parts from the lines AB, AC.

Then AB:AC::AD:AE. And AB:AC:BD:CE (151).

Therefore AD : AE :: BD : CE (155).

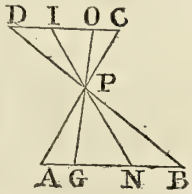
And by alternation, AD : BD :: AE : CE (145).

Cor. Hence, when the sides AB, AC, of a triangle are cut proportionally in D, E, the segments AD, AE; DB, EC; of those sides, are proportional to the sides. And the line DE, drawn to those sections, is parallel to the other side BC.

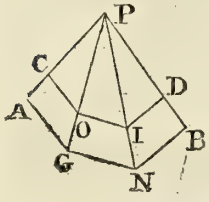


166. *If several right lines meeting, or intersecting each other in a point* P, *are cut by two parallel lines* AB, CD; *the intercepted segments will be respectively proportional.*

AG : CO :: GN : OI :: NB : ID, &c.

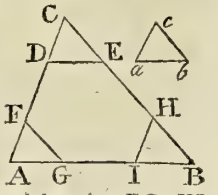


For the triangles APG, CPO; GPN, OPI; NPB, IPD, are respectively equi-angular, and therefore similar; hence AG : CO :: GP : OP :: GN : OI :: NP : IP :: NB : ID, &c. therefore AG : CO :: GN : OI :: NB : ID, &c.



Corol. Hence it is evident, if AG, GN, &c. and CO, OI, &c. are not in the same continued right lines, but respectively parallel as before, that CO, OI, ID, &c. will be in the same proportion as AG, GN, NB, &c.

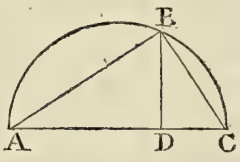
167. *In equiangular triangles,* ABC, *abc, the sides about the equal angles are proportional; and the sides opposite to equal angles are also proportional.*—In CA, CB, take CD=*ca*, CE=*cb*; and draw DE; then the triangles CDE, *cab*, being congruous (99), the ∠CDE=(∠*a*=)∠A. Therefore DE is parallel to AB (95). In the same manner, taking AF=*ac*, AG=*ab*; also BH=*bc*, BI=*ba*; and drawing FG, HI, the triangles AGF, IBH, *abc*, are congruous; therefore FG is parallel to CB, and HI is parallel to CA.



Then (CD=) *ca* : CA :: (CD=) *cb* : CB.
(AF=) *ca* : CA :: (AG=) *ab* : AB.
(BH=) *bc* : BC :: (BI=) *ab* : AB.

168. *Cor.* Hence, triangles having one angle in each equal, and the sides about those equal angles proportional, those triangles are equiangular and similar.

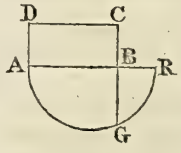
169. *In a right-angled triangle,* ABC, *if a line* BD, *be drawn from the right angle* B, *perpendicular to the opposite side,* AC; *then will the triangles* ABD, BCD, *on each side the perpendicular, be similar to the whole* ABC, *and to one another.*—For in the triangles ABC, ADB, the ∠A is common; and the right angle ABC = right angle ADB. Therefore the remaining ∠C=∠ABD. In the same manner it will appear, that the triangles ABC, BDC, are like; therefore the triangles ABD, BCD, are also similar.



170. *Cor.* 1. Hence, AC : AB :: AB : AD.
AC : BC :: BC : DC.
AD : DB :: DB : DC.

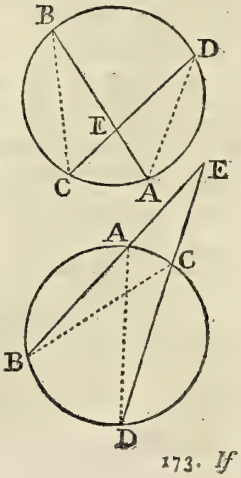
Cor. 2. Hence a right line BD, drawn from a circumference of a circle perpendicular to the diameter AC, is a mean proportional between the segments AD, DC, of the diameter; and AD × DC = DB²; for a circle, the diameter of which is AC, will pass through A, B, C. (131.)

Scholium. This corollary includes what is usually called one of the chief properties of the circle, namely:—The square of the ordinate is equal to the rectangle under the two abscissas.—Here, the ordinate is the perpendicular BD; and the two abscisses are the two segments AD, DC, of the diameter AC.



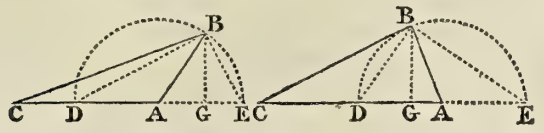
171. *To make a square equal to a given rectangle* ABCD.—Extend AB till BR=BC, and on AR describe a semicircle; then produce CB to G; and the square on BG will be equal to the rectangle under AB, BR, or BC.

172. *In a circle, if two chords,* AB, CD, *intersect each other in* E, *either within the circle, or without, by prolonging them; then the rectangle under the segments, terminated by the circumference and their intersection, will be equal.*—That is, AE×EB=CE×ED. Draw the lines BC, DA; then the triangles DEA, BEC, are similar; for the angle at E is equal (93), or common; and the ∠D=∠B, as standing on the same arc AC (129); then the other angles are equal (98). Therefore AE : CE :: ED : EB (167); consequently AE×EB=CE×ED (162).



173. *If*

173. *If with the leaſt ſide* AB *of a given triangle* ABC, *a ſemicircle be deſcribed from the angular point* A; *meeting the ſide* AC, *produced in the points* D, E; *and from* B, *the lines* BE, BD, *be drawn, and alſo* BG *perpendicular to* DE: *then the values of the ſeveral lines* AG, CG, GE, GD, BE, BD, BG, *may be expreſſed in terms of the ſides of the triangle* ABC, *as follow.*



174. $AG=\frac{\overline{BC}^2-\overline{AC}^2-\overline{AB}^2}{2AC}$.

Or $AG=\frac{\overline{AC}^2+\overline{AB}^2-\overline{BC}^2}{2AC}$.

175. $CG=\frac{\overline{AC}^2-\overline{AB}^2+\overline{BC}^2}{2AC}$. For $CG=AC+AG$, or to $AC-AG$.

And $AC+AG=AC\pm\frac{\overline{BC}^2-\overline{AC}^2-\overline{AB}^2}{2AC}$.

$$=\frac{2\overline{AC}^2+\overline{BC}^2-\overline{AC}^2-\overline{AB}^2}{2AC}.$$

176. $GE=\frac{2H\times H-CB}{2AC}$; here $2H=AC+AB-BC$.

For $GE=AB(AE)\pm AG=AB+\frac{\overline{AC}^2+\overline{AB}^2-\overline{BC}^2}{2AC}$.

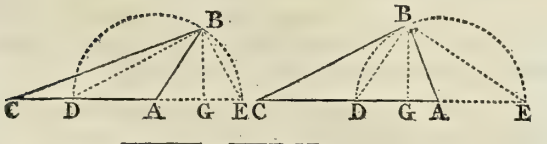
$$=\frac{2AC\times AB+\overline{AC}^2+\overline{AB}^2-\overline{AC}^2}{2AC}.$$

But $2AC\times AB+\overline{AC}^2+\overline{AB}^2=(\overline{AC+AB}^2=)\overline{CE}^2$.

Then $GE\left(=\frac{\overline{CE}^2-\overline{BC}^2}{2AC}\right)=\frac{\overline{CE+BC}\times\overline{CE-BC}}{2AC}$.

$$=\frac{\overline{CA+AB+BC}\times\overline{CA+AB-BC}}{2AC}.$$

$$=\frac{2H\times\overline{2H-2BC}}{2AC}=\frac{2H\times\overline{H-BC}}{AC}.$$



177. $GD=\frac{\overline{H-AC}\times\overline{2H-2AB}}{AC}$. Here $2H=AC+AB+BC$.

For $GD=AD\mp AG=AB\mp AG=AB-\frac{\overline{AC}^2-\overline{AB}^2+\overline{BC}^2}{2AC}$.

$$=\frac{2AC\times AB-\overline{AC}^2-\overline{AB}^2+\overline{BC}^2}{2AC}.$$

$$=\frac{\overline{AC-AB}^2+\overline{BC}^2}{2AC}=\frac{\overline{BC}^2-\overline{CD}^2}{2AC}.$$

$$=\frac{\overline{BC-CD}\times\overline{BC+CD}}{2AC}\ (119).$$

$$=\frac{\overline{BC+AB-AC}\times\overline{BC+AC-AB}}{2AC}.$$

$$=\frac{\overline{2H-2AC}\times\overline{2H-2AB}}{2AC}.$$

178. $BE=\sqrt{\frac{AB}{AC}\times 2H\times\overline{H-CB}}$.

For $\overline{BE}^2=DE\times GE$ (170).

$$=2AB\times\frac{\overline{CE}^2-\overline{BC}^2}{2AC}\ (176).\ \text{Therefore}$$

$$BE=\sqrt{\frac{2AB}{2AC}\times\overline{\overline{CE}^2-\overline{BC}^2}}=\sqrt{\frac{AB}{AC}\times 2H\times\overline{H-CB}}.$$

179. $BD=\sqrt{\frac{AB}{AC}\times\overline{H-AC}\times\overline{2H-2AC}}$.

For $\overline{BD}^2=DE\times GD$ (170).

$$=2AB\times\frac{\overline{BC}^2-\overline{CD}^2}{2AC}\ (177).$$

Therefore $BD=\sqrt{\frac{2AB}{2AC}\times\overline{\overline{BC}^2-\overline{CD}^2}}$ (177).

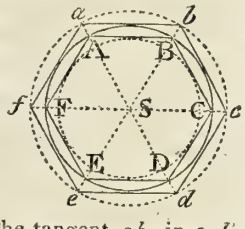
180. $BG=\frac{2}{AC}\times\sqrt{H\times\overline{H-CB}\times\overline{H-AC}\times\overline{H-AB}}$.

For $\overline{BG}^2=GE\times GD$. Therefore $BG=\sqrt{GE}\times\sqrt{GD}$.

And $GE=\frac{2}{AC}\times H\times\overline{H-CB}$. $GD=\frac{2}{AC}\times\overline{H-AC}\times\overline{H-AB}$.

181. *Corol.* Hence is derived the rule uſually given for finding the area, or ſuperficial content, of a triangle, the three ſides being known.—1ſt. From half the ſum of the three ſides, ſubtract each ſide ſeverally, noting the three remainders. 2d. Multiply the ſaid half ſum, and the three noted remainders continually. 3d. The ſquare root of the product is the area of the triangle.

182. *If a regular polygon,* ABCDEF, *be inſcribed in a circle; and parallel to theſe ſides if tangents to the circle be drawn, meeting one another in the points* a, b, c, d, e, f; *then ſhall the figure formed by theſe tangents circumſcribe the circle, and be ſimilar to the inſcribed figure.*—Since the circle touches every ſide of the figure *abcdef*, by conſtruction; therefore the circle is circumſcribed by that figure. Through A and B, draw the radii SA, SB, prolonged till they meet the tangent *ab*, in *a*, *b*; then the triangles ASB, *a*S*b*, are equiangular; for the ∠ at S is common; and the other angles are equal, becauſe AB and *ab* are parallel, by ſuppoſition. Alſo S*a*=S*b*; for the triangles ASB, *a*S*b*, are iſoſceles (104). And the ſame may be proved of the other triangles; and alſo, that they are equal to one another; therefore the figure *abcdef* has equal ſides, and is equiangular to the figure ABCDEF. Now SA : S*a* :: AB : *ab*; and SA : S*a* :: AF : *af* (167); therefore AB : *ab* :: AF : *af*; and the like of the other ſides (155); conſequently the figures ABCDEF, *abcdef*, are ſimilar (145).



183. *Cor.* 1. If two figures are compoſed of like ſets of ſimilar triangles, thoſe figures are ſimilar.

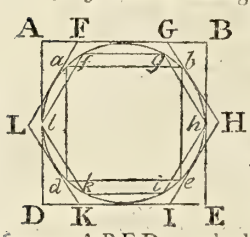
184. *Cor.* 2. Hence, if from the angles *a*, *b*, of a regular polygon circumſcribing a circle, lines *a*S, *b*S, be drawn to the centre S; the chord AB of the intercepted arc will be one ſide of a ſimilar polygon, inſcribed in the

the circle; and the ſides AB, *ab*, of the inſcribed and circumſcribing polygons will be parallel.

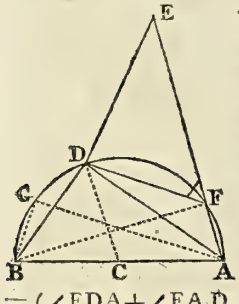
185. *Cor.* 3. The chords or tangents of like arcs in different circles, are in the ſame proportion as the radii of thoſe circles. For if a circle circumſcribe the polygon *abcdef*; then the ſides of the polygon *abcdef*, ABCDEF, are chords of like arcs in their reſpective circumſcribing circles. And if a circle be inſcribed in the polygon ABCDEF, the ſides AB, *ab*, &c. are tangents of like arcs alſo: and theſe have been ſhewn to be proportional to their radii SA, S*a*.

186. *Cor.* 4. The perimeters of like polygons (or the ſum of their ſides) are to one another as the radii of their inſcribed or circumſcribed circles; for SA : S*a* :: AB : *ab* (182); and AB, *ab*, are like parts of the perimeters of their polygons; therefore SA : S*a* :: perimeter ABCDEF : perimeter *abcdef* (151).

187. *If there be two regular and like polygons applied to the ſame circle, the one inſcribed and the other circumſcribed: then will the circumference of that circle, and half the ſum of the perimeters of thoſe polygons, approach nearer to equality, as the number of ſides in the polygons increaſe.*—It is evident at ſight, that the circumſcribing hexagon FGHIKL is leſs than the circumſcribing ſquare ABED; and alſo that the inſcribed hexagon *fghikl* is greater than the inſcribed ſquare *abcd*. And in both caſes, the difference between the hexagon and the circle is leſs than the difference between the circle and the ſquare; therefore the polygon, whether inſcribed or circumſcribed, differs leſs from the circle, as the number of its ſides is increaſed. And when the number of ſides in both is very great, the perimeters of the polygons will nearly coincide with the circumference of the circle; for then the difference of the polygonal perimeters becomes ſo very ſmall, that they may be eſteemed as equal. And yet ſo long as there is any difference between theſe polygons, though ever ſo ſmall, the circle is greater than the inſcribed, and leſs than the circumſcribed, polygons: therefore half their ſums may be taken for the circumference of the circle, when the number of thoſe ſides is very great. Hence, the circumferences of circles are in proportion to one another, as the radii of thoſe circles, or as their diameters. For the perimeters of the inſcribed and circumſcribing polygons are to one another, as the radii of the circles (186). And theſe perimeters and circumferences continually approach to equality.



189. *In a circle* AFB, *if lines*, BA, DA, FA, *be drawn from the extremities of two equal arcs*, BD, DF, *to meet in that point* A *of the circumference determined by one of them*, BA, *paſſing through the centre; then ſhall the middle line* AD, *be a mean proportional between the the ſum* AB+AF *of the extreme lines, and the radius* BC *of that circle.*—On D, with the diſtance DA, cut AF produced in E. Then drawing DE, DF, DB, the triangles ADB, EDF, are congruous (102). For ∠EFD = (∠FDA+∠FAD (96) =) ∠DBA (128). Becauſe the arc DFA = DF+FA. And ∠E = ∠FAD (104) = ∠DAB, by conſtruction; and DE = DA. Therefore EF = AB; and AE = AB+AF. Draw CD; then the triangles ACD, ADE, are ſimilar. For they are iſoſceles and equiangular. Therefore AC : AD :: AD : (AE =) AB+AF.



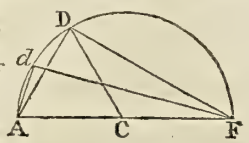
190. Hence, whence the radius of the circle is expreſſed by 1, and one of the extreme lines, or chords, paſſes through the centre; then if the number 2 be added to the other extreme chord, the ſquare root of that ſum will be equal to the length of the mean chord. For ſince AC : AD :: AD : AB+AF (189). Therefore $\overline{AD}^2 = AC \times \overline{AB \times AF}$ (162). Now if AC = 1, then AB = 2; and $\overline{AD}^2 = 2 + AF$; becauſe multiplying by 1 is uſeleſs here. Therefore $AD = \sqrt{2+AF}$.

As the arcs BD and DFA make a ſemicircle, they are called the ſupplements of one another; therefore if the arc BD is any part (as, $\frac{1}{3}$, $\frac{1}{6}$, $\frac{1}{15}$, &c.) of the ſemicircumference; then is the line DA called the ſupplemental chord of that part.

191. *Remark.* In the poſthumous works of the marquis de l'Hôpital, (page 319, Engliſh edition,) this principle is applied to the doctrine of angular ſections; that is, to the dividing of a given arc into any propoſed number of equal parts; or the finding of the chord of any propoſed arc. For if BF was any aſſumed arc, the chord of which had a known ratio to the given radius BC; then as BFA is a right-angled triangle (130), the ſide $AF = \sqrt{\overline{AB}^2 - \overline{BF}^2}$ (113) will alſo be known. And by this theorem the mean chord AD will be known; and alſo DB ($= \sqrt{\overline{AB}^2 - \overline{AD}^2}$) the chord of half the arc BF will alſo be known.

And by biſecting the arc DB in G, and drawing AG, GB, the mean chord AG is known (189); and GB ($= \sqrt{\overline{AB}^2 - \overline{AG}^2}$) is alſo given. And in this manner, by a continual biſection, the chord of a very ſmall arc may be obtained; the practice of which is facilitated by our article 190, deduced from page 330 of the ſaid work.

192. *Required the chord of the* $\frac{1}{3072}$ *part of the circumference of a circle, the radius of which is* 1; *or, required the ſide of a regular polygon of* 3072 *ſides, inſcribed in a circle, the diameter of which is* 2.—Let ADF be a ſemicircle, the diameter AF = 2, and centre C. Take the arc AD = $\frac{1}{3}$ of the ſemicircumference, or equal to 60°; and draw DC, DA, DF. Let *d* repreſent the point where the arc is biſected; *d*F the ſupplemental chord to that biſection: and let the marks *d*, *d*″, *d*‴, *d*ᵛ, &c. expreſs the biſected points agreeable to the number of biſections.



193. Now ſince ∠ACD = 60°,
Therefore ∠CAD+∠ADC = (180°−60° =) 120° (98).
But ∠CAD = ∠ADC (104); then ∠CAD = ($\frac{120}{2}$ =) 60°.
Therefore DA = (DC = AC =) 1. And as the triangle ADF is right-angled at D (130), then DF = $(\sqrt{\overline{AF}^2 - \overline{AD}^2}$ (113) $= \sqrt{4-1} =) \sqrt{3} = 1{,}7320508075688773$
Therefore the ſupplemental chord of the arc AD, or of

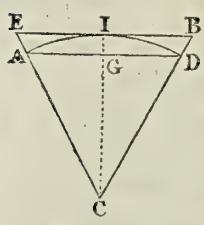
$\frac{1}{3}$ of the ſemicircumference is	F*d* $= \sqrt{3}$	$= 1{,}7320508075688773$
$\frac{1}{6}$ of the ſame (190) is	F*d*′ $= \sqrt{2+Fd}$	$= 1{,}9318516525781366$
$\frac{1}{12}$	F*d*″ $= \sqrt{2+Fd'}$	$= 1{,}9828897227476208$
$\frac{1}{24}$	F*d*‴ $= \sqrt{2+Fd''}$	$= 1{,}9957178464772070$
$\frac{1}{48}$	F*d*ᵛ $= \sqrt{2+Fd'''}$	$= 1{,}9989291749527313$
$\frac{1}{96}$	F*d*ᵛ $= \sqrt{2+Fd^{iv}}$	$= 1{,}9997322758191236$
$\frac{1}{192}$	F*d*ᵛⁱ $= \sqrt{2+Fd^{v}}$	$= 1{,}9999330678348022$
$\frac{1}{384}$	F*d*ᵛⁱⁱ $= \sqrt{2+Fd^{vi}}$	$= 1{,}9999832668887013$
$\frac{1}{768}$	F*d*ᵛⁱⁱⁱ $= \sqrt{2+Fd^{vii}}$	$= 1{,}9999958167178004$
$\frac{1}{1536}$	F*d*ⁱˣ $= \sqrt{2+Fd^{viii}}$	$= 1{,}9999989541791767$

Now

Now Fd^{ix}, the ſupplemental chord of $\frac{1}{1536}$, being known, the chord Ad^{ix} of $\frac{1}{1536}$, part of the ſemicircumference, or of $\frac{1}{3072}$, part of the whole circumference, is alſo known. That is, $Ad^{ix}=$

$$(\sqrt{AF^2-Fd^{ix}{}^2}=)\sqrt{4-2+Fd^{viii}}=0,0020453073606764$$

194. Conſequently, the ſide of a regular polygon of 3072 ſides, inſcribed in a circle whoſe diameter is 2, is 0,0020453073606764



195. *The ſide of a ſimilar polygon circumſcribing the ſame circle, the centre of which is* C, *may be thus found.*—Let BE be the ſide of the circumſcribed polygon; and draw BC, EC, cutting the circle in D and A. Draw DA, and it will be the ſide of the inſcribed polygon; and is parallel to BE (184). Draw CI biſecting the angle BCE, and it will biſect BE and DA at right angles (103). And $DG=(\frac{1}{2}DA=)\frac{1}{2}Ad^{ix}$.

Then $CG=\sqrt{CD^2-DG^2}=\sqrt{1-Ad^{ix}{}^2}$.

But $\frac{1}{2}Ad^{ix}=$	0,00102265368033 8
And its ſquare is	0,00000104582055
Which ſubtracted from 1, leaves	0,99999895417945
Whoſe ſquare root, or CG, is equal to	0,99999947708959

Now the triangles CBI, CDG, are ſimilar.
Then CG : CI :: 2DG : 2BI. Therefore

$$(2BI=)\ BE=(\frac{2DG\times CI}{CG}(164)=)\frac{DA}{CG};\ \text{for IC}=1.$$

$$\text{Or BE}=\frac{0,0020453073606764}{0,9999994770895883}=0,0020453084301895,$$

which is the ſide of a regular polygon of 3072 ſides, circumſcribing a circle the diameter of which is 2.

196. *Scholium.* The ſide of a regular polygon of 3072 ſides, inſcribed in a circle, the diameter of which is 2, is 0,0020453073606764,
Which multiplied by 3072, will give the perimeter of that polygon, which is 6,2831842119979622.
The ſide of a ſimilar polygon, circumſcribing the ſame circle, is 0,0020453084301895.
Which multiplied by 3072, will give for the perimeter of that polygon 6,2831874973420925.
The ſum of theſe perimeters is 12,5663717093400547.
The half ſum is 6,28318585, &c.

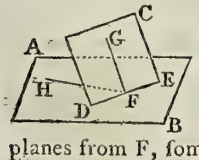
Which is very nearly equal to the circumference of a circle, the diameter of which is 2 (187), the difference between it
and the inſcribed polygon being only 0,00000164, &c.
and the circumſcribed polygon being only 0,00000164, &c.

197. Now the circumferences of circles being in the ſame proportion as their diameters (188);
Therefore the diameter of a circle being 1,
The circumference will be 3,141592, &c. which agrees with the circumference as found by other methods.

Of PLANES and SOLIDS.

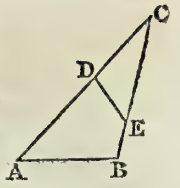
Definitions and Principles.

198. A line is ſaid to be in a plane, when it paſſes through two or more points in that plane, and the common ſection of two planes is a line which is in both of them.

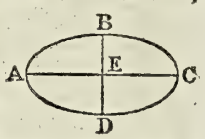


199. The inclination of two meeting planes AB, CD, is meaſured by an acute angle GFH, made by two right lines FG, FH, one in each plane, and both drawn perpendicular to the common ſection DE, of theſe planes from F, ſome point in it.

200. A right line DE interſecting two ſides AC, BC, of a triangle ABC, ſo as to make angles CDE, CED, within the figure, equal to the angles CBA, CAB, at the baſe AB, but with contrary ſides of the triangle, is ſaid to be in a ſubcontrary poſition to the baſe.

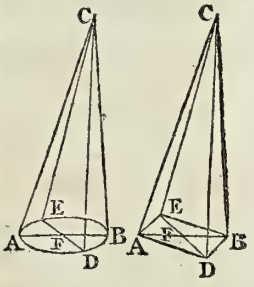


201. If a circle in an oblique poſition be viewed, it will appear of an oval form, as ABCD; that is, it will ſeem to be longer one way, as AC, than another, as DB; nevertheleſs the radii EA, EB, are to be eſteemed as equal. And the ſame muſt be underſtood in viewing any regular figure, when placed obliquely to the eye.



202. If a line be fixed to any point C above the plane of a circle ADBE, and this line while ſtretched be moved round the circle, ſo as always to touch it; then a ſolid which would fill the ſpace paſſed over by the line, between the circle and the point C, is called a *cone*.

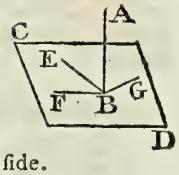
203. If the figure ADBE had been a polygon, and the ſtretched line had moved along its ſides, the figure which would then have been deſcribed, is called a *pyramid*. So that cones and pyramids are ſolids which regularly taper from a circle, or polygon, to a point. The circle or polygon is called the *baſe*; and the point C the *vertex*.



When the vertex is perpendicularly over the middle or centre of the baſe, then the ſolid is called a *right cone*, or a *right pyramid*; otherwiſe an *oblique cone*, or *oblique pyramid*.

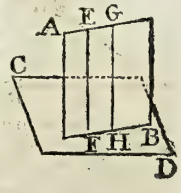
204. If a cone or pyramid be cut by a plane paſſing through the vertex C, and centre of the baſe F, the ſection ABC, or EDC, is a triangle.

205. A right line AB, is perpendicular to a plane CD, when it makes right angles ABE, ABF, ABG, with all the right lines BE, BF, BG, drawn in that plane to touch the ſaid right line AB.



206. So that from the ſame point B, in a plane, only one perpendicular can be drawn to that plane on the ſame ſide.

207. A plane AB, is perpendicular to a plane CD, when the right lines EF, GH, drawn in one plane AB, at right angles to FB, the common ſection of the two planes, are alſo at right angles to the other plane CD.

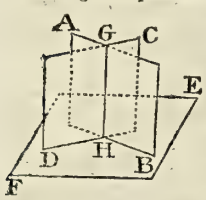


208. So that a line EF, perpendicular to a plane CD, is in another plane AB, and at right angles to BF, the common ſection of the two planes.

209. *If two planes* AB, BC, *cut each other, their common ſection* BD *will be a right line.*—For if it be not, draw a right line DEB in the plane AB, from the point D to the point B; alſo draw a right line DFB in the plane BC. Then two right lines DEB and DFB, have the ſame terms,

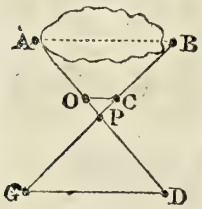
terms, and include a ſpace or figure, which is abſurd. Therefore D E B and D F B are not right lines; neither can any other lines drawn from D to B, beſides B D, be right lines. Conſequently the line D B, the common ſection of the planes, is a right line.

210. *If two planes* A B, C D, *which are both perpendicular to a third plane* E F, *cut one another; their interſection* H G *is at right angles to that third plane* E F.—For the common ſection of A B and C D is a right line G H (209). Alſo H B, H D are the common ſections of AB, CD, with the plane E F. Now from the point H, a line HG drawn perpendicular to the plane E F, muſt be at right angles to HB, HD (205). But H G muſt be in both planes AB, C D (208). Therefore it muſt be in the common ſection of thoſe planes. Conſequently the ſection HG of the planes A B, C D, is at right angles to the plane E F.



METHODS of determining DISTANCES by means of ſimilar TRIANGLES traced on the GROUND.

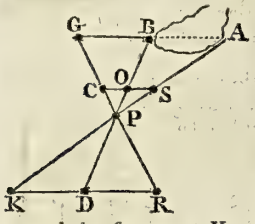
211. *To find the length of the line* AB *acceſſible only at both ends.*—Having fixed on ſome convenient point P, meaſure BP and AP; and prolong thoſe lines till PG=PB, and PD=PA; then the diſtance between the points D and G will be equal to AB. For the ſides of the triangles GPD, BPA, about the equal angles at P, are reſpectively equal, therefore the third ſides GD, BA, will alſo be equal.



Or thus:—Having meaſured PB, PA, (as before,) take PC ſome convenient aliquot part of PB, and PO the ſame aliquot part of PA; then meaſure the croſs diſtance OC, which will be the like aliquot part of the required diſtance AB. For the ſides PO, PA; PC, PB, being proportional, the triangles OPC, APB, will be ſimilar; hence PO : PA :: OC : AB; therefore whatever part PO is of PA, the like OC will be of AB.

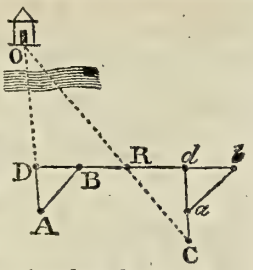
Suppoſe PA=392, and PB=414 feet; and let PO, PC, be $\frac{1}{5}$ of PA, PB, or equal to 78f. 5in. and 82f. $9\frac{1}{2}$in. And ſuppoſe OC meaſures $93\frac{1}{2}$ feet; then AB=$93\frac{1}{2}\times 5$ =$467\frac{1}{2}$ feet.

212. *When the line* (AB) *is acceſſible at one end* (B) *only.*—We ſuppoſe ſome object at the inacceſſible end A: and let a mark be ſet up at B; then in the direction AB take BG (the longer the better), and through a convenient point P, as in the preceding problem, let the diſtances BD, GR, be meaſured ſo that PD =PB, and PR=PG; then if a mark be ſet up at K, the interſection of AP, and RD, when produced, DK will be equal to AB. For the triangles PBG, PDR, being ſimilar and equal in all reſpects, the triangles PBA, PDK, will alſo be ſimilar and equal. Or, BA may be found without the diſtances PD, PR, thus: take PC, PO, like aliquot parts of PG, PB; then SO will be the ſame aliquot part of BA. For PO : PB :: OS : BA.



Suppoſe PB=442, PG=464 feet; and that PO= $110\frac{1}{2}$, PC=116 feet ($\frac{1}{4}$ of PB and PG); alſo, ſuppoſe OS meaſures 113 feet; then BA=452 feet; for $110\frac{1}{2}$: 442 :: 113 : 452.

213. *Let* O *be an object on the oppoſite ſide of a river; to find the diſtance* DO.—Lay down an iſoſceles triangle DBA, the ſide DB being in any convenient direction; then having meaſured a baſe DR, ſet up a mark at R; and in the ſame direction take another baſe R*d*, and make the triangle *dba* ſimilar and equal to DBA (*da* being parallel and equal to DA); then find the concourſe (C) of the lines ORC, *da*C, and meaſure *d*C. By ſimilar triangles, R*d* : *d*C :: RD : DO.



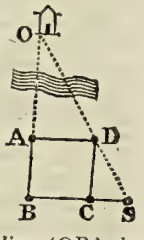
Suppoſe DR=300, R*d*=80, and *d*C=$273\frac{1}{3}$ feet, then 80 : $273\frac{1}{3}$ :: 300 : 1014 feet nearly = DO.

214. But the moſt expeditious method of finding the diſtance to an inacceſſible object, is by means of a rhombus, as follows:

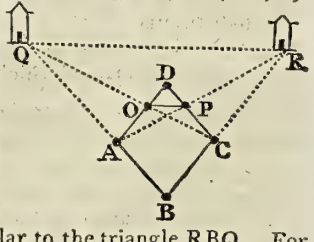
Suppoſe O *the object, and* OB *the required diſtance.*—With a line or meaſuring tape, whoſe length is equal to the ſide of the intended rhombus, lay down one ſide BA in the direction BO, and let BC, another ſide, be in any convenient direction: faſten two ends of two of thoſe lines at C and A, then the other ends (at D) being kept together, and the lines ſtretched on the ground, thoſe lines AD, CD, will form the other two ſides of the rhombus. Set up a mark at R where CO, AD, interſect; and meaſure RD. Then the ſides of the triangles RDC, CBO, being reſpectively parallel, the triangles will be ſimilar; hence, RD : DC :: CB : BO. Suppoſe the ſide of the rhombus is 100 feet, and RD=11f. 7in. then $11\frac{7}{12}$: 100 :: 100 : 863 feet nearly = BO.

Or thus: Having laid down the rhombus, mark the concourſe of the lines ODS, BCS, and meaſure CS; then CS : CD :: AD : AO.

If the ground be nearly level, a rhombus whoſe ſide is 100 feet, will determine diſtances to the extent of 300 yards, within a very few feet of the truth.



215. *To find the length of an inacceſſible line* (QR) *by means of a rhombus.*—At ſome convenient point B, lay down the rhombus (BADC) ſo that two of its ſides BA, BC are directed to the extremities of the line. Mark the interſections O and P, (as in the firſt caſe of the preceding problem;) then the triangle ODP will be ſimilar to the triangle RBQ. For each of the rectangles DO×BQ, DP×BR, being equal to the ſquare on the ſide of the rhombus (as in the preceding prob.) they muſt therefore be equal to each other, or DO×BQ=DP×BR; therefore DO : DP :: BR : BQ; and ſince the angles at D and B are equal, the triangles ODP, RBQ will be ſimilar. Therefore OD : OP :: RB : RQ.



Suppoſe OD=9f. 5in. PD=11f. 10in. OP=13f. 7in. and the ſide of the rhombus = 100 feet;

then $11\frac{10}{12}$: 100 :: 100 : $\frac{10000}{11\frac{10}{12}}$ = RB; therefore

$9\frac{5}{12}$(OD) : $13\frac{7}{12}$(OP) :: $\frac{10000}{11\frac{10}{12}}$(RB) : $\frac{10000\times 13\frac{7}{12}}{9\frac{5}{12}\times 11\frac{10}{12}}$ = 1219 feet = RQ.

Therefore

Therefore the inacceſſible diſtance RQ, is found by multiplying the ſquare of the ſide of the rhombus by OP, and dividing that product by the product of OD and PD.

APPLICATION OF ALGEBRA TO GEOMETRY.

If it be propoſed to reſolve a geometrical problem algebraically, or by algebra, it is proper, in the firſt place, to draw a figure that ſhall repreſent the ſeveral parts or conditions of the problem, and to ſuppoſe that figure to be the true one. Then, having conſidered attentively the nature of the problem, the figure is next to be prepared for a ſolution, if neceſſary, by producing or drawing ſuch lines in it, as appear moſt conducive to that end. This done, the uſual ſymbols or letters for known and unknown quantities, are employed to denote the given parts of the figure, or as many of them as neceſſary, as alſo ſuch unknown line or lines as may be eaſieſt found, whether required or not. Then proceed to the operation, by obſerving the relations that the ſeveral parts of the figure have to each other; from which, and the proper theorems in the foregoing elements of geometry, make out as many equations, independent of each other, as there are unknown quantities employed in them; the reſolution of which equations, in the ſame manner as in arithmetical problems, will determine the unknown quantities, and reſolve the problem propoſed.

As no general rule can be given for drawing the lines, and ſelecting the fitteſt quantities to ſubſtitute for, ſo as always to bring out the moſt ſimple concluſions, becauſe different problems require different methods of ſolution; the beſt way to gain experience in this matter is, to try the ſolution of the ſame problem in different ways, and then apply that which ſucceeds beſt to other caſes of the ſame kind, when they afterwards occur. The following inſtructions, however, may be of ſome uſe to the learner, viz.

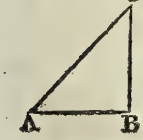
In preparing the figure, by drawing lines, let them be either parallel or perpendicular to other lines in the figure, or ſo as to form ſimilar triangles. And if an angle be given, it will be proper to let the perpendicular be oppoſite to that angle, and to fall from one end of a given line, if poſſible.

In ſelecting the quantities proper to ſubſtitute for, thoſe are to be choſen, whether required or not, which lie neareſt the known or given parts of the figure, and by means of which, the next adjacent parts may be expreſſed by addition and ſubtraction only, without the intervention of ſurds.

When two lines or quantities are alike related to other parts of the figure or problem, the beſt way is, not to make uſe of either of them ſeparately, but to ſubſtitute for their ſum, or difference, or rectangle, or the ſum of their alternate quotients, or for ſome line or lines, in the figure, to which they have both the ſame relation.

When the area, or the perimeter, of a figure, is given, or ſuch parts of it as have only a remote relation to the parts required; it is ſometimes of uſe to aſſume another figure ſimilar to the propoſed one, having one ſide equal to unity, or ſome other known quantity. For, from hence the other parts of the figure may be found, by the known proportions of the like ſides, or parts, and ſo an equation be obtained.—The following problems may ſerve to illuſtrate what has been ſtated above.

216. *In a right-angled triangle, having given the baſe, and the ſum of the hypothenuſe and perpendicular; to find both theſe two ſides.*—Let ABC repreſent the propoſed triangle, right-angled at B. Put the baſe AB=3=*b*, and the ſum AC+BC of the hypothenuſe and perpendicular =9=*s*; alſo, let *x* denote the perpendicular BC; hence it follows that the hypothenuſe AC will be expreſſed by *s*—*x*.



But $AC^2=AB^2+BC^2$ (by theor. 34, Geom.); that is, $(s-x)^2=b^2+x^2$, or $s^2-2sx+x^2=b^2+x^2$, or $s^2-b^2=2sx$; hence $x=\frac{s^2-b^2}{2s}=4=BC$, and $s-x=\frac{s^2+b^2}{2s}=5=AC$, the perpendicular and hypothenuſe as required.

217. *In a right-angled triangle, having given the hypothenuſe, and the ſum of the baſe and perpendicular; to find both theſe two ſides.*—Let ABC repreſent the propoſed triangle, right-angled at B. Put the given hypothenuſe AC=5=*a*, and the ſum AB+BC of the baſe and perpendicular =7=*s*; alſo, let *x* denote the baſe AB; hence it follows that the perpendicular BC will be expreſſed by *s*—*x*.

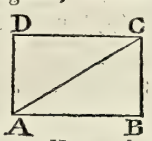
But $AC^2=AB^2+BC^2$ by the nature of right-angled triangles; that is, $a^2=x^2+(s-x)^2=x^2+s^2-2sx+x^2$, or $2x^2-2sx=a^2-s^2$, or $x^2-sx=\frac{1}{2}a^2-\frac{1}{2}s^2$; hence, by completing the ſquare, &c. is found $x=\frac{1}{2}s-\frac{1}{2}\sqrt{2a^2-s^2}=3=AB$; and $s-x=\frac{1}{2}s+\frac{1}{2}\sqrt{2a^2-s^2}=4=BC$; the baſe and perpendicular required.

Or, let *z* denote the difference of the baſe and perpendicular, the ſum being denoted by *s*, as above. Then, becauſe that in any two quantities half their difference added to half the ſum gives the greater quantity, and the ſame ſubtracted gives the leſs quantity, it follows, that $\frac{1}{2}s+\frac{1}{2}z$ and $\frac{1}{2}s-\frac{1}{2}z$ will denote the two legs, or the perpendicular and baſe. Hence then $a^2=(\frac{1}{2}s+\frac{1}{2}z)^2+(\frac{1}{2}s-\frac{1}{2}z)^2=\frac{1}{2}s^2+\frac{1}{2}z^2$; or $z^2=2a^2-s^2$, and $z=\sqrt{2a^2-s^2}$. Then the half of this being added and ſubtracted with $\frac{1}{2}s$ the half ſum, gives

$\frac{1}{2}s+\frac{1}{2}z=\frac{1}{2}s+\frac{1}{2}\sqrt{2a^2-s^2}$, and

$\frac{1}{2}s-\frac{1}{2}z=\frac{1}{2}s-\frac{1}{2}\sqrt{2a^2-s^2}$, the ſame as before.

218. *In a rectangle, having given the diagonal, and the perimeter, or ſum of all the four ſides; to find each of the ſides ſeverally.*—Let ABCD be the propoſed rectangle; and put the diagonal AC=10=*d*, and half the perimeter AB+BC or AD+DC=14=*a*; alſo put one ſide AB=*x*; then the other ſide BC will be denoted by *a*—*x*. Hence, by right-angled triangles, $AC^2=AB^2+BC^2$, that is, $d^2=x^2+(a-x)^2=2x^2-2ax+a^2$; conſequently $x^2-ax=\frac{1}{2}d^2-\frac{1}{2}a^2$, and by completing the ſquare, &c. $x=\frac{1}{2}a+\frac{1}{2}\sqrt{2d^2-a^2}=8=AB$, and $a-x=\frac{1}{2}a-\frac{1}{2}\sqrt{2d^2-a^2}=6=BC$, the two ſides; and the ſame for the other two, AD, DC.

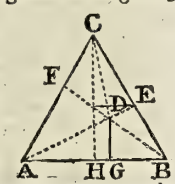


Or, by ſubſtituting for the ſum and difference of the two ſides, AB, BC, this problem may be reſolved, like the latter method of the foregoing one, by a ſimple quadratic, and conſequently without completing the ſquare.

219. *Having given the baſe and perpendicular of any triangle; to find the ſide of a ſquare inſcribed in the ſame.*—Let ABC repreſent the given triangle, and EFGH its inſcribed ſquare. Put the baſe AB=*b*, the perpendicular CD=*a*, and the ſide of the ſquare GF or GH=DI=*x*; then will CI=CD—DI=*a*—*x*.

Then, becauſe the like lines in the ſimilar triangles ABC, GFC, are proportional, AB : CD :: GF : CI, that is, $b:a::x:a-x$. Hence $ab-bx=ax$, or $ab=ax+bx$, and conſequently $x=\frac{ab}{a+b}=$GF or GH, the ſide of the inſcribed ſquare; which therefore is of the ſame magnitude, whatever the ſpecies or the angles of the triangle may be.

220. *In an equilateral triangle, having given the lengths of the three perpendiculars, drawn from a certain point within, on the three ſides; to determine the ſides.*—Let ABC repreſent the equilateral triangle, and DE, DF, DG, the given perpendiculars from the point D. Draw the lines DA, DB, DC, to the three angular points; and let fall the perpendicular CH on the



the base AB. Put the three given perpendiculars DE=a, DF=b, DG=c, and put x=AH or BH, half the side of the equilateral triangle. Then is AC or BC=$2x$, and by right-angled triangles the perpendicular $CH=\sqrt{AC^2-AH^2}=\sqrt{4x^2-x^2}=\sqrt{3x^2}=x\sqrt{3}$.

Now, since the area or space of a rectangle is expressed by the product of the base and height, and that a triangle is equal to half a rectangle of equal base and height, it follows that, the

whole triangle ABC is $=\frac{1}{2}AB\times CH=x\times x\sqrt{3}=x^2\sqrt{3}$,
the triangle ABD $=\frac{1}{2}AB\times DG=x\times c=cx$,
the triangle BCD $=\frac{1}{2}BC\times DE=x\times a=ax$,
the triangle ACD $=\frac{1}{2}AC\times DF=x\times b=bx$.

But the three last triangles make up, or are equal to, the whole former or great triangle; that is, $x^2\sqrt{3}=ax+bx+cx$; hence then $x=\frac{a+b+c}{\sqrt{3}}$, half the side of the triangle sought.

Also, since the whole perpendicular CH is $=x\sqrt{3}$, it is therefore $=a+b+c$; that is, the whole perpendicular CH, is just equal to the sum of all the three smaller perpendiculars DE+DF+DG, taken together, wherever the point D is situated.

Having thus given the elements of common geometry, we proceed now to give some instances of a higher species of geometry, upon the nature of Cycloidal Curves.

CYCLOIDAL CURVES.

On the subject of Cycloidal Curves, an ingenious French writer has made the following remark: *Il semble qu'une destinée particuliere attachée à la cycloide, lui donne préferablement aux autres courbes un plus grand nombre de propriétés remarquables.* "The cycloid seems to be peculiarly favoured in possessing more remarkable properties than any other curve."

Definitions.

1. When a circle is made to rotate on a rectilinear basis, the figure described on the plane of the basis by any point in the plane of the circle is called a trochoid. A circle concentric with the generating circle, and passing through the describing point, may be called the describing circle.

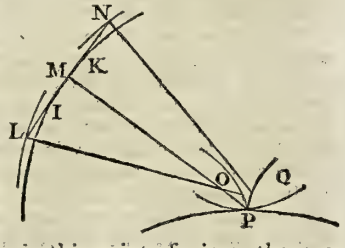
2. If the describing point is in the circumference of the rotating circle, the two circles coincide, and the curve is called a cycloid.

3. If a circular basis be substituted for a rectilinear one, the trochoid will become an epitrochoid, and the cycloid an epicycloid.

Scholium 1. The terms have hitherto been too promiscuously employed; the terms cycloid and trochoid have been used indifferently; and the term epicycloid has comprehended the epitrochoid, the terms prolate and contracted being sometimes added to imply that the describing point is within or without the generating circle. The interior epicycloid and epitrochoid may very properly be distinguished by the names hypocycloid and hypotrochoid, whenever they are the separate objects of consideration. The different species of epicycloids may be denominated according to the number of their cusps, combined with that of the entire revolutions which they comprehend; for instance, the epicycloid described by a circle on an equal basis is a simple unicuspidate epicycloid; and if the diameter of the generating circle be to that of the basis as 5 to 2, the figure will be a quintuple bicuspidate epicycloid. If the describing circle of a trochoid or cycloid be so placed as to touch the middle of the basis, and each of the ordinates parallel to the basis be diminished by the corresponding ordinate of the circle, the curve thus generated has been denominated the companion of the trochoid, the figure of the sines, and the harmonic curve.

Scholium 2. The invention of the cycloid has been attributed by Wallis, Phil. Tr. for 1697, No. 229, to cardinal Cusanus, who wrote about the year 1450; but it seems to be at least as probable that the curve which appears in Cusanus's figure was meant for the semicircle employed in finding a mean proportional. Bovillus, in 1501, has a juster claim to the merit of the invention of the cycloid and trochoid, if it can be any merit to have merely imagined such curves to exist. In 1599, Galileo gave a name to the common cycloid, and attempted its quadrature; but having been accidentally misled by repeated experiments on the weight of a flat substance cut into a cycloidal form, he fancied that the area bore an incommensurable ratio to that of the circle, and desisted from the investigation. Mersennus described the cycloid, in 1615, under the name of *la trochoide*, or *la roulette*, but he went no further. Roberval seems to have first discovered the comparative quadrature and rectification of the cycloid, and the content of a cycloidal solid, about the year 1635, but his treatise was not printed until 1695. Torricelli, in 1644, first published the quadrature and the method of drawing a tangent. Wallis gave, in 1670, a perfect quadrature of a portion of the cycloid. The epicycloid is said to have been invented by Rœmer; its rectification and evolute were investigated by Newton in the *Principia*, published in 1687. In 1695, Mr. Caswell shewed the perfect quadrability of a portion of the epicycloid, and Dr. Halley immediately published an extension of Caswell's discovery, together with a comparison of all epitrochoidal with circular areas. M. Varignon is also said to have reduced the rectification of the epitrochoid to that of the ellipsis, in the same year. Nicole, Delahire, Pascal, Reaumur, Maclaurin, the Bernoullis, the commentators on Newton, and many others, have contributed to the examination of cycloidal curves, both in planes and in curved surfaces; and Waring, the most profound of modern algebraists, has considerably extended his researches upon the nature of those lines which are generated by a rotatory progression of other curves. In the present essay, the most remarkable properties of cycloidal curves are deduced in a simpler and more general manner than appears to have been hitherto done, the equations of several species are investigated, a singular property of the quadricuspidate hypocycloid is demonstrated, and the peculiarities of the spiral of Archimedes are derived from its generation as an epitrochoid.

Prop. I. *Theorem.*—In any curve generated by the rotation of another on any basis, the right line joining the describing point, and the point of contact of the generating curve and the basis, is always perpendicular to the curve described.

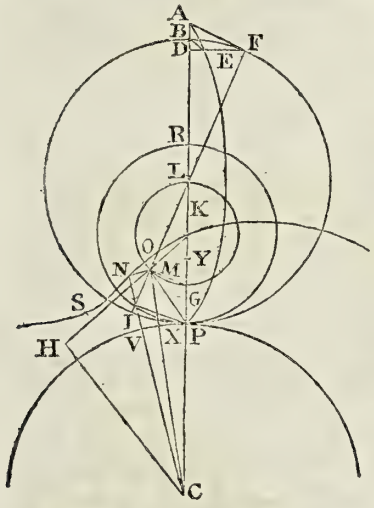


It may by some be deemed sufficient to consider the generating curve as a rectilinear polygon of an infinite number of sides; since, in this point of view, the proposition requires no further demonstration; and, indeed, Newton and others have not scrupled to take it for granted: but it is presumed that a more rigid proof will not be considered as superfluous. Let M be the describing point, and P the point of contact; and let LO, MP, and NQ, be successive positions of the same chord of the generating curve at infinitely small distances; then it is obvious, and easily demonstrable, that the arcs OP and PQ, described by the point P of the generating curve in its passage from O to P, and from P to Q, will be perpendicular to the basis at P, and will therefore touch each other. Let the arcs L, IMK, and N, be described with the radius PM, on the centres O, P, and Q. Then the curve described by M will touch IMK; for since O and Q lie ultimately in the same direction from P, if L be above IMK, N will

alſo be above it, ſince theſe points muſt be in the circles L and N, and infinitely near to M; and if L is below IMK, N, for the ſame reaſon, muſt be below it; and M is common to the circle and the curve; therefore the curve touches the circle IMK at M, and is perpendicular to the radius PM.

PROP. II. *Problem.—To draw a tangent to a cycloidal curve at any given point.*—On the given point as a centre, deſcribe a circle equal to the deſcribing circle of the curve, and from the interſection of this circle, with the line deſcribed by the centre of the generating circle, let fall a perpendicular on the baſis; the point thus found will be the point of contact, and the tangent will be perpendicular to the right line joining this point of contact and the given point, by the firſt propoſition. It will be obvious, from inſpection, which of the two interſections of the circle to be deſcribed, with the tract of the centre, is to be taken as the place of that centre correſponding to the given point.

PROP. III. *Problem.—To find the length of an epitrochoid.*—

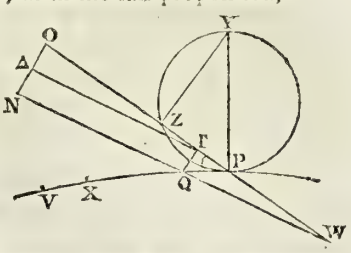


Let C be the centre of the baſis VP, K that of the rotating circle PR, and of the deſcribing circle GL, P the point of contact, and M the deſcribing point. Then joining MXC, and ſuppoſing VX to be an element repreſenting the motion of the point P in either the baſis or the generating circle, draw the arc MN on the centre C, and join CVN, then NM will repreſent the motion of the point M as far as it is produced by the revolution round the centre C: take MO to VX as GK to PK, then MO will be the motion of M ariſing from the revolution round K, and NO will be the element of the curve produced by the joint motion. Let CH be parallel to PM, then CX or CP : CM :: VX : MN, and PK : MK :: CP : HM :: VX : MO, therefore CM : HM :: MN : MO, and theſe lines being perpendicular to CM, HM, the triangle NMO is ſimilar to CMH, and MN : NO :: CM : CH, hence CP : CH :: VX : NO. Take PY to CP as PK to CK, then CH : CP :: PM : PY :: NO : VX. On L deſcribe the circle PFB, and draw IMLF: let FD be perpendicular to PRB, take DE to DF, as PL, and E will be always in the ellipſis BEP: let AE and AF be tangents to the ellipſis and circle at E and F; then the increment of the arc BF will be to MO as PL to GL, and to VX as PL to PR. Join GM, and parallel to it draw PI; then PIL is a right angle, and ILP = AED, and IM : IL :: PG : PL :: DE : DF, by conſtruction; therefore the figure IPML is ſimilar to DAEF, as PL to PM ſo is AF to AE, and ſo is the increment of the arc BF to that of BE; but the increment of BF is to VX as PL to PR, therefore the increment of BE is to VX as PM to PR. Now, it was proved that NO : VX :: PM : PY; therefore the increment of BE is to NO as PY to PR, or as CP to 2CK: and the whole elliptic arc BE is to the whole SM as the radius of the baſis to twice the diſtance of the centres.

Corollary 1. The fluxion of every cycloidal arc is proportional to the diſtance of the deſcribing point from the point of contact.

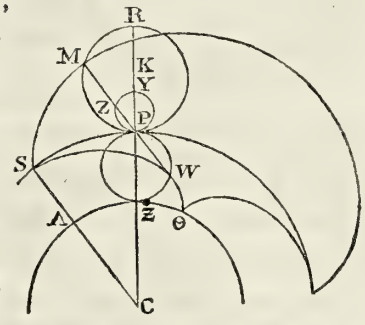
Corollary 2. In the epicycloid the ellipſis coincides with its axis BP, and the arc BE with BD, which is double the verſed ſine of half the arc GM, in the deſcribing or generating circle: therefore the length of the curve is to this verſed ſine as four times the diſtance of the centres to the radius of the baſis.

PROP. IV. *Problem.—To find the centre of curvature of an epitrochoid.*—Let PY be, as in the laſt propoſition, to CP as PK to CK, and on the diameter PY deſcribe the circle PZY, cutting PO in Z: take OW a third proportional to OZ and OP, and W will be the centre of curvature. For, let QP = VX be the ſpace deſcribed by P, while NO is deſcribed by O; it is obvious from Prop. 1, that the interſection of NQ and OP muſt be the centre of curvature. Let QΓ be perpendicular to ΓΔ parallel to QN; then, by Prop. 3, NO : VX or QP :: PO : PY, but by ſimilar triangles QP : CΓ :: PY : PZ; therefore NO : QΓ :: PO : PZ, and by diviſion, NO : ΔO :: OP : OZ, and by ſimilar triangles :: OW : OΓ or OP.

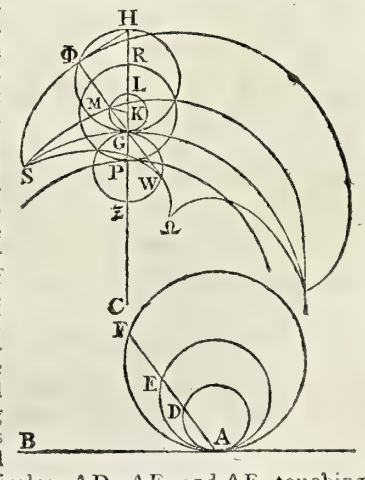


Corollary. When Z coincides with O or M, OW is infinite; therefore whenever PZY interſects the deſcribing circle, the epitrochoid will have a point of contrary flexure at the ſame diſtance from C as this interſection: and the circle PZY is given when the baſis and generating circle are given, whatever the magnitude of the deſcribing circle may be.

PROP. V. *Problem.—To find the evolute of an epicycloid.*—In the epicycloid SM, the point M being in the circumference of PMR, PZ will be to PM in the conſtant ratio of PY to PR, and MZ to PM as RY to PR; and PM to MW in the ſame ratio; hence PM : PW :: RY : PY :: CR : CP, therefore the point W is always in a circle PWΞ of which the radius is to PK in that proportion, and which touches SP in P. On the centre C deſcribe a circle ΛΞΘ touching PWΞ in Ξ; then, ſince CR : CP :: PR : PΞ, we have by diviſion CR : CP :: CP : PΞ, and the circle PWΞ being to ΛΞΘ as PMR to SP, the arc PM being equal to SP, the ſimilar arc PW will be equal to ΛΞ, and, taking ΛΞΘ = PWΞ, ΞΘ will be always equal to ΞW, and W in a curve ΘWS ſimilar to SM, of which it is the evolute.



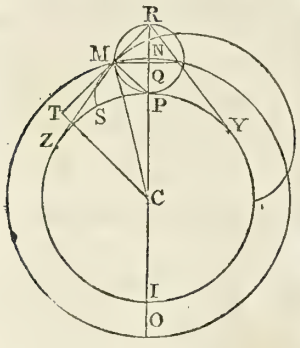
PROP. VI. *Problem.—To find the area of an epitrochoid.*—On the centre C deſcribe a circle touching the epitrochoid in S, take GH to GC as PR to PC, and let the circle GΦH deſcribe on the baſis SG the epicycloid SΦ. Then taking GM always to GΦ as GL to GH, M will be in the epitrochoid SM; for the angular motion of the chord GΦ, is the ſame as that of GM in the primary epitrochoid. Let SΩ be the evolute of SΦ, and GWΞ its generating circle. On diameters equal to ΞG, ΞL, and ΞH, deſcribe three circles, AD, AE, and AF, touching



the right line AB in A; let the angle BAD be always equal to GHΦ, and it is evident that AD, AE, and AF, will be equal respectively to WG, WM, and WΦ. But the angular motion of WG on W being equal to the sum of the angular motions of GM on G, and CG on C, is to that of AF, or of GM, or half that of KM, in the ratio of CH to CG, or CR to CP; therefore the fluxions of the areas SWG, SWM, and SWΦ, are to those of the segments AD, AE, and AF, in the same ratio; and that ratio being constant, the whole areas, and their differences, are also respectively to each other as CR to CP.

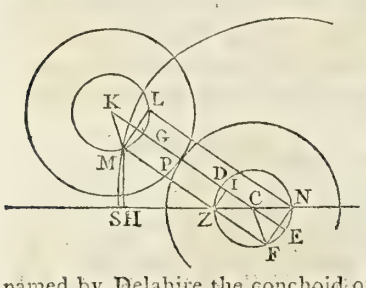
Scholium. The quadrable spaces of Halley are those which are comprehended between the arc of the epitrochoid, that of the describing circle, and that of a circle concentric with the basis, and cutting the describing circle at the extremities of its diameter.

PROP. VII. *Problem.—To find a central equation for the epicycloid.*—Let CT be perpendicular to RT, the tangent at the point M, then PMR will be a right angle, and PM parallel to CT. On the centre C describe through M the circle MNO, and let MQ be perpendicular to RO. Then the rectangle OQN = PQR, OQ : PQ :: QR : QN, by addition OQ : PQ :: OR : PN; hence, by division, OP : PQ :: IR : PN, and $PQ=\frac{OPN \text{ or } INP}{IR}$. But



$PMq = PR \times PQ = \frac{PR}{IR} \times INP$; and by similar triangles CT : CR :: PM : PR, whence $CTq=\frac{CRq}{PRq}\times PMq=CRq\times\frac{INP}{IRP}$. Let MZ and RY be tangents to SP, then INP = MZq, and IRP = RYq, $CT=CR\times\frac{MZ}{RY}$, and CT will be to MZ in the constant ratio of CR to RY. Putting CP = a, CR = b, CM = s, CT = u, then $uu=bb\frac{ss-aa}{bb-aa}$.

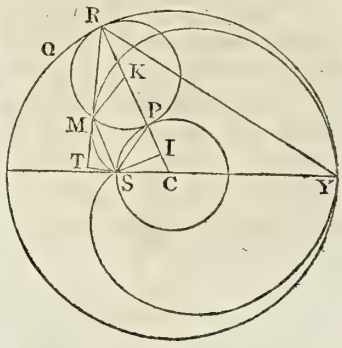
PROP. VIII. *Problem.—To find a geometrical equation for the conchoidal epitrochoid.*—Let CP = PK. On the centre C describe a circle equal to GM, cutting SC in Z. Join MZF, then the arc DZ = GM, and MZ is parallel to CK; therefore EF is also equal to DZ or GM, CF is parallel to KM, and MF = CK: therefore this epitrochoid is the curve named by Delahire the conchoid of a circular basis, as was first observed by Reaumur in 1708, and afterwards by Maclaurin, in 1720. Call CK, a; DE, b; ZH, x; HM, y; ZM, s; and let ZI be perpendicular to CK; then $FZ=a-s$, $CI=\frac{a-s}{2}$, and, CIZ and ZHM being



similar, CZ : CI :: ZM : ZH, or $\frac{b}{2} : \frac{a-s}{2} :: s : x$; hence $bx=as-ss$, $bx+ss=as$, $b^2x^2+2bxs^2+s^4=a^2s^2$, and by substituting for s^2, $x^4+2bx^3-a^2x^2+b^2x^2+2x^2y^2+2bxy^2+y^4-a^2y^2=0$.

Corollary 1. Join FN, and complete the parallelogram MPNL, then since EF = DZ = EN, FN is perpendicular to EK, and ML to NL; and, NL being always equal to FM or CK, L is always in a circle described on the centre N, LM a tangent to that circle, and ZM a perpendicular to that tangent drawn from the point Z.

Corollary 2. The unicuspidate epicycloid admits of a peculiar central equation, with respect to the point S. Call SM, s, and let ST = u be perpendicular to the tangent MT, then $u=\sqrt{\frac{s^5}{2a}}$. For the triangles SIP and MTS being similar, and IP being half of SM,



or s, $SP=\sqrt{\frac{as}{2}}$, SPq : SMq :: IPq : STq, or $\frac{as}{2} : s^2 :: \frac{ss}{4} : u^2$, and $2au^2=s^3$.

Corollary 3. The unicuspidate epicycloid is one of the caustics of a circle. For making the angle CRY = MRC = ½SCP, the triangle CRY is isosceles, and CY is constant; so that all rays in the direction of the tangent MR will be reflected by the circle QR towards Y, and consequently SM will be the caustic of a radiant point at Y.

PROP. IX. *Problem.—To find a geometrical equation for the tricuspidate hypocycloid.*—Let PA and MF be perpendicular to CS. Join PMB, KM, RMG, and PD. Then the angle APB is equal to the difference of APC and MPR, or to that of their complements PRM, PCA; but PRM = ½PKM = ½PCA, therefore APB = ½PCA = ADP = APS, and the triangles APS and APB are similar and equal. Let SC = a, SF = x, FM = y, and SB = r. Then

SA : SP :: SP : SD, and $SP=\sqrt{ar}$. Draw PE perpendicular to BP; then BE = SD = 2a, BC = $a-r$, EC = $3a-r$, and by similar triangles, CP : CR :: EC : CG = ½EC = $a-\frac{1}{3}r$; therefore GB = $\frac{2}{3}r$; but BE : BG :: BP : BM, or $2a : \frac{2}{3}r :: \sqrt{ar} : \frac{r}{3a}\sqrt{ar}=BM$; again,

BP : BM :: BA : BF, or $\sqrt{ar} : \frac{r}{3a}\sqrt{ar} :: \frac{r}{2} : \frac{rr}{6a}$, and

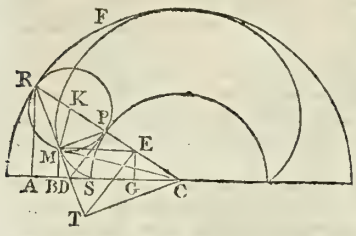
$SF=x$, $=r-\frac{rr}{6a}$, $6ax=6ar-rr$, and $r=3a\pm\sqrt{9aa-6ax}$.

But MFq = BMq − BFq, or $y^2=\frac{r^3}{9a}-\frac{r^4}{36aa}$, and $36a^2y^2=4ar^3-r^4$. By adding to this the square of the former equation, and proceeding in the same manner to exterminate r, we obtain an equation of the value of x and y, which, when the surds are brought to the same side, and the square of the whole is taken, is at last reduced to $x^4-\frac{4}{3}ax^3+2x^2y^2-12axy^2+y^4+12a^2y^2=0$, a regular equation of the fourth order.

Scholium. The equation of the corresponding hypotrochoids may be investigated nearly in the same manner, by dividing PR and PM in a given ratio, but the process will be somewhat more tedious.

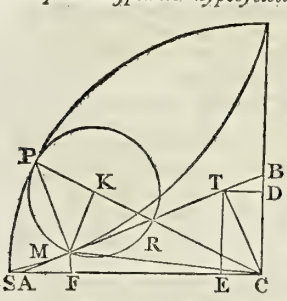
PROP.

PROP. X. *Problem.—To find a geometrical equation for the bicuſpidate epicycloid.*—Let CP=PR. Join RMS, PM, PD; draw CT perpendicular to RT, TE to CR, and EG, MB, RA, to SC. Then the angle DRP $=\frac{1}{2}$MKP=SCP, and by equal triangles, RA=CT, and RD=CD, and by ſimilar triangles RM : RP :: RE : RT, and RP : RD :: RT : RC; therefore RM : RD :: RE : RC, and ME is parallel to SC, and EG=BM. Put CP=a, BC=x, BM=y, CM=s, CT=u; then by Prop. 7, $u^2=\frac{4}{3}s^2-a^2$; or $\frac{3}{4}u^2=s^2-a^2$; but RC : CT :: CT : CE :: CE : EG, or y; hence $y=\frac{u^3}{4aa}$ $u^6=16a^4y^2$, $\frac{27}{64}u^6=\frac{27}{4}a^4y^2=\overline{ss-aa^3}=\overline{xx+yy-aa^3}$; whence by involution the equation of the ſixth order may be had at length.



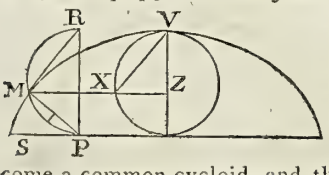
Corollary. Since CRM=SCR, a ray in the direction of the tangent MR will be reflected by a circle FR always parallel to SC: therefore SM is the cauſtic of the circle FR when the incident rays are parallel to CS.

PROP. XI. *Problem.—To find a geometrical equation for the quadricuſpidate hypocycloid.*—Let CR=PR, then the angle PRM $=\frac{1}{2}$PKM=2PCS, RAC=ACR, RA=RC=RB=RP, AB=SC, and drawing the perpendiculars CT, TD, TE, and MF, RM=RT, AM=BT, AF=EC, FC=AE, and FM=BD. Let SC=a, FC=x, FM=y, CM=s, CT=u; then AB : AC :: AC : AT :: AT : AE, whence AT=$\overline{axx}^{\frac{1}{3}}$, and in the ſame manner BT=$\overline{ayy}^{\frac{1}{3}}$; and CT being a mean proportional between AT and TB, $u^2=\overline{a^2x^2y^2}^{\frac{1}{3}}$, and $u^6=a^2x^2y^2$. But by Prop. 7, $3u^2=a^2-s^2$, therefore $27a^2x^2y^2=\overline{a^2-s^2}^3=\overline{a^2-x^2-y^2}^3$; whence the equation may be had at length by involution. The ſame reſult may be obtained by Dr. Waring's method of reduction, from $\overline{axx}^{\frac{1}{3}}+\overline{ayy}^{\frac{1}{3}}=a$.

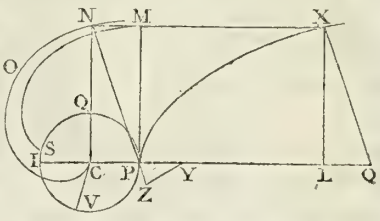


Corollary. Since the portion of the tangent AB intercepted between the perpendiculars AC, BC, is a conſtant quantity, this hypocycloid may in that ſenſe be called an equitangential curve; and the rectangular corner of a paſſage muſt be rounded off into the form of this curve in order to admit a beam of a given length to be carried round it.

PROP. XII. *Problem.—To inveſtigate thoſe caſes in which the general propoſitions either fail or require peculiar modifications.*—Caſe 1. If the generating circle be conſidered as infinitely ſmall, or the baſis as infinitely large, ſo as to become a ſtraight line, the epicycloid will become a common cycloid, and the ratio of CP to CK in Prop. 3, cor. 2, becoming that of equality, the length of the arc SM will be four times the verſed ſine of half PM, and VM twice the chord RM or VX, therefore the ſquare of the arc VM is always as the abſciſs VZ. The evolute is an equal cycloid, and the circles in Prop. 6, being as 1 to 4, the area of the cycloid is to that of its generating circle as 3 to 1. The properties of the cycloid as an iſochronous, and as a brachiſtochronous, curve, belong to mechanics; and it is demonſtrated by writers on optics that its cauſtic is compoſed of two cycloids.



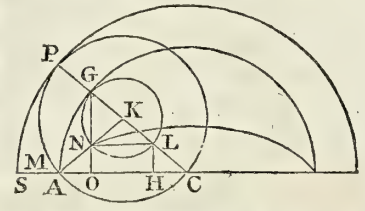
Caſe 2. If the generating circle be ſuppoſed to become infinite while the baſe remains finite, the epicycloid will become the involute of a circle; and the fluxion of the curve being always, by Prop. 3, cor. 1, to that of PM as PM to CP, its length SM will be a third proportional to IP and PM. Call CP, a, and PM, x, then the fluxion of SM is $\frac{xx}{a}$; but the rectangle contained by half PM and the fluxion of SM is the fluxion of the area PSM, or PSM=$\int\frac{xx\dot{x}}{2a}=\frac{x^3}{6a}$. The epitrochoid deſcribed by the point C of the generating plane will be the ſpiral of Archimedes, ſince CN is always equal to PM=PS=QV; and ſince the angular motion of CN and PM are alſo equal, the area CON=PSM=$\frac{x^3}{6a}$. Inſtead of the ellipſis of Prop. 3, let PX be a parabola of which IP is the parameter, and continuing NM to X, the arc PX will be equal to CON. For making LQ=CP, it is well known that the fluxion of PX varies as XQ, or as PN, which repreſents the fluxion of CON. For the curvature, PY in Prop. 4, becomes =CP, and the radius is a third proportional to NZ and NP.



Caſe 3. Suppoſing now the generating circle to become again finite, but to have its concavity turned towards the baſis, the ſame curve will be deſcribed as would be deſcribed by the rotation of a third circle on the ſame baſis in a contrary direction, equal in diameter to the difference of thoſe of the two firſt circles.

Caſe 4. If the circles be of the ſame ſize, with their concavities turned the ſame way, no curve can be deſcribed; but if the generating circle be ſtill further leſſened, a hypocycloid will be produced, if the ſame figure as that which would be deſcribed by a third circle equal in diameter to the difference of the two firſt. All the general propoſitions are equally applicable to hypocycloids with other epicycloids, as might eaſily have been underſtood from an inſpection of the figures, if there had been room for a double ſeries.

Caſe 5. If the diameter of the generating circle be half that of the baſis, the hypocycloid will become a right line, and the hypotrochoid an ellipſis. For ſince the angle PKM=2PCS, PCM, being half PKM, coincides with PCS, and M is always in CS. Let GNL be the deſcribing circle of the hypotrochoid, and join GNO, then NL is parallel, and ON perpendicular to SC, and ON=HL, which is always to GO as CL to CG; therefore AN is an ellipſis: and the centre C will evidently deſcribe a circle.



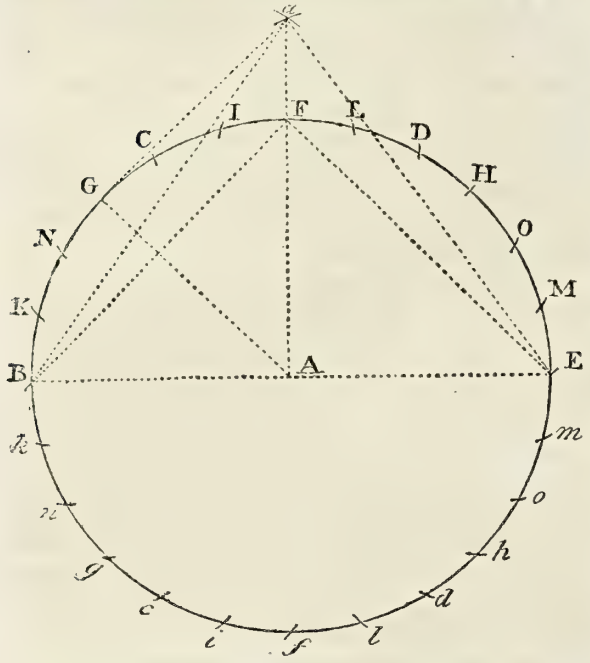
GEOMETRY OF THE COMPASS.

This ingenious department of geometry, for which we are indebted to ſignor L. Maſcheroni, ſeems not only well calculated to exerciſe the powers of invention in young

young mathematicians, but promiſes to afford very conſiderable aſſiſtance to architects and military engineers, by facilitating the method of drawing plans and elevations, in ſtriking lines of circumvallation, projecting the form of outworks, and conſtructing the angles and breaſtworks in regular fortifications. But the principal utility of this ſpecies of geometry is in its application to the diviſion of aſtronomical inſtruments.

The method here laid down, is defined by the inventor, to be that by which, with the *compaſs* only, without the uſe of the *rule*, we can more correctly determine the poſition of points. And it is recommended to the artiſt, or mathematician, in order to inſure preciſion, to have as many pair of good compaſſes as there are diſtances to be taken in the ſolution of the problem; becauſe he will often have occaſion to uſe the ſame opening, or diſtance, ſeveral times after having intermediately uſed other diſtances. In ſuch caſe, without ſhutting or opening his compaſſes, he may recur to the diſtance he wants. In ſolving a few problems, we ſhall ſuppoſe this method to be purſued, and ſhall accordingly denominate theſe inſtruments, the firſt, ſecond, or third, pair of compaſſes.

1. *To divide the circumference of the circle* B D *d, into four equal parts.*—Let A be the centre, and equal to A B, as



chords, ſet off upon the circumference, A B = B *c* = B C = C D = D E = E *d*, with the firſt pair of compaſſes; and you will have *d c* = *c* B = B A (Euclid, Prop. 15. b. 4.) Then ſet off B D = B *a* = E *a* with the ſecond pair of compaſſes, and A *a* = B F = B *f* with the third pair; and the circumference will then be divided into four equal parts, B F, F E, E *f*, *f* B.

Demonſtration. B A E being a diameter, and the triangles *a* A B, *a* A E, having all their ſides equal, and conſequently the angles *a* A B, *a* A E, alſo equal (Euclid 8. b. 1.), theſe two angles will be right ones (Euclid 13. b. 1.); therefore $(a\,B)^2 = (A\,B)^2 + (a\,A)^2$ (Euclid 47. b. 1.), and, ſubtracting from each ſide $(A\,B)^2$, we have $(a\,B)^2 - (A\,B)^2 = (a\,A)^2$. In order to ſhorten the work, let A B = 1; and we ſhall have $(a\,B)^2 = (B\,D)^2 = 3$; hence, $(a\,A)^2 = 3 - 1 = 2$; and $(B\,F)^2 = (a\,A)^2 = 2 = 1 + 1 = (A\,B)^2 + (A\,F)^2$. Therefore, in the triangle F A B, the angle F A B will be a right one (Euclid 48. b. 1), and conſequently F A E alſo (Euclid 13. b. 1); therefore the arcs B F, F E, will be equal to each other, and fourth parts of the circle; as alſo the arcs B *f*, *f* E.

2. *Corollary.* The angles B A *a*, B A F, being right angles, the three points, A, F, *a*, will be in the ſame right line.

3. Thus we have the circumference already divided, in two equal parts at the points B and E; in three parts, at the points B, D, *d*, (E. 15. b. 4.) in four parts, at the points B, F, E, *f*; and in ſix parts, at the points B, C, D, E, *d*, *c*.

4. *To divide a circumference into eight equal parts.*—In the ſame figure, let A B = *a* G = *a* H with the firſt pair of compaſſes; and A *a* = G *g* = H *h* with the third pair; then we ſhall have *g h* = A *a*, and the circumference will be divided into eight equal parts at the points B, G, F, H, E, *h*, *f*, *g*.

Demonſtration. As $(A\,a)^2 = 2$, we have $(A\,a)^2 = (AG)^2 + (a\,G)^2$, therefore the angle *a* G A is a right angle (E. 48. b. 1.); and as *a* G A is an iſoceles triangle, the angle G A *a* = G *a* A, and each equal to half a right angle; hence, G A F (= E A *a*) = half a right angle = half B A F; and G F = B *g*. But by conſtr. G *g* = B F; hence, taking B G from each, we have G F = B *g*. Thus we prove it for the other arc, and the circumference is divided into eight equal parts.

5. *To divide the circumference into* 12 *equal parts.*—Things being as at No. 1. draw (ſame figure) A B = F N = N *n* = F O = O *o*; and the circumference will be divided into 12 equal parts at the points B, N, C, F, D, O, E, *o*, *d*, *f*, *c*, *n*.

Demonſtration. As B F = F E, ſubtract from them B C = D E, and we have C F = F D; but C D is the ſixth part of the circumference; therefore C F is the twelfth part. Thus we go on to prove the other parts.

6. *To divide the ſame circumference into* 24 *equal parts.*—Things being as at No. 4 and 5. draw (ſame figure) A B = G L = L M = G *k* = *ki* = H I = I K = H *m* = *ml*, with the firſt pair of compaſſes, and the problem is ſolved.

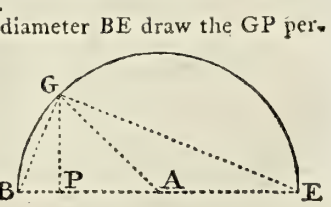
Demonſtration. From G F = G B ſubtract C F = N B, and we get G C = G N. But C N is the twelfth part; therefore G C, G N, are the twenty-fourth parts of the circumference.

7. The ancients, by means of the centre A and the radius A B, divided, by the compaſs only, the circumference into ſix equal parts. Other diviſions they effected with the rule and compaſs, by taking ſeveral points out of the circumference. We have been able to determine one ſingle point *a*, with which alone we can divide it into 24 parts with the compaſs alone; which is more expeditious, more convenient, and at the ſame time much more exact, than the method uſed by the ancients.

8. Let us alſo notice the elegant law which guides the three openings of compaſſes neceſſary for this diviſion: The opening of the firſt pair = $\sqrt{1}$, of the third = $\sqrt{2}$, and of the ſecond = $\sqrt{3}$.

9. *Lemma.* If in the circle BGE, there be a radius A B = 1, while the arc BG is the eighth part of the circumference, we ſhall have the ſquare of its chord BG, that is $(BG)^2 = 2 - \sqrt{2}$.

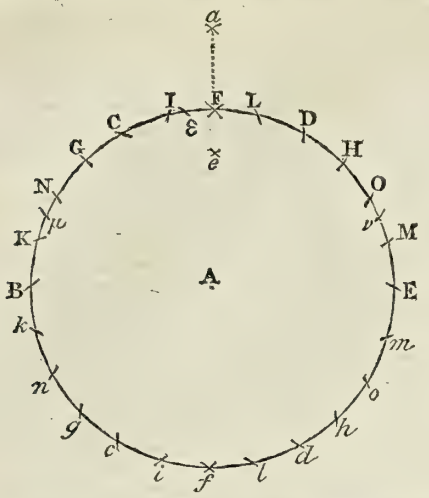
Demonſtration. On the diameter BE draw the GP perpendicular to EB, G being found as before. Then as the angle G A B = 45°, A G P = 45°, and A P = P G; hence, $(AG)^2 = (PG)^2 + (AP)^2 = 2(AP)^2$, or $2(AG)^2 = 4(AP)^2$, or $2 = (2AP)^2$,



and $\sqrt{2} = 2AP$; hence, AP = $\frac{1}{2}\sqrt{2}$, and BP = AB − AP = $1 - \frac{1}{2}\sqrt{2}$. But BP : BG :: BG : BE; hence, $BG^2 = BP \times BE = 2BP$, and $BG = 2 - \sqrt{2}$.

In like manner GE = $2 + \sqrt{2}$.

10. *The circumference being divided into* 24 *equal parts,* (No. 6.) *to ſubdivide it into* 48.—Draw $aN = Be = Ee$,



with a fourth pair of compaſſes, and $AB = e\mu = e\nu$ with the firſt pair. The arcs $K\mu$, μN, $M\nu$, νO, will be the forty-eighth parts of the circumference.

The demonſtration eaſily follows from the foregoing.

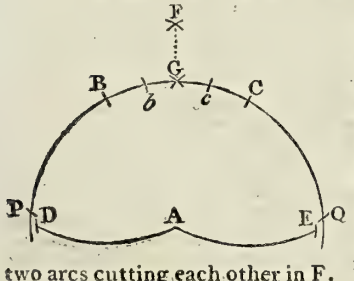
It is to be obſerved, that, in order to keep the diagram or figures clear, the lines mentioned are not drawn upon them, nor even dotted; but the points being marked on the circle, no miſtake can take place.

A circumference, then, by means of four pair of compaſſes, or four openings of the compaſſes, may be divided into 48 equal parts. With the firſt pair, with an aperture $= AB$, divide the circumference into 6 parts, beginning at the point μ; and the arcs IF, HO, mo, fl, ng, will be divided in two equal parts; then, by dividing the circumference into ſix parts beginning at the point ν, the arcs oh, fi, nk, NG, FL, will be divided into two equal parts. Then, dividing the circumference into four parts with the third pair of compaſſes opening $= Aa$, and ſetting out from the point μ, the remaining arcs, LD, ic, will be divided in two equal parts; and, by ſtarting from the point ν, the arcs IC, ld, will be divided in like manner. Laſtly, dividing the circumference again into ſix equal parts with the firſt pair of compaſſes, but beginning from the laſt points found by the third pair, all the reſt of the arcs will be divided into two equal parts.

The demonſtration is the ſame as in No. 6.

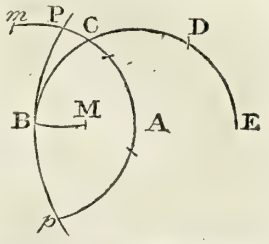
Beſides the propoſitions and demonſtrations here given, it may not be amiſs to add ſome other problems with their ſolutions, omitting their demonſtrations, as they depend upon ſuch problems as have not been introduced, and therefore could not be here given; ſince they will ſhew to what extent this uſeful ſpecies of geometry may be carried.

11. *To divide an arc,* as BC, *into two equal parts at* G.—

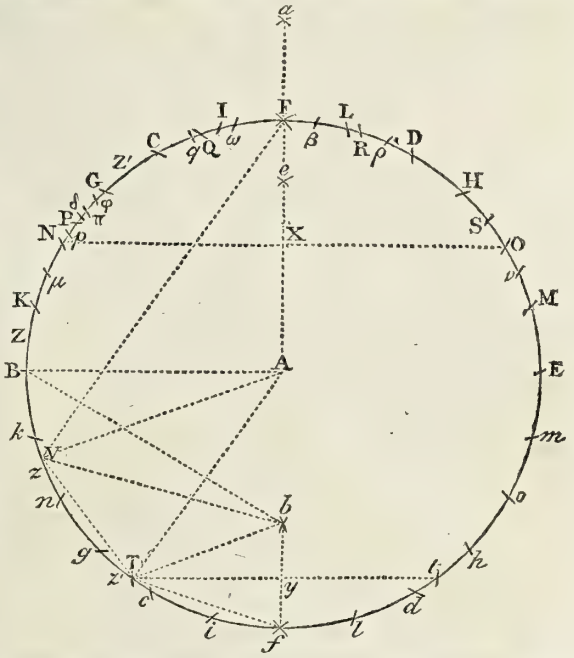


With the radius AB, (by which the arc BC to be divided was drawn,) and from the centres B and C, which are the two extremities of the arc, deſcribe the arcs AD and AE; ſet off $BC = AD = AE$; then, from the centres D and E, with a radius $DC = BE$, deſcribe two arcs cutting each other in F. Then, with the radius AF and the ſame centres D and E, draw two other arcs interſecting in G; the point G will be on the circumference, and the arc BG will be equal to the arc GC; conſequently BC is equally divided.

12. *To divide the diſtance* AB *in two equal parts*; i.e. *to find the point* M *which ſhall be in the middle of the right line* AB.—Deſcribe the ſemicircle BCDE; from the centre E, with a radius EB, draw an indefinite arc PBp; from the centre B, with a radius BA, draw another ſemicircle $pAPm$; then, from the centre P with the radius PB, deſcribe the arc BM; and from P ſet off $Pm = BM$: M will be the point ſought, midway between A and B.

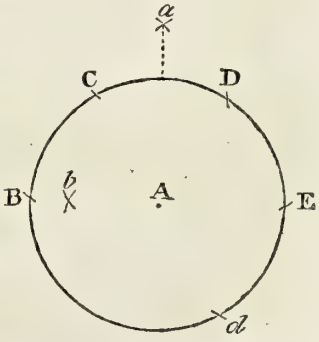


13. *To divide the circumference* B D *d into five equal parts.*—Things being as in Art. 5. from A as a centre ſet off



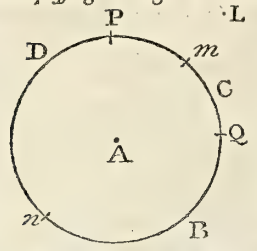
$Aa = Nb = Ob$, with the third pair of compaſſes; from B ſet off $Bb = BQ$; and the arc BQ will be the fifth part of the circumference.—The other letters placed round this diagram ſhew the diviſions or interſections of the circumference, as demonſtrated in the preceding articles.

14. *To find a mean and extreme proportional on the line* AB.—From the centre A, with the radius AB, deſcribe the circle BDd; and in its circumference ſet off $AB = BC = CD = DE = Ed$. From B as a centre, make $BD = Ba = Ea$; and from A make $Aa = Eb = db$. The right line AB will be divided in mean and extreme proportion at the point b; and we have $BA : Ab :: Ab : bB$.



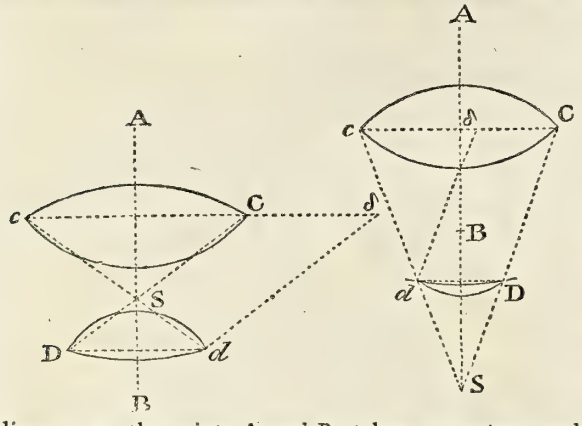
15. *The arc* BCD, *deſcribed from the centre* A, *being given, to find the two points where the circumference is cut by the right*

line passing through A *and through another given point* L.—



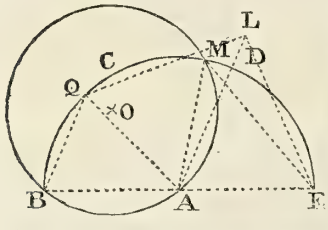
From L as a centre, with an arbitrary radius, as LP, describe an arc which shall intersect the arc BCD in P and in Q. Divide the arc PQ in two equal parts, at the point *m* (Art. 12); find the semi-circumference in D*n*; and the points *m* and *n* are the two points sought.

16. *Two points*, A, B, *on a right line, and two points* C, D, *on another right line, being given, to find the point* S *where they will cut each other.*—From two points on one of the right

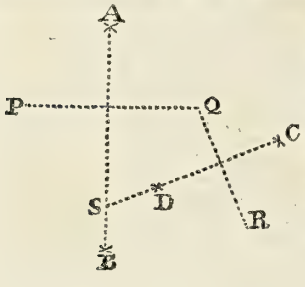


lines, e. g. the points A and B, taken as centres, and with the respective distances, AC, AD, from those points; and BC, BD, of the two points C and D on the other right line, taken as radii, describe four arcs, two of which shall intersect at the points C and *c*, and the other two at the points D and *d*. Find the fourth point δ of the parallelogram C D *d* δ, by making D*d* = C δ, and DC = *d* δ. Find the fourth proportional to the three lines *c* δ, CD, C*c*. With this distance taken for a radius, and from the centres C and *c*, describe two arcs cutting one another in S; and S will be the point of intersection of the two right lines AB, CD.

17. *To find the centre of a given circle* MAB.—Take for a centre any point on the circumference, as A, and with a radius at pleasure, AB, but less than the diameter of the given circle, and greater than the fourth part of that diameter, describe the semicircle BCDE, and make AB = BC = CD = DE; let M be the point where it cuts the given circle. From the centres E and A, with the radius EM, describe two arcs intersecting in L; from the centre L, with same radius LA, cut the semicircle BMC in Q. From B and A as centres, with a radius BQ, describe two arcs, which shall cut each other at O; the point O will be the point sought.



18. *To find the centre* S, *of a circle which goes through three given points*, P, Q, R. From the points P and Q as centres, with a radius at pleasure, describe two arcs intersecting in C and D. The point S, where the lines AB, CD, cross each other, (Art. 16.) will be the centre required.



GE'ON, the name of a place celebrated on account of its excellent vintage. *Ecclus*, xxiv. 27.

GEOPON'ICAL, *adj.* [*geoponique*, Fr. γεωπονικὸς, of γῆ, the earth, and πονος, Gr. labour.] Relating to agriculture; relating to the cultivation of the ground.—Such expressions are frequent in authors *geoponical*, or such as have treated *de re rustica*. *Brown*.

GEOPON'ICS, *f.* [γῆ and πονος, Gr.] The science of cultivating the ground; the doctrine of agriculture.

GEORGE, a proper name of men.

GEORGE, surnamed *the Cappadocian*, a famous bishop of Alexandria. He was born at Epiphania in Cilicia, where his father pursued the employment of a fuller. From this obscure and servile situation, George withdrew to Alexandria, where he professed great zeal for the principles of Arius, and acquired considerable influence with his disciples in that city. He likewise, either from the love or ostentation of learning, collected a large and valuable library of history, rhetoric, philosophy, and theology, which the emperor Julian afterwards made the foundation of the noble library established by him in the temple erected in honour of the emperor Trajan at Antioch, but which, to the great loss of the republic of letters, was malignantly permitted to be burnt by the emperor Jovian. When about the year 356 Athanasius was obliged to abscond from the fury of the savage military, who had received directions from the emperor Constantius to expel him from his see, George was elected bishop by the prevailing party. His conduct in this station was in the highest degree oppressive and cruel. The catholics he persecuted with unrelenting rage; the merchants of Alexandria were impoverished by an unjust, and almost universal, monopoly; and he incensed the inhabitants in general, by suggesting an invidious tax upon all the houses of that city. The resentment of the people at length rose to fury, and he was for a time expelled from the city; nor was it without a violent struggle that the civil and military powers were able to restore his authority. When, however, in 362, information arrived at Alexandria of the accession of Julian to the empire, the public rage against the bishop again broke forth, and after he had been seized, together with two of the ministers of his atrocities, they were ignominiously dragged in chains to the public prison. When they had been confined for some days, the pagan populace, fearful lest they should escape their vengeance, forced open the prison doors, and with cruel insults massacred them. After their lifeless bodies had been carried in triumph through the streets, according to some accounts they were burnt, but according to others, thrown into the sea; "and the popular leaders of the tumult (says Gibbon) declared their resolution to disappoint the devotion of the Christians, and to intercept the future honours of these martyrs, who had been punished, like their predecessors, by the enemies of their religion. The fears of the pagans were just, and their precautions ineffectual. The cruel death of the archbishop obliterated the memory of his life. The memory of the rival of Athanasius became sacred to the Arians, and the seeming conversion of those sectaries introduced his worship into the bosom of the catholic church. The odious stranger, disguising every circumstance of time and place, assumed the mask of a martyr, a saint, a Christian hero; and hence the famous George of Cappadocia has been transformed into the renowned St. George of England, the patron of arms, of chivalry, and of the Garter."

GEORGE, called also *Amira*, a learned Maronite, who flourished towards the latter end of the sixteenth and the beginning of the seventeenth century, came to Rome under the pontificate of Clement VIII. He there published A Syriac and Chaldee Grammar, 1596, 4to. which is much esteemed in the learned world. On his return to his native country, he was elected patri-

arch

arch of the Maronites, among whom he introduced the uſe of the Gregorian calendar, and died about the year 1641.

GEORGE OF TREBISOND (in Latin *Trapezuntius*), a learned Greek, born in 1395 in the iſle of Crete, of a family originally from Trebiſond, whence he choſe to take his deſignation. He came to Italy about the year 1420, and learned the Latin language under Vittorino da Feltre. His patron was Francis Barbaro, a noble of Venice, and a great promoter of letters, through whoſe means he was invited to a profeſſorſhip of Greek at Vicenza. Thence he removed to Venice, where he acquired great reputation as a grammarian and inſtructor in Grecian eloquence. In 1437, he obtained an invitation from pope Eugenius IV. to ſettle at Rome. During the time of that pontiff he was occupied in teaching rhetoric and philoſophy, and alſo in tranſlating ſeveral ancient Greek authors into Latin. Pope Nicholas V. continued to employ him for ſome time; but falling under the diſpleaſure of the pope, he was obliged to depart from Rome. He took refuge in 1452 at Naples, where he was graciouſly received by king Alphonſo. In 1459 he was at Venice, where he preſented to the doge his verſion of Plato's book on Laws, and was engaged as a profeſſor of belles-lettres. From that city he ſailed, in 1464, to his native iſland of Crete, and thence paſſed to Conſtantinople. Upon his return to Italy, he found his ſcholar Paul II. in the pontifical chair, which induced him again to viſit Rome. From ſome unknown cauſe, however, he incurred the diſpleaſure of the pope, who impriſoned him for four months in the caſtle of St. Angelo. He was at that time much debilitated by age, yet he lived many years longer, and ſurvived his faculties. The year of his deceaſe was probably about 1480. He was a very voluminous writer, and contributed largely towards the introduction of Greek literature in the weſt. He tranſlated into Latin, Euſebius's Evangelic Preparation; ſeveral works of Cyril of Alexandria, of Gregory Nyſſen, of Nazianzen, and of John Chryſoſtom; many pieces of Ariſtotle, Plato on Laws, Ptolemy's Almageſt and Centiloquium, and an Oration of Demoſthenes. His tranſlations were at firſt in great eſteem; but ſince a more accurate knowledge of the Greek has obtained, they have been found very deficient in exactneſs and fidelity. He alſo compoſed many works; of which are, *De Arte Rhetorica, Lib.* V. firſt printed at Venice in 1470; Reflections and Commentaries on ſome Orations of Cicero; Letters; Orations; and, many pieces in controverſy. Many of his writings ſtill remain in manuſcript.

GEORGE, I. II. and III. illuſtrious kings of England. See the article ENGLAND, vol. vi. p. 713, 726, 727, &c.

GEORGE LAKE, or LAKE GEORGE, in Eaſt Florida, is a dilation of the river St. Juan, or St. John, and called alſo Great Lake. It is about fifteen miles wide, and generally about fifteen or twenty feet deep, excepting at the entrance of the river, where lies a bar, which carries eight or nine feet water. The lake is beautified with two or three fertile iſlands. The largeſt is about two miles broad, and commands a moſt delightful and extenſive proſpect of the waters, iſlands, eaſt and weſt ſhores of the lake, the capes, the bay and Mount Royal; and to the ſouth the view is very extenſive. Here are evident marks of a large town of the aborigines, and the iſland appears to have been once the choſen reſidence of an Indian prince. On the ſcite of this ancient town ſtands a very pompous Indian mount, or conical pyramid of earth, from which runs in a ſtraight line a grand avenue or Indian highway, through a magnificent grove of magnolias, live oaks, palms, and orange trees, terminating at the verge of a large, green, level, ſavanna. From fragments dug up, it appears to have been a thickly-inhabited town.

GEORGE LAKE, or LAKE GEORGE, ſituated in to the ſouthward of Lake Champlain, and its waters lie about one hundred feet higher. The portage between the two lakes is a mile and a half; but with a ſmall expence might be reduced to ſixty yards; and with one or two locks might be made navigable through for batteux. It is a moſt beautiful collection of water; thirty-ſix miles long, and from one to ſeven wide. It emboſoms more than 200 iſlands, ſome ſay 365; very few of which are any thing more than barren rocks, covered with heath, and a few cedar, ſpruce, and hemlock, trees, and ſhrubs, and abundance of rattle-ſnakes. On each ſide it is ſkirted by prodigious mountains; from which large quantities of red cedar are annually carried to New York for ſhip-timber. The lake is full of fiſhes, and ſome of the beſt kind, as the black or Oſwego baſs, alſo large ſpeckled trouts. It was called Lake Sacrament by the French, who, in former times, were at the pains to procure this water for ſacramental uſes in all their churches in Canada: hence probably it derived its name. The remains of Fort George ſtand at the ſouth end of the lake, about fourteen miles north by weſt of Fort Edward, on Hudſon river. The famous fort of Ticonderoga, which ſtood at the north ſide of the outlet of the lake, where it diſcharged its waters into lake Champlain, is now in ruins. See TICONDEROGA.

GEORGE-NO'BLE, *ſ.* A gold coin of Hen. VIII. —*George-nobles* at ſix ſhillings and eight-pence. *Leake.*— The gold coins of Henry the Eighth were ſovereigns, half-ſovereigns, rials, half and quarter rials, angels, angelets, and quarter-angels, *George-nobles*, forty-penny pieces, crowns of the double roſe, and half-crowns. *Leake.*

GEORGE's (ST.), and other places thus named, ſee SAINT GEORGE.

GEORGE's TOWN, a town of Scotland, in the county of Inverneſs: thirty-ſix miles north-north-eaſt of Inverary, and thirty-ſeven north-weſt of Stirling.

GEOR'GENBERG, a town of Sileſia, in the principality of Oppeln: nine miles north of Beuthen.

GEOR'GENBURG, a town of Pruſſian Lithuania: two miles ſouth of Inſterburg.

GEOR'GENTHAL, a town of Germany, in the circle of Upper Saxony, and principality of Gotha: ſix miles ſouth of Gotha.

GEOR'GETOWN, a town of the American States, in Suſſex county, Delaware, ſituated ſixteen miles weſt-ſouth-weſt of Lewiſtown, and one hundred and three ſouth of Philadelphia. It has lately been made the ſeat of the county courts.

GEOR'GETOWN, a poſt-town of the American States, in Maryland, ſituated in Kent county, on the eaſt ſide of Cheſapeak bay. It is nine miles from the mouth of the river Saſſafras, being ſeated on the ſouth ſide oppoſite to Frederic: ſixty miles north-eaſt of Cheſter, and ſixty-five ſouth-weſt of Philadelphia.

GEOR'GETOWN, a town of the American States, in Fayette county, Pennſylvania, ſituated on the ſouth-eaſt ſide of Monongahela river, at the mouth of George's creek. Here a number of veſſels are annually built for the trade to the weſtern country. It lies ſixteen miles ſouth-weſt of Union.

GEOR'GETOWN, a poſt-town and port of entry of the American States, in Montgomery county, Maryland, in the territory of Columbia. It is pleaſantly ſituated on a number of ſmall hills, upon the northern bank of Potowmack river; bounded eaſtward by Rock creek, which ſeparates it from Waſhington city, and lies four miles from the capitol, and eight north of Alexandria. The Roman catholics have eſtabliſhed a college here for the promotion of general literature, which is at preſent in a very flouriſhing ſtate. The building being found inadequate to contain the number of ſtudents that applied, a large addition has been made to it. Georgetown carries on a conſiderable trade with Europe and the Weſt Indies. It is forty-ſix miles ſouth-weſt by

by weſt of Baltimore, and one hundred and forty-eight ſouth-weſt of Philadelphia.

GEOR'GETOWN, a town of the American States, in Lincoln county, diſtrict of Maine, ſituated on both ſides of Kennebeck river. It was incorporated in 1716, is the oldeſt town in the county, and contains 1333 inhabitants. It is bounded ſoutherly by the ocean, weſterly by the towns of Harpſwell and Brunſwick, north-weſterly by Bath, and eaſterly by Woolwich; being entirely ſurrounded by navigable waters, excepting about two miles of land, which divides the waters of Winnagance creek, a part of the Kennebeck, from an arm or influx of Caſco bay, called Stephen's river.

The entrance at the mouth of Kennebeck river, is guided on the eaſt by Parker's iſland, belonging to this townſhip. It contains about twenty-eight thouſand acres of arable land and ſalt marſh, and is inhabited by more than one third part of the people of the townſhip. This was the ſpot on which the Europeans firſt attempted to colonize New England, in the year 1607. It is a part of what was called Sagadahock; and the patentees of the Plymouth company began here to lay the foundation of a great ſtate. They ſent over a number of civil and military officers, and about one hundred people. By various misfortunes they were forced to give up the ſettlement, and in 1608, the whole number who ſurvived the winter returned to England. There was a tradition among the Norridge-walk Indians, that theſe planters invited a number of the natives, who had come to trade with them, to draw a ſmall cannon by a rope, and that when they were ranged in a line, the white people diſcharged the piece, and thereby killed and wounded ſeveral of them. The reſentment of the natives at this treacherous murder, obliged the Europeans to reimbark the next ſummer. Georgetown is fifteen miles ſouth of Pownalborough, and one hundred and ſeventy north by eaſt of Boſton.

GEOR'GETOWN, a poſt-town of the American States, in Georgia, in the county of Oglethorpe, fifty miles ſouth-weſt of Auguſta, ſurrounded by a poor country: but nevertheleſs exhibits marks of growing proſperity.

GEOR'GETOWN, a large maritime diſtrict of the American States, in the lower country of South Carolina, ſituated in the ſouth-eaſt corner of the ſtate; bounded north-eaſt by the ſtate of North Carolina; ſouth-eaſt by the ocean; ſouth-weſt by Santee river, which divides it from Charleſtown diſtrict; and north-weſt by Camden and Cheraw diſtricts. It is about one hundred and twelve miles from north to ſouth, and ſixty-three from eaſt to weſt, and is divided into the pariſhes of All Saints, Prince George, and Prince Frederic. It contains, according to the cenſus of 1790, twenty-two thouſand one hundred and twenty-two inhabitants. It ſends to the ſtate legiſlature ten repreſentatives and three ſenators.

GEOR'GETOWN, a poſt-town of the American States, and capital of the above diſtrict, ſituated on a ſpot near which ſeveral ſtreams unite their waters, and form a broad ſtream called Winyaw bay, twelve miles from the ſea. Its ſituation connects it with an extenſive back country of both the Carolinas, and would be a place of vaſt importance, were it not for a bar at the entrance of Winyaw bay, which interrupts the entrance of veſſels drawing above eleven feet water, and is in many reſpects a dangerous harbour. The public buildings are a court-houſe, gaol, and academy; three churches, of which the epiſcopalians, baptiſts, and methodiſts, have one each. It carries on a ſmall trade to the Weſt Indies: ſixty miles north-eaſt by north of Charleſton, one hundred and twenty-ſeven ſouth-weſt of Wilmington, North Carolina, and ſix hundred and eighty-one from Philadelphia. Lat. 33. 24. N. lon. 79. 35. W.

GEOR'GIA, a country of Aſia, called by ſome geographers *Gurgiſtan*, and by others *Kurgiſtan*, ſituated between the Caſpian and the Black Seas; but now particularly applied to a country between the Caſpian Sea and Mingrelia, anciently known by the name of IBERIA, which ſee. The air is dry, very warm in ſummer, and very cold in winter. Fine weather commences in the month of May, and continues till the end of November. The ſoil is exceedingly fertile, provided the ground be watered. The bread and fruits are excellent, and the paſtures maintain a great number of cattle. The game is in abundance, and of excellent flavour; and the wild hogs delicate. The inhabitants make wine, which they ſend into Armenia and Perſia, eſpecially to Iſpahan, for the king's table. Silk forms a conſiderable branch of trade to Erzerum; but the inhabitants are not acquainted with the beſt method of winding it. Georgia was formerly in one kingdom, of which the inhabitants were Chriſtians; but ſince the year 1639, they have become a mixture of Mahometans; and the king of Perſia having conquered the country, has divided it between two native princes, by themſelves called kings, but by the ſophi ſtyled only governors, or viceroys. See PERSIA. The moſt powerful of the two is that of Teflis, called, in the language of the country, the king of Cartela. Each of theſe princes has generally a guard of Mahometan horſe in pay. The king of Perſia obliges them to embrace the Mahometan religion, to preſerve the dignity in the family. The Chriſtians of the country in part follow the rites of the Armenians, and in part that of the Greek church, and are repreſented as the moſt tractable of all the Chriſtians of the eaſt. Their money bears the name of the kings of Perſia, but juſtice is adminiſtered by Chriſtian magiſtrates. The Georgians have wonderful ſkill in the uſe of the bow, and have the reputation of being the beſt ſoldiers of any in Aſia. The women have been always celebrated for their beauty. As the country produces ſtrong wine, the Georgians are great drunkards, and are particularly fond of brandy, the women as well as the men. The manners and cuſtoms of the Georgians are a mixture of thoſe nations which are ſituated about them. The men have no virtue, but courage; fathers ſell their children, and ſometimes their wives: the daughters ſupply the harems of the grand ſeignor and Turkiſh noblemen; and the ſons are bought by the beys of Egypt, to keep in full force their choſen cavalry of mamalukes. See the article EGYPT, vol. vi.

GEOR'GIA, one of the United States of North America, ſituated between 30. 37. and 35. 0. N. lat. and between 80. 8. and 91. 8. W. lon. being about ſix hundred miles in length, and, on an average, two hundred and fifty in breadth. It is bounded eaſt by the Atlantic ocean; on the ſouth by Eaſt and Weſt Florida; on the weſt by the river Miſſiſſippi; and, on the north-eaſt and north by South Carolina and the Tenneſſee ſtate. It was formerly divided into pariſhes, afterwards into three diſtricts, but lately into two diſtricts, viz. Upper and Lower, which are ſubdivided into twenty-four counties, as follow:—In the Lower diſtrict are, Camden, Glynn, Liberty, Chatham, Bryan, M'Intoſh, Effingham, Scriven, and Burke. The counties in the Upper diſtrict are, Montgomery, Waſhington, Hancock, Greene, Franklin, Oglethorpe, Elbert, Wilkes, Lincoln, Warren, Jefferſon, Jackſon, Bullock, Columbia, and Richmond. The principal towns are Auguſta, formerly the ſeat of government, Savannah, the former capital of the ſtate, Sunbury, Brunſwick, Frederica, Waſhington, and Louiſville, which is the metropolis of the ſtate; and here are depoſited the records of the ſtate.

The principal rivers that fertilize Georgia are, Savannah, which ſeparates it from South Carolina; Ogeechee river, which runs parallel with the former, and Alatamaha, which runs parallel with the others. Beſides theſe and their numerous branches, there is Turtle river, Little Sitilla, Great Sitilla, Crooked river, and St.

St. Mary's, which forms a part of the ſouthern boundary of the United States. The rivers in the middle and weſtern parts belong more properly to *Georgia Weſtern Territory*. All theſe are ſtored with a great variety of fiſh, as rock, mullet, whiting, ſhad, trout, drum, baſs, catfiſh, white, brim, and ſturgeon; and the bays and lagoons are ſupplied with oyſters, and other ſhell-fiſh, crabs, ſhrimps, &c. The clams, in particular, are large, their meat white, tender, and delicate. The ſhark and great black ſting-ray are inſatiable cannibals, and very troubleſome to the fiſhermen. The chief lake or marſh is Ekanſanoka, by ſome called Ouaquaphenogaw, which is three hundred miles in circumference.

The eaſtern part of the ſtate, between the mountains and the ocean, and the rivers Savannah and St. Mary's, a tract of country more than one hundred and twenty miles from north to ſouth, and from fifty to eighty eaſt and weſt, is level, without a hill or ſtone. At the diſtance of about forty or fifty miles from the ſea board, or ſalt marſh, the lands begin to be more or leſs uneven, until they gradually riſe to mountains. The vaſt chain of the Alleghany or Appalachian mountains, which commence with the Kaats Kill, near Hudſon river, in the ſtate of New York, terminate in Georgia, ſixty miles ſouth of its northern boundary. From the foot of this mountain ſpreads a wide extended plain, of the richeſt ſoil, and in a latitude and climate well adapted to the cultivation of moſt of the productions of the ſouth of Europe, and of the Eaſt Indies. In the low country, near the rice ſwamps, bilious complaints and fevers of various kinds prevail during the months of July, Auguſt, and September; but the fertility of the ſoil, and the eaſe with which it is improved, are a ſufficient inducement to ſettlers, and an unfailing ſource of wealth. Before the ſickly ſeaſon approaches, the rich planters, with their families, remove to the ſea iſlands, or ſome elevated ſituation, for the benefit of the freſh air. In the winter and ſpring, pleuriſies, peripneumonies, and other inflammatory diſorders, occaſioned by violent and ſudden colds, are very common, and frequently fatal. Conſumptions, epilepſies, cancers, palſies, and apoplexies, are not ſo common among the inhabitants of the ſouthern as northern climates. Yet the winters in Georgia are very mild and pleaſant. Snow is ſeldom ſeen; nor is vegetation often prevented by ſevere froſts. Cattle ſubſiſt well during the winter, feeding in the woods and ſavannas, and are fatter in that ſeaſon than in any other. In the hilly country, which begins about fifty, and in ſome places one hundred, miles, from the ſea, the air is pure and ſalubrious, and the water plentiful and good. From June to September, the mercury in Fahrenheit's thermometer commonly fluctuates from 76 to 90; in winter from 40 to 60. The moſt prevailing winds are ſouth-weſt and eaſt; in winter north-weſt. The eaſt wind is warmeſt in winter, and cooleſt in ſummer. The ſouth wind, in ſummer and fall particularly, is damp, ſultry, unelaſtic, and of courſe unhealthy. In the ſouth-eaſt parts of this ſtate, which lie within a few degrees of the torrid zone, the atmoſphere is kept in motion by impreſſions from the trade winds. This purifies the air; ſo that it is found to have ſalutary effects on conſumptive habits.

In the low lands are the rice fields. In the interior and hilly parts, wheat, Indian corn, and the other productions more common to the northern ſtates. Rice is at preſent the ſtaple commodity of the ſtate; tobacco, wheat, and indigo, are the other great articles of produce. Beſides theſe, the ſtate yields cotton, ſilk, corn, potatoes, oranges, figs, olives, pomegranates, &c. The foreſts conſiſt of oak, hickory, mulberry, pine, cedar, &c. The whole coaſt is bordered with iſlands; the principal of which are Skidaway, Waſſaw, Oſſabaw, St. Catharine's, Sapelo, Frederica, Jekyl, Cumberland, &c. Theſe iſlands are ſurrounded by navigable creeks, between which and the main land is a large extent of ſalt marſh, fronting the whole ſtate, not leſs, on an average, than four or five miles in breadth; interſected with creeks in various directions, admitting, through the whole, an inland navigation, between the iſlands and the main land, from the north-eaſt to the ſouth-eaſt corners of the ſtate. The eaſt ſides of theſe iſlands are, for the moſt part, clean ſandy beaches, expoſed to the waſh of the ocean. Between theſe iſlands are the entrances of the rivers from the interior country, winding through the low ſalt marſhes, and delivering their waters into the ſounds, which form capacious harbours of from three to eight miles over, and which communicate with each other by parallel creeks.

The ſoil and its fertility are various, according to ſituation and different improvement. The iſlands in their natural ſtate are covered with a plentiful growth of pine, oak, hickory, live oak, (an uncommonly hard and very valuable wood,) and ſome red cedar. The ſoil is a mixture of ſand and black mould, making what is commonly called a grey ſoil. A conſiderable part of it, particularly that whereon grow the oak, hickory, and live oak, is very rich, and yields on cultivation good crops of indigo, cotton, corn, and potatoes. The ſoil of the main land, adjoining the marſhes and creeks, is nearly of the ſame quality with that of the iſlands; except that which borders on thoſe rivers and creeks which ſtretch far back into the country. On theſe commence the valuable rice ſwamps, which, on cultivation, afford the preſent chief ſtaple of Georgian commerce. The ſoil between the rivers and the edge of the ſwamps, at the diſtance of twenty or thirty miles, changes from a grey to a red colour, on which grows plenty of oak and hickory, with a conſiderable intermixture of pine. In ſome places it is gravelly, but fertile, and ſo continues for a number of miles, gradually deepening the reddiſh colour of the earth, till it changes into what is called the Mulatto ſoil, conſiſting of a black and red earth. The Mulatto lands are generally ſtrong, and yield large crops of wheat, tobacco, corn, &c. To this kind of land ſucceeds by turns a ſoil nearly black, and very rich, on which grow large quantities of walnut, mulberry, &c. This ſucceſſion of different ſoils continues uniform and regular, though there are ſome large veins of all the different ſoils intermixed; and what is more remarkable, this ſucceſſion, in the order mentioned, ſtretches acroſs this ſtate nearly parallel with the ſea-coaſt, and extends through the ſeveral ſtates, nearly in the ſame direction, to the banks of Hudſon-river.

Cotton was formerly planted here only by the poorer claſs of people, and that for family uſe. They planted two kinds, the annual, and the Weſt Indian; the former is low, and planted every year; the balls are large, and the flocks ſtrong, and perfectly white. The latter is a tall perennial plant, the ſtalk ſomewhat ſhrubby, ſeveral of which riſe up from the root for ſeveral years ſucceſſively; the ſtems of the former year being killed by the winter froſts. The balls of the Weſt-India cotton are not quite ſo large as the other, but the flock or wool is long, extremely fine, ſilky, and white. A plantation of this kind will laſt ſeveral years, with moderate labour and care. The culture of cotton in Georgia is now much more attended to; ſeveral indigo planters have converted their plantations into cotton fields; and it is expected that the ſtates of South Carolina and Georgia will be able to raiſe more than ten millions of pounds of cotton annually for exportation.

Moſt of the tropical fruits would flouriſh in this ſtate, with proper attention. The ſouth-weſtern part of Georgia, and the parts of Eaſt and Weſt Florida, which lie adjoining, will, probably, in ſome future time, become the vineyard of America. The chief articles of export are rice, tobacco, indigo, ſago, lumber, naval ſtores, leather, deer-ſkins, ſnake-root, myrtle, bees-wax, corn, and live ſtock. The planters and farmers raiſe large ſtocks of cattle, from 1,000 to 1,500 head, and

ſome more. The value in ſterling money of the exports of Georgia, in the year 1755, was 15,744l.—in 1772, 121,677l.—in 1791, value in dollars 491,472—in 1792, 458,973—in 1794, 501,383—in 1795, 676,154; and in 1796, 950,158. In 1790, the tonnage employed in this ſtate was 28,540, and the number of American ſeamen 11,225. In return for her exports Georgia receives Weſt-India goods, teas, wines, clothing, and dry goods of all kinds. From the northern ſtates, cheeſe, fiſh, potatoes, apples, cider, and ſhoes. The imports and exports are principally to and from Savannah, which has a fine harbour, and is the place where the principal commercial buſineſs of the ſtate is tranſacted.

According to the cenſus of 1790, the number of inhabitants amounted to 82,548; and the increaſe has been very conſiderable ſince. The different religious ſects are Preſbyterians, Epiſcopalians, Baptiſts, and Methodiſts. The literature of this ſtate is conducted on a plan which will be very advantageous to the riſing generation. A college, with ample and liberal endowments, is inſtituted in Louiſville, a high and healthy part of the country, near the centre of the ſtate. There is alſo proviſion made for the inſtitution of an academy in each county of the ſtate, ſupported by the ſame funds, and conſidered as parts and members of the ſame inſtitution, under the general ſuperintendance and direction of a preſident and board of truſtees, ſelected for their literary accompliſhments from the different parts of the ſtate, and inveſted with the cuſtomary powers of corporations. This inſtitution is denominated *The Univerſity of Georgia.* The funds for the ſupport of literary inſtitutions are principally in lands, amounting in the whole to fifty thouſand acres, a great part of which is of the beſt quality, and very valuable; together with nearly ſix thouſand pounds ſterling in bonds, houſes, and town lots in Auguſta. Other public property, to the amount of one thouſand pounds in each county, has been ſet apart for the purpoſes of building and furniſhing their reſpective academies. The funds originally deſigned to ſupport the literary orphan-houſe, founded by the Rev. George Whitefield, are chiefly in rice-plantations and negroes. On the death of the counteſs of Huntingdon, to whom Mr. Whitefield bequeathed this property, as truſtee, the legiſlature, in 1792, paſſed a law veſting it in thirteen commiſſioners, with powers to carry the original intention of Mr. Whitefield into execution; and in compliment to the counteſs, the ſeminary is ſtyled Huntingdon College.—This ſtate was firſt colonized in the year 1732, and was the only colony ſettled at the expence of the king of England.

GEORGIA WESTERN TERRITORY.—Under this name is included all that part of the ſtate of Georgia which lies weſt of the head waters of thoſe rivers which fall into the Atlantic Ocean. This extenſive tract of country embraces ſome of the fineſt land in the United States, is interſected with a great number of noble rivers, and is inhabited (except ſuch parts wherein the Indian title has been extinguiſhed) by three nations of Indians, viz. the Muſkogulge or Creek, the Chactaws, and Chickaſaws. The Cherokees alſo have a title to a ſmall portion of the northern part of this territory, on the Tenneſſee river. Theſe nations together can furniſh between eight and nine thouſand warriors. About two thouſand families of white people inhabit thoſe parts of this territory where the Indian title has been extinguiſhed, chiefly at the Natchez; and the Yazoo river, on the banks of the Miſſiſſippi, and a conſiderable number on the Tombigbee river, and ſcattered among the Creek Indians. This territory, lying between the thirty-firſt and thirty-fifth degrees of north latitude, is not ſubject to the extremes of heat or cold: the climate is temperate and delightful through the year; and except in low grounds, and in the neighbourhood of ſtagnant waters, is very healthful. White froſts, and ſometimes thin ice, have been ſeen as far ſouth as the thirty-firſt degree of latitude; but ſnow is very uncommon in any part of this territory. Mr. Hutchins, ſpeaking of this tract of country, in his Hiſtorical Narrative of Louiſiana, &c. ſays, "the climate is healthy and temperate, the country delightful and well watered, and the proſpects beautiful and extenſive; variegated by many inequalities and fine meadows, ſeparated by innumerable copſes, the trees of which are of different kinds, but moſtly of walnut and oak. The elevated, open, and airy, ſituation of this country, renders it leſs liable to fevers and agues (the only diſorders ever known in its neighbourhood) than ſome other parts bordering on the Miſſiſſippi, where the want of a ſufficient deſcent to convey the waters off occaſions numbers of ſtagnant ponds, whoſe exhalations infect the air."

To give a juſt view of the rivers, and to aſcertain the advantages derived from them to this part of Georgia, it is neceſſary to trace them from their mouths in the Gulf of Mexico. The Miſſiſſippi bounds this territory on the weſt. The free navigation of this noble river is now fully enjoyed by the inhabitants of the United States. It empties, by ſeveral mouths of different depths from nine to ſixteen feet, into the Gulf of Mexico, in about lat. 29. N. The bars at the mouth of this river frequently ſhift; after paſſing them into the river, there is from three to ten fathoms of water, as far as the ſouth-weſt paſs; and thence to the Miſſouri, a diſtance of 1,142 computed miles, twelve, fifteen, twenty, and thirty, fathoms, is the general depth. On both ſides the Miſſiſſippi there are extenſive natural meadows, with a proſpect of the Gulf of Mexico on each ſide, the diſtance of thirty-two miles, to a place called Detour-aux-Plaquemines, in Weſt Florida. Thence twenty miles to the ſettlements, the banks are low and marſhy, generally overflowed and covered with thick wood, palmetto buſhes, &c. apparently impenetrable by man or beaſt. Thence to Detour-des-Anglois, at the bend of the river, the banks are well inhabited; as alſo from hence to New Orleans, eighteen miles, which diſtance there is a good road for carriages. Veſſels paſs from the mouth of this river to New Orleans, 105 miles, in ſeven or eight days, commonly; ſometimes in three or four.

From New Orleans, the capital of Louiſiana, there is an eaſy communication with Weſt Florida by Bayouk Creek, which is a water of lake Ponchartrain, navigable for veſſels drawing four feet water, ſix miles up from the lake, to a landing-place two miles from New Orleans. For nearly fifty miles up the river, both its banks are ſettled and highly cultivated, in part by emigrants from Germany, who furniſh the market with indigo of a ſuperior quality, cotton, rice, beans, myrtle, wax, and lumber. In 1762, ſome rich planters attempted the cultivation of canes and the making of ſugar, and erected mills for the purpoſe. This ſugar was of an excellent quality, and ſome of the crops were large; but ſome winters proving ſo ſevere as to kill the canes, no dependence can be placed in the culture of that article.

The ſettlements of the Acadians, which were begun in 1763, extend on both ſides of the river, from the Germans to the river Ibberville, which is ninety-nine miles above New Orleans, and two hundred and ſeventy from Penſacola, by way of lakes Ponchartrain and Maurepas. At Point Coupee, thirty-five miles above the Ibberville, are ſettlements extending twenty miles on the weſt ſide of the river, which thirty years ago had two thouſand white inhabitants, and ſeven thouſand ſlaves, who were employed in the cultivation of tobacco, indigo, Indian corn, &c. for the New Orleans market, which they furniſhed alſo with poultry, and abundance of ſquared timber, ſtaves, &c.

Mr. Hutchins, from his perſonal knowledge, deſcribes the country on both ſides of the Miſſiſſippi, between the latitudes 30 and 31, bordering on Georgia, as follows: "Although this country might produce all the valuable

valuable articles raiſed in other parts of the globe ſituated in the ſame latitudes, yet the inhabitants principally cultivate indigo, rice, tobacco, Indian corn, and ſome wheat; and they raiſe large ſtocks of black cattle, horſes, mules, hogs, ſheep, and poultry. The ſheep are ſaid to make the ſweeteſt mutton in the world. The black cattle, when fat enough for ſale, which they commonly are the year round, are driven acroſs the country to New Orleans, where there is always a good market. The woods are principally timbered with all the different kinds of oak, but moſtly with live oak of the largeſt and beſt quality, uncommonly large cypreſs, black walnut, hickory, white aſh, cherry, plum, poplar trees, and grape vines; here is found alſo a great variety of ſhrubs and medicinal roots. The lands bordering the rivers and lakes are generally well wooded, but at a ſmall diſtance from them are very extenſive natural meadows, or ſavannas, of the moſt luxuriant ſoil, compoſed of a black mould, about a foot and a half deep, very looſe and rich, occaſioned in part by the frequent burning of the ſavannas; below the black mould is a ſtiff clay of different colours. It is ſaid this clay, after being expoſed ſome time to the ſun, becomes ſo hard that it is difficult either to break or bend, but when wet by a light ſhower of rain, it ſlackens in the ſame manner as lime does when expoſed to moiſture, and becomes looſe and moulders away, after which it is found excellent for vegetation."

After paſſing the thirty-firſt degree of north latitude from Weſt Florida into Georgia, we enter what is called the *Natchez Country*, bordering on the Miſſiſſippi. Fort Roſailie, in this country, is in lat. 31.40. two hundred and forty-three miles above New Orleans. "The ſoil of this country is ſuperior to any of the lands on the borders of the river Miſſiſſippi, for the production of many articles. Its ſituation being higher, affords a greater variety of ſoil, and is in a more favourable climate for the growth of wheat, rye, barley, oats, &c. than the country lower down, and nearer to the ſea. The ſoil alſo produces in equal abundance Indian corn, rice, hemp, flax, indigo, cotton, pot-herbs, pulſe of every kind, and paſturage; and the tobacco made here is eſteemed preferable to any cultivated in other parts of America. Hops grow wild; all kinds of European fruits arrive to great perfection, and no part of the known world is more favourable for the raiſing of every kind of ſtock. The riſing grounds, which are clothed with graſs and other herbs of the fineſt verdure, are well adapted to the culture of vines; the mulberry trees are very numerous, and the winters ſufficiently moderate for the breed of ſilk worms. Clay of different colours, fit for glaſs-works and pottery, is found here in great abundance; and alſo a variety of ſtately timber, fit for houſe and ſhip building, &c."

This country was once famous for its inhabitants, the Natchez Indians; who, from their great number, and the improved ſtate of ſociety among them, were conſidered as the moſt civilized Indians on the continent of America. Nothing now remains of this nation but their name, by which their country continues to be called. The diſtrict of the Natchez, as well as all along the eaſtern bank of the Miſſiſſippi to the river Ibberville, was ſettling very faſt by emigrations from the northern ſtates, till the capture of the Britiſh troops on the Miſſiſſippi, in 1779, put an entire ſtop to it.

From Fort Roſailie to the Petit Goufre is thirty-one miles and a half. There is a firm rock on the eaſt ſide of the Miſſiſſippi for near a mile, which ſeems to be of the nature of lime-ſtone. The land near the river is much broken and very high, with a good ſoil, and ſeveral plantations on it. From the Petit Goufre to Stoney river is four miles and a quarter. From the mouth to what is called the fork of this river, is computed to be twenty-one miles. In this diſtance there are ſeveral quarries of ſtone, and the land has a clay ſoil, with gravel on the ſurface of the ground. On the north ſide of this river, the land in general is low and rich; that on the ſouth ſide is much higher, but broken into hills and vales; but here the low lands are not often overflowed: both ſides are ſhaded with a variety of uſeful timber. At the fork, the river parts almoſt at right angles, and the lands between and on each ſide of them are ſaid to be clay and marl ſoil, not ſo uneven as the lands on this river lower down. From Stoney river to Louſa Chitto, or Big Black river, is ten miles. This river, at the mouth, is about thirty yards wide, but within from thirty to fifty yards, and is ſaid to be navigable for canoes thirty or forty leagues. About a mile and a half up this river, the high lands are cloſe on the right, and are much broken. A mile and a half further, the high lands appear again on the right, where there are ſeveral ſprings of water, but none as yet have been diſcovered on the left. At about eight miles further, the high lands are near the river on the left, and appear to be the ſame range that comes from the Yaxoo cliffs. At ſix miles further, the high lands are near the river on both ſides, and continue for two or three miles, but broken and full of ſprings of water. This land on the left was choſen by general Putnam, captain Enos, Mr. Lyman, and other New-England adventurers, as a proper place for a town; and, by order of the governor and council of Weſt Florida, in 1773, it was reſerved for the capital. The country round is very fit for ſettlements. For four or five miles above this place, on both ſides of the river, the land is rich, and not ſo much drowned, nor ſo uneven, as ſome parts lower down. About ſix miles and a half further, there is a rapid water, ſtones and gravel bottom, 160 yards in length; and in one place a firm rock almoſt acroſs the river, and as much of it bare when the water is at a moderate height, as confines the ſtream to nearly twenty feet; and the channel is about four feet deep.

From the Louſa Chitto to the Yazoo Cliffs, is forty miles. From this cliff the high lands lie north-eaſtward and ſouth-ſouth-eaſtward, bearing off from the river, full of cane and rich ſoil, even on the very higheſt ridges. Juſt at the ſouth-end of the cliffs, the bank is low, where the water of the Miſſiſſippi, when high, flows back, and runs between the bank and high land, which ranges nearly northerly and ſouth-ſouth-eaſterly to the Louſa Chitto, occaſioning much wet ground, cypreſs ſwamp, and ſtagnant ponds. From the cliffs, is ſeven miles and a half to the river Yazoo. The mouth of this river is upwards of one hundred yards in width, and was found by Mr. Gaul to be in lat. 32. 37. and by Mr. Purcell in 32. 28. N. The water of the Miſſiſſippi, when the river is high, runs up the Yazoo ſeveral miles, and empties itſelf again by a number of channels, which direct their courſe acroſs the country, and fall in above the Walnut Hills. The Yazoo runs from the north-eaſt, and glides through a healthy, fertile, and pleaſant, country, greatly reſembling that about the Natchez, particularly in the luxuriance and diverſity of its ſoil, variety of timber, temperature of climate, and delightful ſituation. It is remarkably well watered by ſprings and brooks; many of the latter afford convenient ſeats for mills. Further up this river the canes are leſs frequent, and ſmaller in ſize, and at the diſtance of twenty miles there are ſcarcely any. Here the country is clear of under-wood, and well watered, and the ſoil very rich, which continues to the Chactaw and Chickaſaw towns, on the eaſtern and north-weſtern branches of Yazoo river. Theſe branches unite fifty miles from the Miſſiſſippi, following the courſe of the river; the navigation to their junction, commonly called the Fork, is practicable with very large boats in the ſpring ſeaſon, and with ſmaller ones a conſiderable way further, with the interruption of but one fall, where they are obliged to make a ſhort portage, twenty miles up the north-weſtern branch, and ſeventy miles from

the Miſſiſſippi. The country in which the Chactaw and Chickaſaw towns are ſituated, is ſaid to be as healthy as any part of the continent, the natives ſcarcely ever being ſick. Such of them as frequent the Miſſiſſippi, leave its banks as the ſummer approaches, leſt they might partake of the fevers that ſometimes viſit the low ſwampy lands bordering upon that river. Wheat, it is ſaid, yields better at the Yazoo than at the Natchez, owing probably to its more northern ſituation. Though the quantity of good land on the Miſſiſſippi and its branches, from the Bay of Mexico to the river Ohio, a diſtance of nearly one thouſand miles, is vaſtly great, and the conveniences attending it; ſo likewiſe we may eſteem that in the neighbourhood of the Natchez, and of the river Yazoo, the prime of it all.

About a mile and a half up the Yazoo river, on the north ſide, there is a large creek, which communicates with the Miſſiſſippi above the river St. Francis, about one hundred leagues higher up by the courſe of the river. It paſſes through ſeveral lakes by the way. At the diſtance of ſeveral miles from the mouth of the river Yazoo, on the ſouth ſide, are the Yazoo hills. There is a cliff of ſolid rock at the landing place, on which are a variety of broken pieces of ſea-ſhells, and ſome entire. Four miles further up, is the place called the Ball Ground, near which a church, fort St. Peter, and a French ſettlement, formerly ſtood. They were deſtroyed by the Yazoo Indians in 1729. That nation is now entirely extinct.

From about twenty miles eaſtward of the Miſſiſſippi, to Halfway or Pearl river, the diſtance of about ſixty miles, is "a fine level country, very fertile, and better watered than nearer the Miſſiſſippi. There is ſome mixture of ſand with loam; the timber the ſame, with the addition of black-jack, and poſt-oak. This tract is interſperſed with what the French call *prairies*, or ſavannas, which are extenſive intervals of one and two thouſand acres of excellent land, of a deep black ſoil, free of all timber and trees. It is this kind of land which the Indians cultivate. From the Miſſiſſippi to this river there are no Indians. To a tract of this country, extending along the Miſſiſſippi from the thirty-firſt degree of latitude to the Yazoo river, at the ſouth end, thirty miles wide, and narrowing as we proceed northerly to the width of fifteen miles, the Indian title has been extinguiſhed. It was firſt purchaſed by the Engliſh; but they not having completed the payment of the purchaſe money before it fell into the hands of the Spaniards, they, (the Spaniards,) in the year 1792, paid the balance. At Walnut Hills the Spaniards had a fort, ſince given up to the United States. To the country north of the Yazoo, the Indian title is not yet extinguiſhed. About one half of the ſouthern part, a diſtance of about fifty miles up the Yazoo, is owned by the Chactaws; the northern half by the Chickaſaws." The gentleman who gives the above information, and who was in this country in the year 1792, ſays, "that the Yazoo is about ninety yards wide; is navigable one hundred miles; that he croſſed the country by different routes three or four times from the Miſſiſſippi to the Tombigbee; paſſed over the Yazoo ſeveral times; went up and down the river on the ſhore; and ſays that the lands to the eaſt of the Yazoo (the diſtance of about one hundred miles) are very excellent."

Pearl river is about forty yards wide; a branch of it, paſſing eaſt of the Natchez and neareſt, bears the name of Buffalo river. On the eaſt ſide of Pearl river commence the Chactaw ſettlements, and extend to the Chickaſaw Hay river; thence, about forty miles eaſtward, the ſettlements extend near to the Tombigbee. This is a numerous nation, containing about three thouſand hunters, who are a peaceable and friendly people. The ſtreams on which the Chactaws are ſettled, are laid down by Coxe as proceeding from weſt to eaſt; the Homachitta, (called by Purcell, Hoſtaphatcha,) Chactaw, and Souhawtee, which unite, and the main ſtream, retains the name of Homachitta till it empties into the Gulf of Mexico. This is probably the ſame river that Hutchins calls Paſcagoula. The head branches of this river ſpread extenſively through the northern part of this territory, chiefly weſtward of the Chactaw nation. White or Bluff river, appears to riſe in about lat. 33. N. takes a courſe to the eaſt of the Chactaws, and empties into the Tombigbee ſome diſtance below the head of the tide water, and is laid down as about the ſize of Pearl river.

From the compact ſettlements of the Chactaws eaſtward, to the weſtern branches of the Tombigbee, the land is tolerably good: the timber generally oak and pine, with ſome hickory, well watered and level. Of this kind is the country a diſtance of about forty miles weſtward of the weſtern branches of the Tombigbee; afterwards the land is more uneven, interſperſed with large ſavannas, and the whole generally good land, and pretty well watered; the water, however, has a limy taſte. The natural growth much the ſame as on the Miſſiſſippi. The intervals, or, as they call it in this country, the *bottom lands*, are generally about a mile wide on the river, extremely rich, and thickly overgrown with canes. This general deſcription will apply to the whole tract belonging to the Georgia Miſſiſſippi Company.

We have now arrived eaſtward to the Mobile, the principal river in this territory. "On the bar at the entrance of the bay of Mobile, there is only about fifteen or ſixteen feet water; two-thirds of the way through the bay, towards the town of Mobile, there is from two to three fathoms; and the deepeſt water to be depended on in the upper part of the bay is only ten or twelve feet, and in many places not ſo much. Large veſſels cannot go within ſeven miles of the town. This bay is about thirty miles long, and from ten to twelve wide. The tide flows ſixty or ſeventy miles above this bay, and is ſo far navigable for ſea-veſſels. Thence 150 or 200 miles north, is good boat navigation, ſmooth water, generally 100 or 150 yards wide, and eight to ten feet deep. The bay of Mobile terminates a little to the north-eaſtward of the town, in a number of marſhes and lagoons; which ſubject the people to fevers and agues in the hot ſeaſon. The river Mobile divides into two principal branches, about forty miles above the town; one of which, called the Tanſaw, falls into the eaſt part of the bay; the other empties itſelf cloſe by the town, where it has a bar of ſeven feet; but there is a branch a little to the eaſtward of this, called Spaniſh river, where there is a channel of nine or ten feet when the water is high: this joins Mobile river about two leagues above the town. Two or three leagues above the Tanſaw branch, the Alabama river falls into the Mobile, after running from the north-eaſt a courſe of about 130 miles; that is, from Alabama fort, ſituated at the confluence of the Cooſa, and Talipoſee, both very conſiderable rivers; on which and their branches are the chief ſettlements of the Upper Creek Indians. The French fort at Alabama was evacuated in 1763, and has not ſince been garriſoned. Above the confluence of Alabama and Mobile, the latter is called the Tombigbee river, from the fort of Tombigbee, ſituated on the weſt ſide of it, about ninety-ſix leagues above the town of Mobile. The ſource of this river is reckoned to be about forty leagues higher up, in the country of the Chickaſaws. The fort of Tombigbee was taken poſſeſſion of by the Engliſh, but abandoned again in 1767, by order of the commandant of Penſacola. The river is navigable for ſloops and ſchooners about thirty-five leagues above the town of Mobile. The banks, where low, are partly overflowed in the rainy ſeaſons, which adds greatly to the ſoil, and adapts it particularly to the cultivation of rice. The ſides of the river are covered in many places with large canes, ſo thick that they are

almoſt

almoſt impenetrable; there is alſo plenty of remarkable large red and white cedar, cypreſs, elm, aſh, hickory, and various kinds of oak. Several people have ſettled on this river, who find the ſoil to anſwer beyond expectation. The lands near the mouth of the Mobile are generally low; as we proceed upwards, the land grows higher, and may with propriety be divided into three ſtages. Firſt, low rice lands, on or near the banks of the river, of a moſt excellent quality. Secondly, what are called by the people of the country, ſecond low lands, or level flat cane lands, about four or five feet higher than the low rice lands. And, thirdly, the high upland or open country. The firſt, or low lands, extend about an half or three-quarters of a mile from the river, and may almoſt every where be eaſily drained and turned into moſt excellent rice fields, and are capable of being laid under water at almoſt all ſeaſons of the year. They are a deep black mud or ſlime, which have in a ſucceſſion of time been accumulated, or formed by the overflowing of the river. The ſecond low grounds being, in general, formed by a regular riſing of about four or five feet higher than the low lands, appear to have been originally the edge of the river. The ſecond claſs or kind of land is in general extremely rich, and covered with large timber and thick ſtrong canes, extending in width upon an average three-quarters of a mile, and in general a perfect level. It is excellent for all kinds of grain, and well calculated for the culture of indigo, hemp, flax, or tobacco. At the extremity of theſe ſecond grounds, we come to what is called the uplands, which is covered with pine, oak, and hickory, and other kinds of large timber. The ſoil is of a good quality, but much inferior to the ſecond or low land. It anſwers well for raiſing Indian corn, potatoes, and every thing elſe that delights in a dry ſoil. Further out in the country again, on the weſt ſide of this river, we come to a pine barren, with extenſive reed ſwamps and natural meadows or ſavannas, which afford excellent ranges for innumerable herds of cattle. On the eaſt of the Mobile, towards the river Alabama, is one entire extended rich cane-country, not inferior, perhaps, to any in America. Whenever portages are made between the Mobile and Tenneſſee, or their branches, which are probably but a few miles apart, the Mobile will be the firſt river for commerce (the Miſſiſſippi excepted) in this part of the world, as it affords the ſhorteſt and moſt direct communication to the ſea."

The principal rivers which meander through this tract of country, are Seprey's and Cane-Brake rivers, both which fall into the Tombigbee, and are navigable for boats as high as the thirty-third degree of latitude; and the Cawhawbon river, which falls into the Alabama, below the junction of Cooſa and Oatfuſkee, are boatable as far north as the rivers laſt mentioned. The ſoil on the eaſt ſide of Tombigbee, according to colonel Hammond, ſurveyor-general of Georgia, is of a reddiſh caſt, producing naturally oak, hickory, and abundance of very high graſs. The country appears well calculated for the culture of wheat, corn, rye, oats, and barley. The bottoms or intervales on the rivers are not ſubject to inundations, and are exceedingly rich. The country is well watered with good wholeſome water. Further north, the country becomes uneven and ſomewhat hilly, that part particularly which divides the waters of Tombigbee from Tenneſſee river; but as you deſcend to a lower latitude, the country is more level; and down about the mouth of Cane Brake river, and thence acroſs to the Alabama, is almoſt one entire cane brake.

The ridge which divides the Tombigbee and Alabama rivers is ſtony, and the ſoil inferior to that on the rivers; of this deſcription alſo is the country lying between the Cawhawbon and Alabama rivers; but the bottom lands on the water-courſes are exceedingly rich. The country is pleaſant and healthy, being generally overgrown with high graſs, well calculated for farming, particularly for raiſing cattle. There are many extenſive and rich bottoms of cane-land on the Alabama. The river which falls into the Tombigbee next above Seprey's river, has much rich land on its banks, and is boatable ſome diſtance in ſmall boats, and ſpreads into many branches, through a pleaſant, healthy, and well-watered, country. As we advance eaſtward of the Alabama, we come firſt to the Eſcambia river, and then to the Chatta Hatcha, or Pea river, which Capt. Hutchins thus deſcribes:—The river Eſcambia is the moſt conſiderable that falls into the Bay of Penſacola. The Chatta Hatcha or Pea river, which alſo heads in the Georgia Weſtern Territory, empties from the north-eaſt into Roſe Bay, which is thirty miles long, and from four to ſix broad. The bar at the entrance into the bay has only ſeven or eight feet water at deepeſt; but, after croſſing the bar, has ſixteen or ſeventeen feet. The mouths of the river (for almoſt all the ſouthern rivers have ſeveral mouths) are ſo ſhoal, that only a ſmall boat or canoe can paſs them. Mr. Hutchins aſcended this river about ſeventy-five miles, and found that its banks very much reſembled thoſe of Eſcambia. Further to the eaſt are the Appalachicola, Flint, and Alabaha, rivers, which the reader will find deſcribed under their reſpective heads.

The northern parts of this territory are watered by the great bend of the Tenneſſee, and its tributary ſtreams. This noble river bends ſouthward as far as latitude 34. 15. and divides, into nearly equal parts, the purchaſe of the Tenneſſee company. North of the Tenneſſee, in this purchaſe, there is not an Indian inhabitant. From the ſouth, the Tenneſſee, in its courſe through Georgia, receives, beſides ſmaller ſtreams, the Hiwaſſee, Chiccamauga, and Occochappo or Bear creek. Travellers ſpeak of the lands on the bend of the Tenneſſee, in terms of the higheſt commendation.

Of the territory deſcribed above, the ſtate of Georgia, by act of their legiſlature, paſſed Jan. 7, 1795, ſold about twenty-two millions of acres to four different companies, whoſe names and the limits of their reſpective purchaſes, as defined by the act, as follow:

1. "All that tract or parcel of land, including iſlands, beginning on Mobile bay, where the lat. 31. N. of the equator interſects the ſame, running thence up the ſaid bay to the mouth of the lake Tenſaw; thence up the ſaid lake Tenſaw to the Alabama river, including Currey's and all other iſlands therein; thence up the ſaid river Alabama to the junction of the Cooſa and Oakfuſkee rivers; thence up the Cooſa river, above the Big Shoals, to where it interſects the latitude of 34. N. of the equator; thence a due weſt courſe to the Miſſiſſippi river; thence down the middle of the ſaid river to the latitude of 32. 40. thence a due eaſt courſe to the Dan or Tombigbee river; thence down the middle of the ſaid river to its junction with the Alabama river; thence down the middle of the ſaid river to Mobile bay; thence down the ſaid Mobile bay, to the place of beginning; ſhall be ſold unto James Gun, Matthew M'Alliſter, and George Walker, and their aſſociates, called *The Georgia Company*."

2. "All that tract of country, including iſlands, within the following boundaries, viz. beginning on the river Miſſiſſippi, at 31. 18. N. lat. thence a due eaſt courſe to the middle of Dan or Tombigbee river; thence up the middle of the ſaid river to N. lat. 32. 40. thence a due weſt courſe along the Georgia Company line, to the river Miſſiſſippi; thence down the middle of the ſame to the place of beginning; ſhall be ſold to Nicholas Long, Thomas Glaſcock, Ambroſe Gordon, and Thomas Cummings, and their aſſociates, called, *The Georgia Miſſiſſippi Company*."

3. "All that tract of country, including iſlands,

within the following boundaries, viz. beginning at the Miſſiſſippi river, where the northern boundary line of the ſtate ſtrikes the ſame; thence along the ſaid northern boundary line, due eaſt to the Tenneſſee river; thence along the ſaid Tenneſſee river to the mouth of Bear creek; thence up Bear creek to where the parallel of latitude, twenty-five Britiſh ſtatute miles ſouth of the northern boundary line of the ſtate, interſects the ſame; thence along the laſt-mentioned parallel of latitude, acroſs Tombigbee or Twenty Mile creek, due weſt to the Miſſiſſippi river; thence up the middle of the ſaid river, to the beginning; ſhall be ſold to John B. Scott, John C. Nightingale, and Wade Hampton, called *The Upper Miſſiſſippi Company.*"

4. "All that tract of land, including iſlands, within the following boundaries, viz. beginning at the mouth of Bear creek, on the ſouth ſide of Tenneſſee river; thence up the ſaid creek to the moſt ſouthern ſource thereof; thence due ſouth to lat. 34. 10. N. thence due eaſt 120 miles; thence a due north courſe to the Great Tenneſſee river; thence up the middle of the ſaid river to the northern boundary line of the ſtate; thence a due weſt courſe along the ſaid line to where it interſects the Great Tenneſſee river, below the Muſcle Shoals; thence up the ſaid river to the place of beginning; ſhall be ſold to Zachariah Cox, Mathias Maher, and their aſſociates, called *The Tenneſſee Company.*"

The ſame law enacts alſo, "that all lands lying weſtward and ſouthward of the eaſtern boundary of the ſeveral companies' purchaſes, and not included therein, eſtimated at one-fourth of the whole lands lying weſtward and ſouthward of the eaſtern boundary of the ſaid purchaſes, and ſuppoſed to contain 7,250,000 acres, ſhall be, and the ſame is hereby declared to be, reſerved and ſet apart to and for the uſe and benefit of this ſtate, to be granted out, or otherwiſe diſpoſed of, as future legiſlators may direct."

GEOR'GIA, a townſhip of the American States, in Franklin county, Vermont. It is ſituated on lake Champlain, oppoſite to the north end of South Hero iſland, and joins Milton on the ſouth, and St. Alban's on the north. La Moille river croſſes the extremity of the ſouth eaſt corner of this townſhip.

GEOR'GIA (New), or SOUTH GEORGIA, an iſland in the South Atlantic Ocean, about thirty leagues in length, and ten in breadth. It abounds in bays and harbours; but the prodigious quantity of ice on the coaſt renders it inacceſſible during a great part of the year, and even at other times the floating maſſes of ice render the anchorage dangerous. The appearance of the land is the ſame throughout; the lofty mountains towards the ſouth are divided into numberleſs parts, and appear like flames of fire. The coaſts are bounded with high perpendicular rocks of ice, large portions of which frequently break off and fall into the vallies or into the ſea, where they are moved about by the waves, and reſemble ſmall detached iſlands. The interior country is not leſs ſavage; the ſummits of the rocks are loſt in the clouds, and the vallies are covered with eternal ſnow: there is neither tree nor ſhrub. The only vegetables diſcovered were a kind of coarſe graſs, a ſpecies of burnet, and a plant like moſs. The rocks are compoſed of a kind of ſlate, of a blueiſh-grey colour, diſpoſed in horizontal beds; many ſhining fragments of which cover the ſtrand, and appear to have no mineral in the compoſition. In all the coaſt there was found neither river, nor freſh-water ſpring. A great number of ſea-calves and ſea-bears were found, and flocks of penguins, ſome of which weighed thirty-eight pounds, and meaſured three feet three inches long. The only birds ſeen on the land appeared to be a ſpecies of the lark: no quadruped was found, but the dung of one was ſeen, ſuppoſed to have belonged to a fox, or animal of that kind. Lat. 54. 30. S. lon. 37. W. Greenwich.

GEORGIA'NA, a proper name for women.

GEORGIA'NA, the name originally given in the charter to a large tract of country in the province of Maine, in the American States.

GEOR'GIANS, a ſect of heretics, ſo called from one *David George*, born at Delft in Holland, who held that the law and goſpel were unprofitable for the attaining heaven, and that himſelf was the true Chriſt and Meſſiah.

GEOR'GIC, *ſ.* [γεωργικον, Gr. *georgique*, Fr.] Some part of the ſcience of huſbandry put into a pleaſing dreſs, and ſet off with all the beauties and embelliſhments of poetry. Heſiod and Virgil are the two greateſt maſters in this kind of poetry.

GEOR'GIC, *adj.* Relating to the doctrine of agriculture:

Here I peruſe the Mantuan's *georgic* ſtrains,
And learn the labours of Italian ſwains. *Gay.*

GEORGIEV', a town of Ruſſia, in the government of Caucaſus: thirty-two miles weſt-north-weſt of Ekaterinograd.

GEORGI'NA, *ſ.* in botany, a genus of the claſs ſyngeneſia, order polygamia ſuperflua. Generic character—Receptacle chaffy; down o; calyx double, the outer many-leaved; inner one-leafed, eight-parted.

Species. 1. Georgina purpurea: midrib of the leaves winged; leaflets obovate, pointed, ſerrate, ſhining glabrous underneath; outer calyx reflected. 2. G. roſea: midrib of the leaves naked; leaflets ovate, rather obtuſe, obtuſely ſerrate, glabrous; outer calyx ſpreading. 3. G. coccinea: midrib of the leaves naked; leaflets ovate, pointed, ſerrate, roughiſh underneath; outer calyx ſpreading. All natives of Mexico.

GEOR'GITZ, a town of Walachia: eighteen miles north-north-eaſt of Buchoreſt, and twenty-four ſouth-eaſt of Tergoviſto.

GEOR'GIUM SI'DUS, the GEORGIAN PLANET. See the article ASTRONOMY, vol. ii. p. 391.

GEOS'COPY, *ſ.* [from γη, the earth, and σκοπεω, Gr. to view.] An obſervation of the different qualities of the earth. *Scott.*

GEOT'IC, *adj.* [from γη, Gr.] Belonging to the earth; terreſtrial. *Not much uſed.*

GEOT'IC, or GE'OTY, *ſ.* A kind of magic; geomancy. *Scott.*

GEPHY'RA, one of the cities of the Seleucidæ in Syria. *Strabo.*

GEPHYRÆ'I, a people of Phœnicia, who paſſed with Cadmus into Bœotia, and from thence into Attica. *Herodot.* 5. c. 57.

GEP'IDÆ, or GEP'IDI, in ancient geography, a Gothic people, who ſettled in an iſland at the mouth of the Viſtula, which they called *Gepidos. Procopius.*

GE'RA, [Heb. a pilgrimage.] A man's name.

GE'RA, a town of Germany, in the circle of Upper Saxony, and county of Reus, on the Elſter. It was ravaged by the Bohemians, in 1449: thirty miles ſouth-ſouth-weſt of Leipſic, and ſixty-eight weſt of Dreſden. Lat. 50. 49. N. lon. 29. 44. E. Ferro.

GERÆ'STUS, in ancient geography, a port of Eubœa. *Livy.*

GE'RAH, *ſ.* [Hebrew.] The twentieth part of a ſhekel; near three-halfpence Engliſh.

GE'RANGER, a town of Norway, in the dioceſe of Drontheim: twenty-two miles ſouth-ſouth-weſt of Romſdal.

GERA'NIA, a mountain between Megara and Corinth.

GE'RANIS, *ſ.* [from γερανος, Gr. a crane.] In ſurgery, a bandage for a fractured clavicle; ſo called becauſe it is ſhaped like an extended crane.

GERANI'TES, *ſ.* [from γερανος, a crane.] In natural hiſtory, an appellation given to ſuch of the ſemi-

pellucid gems as are marked with a ſpot reſembling a crane's eye.

GERA'NIUM, *ſ.* [from γερανος, Gr. a crane, the fruit having the form of a crane's head and neck.] Crane's Bill; in botany, a genus of the claſs monadelphia, order decandria, nat ural of gruinales, (gerania, *Juſſ.*) The generic characters are—Calyx: five-leaved; leaflets ovate, acute, concave, permanent. Corolla: petals five, obcordate or ovate, ſpreading, regular; nectary five honied glands, faſtened to the baſe of the longer filaments. Stamina: filaments ten, awl-ſhaped, connected ſlightly at the baſe, ſpreading at the top, ſhorter than the corolla; antheræ oblong, verſatile. Piſtillum: germ five-cornered, beaked; ſtyle awl-ſhaped, longer than the ſtamens, permanent; ſtigmas five, reflex. Pericarpium: capſule five-grained, beaked, the cells opening inwards, each having a ſimple naked tail fixed to it. Seeds: ſolitary, ovate-oblong.—*Eſſential Character.* Calyx five-leaved; corolla five-petalled, regular; nectary five honied glands, faſtened to the baſe of the longer filaments; fruit five-grained, beaked; beaks ſimple, naked, neither ſpiral nor bearded.

The genus of Geranium, as conſtituted by Linnæus, having become very unwieldy by modern diſcoveries, it is found very convenient to divide it; and a diviſion is commodiouſly made from this remarkable circumſtance; namely, that in ſome ſpecies all the ten filaments are fertile, whilſt in others three or even five of them are caſtrated, that is, are deſtitute of antheræ. Hence three genera are now conſtituted out of one: *Erodium*, with five fertile ſtamens only; *Pelargonium*, with ſeven; and this, retaining the old name, with all the ten fertile. There are alſo other marks of diſcrimination recited in their reſpective eſſential characters. Theſe three artificial genera or families, however, form but one natural family, agreeing in their five-leaved calyxes, their five-petalled corollas, their pentacoccous roſtrated fruits, and their general habit and ſtructure. They alſo agree in their inflorescence, the peduncles being curved downwards before flowering time; but when the flowers are about to open, the general peduncle firſt, and then each pedicel becoming erect. The fructification of Geranium is ſhewn on the Botany Plate XII. fig. 26–27; ſee alſo Plate IV. fig. 16, 23, 67; and Plate VIII. fig. 31, 37.

Species. I. Peduncles one-flowered. 1. Geranium Sibiricum, or Siberian crane's-bill: peduncles commonly one-flowered; leaves five-parted, acute; leaflets pinnatifid. Root perennial; ſtems herbaceous, annual, diffuſely dichotomous, jointed, almoſt round and ſmooth. Native of Siberia. Cultivated before 1768 by Mr. Miller, who received the ſeeds from Linnæus. It flowers in June.

2. Geranium ſanguineum, or bloody crane's-bill: peduncles one-flowered; leaves five-parted, trifid, orbiculate. Root perennial, ſomewhat woody; the whole plant ſet with white ſpreading hairs; ſtems a foot or more in height, ſpreading, branched, round, jointed, ſwelling at the joints. The whole plant frequently turns red or purple after flowering. Native of many parts of Europe, in thickets and rocky paſtures, flowering moſt part of the ſummer, and often introduced into gardens as an ornamental plant.

β. Miller inſiſts that the "Lancaſhire bloody crane's-bill" is a diſtinct ſpecies, the plants which he raiſed from ſeeds having always continued the ſame. The ſtalks are ſhorter, and flat on the ground; the leaves are much leſs, and not ſo deeply divided; and the flowers are much ſmaller, of a pale colour, marked with purple. It grows naturally in Lancaſhire and Weſtmoreland. There are other varieties of this ſpecies. One is mentioned by Ray, with larger paler leaves, more deeply divided. And a ſecond, in Engliſh Botany, ſent by Mr. Davall from Swiſſerland, which has two flowers and four bractes from each joint; the ſtem, flower-ſtalks, calyx, and back of the leaves, clothed with white ſlender ſpreading hairs, the upper ſide and margin of the leaves with ſhort depreſſed briſtles.

3. Geranium ſpinoſum, or ſpiny crane's-bill: peduncles one-flowered; ſtem fleſhy, knobbed; ſpines ſolitary, ſtrict. This is a low ſucculent plant. Root ſimple, ſcarcely fibrous. Stem ſuffruticoſe, erect, branched, fenced all round with broad, ſmooth, irregular, knots or tubercles, from the centre of which ariſes a very long, ſharp, black, ſpine. Native of the Cape of Good Hope.

4. Geranium emarginatum, or emarginated crane's-bill: peduncles one-flowered; leaves ovate, emarginate, crenate. This is a native of the Cape of Good Hope; obſerved by Thunberg.

II. Peduncles two-flowered, ſhrubby. 5. Geranium anemonefolium, or ſmooth crane's-bill: leaves palmate; leaflets pinnatifid; ſtem ſhrubby. The whole plant is remarkably ſmooth, whence it had originally the name of *lævigatum*. From a thick root ariſes a very ſhort ſtem, the thickneſs of a finger, and ſucculent, whence ſpring branches two feet long, with very long leafleſs internodes. Native of Madeira; introduced by Maſſon in 1778; flowers from May to September.

6. Geranium macrorhizum, or long-rooted crane's-bill: calyxes inflated; petals entire; piſtil very long; ſcape dichotomous. Root perennial, the thickneſs of a finger, becoming woody, dark purple on the outſide, round, ſingle, or branched, having many long, round, thickiſh fibres. Hence ſprings a bundle of leaves, and ſeveral almoſt upright ſtems or rather ſcapes. Theſe are all very ſoft and ſmooth, like the leaves of marſhmallow, with a very ſhort cloſe down. Flowers large, elegant, deep red, or bright purple. The whole plant, when rubbed, emits an agreeable odour. Native of Italy. Cultivated in the botanic garden at Oxford in 1658. It flowers in May and June.

III. Peduncles two-flowered, perennial. 7. Geranium caneſcens, or ſilky-leaved crane's-bill: leaves ſubpeltate, five-parted, caneſcent underneath, lobes gaſhed; petals emarginate. Native of the Cape, where it was obſerved by Maſſon; flowers in May and June.

8. Geranium incanum, or hoary crane's-bill: calyxes awned; petals entire; arils hirſute; leaves ſubdigitate, pinnatifid. Native of the Cape of Good Hope; cultivated in 1704, by the ducheſs of Beaufort.

9. Geranium tuberoſum, or tuberous-rooted crane's-bill: leaves many-parted; ſegments linear, ſubdivided, obtuſe. Native of Italy and Sileſia; cultivated in 1596, by Gerarde; flowers in May.

10. Geranium phæum, or dark-flowered crane's-bill: peduncles ſolitary, oppoſite to the leaves; calyxes ſlightly awned; ſtem erect; petals waved. Stems upright, nearly cylindrical, from eighteen inches to two and even three feet in height, below woolly, and having a few long ſhining hairs on them; joints large, commonly tinged with red. Leaves ſoft, the younger ones ſilky, ribbed; the lower on long petioles in pairs, the upper ſolitary; lobes moſtly five, unequally toothed, the lateral ones lobed; the lower leaves have frequently ſix or ſeven lobes, and the uppermoſt only three or four. Native of Swiſſerland, Hungary, Styria, and England, about Clapham, and Ingleton in Yorkſhire, and Tovel near Maidſtone.

11. Geranium fuſcum, or brown crane's-bill: peduncles two-flowered, oppoſite to the leaves, in pairs; ſtem patulous; petals quite entire. Linnæus ſeparates this unwillingly from the preceding, with which it agrees in many circumſtances, and particularly in having the whole corolla ſpread out, and dark-coloured. It differs, however, in having the leaves rigid, the corolla more reflex and ſmaller, the petals ſuborbiculate, mucronate, quite entire, flat, the peduncles not ſolitary, two-flowered, but two diſtinct. Native of the South of Europe.

12. Geranium reflexum, or purple-flowered crane's-bill: peduncles and leaves alternate; petals reflex, laciniated,

ciniated, the length of the calyx, which is awnleſs. Stem a foot high, dichotomous or bifid, patulous, pubeſcent; upper leaves alternate, five-lobed, wrinkled, tomentoſe, not ſpotted. Native of Italy.

13. Geranium lividum, or wrinkled-leaved crane's-bill: leaves half-ſeven-lobed, gaſhed; calyxes ſimple, hairy; petals flat, ſomewhat waved. This is allied to the two laſt. The ſtem is the ſame; the lower leaves are conjugate, the upper ones ſolitary, narrower, deeply ſeven-cleft, with trifid ſerrate lobes. It is a native of Swiſſerland, about Aigle, &c.

14. Geranium nodoſum, or knotty crane's-bill: petals emarginate; ſtem-leaves three-lobed, entire, ſerrate, lucid underneath. This is an herbaceous plant, having knobs like little bulbs at the origin of the branches and peduncles, whence the name. Stems ſmooth, ſhining, ſwelled at the joints. Native of Dauphiné, and the mountains of Cumberland; flowering in July and Auguſt.

15. Geranium ſtriatum, or ſtreaked crane's-bill: leaves five-lobed, lobes widened in the middle; petals two-lobed, netted-veined. Root perennial, ſending up many branching ſtalks a foot and a half high; leaves light green, thoſe on the lower part of the ſtalk have five lobes, and ſtand upon long foot-ſtalks; thoſe on the upper part have but three lobes, ſit cloſer to the ſtalks, and are ſharply indented on the edges. Native of Italy; cultivated in 1629; flowers in May and June.

16. Geranium argenteum, or ſilvery-leaved crane's-bill: petals emarginate; leaves ſubpeltate, ſeven-parted, trifid, tomentoſe-ſilky. Root perennial, thick; leaves on long petioles, ſilvery, and ſhining; flower-ſtalks four or five inches high, with one or two ſmall leaves on them, like thoſe below, but ſeſſile; and terminated by two pretty large pale flowers, with entire petals that ſpread open flat. It flowers in June. Native of Monte Baldo, and Dauphiné.

17. Geranium maculatum, or ſpotted crane's-bill: ſtem dichotomous, erect; leaves five-parted, gaſhed, the uppermoſt ſeſſile. Root perennial; ſtems ſeveral, about a foot high, or more, dividing by pairs; from the middle of the diviſions come out the peduncles, which are pretty long and naked, each ſuſtaining two pale purple flowers, with entire petals. It flowers in June. Native of Carolina and Virginia.

18. Geranium pratenſe, or meadow crane's-bill: leaves ſubpeltate, many-parted, wrinkled, acute; petals entire. Root perennial, ſending up many ſtalks, which riſe near three feet high, forked, tinged more or leſs with red; hairs on the upper branches white, terminated by minute dark red globules. The flowers appear in May and June. Native of meadows, in moſt parts of Europe.

19. Geranium paluſtre, or marſh crane's-bill: peduncles very long, declined; leaves five-lobed, gaſhed; petals entire. The branches of this are extremely divaricated, bifariouſly and obtuſely angular. It may be diſtinguiſhed from G. ſylvaticum, No. 21, which it reſembles very much in the leaves, by the ſuperior length of the peduncles, which are alſo recurved before the flowers open, and are not erect, but declined; the petals likewiſe are entire, not emarginate. Native of Germany, Ruſſia, and Denmark.

20. Geranium aconitifolium, or aconite-leaved crane's-bill: leaves ſubpeltate, ſeven-parted; petals entire, veiny-lined. Native of Swiſſerland and Dauphiné; flowers in May.

21. Geranium ſylvaticum, or wood crane's-bill: leaves ſubpeltate, five-lobed, gaſh-ſerrate; ſtem erect; petals emarginate. Stem two or three feet high, covered with reflexed hairs, much branched. Native of mountainous woods and thickets in many, particularly the northern, parts of Europe. With us, in Durham, Weſtmoreland, Cumberland, Lancaſhire, and Yorkſhire. About Ayſgarth Force, Wenſly-dale; near Hales Owen in Shropſhire; Holt-wood in Leziate, near Lynn, Norfolk, &c. It flowers in June and July.

22. Geranium pyrenaicum, or mountain crane's-bill: leaves rounded, five-lobed or three-lobed, gaſhed; petals two-lobed. This ſpecies is twice as large as the common ſort, No. 23. and always nearly upright. Stem hairy, forked twice or thrice. Leaves hairy, the lower generally ſeven-lobed, theſe again trifid, with rounded or blunt diviſions, the middle one frequently crenate. The upper leaves are frequently three-lobed, the lobes trifid, entire, the ſegments more acute than in the lower leaves, and the lobes more patent; they are often red at the edge. Native of the South of France, the Pyrenees, and England; near London, about Chelſea, Brompton, and Batterſea; near Enfield, Oxford, Bingley, and Keighley in Yorkſhire.

IV. Peduncles two-flowered, annual. 23. Geranium molle, common crane's-bill, or dove's-foot: peduncles and floral leaves alternate; petals bifid; calyxes awnleſs; ſtem ſomewhat erect. Stems procumbent, round, reddiſh, from nine inches to a foot in length, villoſe, branched. Root-leaves roundiſh, hoary, and veiny underneath, deeply divided into ſeven ſegments, which are jagged; ſtem-leaves alternate, divided into fewer, narrower, and more pointed, ſegments. Petals purple, obcordate, a little longer than the calyx; antheræ blue; ſtyle with glandular hairs; ſeeds ſmooth, covered with a wrinkled aril. G. molle when growing detached is procumbent, but among other plants it is drawn upright. It varies much in ſize, and the flowers vary in colour through many gradations of purple to pale red and white. It is the moſt common of all our geraniums, on dry banks, under walls, in corn-fields, and in paſtures; beginning to flower in April, and continuing through the ſummer.

24. Geranium rotundifolium, or round-leaved crane's-bill: petals almoſt entire, equal to the calyx, which is ſomewhat awned; leaves kidney-ſhaped, lobed, gaſhed, ſinuſes glandular. Stems much branched, ſtraggling, but ſcarcely proſtrate; ſtem and branches covered with a very ſhort down, which feels extremely ſoft like velvet, when drawn through the fingers. The leaves are rounder, and of a paler colour; the ſeeds are dotted, ſo as to appear reticulated. Hairs on the aril ſpreading. Theſe marks diſtinguiſh it from the foregoing. The filaments are clearly diſtinct at the baſe. The petals are fleſh-coloured or purple, varying to white, emarginate or obcordate; Mr. Woodward does not think that the diviſion of the petals is to be at all depended on. When freſh gathered it has a pretty ſtrong ſcent of muſk, but it ſoon goes off. Found on walls, roofs, banks, and in ſandy paſtures, about Iſlington, Hackney, Batterſea, Wandſworth, Mortlake, Kew, &c. near London; Church Brampton in Northamptonſhire; about Bath and Briſtol; in Suffolk, common.

25. Geranium puſillum, or ſmall-flowered crane's-bill: petals emarginate; arils even, with hairs preſſed cloſe; ſtem ſubpubeſcent. This differs from the *molle* in having the leaves more divided, of a paler and more yellow colour; the flowers much ſmaller, of a bluer and leſs brilliant hue; the ſtems ſcarce perceptibly hairy, or but ſlightly pubeſcent: the leaves in general grow oppoſite, but frequently not ſo towards the top of the ſtem, and are more open behind: the fertile ſtamina are never more than five; and the aril is not tranſverſely wrinkled as in the molle, but comparatively ſmooth. It forms a larger tuft than the molle, and ſometimes varies with white flowers, as that does. It is alſo equally common in many places; particularly on the weſt ſide of London, in neglected gardens and fallow fields; flowering in June and July.

26. Geranium lucidum, ſhining crane's-bill or dove's-foot: calyxes pyramidal, angular, raiſed in wrinkles; leaves five-lobed, rounded. Stems and leaves ſmooth and ſhining as if varniſhed, whence its ſignificant trivial name; they are, however, ſlightly hairy. Leaves kidney-ſhaped, moſtly five-lobed, theſe again divided half-way into

into three lobes, the middle one having usually three notches, the side ones entire. It varies, however, from this disposition; in rocky situations the leaves are only half an inch broad, and not so much divided. The whole plant is sometimes red. Native of most parts of Europe, on walls, roofs, banks, in rocky and shady places, and in a chalky soil among corn; it flowers from June till August.

27. Geranium columbinum, or long-streaked crane's-bill: peduncles longer than the leaf; leaves five-parted, multifid; calyxes five-cornered, awned; arils smooth. Slender, mostly procumbent, with small, rigid, close-pressed, hairs. Leaves a little hairy on both surfaces, divided to the foot-stalk into several lobes, these again divided with linear segments. Native of most parts of Europe, in corn-fields and pastures, and under hedges. It flowers from June till August.

28. Geranium incanum, or hoary crane's-bill: peduncles two-flowered; calyxes awned; petals entire; arils hirsute; leaves subdigitate, pinnatifid. Native of the Cape of Good Hope.

29. Geranium dissectum, or jagged crane's-bill: peduncles shorter than the leaf; leaves five-parted, trifid, and multifid; petals emarginate; arils villose. This species can scarcely be mistaken for any other; it is, however, not only distinguished by its finely divided leaves, whence its trivial name, but by the flowers, which are usually of a bright colour. It varies greatly in size; also with flesh-coloured and white flowers. Native of most parts of Europe, by road sides, on banks, in fallow fields, and on the borders of pastures, flowering in May and June, till August.

30. Geranium Carolinianum, or Carolina crane's-bill: leaves five-parted, gashed; calyxes awned; petals emarginate; arils hirsute. This greatly resembles common dove's-foot or crane's-bill, No. 23. but is smaller, and the branches are shorter: the flowers are very small, of a pale blue colour; seeds black, with short erect beaks. Native of Carolina.

31. Geranium Bohemicum, or Bohemian crane's-bill: petals emarginate; arils rough with hairs; cotyledons trifid, with the middle cleft truncate. Stems many, branched. Flowers of a fine blue colour. Said to be a native of Bohemia; flowers from June till August.

32. Geranium Robertianum, stinking crane's-bill, or herb Robert: leaves quinate and ternate, gashed; calyxes ten-angled. Stems spreading, branched, blood-red, hairy, particularly in young plants. The whole is beset with pellucid hairs, but becomes smoother as the plant grows older. It is commonly red at the joints, and the whole plant is frequently red. It has a disagreeable rank smell when bruised. A decoction of herb Robert has been known to give relief in calculous cases; it is considerably astringent, and is given to cattle when they make bloody water, or have the bloody flux. Native of all Europe, in woods, under hedges, in hollow trees, on walls and the roofs of houses, among rubbish, and in stony places, flowering from April through the whole summer.

β. In the variety which occurs near Swanning in Dorsetshire, and on the shore of Selsey island, the whole plant is shining, the leaves smaller, and more deeply divided.

Propagation and Culture. The annual sorts of geranium may be increased by seeds; and, if these be permitted to scatter, the plants will come up without any farther care. The perennial sorts, which are more numerous, may be increased the same way, or by parting the roots in autumn. They may be planted in almost any soil or situation, and require no other culture but to keep them clean from weeds. Many of them, indeed, are common weeds, but even some of these have beauty enough to recommend them to a place in a garden, particularly the second, eighteenth, twenty-first, and twenty-second, species. See ERODIUM, GRIELUM, MONSONIA, and PELARGONIUM.

GERANOM'ACHY, *s.* [from γερανος, a crane, and μαχομαι, Gr. to fight.] The fabulous war between the cranes and pigmies. *Scott.*

GERAN'THRÆ, in ancient geography, a town of Laconia. *Pausanias.*

GE'RAR, [Heb. a pilgrimage.] A man's name.

GE'RAR, the name of a place situated in the land of the Philistines; noted in scripture as the temporary residence of the patriarchs Abraham and Isaac; and where each of them practised the same expedient of denying his wife. Asa king of Judah gained a decisive victory over Zerah the Ethiopian near this place. *Gen.* xx. xxvi. 2 *Chron.* xiv. 13, 14.

GER'ARD, surnamed THOM, or according to others TUNG, or TENQUE, the founder and first grand-master of the order of St. John of Jerusalem, was a native of the isle of Martigues, on the coast of Provence. While Jerusalem was in the hands of the Saracens, some merchants of Amalfi, a town in the Neapolitan territory, obtained permission from the sultan of Egypt and Syria, to erect a benedictine monastery near the holy sepulchre, for the convenience of the numerous pilgrims who came to visit it. Among others, Gerard arrived to pay his devotions in the holy city, where he acquired a high character with the Christians for his piety and prudence. The fanaticism of the times occasioning the number of pilgrims to increase every year, by which means the treasury of the monastery received considerable supplies, the abbot was enabled, in 1080, to build a hospital for the reception of the poorer pilgrims, and with accommodations for the relief of the sick, the management of which he gave to Gerard. The chapel of that hospital was consecrated to St. John, because of a tradition among the inhabitants of Jerusalem, that Zecharias, the father of St. John, had lived on the spot where it was built. After the conquest of Jerusalem by the Christians, under Godfrey of Bouillon, Gerard projected the foundation of a new religious order, in which the ecclesiastical and military characters were to be blended. This design he began to carry into execution in 1100, when numbers of persons associated with him under the denomination of "Hospitalers of St. John of Jerusalem," who, besides the three vows of chastity, poverty, and obedience, took a particular vow to devote themselves to the relief of all Christians in distress. This order, and the rules drawn up for its government, were approved and confirmed by pope Paschal II. who, by a bull which he issued, granted it considerable privileges, and recognised Gerard as the first grand-master. Gerard died in 1120. Thus commenced that order, which, in succeeding times, became so celebrated in history, when its members were commonly known by the name of "Knights of Rhodes," and afterwards by that of "Knights of Malta."

GER'ARD (John), a learned German lutheran divine, born at Quedlinburg in Saxony, in 1582. He filled the chair of theological professor at the university of Jena for many years with distinguished reputation, and died in 1637. He was the author of a great number of works, the principal of which were: 1. Commentaries on Genesis, Deuteronomy, the Epistles of St. Peter, and the Apocalypse. 2. The Catholic Confession. 3. A Harmony of the Four Evangelists, in three vols. folio, left by him in an unfinished state, and completed by MM. Chemnitz and Lyserus, who published it in 1646. 4. A Collection of Common Places in Theology; a work in which he has treated of the lives and writings of the authors of the primitive church, &c.

GER'ARD (John), a learned German professor, born at Jena, in 1621. He was educated in his native place, where he went through the usual course of academic

ſtudies, and then went to Altdorf, in 1640, for the ſake of receiving inſtructions in the oriental languages. In 1646, he was appointed aſſiſtant profeſſor of philoſophy at Wittemberg; and in 1652, nominated profeſſor of hiſtory at Jena. In the following year he was created doctor of divinity; and in 1655, preferred to the rectorſhip of the univerſity of Jena. He died in 1668, when no more than forty-ſeven years of age. He was the author of, 1. *Harmonia Linguarum Orientalium.* 2. *Diſputationum Theologicarum Faſciculus.* 3. *Locorum Theologicorum Epitome.* 4. *De Sepultura Moſis Diſſ.* 5. *Conſenſus & Diſſenſus religionum profanarum.* 6. *De Eccleſiæ Copticæ Ortu, Progreſſu, & Doctrina*; and other works of great erudition and merit.

GER'ARD (Alexander), a Scottiſh divine and profeſſor, born at Garioch, in the county of Aberdeen, in 1728. After the uſual preparatory education, he entered a ſtudent in Mariſchal-college, Aberdeen. Here, after devoting four years to the ſtudy of Greek, Latin, the mathematics, and philoſophy, he was admitted to the degree of maſter of arts, and then commenced his theological ſtudies, which he proſecuted in the univerſities of Aberdeen and Edinburgh. In 1748, juſt after he had completed his twentieth year, he was licenſed to preach in the church of Scotland; and in 1750, was choſen aſſiſtant to Mr. David Fordyce, profeſſor of philoſophy in the Mariſchal college. In this capacity he diſcharged the duties of profeſſor during Mr. Fordyce's abſence on his continental tour; and upon the death of that gentleman, in 1752, was appointed his ſucceſſor. Mr. Gerard's department was confined to moral philoſophy and logic, the duties of which he diſcharged with unwearied diligence, and with equal ſucceſs and reputation. In 1759, he was ordained a miniſter of the church of Scotland; and in the following year he was appointed profeſſor of divinity in the Mariſchal college, and miniſter of the Greyfriars church, in Aberdeen. About the ſame time he was created doctor of divinity. He continued to diſcharge the duties of his profeſſorſhip, and to proſecute his ſtudies, until the year 1795, when he died on his birth-day, juſt as he had completed his ſixty-ſeventh year. Beſides ſeveral ſingle ſermons preached on occaſional ſubjects, he was the author of, 1. An Eſſay on Taſte, 1759, 8vo. to which the philoſophical ſociety of Edinburgh adjudged, in 1756, the prize of a gold medal, offered for the beſt piece on that ſubject, and which appeared in a conſiderably enlarged form in 1780. 2. Diſſertations on the Genius and Evidences of Chriſtianity, 1766, 8vo. 3. An Eſſay on Genius, 1774, 8vo. and two volumes of excellent Sermons, publiſhed in 1780 and 1782, 8vo. In 1799, the author's ſon and ſucceſſor in the divinity profeſſorſhip, Dr. Gilbert Gerard, publiſhed from his father's manuſcripts a part of his theological courſe under the title of The Paſtoral Care, &c. 8vo. which is a work of very conſiderable merit in that claſs of compoſitions.

GER'ARD (John), a celebrated Engliſh botaniſt, born in 1545, at Namptwich in Cheſhire. He was educated as a ſurgeon, and appears to have ſpent ſome time in foreign travel. At length he ſettled in London, where he was patroniſed by lord Burleigh, whoſe large and curious garden he ſuperintended for twenty years. He had alſo, at his reſidence in Holborn, a phyſic-garden of his own, which was probably more richly ſupplied than any other in England. He ſeems to have enjoyed the favour of the college of phyſicians, and is ſpoken of with great commendation by ſome of his contemporaries. He arrived at the rank of maſter of his company, and died about 1607. Gerard's firſt publication was a catalogue of the plants in his own garden, entitled *Catalogus Arborum, Fruticum & Plantarum, tam indigenarum quam exoticarum, in horto Joh. Gerardi, civis & chirurgi Londin. naſcentium*, 4to. 1596 and 1599. The number of ſpecies contained in it is 1033, and an atteſtation of its fidelity is ſubjoined by the botaniſt Lobel. His great work, entitled Herbal, or General Hiſtory of Plants, folio, was publiſhed in 1597. Its foundation was a tranſlation into Engliſh of the herbal of Dodoens, made, according to Lobel, by Dr. Prieſt, which after his death came into the hands of Gerard, who was not enough ſkilled in Latin to have undertaken it himſelf. Its diſtribution, however, is altered, and many new plants are added from Lobel and Cluſius. The figures were procured from Frankfort, being from the blocks uſed in the Dutch Herbal of Tabernæmontanus. Though, from this account, Gerard's ſhare in the work appears to have been inconſiderable, yet he has the merit of having contributed to diffuſe a more general taſte for botany throughout the kingdom, and to have furniſhed herbaliſts with an uſeful book of plants. The greatly-improved edition by Thomas Johnſon, in 1633, long continued to be a ſtandard work, and is ſtill valued.

GERAR'DIA, *ſ.* [ſo named by Plumier in honour of *John Gerard*, our old Engliſh botaniſt.] In botany, a genus of the claſs didynamia, order angioſperma, natural order of perſonatæ, (ſcrophulariæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, five-cleft, upright, ſharp, permanent. Corolla: one-petalled, ringent; tube round, longer than the calyx: upper lip upright, blunt, flat, broader, emarginate; lower lip reflex, three-parted; diviſions lateral, emarginate; middle ſhorter, two-parted. Stamina: filaments four, ſcarcely the length of the tube, two a little ſhorter; antheræ ſmall. Piſtillum: germ ovate, ſmall; ſtyle ſimple, ſhort; ſtigma blunt. Pericarpium: capſule ovate, two-celled, two-valved, gaping at the baſe; partition contrary. Seeds: ovate, ſolitary.—*Eſſential Character.* Calyx five-cleft; corolla two-lipped, lower lip three-parted, the lobes emarginate, the middle ſegment two-parted; capſule two-celled, gaping.

Species. 1. Gerardia tuberoſa, or tuberous Gerardia: leaves ſubovate, tomentoſe, repand, the length of the ſtalk. It may be doubted whether it be not of another genus. Linnæus recommends a farther examination of the fructification. Native of South America.

2. Gerardia Japonica, or Japoneſe Gerardia: leaves ovate, gaſh-pinnatifid, petioled; ſtalk ſimple. Differs from G. pedicularia, No. 8, in having a ſimple ſtalk, peduncle ſhorter than the leaf, and gaſh-pinnatifid leaves, with ſerrate pinnas. Native of Japan.

3. Gerardia delphinifolia, or larkſpur-leaved Gerardia: leaves linear, pinnatifid; ſtalk ſomewhat branched. Stem a foot high, obtuſely four-cornered, upright, even, with a few alternate branches. Native of the Eaſt Indies.

4. Gerardia ſcabra, or rough Gerardia: hiſpid, ſcabrous; leaves oblong, pinnatifid. Found at the Cape of Good Hope by Thunberg.

5. Gerardia purpurea, or purple Gerardia: leaves linear. Root annual; ſtalks a foot high, filiform, either very ſimple, or brachiate, ſmooth. Native of North America. It is the only ſpecies of this genus yet cultivated among us, and was introduced in 1772 by Dr. Samuel Martin; it flowers in July and Auguſt.

6. Gerardia tubuloſa, or long-tubed Gerardia: ſmooth; leaves linear, entire, ſharp; tube of the flower longer than the calyx. Found at the Cape of Good Hope by Thunberg.

7. Gerardia flava, or yellow Gerardia: leaves lanceolate, pinnate-toothed; ſtalk extremely ſimple; a foot high, or more. Native of North America.

8. Gerardia pedicularia: leaves oblong, doubly-ſerrate; ſtalk panicled; calyxes crenate. It dries black, like a pedicularis, and is allied to P. triſtis. Native of North America.

9. Gerardia glutinoſa, or clammy Gerardia: leaves ovate, ſerrate; bractes linear, hiſpid. Native of China.

10. Gerardia Nigrina: ſcabrous; leaves lanceolate, ſerrate at the bottom; ſtalk four-cornered. This was formerly made a diſtinct genus by Linnæus, under the name

name of *Nigrina*; but he was afterwards of opinion that it could not be ſeparated from the Gerardias. Native of the Cape of Good Hope.

GERARDMER', a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Bruyères: three leagues and a half ſouth-eaſt of Bruyères, and three and three-quarters eaſt of Remiremont.

GER'ARDSTOWN, a town of the American States, in Berkely county, Virginia: ten miles from Martinſburg, and 254 from Philadelphia.

GERASCAN'THUS, *ſ.* in botany. See CORDIA.

GER'ASTORFF, a town of Germany, in the archduchy of Auſtria: ſeven miles eaſt of Korn-Neuburg.

GERAU', a ſmall country of Germany, ſituated near the conflux of the Maine and the Rhine, in the circle of the Upper Rhine. It takes its name from Gerau; but Darmſtadt is the capital.

GERAU' (Groſs), a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: eight miles weſt-north-weſt of Darmſtadt, and ten ſouth-eaſt of Mentz.

GER'BA, or JERBA, a ſmall iſland in the Mediterranean, near the coaſt of Tripoli. Its principal produce is barley and fruit. Lat. 33. 30. N. lon. 11. 30. E. Greenwich.

GER'BEL (Nicholas), a learned juriſt, born at Pfortzheim. He was brought up to the ſtudy of the law, and became a profeſſor of it at Vienna, and afterwards at Straſburg. He applied to the ſtudy of hiſtory and antiquities, and obtained great reputation by his writings. De Thou characterizes him as one equally eſtimable for his erudition and humanity. He died at a very advanced age in 1560. His works are: 1. *Iſagoge in Tabulam Græciæ Nicolai Sophiani*, 1545, afterwards augmented into ſeven books, comprehending a complete deſcription of all Greece, and printed at Baſil, fol. 1550. 2. *De Anabaptiſtarum Ortu et Progreſſu.* 3. *Vita Joannis Cuſpiniani.* He corrected Cuſpinian's Chronicle of the Cæſars, and Arrian's Hiſtory of Alexander.

GER'BERA, *ſ.* in botany. See ARNICA.

GER'BERON (Gabriel), a French eccleſiaſtic, and controverſial writer in ſupport of the Janſeniſt principles, born at Saint-Calais, in 1628. He taught theology for ſome years with conſiderable ſucceſs, and was appointed ſub-prior of the abbey of Corbie. When the controverſy on the ſubject of grace raged between the Janſeniſts and the Jeſuits, he wrote with much zeal and ability in ſupport of the ſide of the queſtion embraced by the former; whence the Jeſuits became his determined enemies, and found means to prejudice Louis XIV. ſo ſtrongly againſt him, that in 1682, the king gave orders for his being put under arreſt. Gerberon, however, having obtained information of the approach of the officers, found means to eſcape, and retired into Holland, where, under the name of Auguſtine Kergré, he exerciſed the paſtoral functions for ſeveral years, and wrote a great variety of books on the queſtions agitated in the controverſies concerning free-will and grace. The air of Holland at length proving injurious to his health, he removed into Flanders, where, in 1703, he was taken into cuſtody by the archbiſhop of Mechlin, and committed to the caſtle of Vincennes. In that priſon he continued ſhut up until the year 1710, retaining his natural vivacity and zeal for what appeared to him to be truth, undiminiſhed by his ſufferings. The king now ordered him to be delivered into the care of his ſuperiors, by whom he was ſent to the abbey of St. Denys, where he died in 1711, when nearly eighty-three years of age. He ſuperintended an edition of The Works of Marius Mercator, to which he added notes, and printed it at Bruſſels in 1673, 12mo. under the aſſumed name of Rigberius; a new edition of The Works of St. Anſelm; and a new edition of The Works of Baius, 1696, 4to. He was the author of, A General Hiſtory of Janſeniſm, publiſhed at Amſterdam in 1700, 3 vols. 12mo. a tranſlation of father Gabriel's *Specimina moralis Chriſtianæ & moralis Diabolicæ*, under the title of Eſſays on Moral Theology, 1680, 12mo. and a vaſt number of devotional pieces, and controverſial tracts.

GERBEROY', a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Beauvais; fortified in the ninth century to ſtop the incurſion of the Normans. It was taken by the Engliſh in the years 1160 and 1437; but, in 1449, the troops left in garriſon were put to death by the Picards: four leagues north-weſt of Beauvais, and two north-eaſt of Gournay. Lat. 49. 32. N. lon. 19. 32. E. Ferro.

GERBEVIL'LER, a town of France, in the department of the Meurte, and chief place of a canton, in the diſtrict of Luneville: one league and three quarters ſouth of Luneville, and five and a quarter eaſt of Vezelize.

GERBILLO'N (John Francis), a diſtinguiſhed Jeſuit miſſionary, born at Verdun in 1654. He entered into the ſociety of Jeſuits in 1670; and having conſtantly the miſſion to China in view, he qualified himſelf for it by the ſtudy of mathematics, in which he became very ſkilful. His wiſhes were accompliſhed in 1685, when he embarked for China, in company with ſix mathematicians of the ſame ſociety. At the deſire of the emperor, he remained at Pekin, ſtudying the Tartarian language; and he ſo much ingratiated himſelf with that monarch, as to be appointed to join an embaſſy ſent to regulate the boundaries with the court of Muſcovy. By his addreſs and knowledge of languages, he greatly contributed to the ſucceſs of this negociation; and on his return to China was treated with great reſpect by the emperor, who choſe him for his inſtructor in mathematics and philoſophy, and kept him about his perſon in ſeveral journeys which he made into Tartary. He obtained free permiſſion to preach the Chriſtian religion in China, and had the direction of the French college in Pekin, and finally was made ſuperior-general of all the Jeſuit miſſionaries ſent from France. He died at Pekin in 1707. He wrote, in the Chineſe and Tartar languages, Elements of Geometry, extracted from Euclid and Archimedes; and, Geometry, practical and ſpeculative; both ſplendidly printed at Pekin. The curious accounts of his eight journeys into Tartary are printed in father Du Halde's *Deſcription de la Chine.* He left in manuſcript, A Voyage to Siam, of which extracts are given in Michault's *Melanges Hiſtoriques.*

GERB'STADT, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld: thirty miles ſouth-weſt of Deſſau, and thirty-ſix ſouth of Magdeburg.

GERDAVAN', a town of Pruſſia, in the province of Natangen, built in 1325, and defended by two caſtles; ſituated on the Omer, near a conſiderable lake, which is called the *Calendar of Gerdavan*, as prognoſticating weather: thirty miles ſouth-eaſt of Konigſberg.

GER'DEN, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderburn: two miles ſouth-eaſt of Dringenberg.

GER'DES (Daniel), a learned profeſſor of theology at Groningen, born in 1698 at Bremen, where his father was engaged in commerce. His parents obſerving, at an early period, that he was endowed with a happy genius, ſpared neither pains nor expence to give him a good education. Having gone through the uſual courſe of ſchool inſtruction, he was placed for ſix years at the gymnaſium of his native town, where he applied with ſuch diligence, that in 1714 he gave a public and honourable teſtimony of the progreſs he had made, by explaining a paſſage in the Plutus of Ariſtophanes. He at firſt propoſed to ſtudy the law; but he afterwards altered his plan, and devoted himſelf to theology. He therefore attended the lectures of Dr. Gerrard Buſch on philoſophy and philology, and thoſe of Schumacher

and Juſt on theology, and gave a double proof of his knowledge by two publications; for in 1717 he wrote his learned diſſertation, *De Larium & Penatium origine*, which Maſſon thought worthy of being inſerted in the fifteenth part of his *Hiſtoire critique de la République des Lettres*; and two years after he defended, under Schumacher, his theſis *De Opera Miniſterii Evangelici adumbrata ſub emblemate Collectionis quæ ſit tempore miſſis*. In 1719 he went to Utrecht, where he diligently attended the lectures of Burman, Alphen, and Lampen; and before the end of that year defended a theological theſis, *Ad Hiſtoriam Pauli Apoſtoli*. In 1722 he finiſhed his academical ſtudies and repaired to the Hague, where in the ſame year he was admitted a candidate for holy orders. He then viſited the moſt celebrated academies of Germany, as well as the principal towns in Swiſſerland, Holland, and France, and formed an acquaintance with the moſt learned men of that period. In 1726 he was invited to Duiſburg to be profeſſor of theology; he therefore took the degree of doctor in that faculty at Utrecht, and entered on his academic office with an oration, *De Docta in Theologia ignorantia*. Two years after, he obtained the profeſſorſhip of church hiſtory; and on this occaſion publiſhed a diſſertation, *De Uſu Euchariſtiæ medico*. Having now attained a conſiderable degree of celebrity, the curators of the univerſity of Groningen, on the tranſlation of Voigt to Utrecht, in 1735, were induced to invite him to the theological chair, which he accepted; and on the 11th of June the following year, he delivered his introductory oration, *De Unctione quæ Fideles omnia docet*. The ſame year he was elected a member of the royal academy of ſciences at Berlin. Gerdes continued to diſcharge his duty, both as a profeſſor and preacher, till the year 1752; when a diſorder in the breaſt, with which he had been affected in his youth, obliged him to give over preaching, and to attend only to the profeſſorſhip of church-hiſtory: but his weakneſs increaſing, he died on the 11th of February, 1765. His principal works are: 1. *Veſperæ Vadenſes, ſive Diatribæ Theologico-philologicæ de Hyperbolis ex Scriptoribus ſacris eliminandis*. Utrecht, 1727, 4to. 2. *Obſervationes Miſcellaneæ ad quædam loca SS. in quibus Hiſtoriæ Patriarcharum illuſtratur, Diſ.* III. Duiſburg, 1729–1733, 4to. 3. *Miſcellanea Duiſburgenſia, ad incrementum Rei Literariæ omnis præcipue vero Eruditionis Theologicæ publicata*. Amſt. & Duiſb. 1732–1738, 4 vols. 8vo. 4. *Miſcellanea Groningiana*, vol. i. Duiſb. 1736; vol. ii. iii. iv. Groning. 1737–1745, 8vo. This is a continuation of the preceding work. 5. *Florilegium Hiſtorico-criticum librorum variorum, cui multa ſimul ſcitu jucunda interſperguntur, Hiſtoriam omnem Literarium & cum primis Reformationis eccleſiaſticum illuſtrantia*. This *Florilegium* appeared firſt in his *Miſcellanea Groningiana*, vol. ii. and iii. but was ſoon after printed by itſelf, at Groningen, 1740, in 8vo. and enlarged and improved, in 1747, 8vo. It forms an excellent ſupplement to Voigt's *Catalogus Librorum rariorum*. 6. *Compendium Theologiæ dogmaticæ*, ibid. 1734, 8vo. 7. *Exercitationum Academicarum, Libri* iii. *quibus varia ſacra, tum ad Hiſtoriam Patriarcharum tum ad Juadaias Antiquitates, &c. ſpectantia illuſtrantur*. Amſt. 1738, 4to. with a head of the author. 8. *Introductio in Hiſtoriam Evangelii ſeculi* XVI. *paſſim per Europam renovati, &c.* Groningen, 1744–1752, 4 vols. 4to. 9. *Meletemata ſacra ſive Exegeſis & Iſagoge, in Cap.* xv. *Ep.* i, *ad Corinthios*. Groning. 1759, 4to.

GER'DIN, a town of Ruſſia, in the government of Perm, on the Colva: 152 miles north of Perm. Lat. 59. 40. N. lon. 74. E. Ferro.

GEREMSCHANGKAI'A, a town of Ruſſia, in the government of Upha: thirty-ſix miles weſt-north-weſt of Bugulma.

GERENSCHANG'SKOI, a fortreſs of Ruſſian Siberia, in the government of Kolivan: 240 miles ſouth-ſouth-weſt of Kolivan. Lat. 50. 45. N. lon. 97. E. Ferro.

GE'RENT, *adj.* [*gerens*, Lat.] Carrying; bearing.

GEREN'ZA. See CERENZA.

GE'RERSDORF, a town of Germany, in the archduchy of Auſtria: three miles eaſt-ſouth-eaſt of Crems.

GE'RESTADT, a town of Norway, in the biſhopric of Aggerhuus: thirty-two miles ſouth-weſt of Tonſberg.

GERES'TICUS, a harbour of Teios in Ionia. *Livy*.

GERESTO', a town of the iſland of Negropont: fifteen miles ſouth of Cariſto.

GER'FALCON, *ſ.* the brown and the white. See the article FALCO, vol. vii. p. 189.

GER'GAR, a town of Spain, in the province of Grenada: ten miles ſouth-ſouth-weſt of Purchena.

GERGEFAL'VA, a town of Tranſilvania: ſixteen miles weſt-north-weſt of Hermenſtadt.

GERGE'SA, in ancient geography, a Transjordan town, no otherwiſe known than by the *Gergeſeni* of St. Matthew, and *Gergeſæi* of Moſes; ſuppoſed to have ſtood in the neighbourhood of Gadara and near the Sea of Tiberias. The *Gergeſæi*, one of the ſeven ancient people of Canaan, leſs frequently mentioned than the reſt, appear to have been leſs conſiderable and more obſcure: their name is from *Girgaſi*, one of Canaan's ſons. See GADARENES.

GERGESE'NES, (country of). See GADARENES.

GER'GITHUM, in ancient geography, a town near Cumæ in Æolia. *Pliny*.

GERGO'BIA, a town of Gaul. *Cæſar*.

GER'HARD (Ephraim), a German lawyer and philoſopher, born at Gierſdorf, in the duchy of Brieg, in Sileſia, in 1682. He became advocate to the court and regency of Weimar, and afterwards filled the chair of profeſſor of law in the univerſity of Altdorf, where he died, in 1718, when only thirty-ſeven years of age. He was the author of ſeveral treatiſes on juriſprudence and philoſophy, of which the moſt important is entitled, *Delineatio Philoſophiæ rationalis*; to which is ſubjoined an excellent diſſertation, *De præcipuis Sapientiæ Impedimentis*, &c.

GER'HARDSBRON, a town of Germany, in the circle of Franconia, and principality of Anſpach: twenty-eight miles weſt of Anſpach.

GE'RINGSWALDE, a town of Germany, in the circle of Upper Saxony, and circle of Leipſic: four miles north-eaſt of Rochlitz.

GER'IZIM, or GARIZIM, a mountain of Paleſtine, ſituated in Samaria near the plain of Moreh. This mountain and Ebal were appointed by Moſes for the firſt promulgation of the law, upon the Iſraelites' entrance into Canaan; whereon the bleſſings for obedience and the curſes for diſobedience were ſeverally pronounced. The *bleſſing* was attached to Gerizim, which from that circumſtance ſeems to have gained a kind of religious veneration from that period; for it is ſaid the temple of the Samaritans was afterwards erected upon it, which by order of Antiochus was dedicated to Jupiter, in the days of the Maccabees, when it is mentioned by the name of *Garizim*. *Deut.* xi. & xxvii. *Joſh.* viii. 30, &c. 2 *Macc.* vi. 2.

GER'KIN, *ſ.* A ſmall cucumber.

GER'LACH (Stephen), a learned German lutheran divine, born at Knitlingen, in Swabia, in 1546. His early education he received in his native place; and, in 1563, he was ſent to the univerſity of Tubingen, where he diſtinguiſhed himſelf by his diligence in his ſtudies, and in 1566 proceeded to his degree of bachelor of arts with great applauſe. Being ſoon afterwards obliged to withdraw from this univerſity, on account of its being viſited with the plague, he went to Eſſingen, where, in 1567, he was admitted to the degree of doctor in philoſophy. In 1573, the emperor Maximilian II. having appointed baron Urgrad his ambaſſador to the Turkiſh court, Gerlach was made choice of for his chaplain; and accompanied the ambaſſador to Conſtantinople. In this city he continued upwards of five years, acquainting himſelf with the manners and religion of the Turks and of the Greeks, and cultivating the friendſhip of the moſt

moſt eminent men in the latter communion, to whom he recommended himſelf by his learning, piety, and amiable manners. In 1578, Gerlach took his leave of the ambaſſador, and returned to Tubingen, where he was made profeſſor in ordinary of the prophetic Scriptures, dean of the church of Tubingen, and colleague of the academic ſenate. In 1590, he was appointed to deliver a courſe of lectures explanatory of the Epiſtles of St. Paul; and was made inſpector and ſuperintendant of the theological college at Tubingen. The duties of theſe reſpective appointments he diſcharged with exemplary diligence, until incapacitated by diſorders which brought on a ſudden decay of his faculties. He died in 1612, in the ſixty-ſixth year of his age. He was the author of An Epitome of Eccleſiaſtical Hiſtory, written in Latin; A Journal of the Embaſſy ſent to the Porte by the Emperors Maximilian II. and Rodolf II. in the German language, and abounding in curious and intereſting particulars, hiſtorical, eccleſiaſtical, and theological; and numerous theological Diſſertations, Theſes, and Diſputations, in controverſy with the Catholics, Calviniſts, &c.

GERLATZ'KOI, a fortreſs of Ruſſian Siberia, on the eaſt ſide of the Irtiſch, in the government of Kolivan: 212 miles weſt of Kolivan. Lat. 54. 20. N. lon. 93. 10. W. Greenwich.

GERM, *ſ.* [*germen*, Lat.] A ſprout or ſhoot; that part which grows and ſpreads.—Whether it be not made out of the *germ*, or treadle of the egg, doth ſeem of leſſer doubt. *Brown.*

GERMA'IN (Thomas), a celebrated artiſt, born at Paris in 1674. His father was the king's goldſmith, alſo a workman of great ſkill. His father dying while he was a child, his mother ſent him to the ſchool of the painter Boullongne. Thence, under the protection of Louvois, he went to Italy; but his progreſs was interrupted by the death of his protector, which deprived him of ſupport. With the true ſpirit of one devoted to improvement, he bound himſelf apprentice to a goldſmith for ſix years, on condition that he ſhould be allowed two hours a-day to draw at the Vatican. He well knew that all the departments of art are connected, and that it is impoſſible to excel in one without poſſeſſing the baſis of the whole. His great application, therefore, made him a maſter in his profeſſion. During his reſidence at Rome he became known by many fine ſculptures in metal, and upon his return to France he took the lead in all works of that kind. Plate richly chaſed was then greatly in vogue, and Germain was employed for all the ſplendid ornaments of the toilets of queens and the buffets of kings which were ſent as preſents from that magnificent court, or ordered from Paris, the ſeat of taſte and elegance. Apartments were given him in the Louvre, and in 1738 he was created echevin or ſheriff of Paris. He was ſkilled in architecture, and from his deſigns were conſtructed a fine church at Leghorn, and that of St. Louis in the Louvre. He died in 1748, and was interred in the latter edifice.

GER'MAN, *ſ.* [*germain*, Fr. *germanus*, Lat.] Brother; one approaching to a brother in proximity of blood: thus the children of brothers or ſiſters are called couſins-*german*.—Wert thou a bear, thou wouldſt be killed by the horſe; wert thou a horſe, thou wouldſt be ſeized by the leopard; wert thou a leopard, thou wert *german* to the lion, and the ſpots of thy kindred were juries on thy life. *Shakeſpeare.*—The German language.—Do you learn *German* yet, to read, write, and ſpeak it. *Cheſterfield.*

GER'MAN, *adj.* [*germanus*, Lat.] Related. *Obſolete.*—Not he alone ſhall ſuffer what wit can make heavy, and vengeance bitter; but thoſe that are *german* to him. *Shakeſpeare.*—Spoken in Germany.—I alſo expect that you make yourſelf perfect maſter of the *German* language. *Cheſterfield.*—Any thing belonging to Germany; as the German empire, German flute, German legion, &c.

GER'MAN, a townſhip of the American States, in Fayette county, Pennſylvania.

GER'MAN FLATS, the chief townſhip of Herkemer county, in the American States, taken from that of Montgomery, in New-York. By the cenſus of 1790, it contained 1307 inhabitants; and by the ſtate cenſus of 1796, 4194 inhabitants. It lies on the ſouth ſide of Mohawk river, oppoſite Herkemer: twenty-four miles eaſt of Whiteſtown, and ſixty weſt of Schenectady.

GERMAN'DER, *ſ.* in botany. See TEUCRIUM.

GERMAN'ICUS (Cæſar), a ſon of Druſus and Antonia the niece of Auguſtus. He was adopted by his uncle Tiberius, and raiſed to the moſt important offices of the ſtate. When his grandfather Auguſtus died, he was employed in a war in Germany, and the affection of the ſoldiers unanimouſly ſaluted him emperor. He refuſed the unſeaſonable honour, and appeaſed the tumult which his indifference occaſioned. He continued his wars in Germany, and defeated the celebrated Arminius, and was rewarded with a triumph at his return in Rome. Tiberius declared him emperor of the eaſt, and ſent him to appeaſe the ſeditions of the Armenians. But the ſucceſs of Germanicus in the eaſt was ſoon looked upon with an envious eye by Tiberius, and his death was meditated. He was ſecretly poiſoned at Daphne, near Antioch, by Piſo, A. D. 19, in the thirty-fourth year of his age. The news of his death was received with the greateſt grief, and the moſt bitter lamentations, and Tiberius ſeemed to be the only one who rejoiced in the fall of Germanicus. He had married Agrippina, by whom he had nine children, one of whom, Caligula, diſgraced the name of his illuſtrious father. Germanicus has been commended, not only for his military accompliſhments, but alſo for his learning, humanity, and extenſive benevolence. In the midſt of war, he devoted ſome moments to ſtudy, and he favoured the world with two Greek comedies, ſome epigrams, and a tranſlation of Aratus in Latin verſe.

GER'MANISM, *ſ.* An idiom of the German language.—It is full of Latiniſms, Galliciſms, *Germaniſms*, and all *iſms* but Angliciſms. *Cheſterfield.*

GERMAN'ITY, *ſ.* [*germinatas*, Lat.] Brotherhood.

GER'MANTOWN, a town of the American States, in Columbia county, containing 516 inhabitants. In 1796 it had ſeventy-five qualified voters.

GER'MANTOWN, a town of the American States, in Philadelphia county, Pennſylvania; ſeven miles north of Philadelphia, and eſteemed the ſecond town in the country, until ſeveral inland towns eclipſed it by ſuperior eſtabliſhments and number of inhabitants. It is a corporation, conſiſting chiefly of High and Low Dutch, and contains about 250 houſes, chiefly of ſtone, ſome of which are large, elegant, and commodious, built chiefly in one ſtreet, about two miles in length. The public buildings are a German Calviniſt and Lutheran church, a Friends' meeting-houſe, and an academy. Knit ſtockings, of cotton, thread, and worſted, are manufactured here to a conſiderable extent, and of an excellent quality. It is an ancient town, pleaſantly ſituated, and by its vicinity to the metropolis, well adapted for manufactures. Here is the principal congregation of the Mennoniſts, and the mother of that ſect in America. They derive their name from Menno Simon, a learned man of Witmars in Germany, one of the reformers, born in 1505. Some of his followers came into Pennſylvania from New-York, in 1692. There are about four thouſand of them in the ſtate. They do not, like the Tunkers, believe in general ſalvation; yet, like them, they will neither ſwear nor fight, nor bear any civil office, nor go to law, nor take intereſt for money. They uſe great plainneſs in their dreſs, and practiſe many of the rites of the primitive Chriſtian church.

This town is alſo rendered famous by the battle fought in it, on the 4th of October, 1777.

GER'MANTOWN, a poſt-town of the American States, and capital of Stokes county, North Carolina. It is ſituated near the Town Fork of Dan river, and contains a court-houſe and gaol: 528 miles ſouth-weſt by ſouth of Philadelphia.

GER'MANTOWN, a town of the American States, in Hyde county, Newbern diſtrict, North Carolina.

GER'MANY, one of the moſt celebrated countries of Europe, ſituated nearly in its centre, and famed for having originally peopled, and given its laws, manners, and cuſtoms, to moſt of the other nations in its vicinity. Yet, notwithſtanding this pre-eminent celebrity, it is the moſt perplexed, in its government and ſubordination, of any region on the ſurface of the globe; the grand ſtates, or *circles*, being now interwoven and almoſt antiquated, while no modern or rational diviſion has ſince taken place. Its ancient extent was much more conſiderable than it is at preſent; which the reader will readily perceive, by referring to the article GEOGRAPHY, p. 373, and 395, of this volume.

Germany, conſidered in its modern limits, extends about ſix hundred Britiſh miles in length, from the iſle of Rugen in the north, to the ſouthern limits of the circle of Auſtria. The modern breadth, from the Rhine to the eaſtern boundary of Sileſia, is about five hundred Britiſh miles: anciently the breadth extended beyond the Viſtula, about two hundred miles more to the eaſt; a ſpace filled by the Poles, a Slavonic nation; and ſince divided between Auſtria, Ruſſia, and Pruſſia.

This country appears to have been full of extenſive foreſts, even in the Roman period; and of courſe to have been in many parts thinly peopled; yet there are faint indications that the Cimbri, or Celts, poſſeſſed ſeveral tracts in the ſouth, as they certainly held a large portion of the north-weſt. On the north-eaſt of Germany, the Finniſh nations long preceded the incurſions of the Goths and Slavonians. It alſo appears that the central parts of Germany were very little known to the ancients. The ſouthern and weſtern diſtricts, as bordering on the Roman empire, had been partially explored. Roman ſhips had navigated the Baltic, and Roman armies had viſited the northern courſe of the Elbe; but the centre and the eaſt long remained unknown. The Roman arms had penetrated nearly in a direction due eaſt, to the neareſt circuit of the Elbe near Magdeburg, in which quarter the trophies of the Roman general Druſus were erected. On the ſouth, the Sudetic mountains, and perhaps the Erzgeberg, ſeem to bound the knowledge of the ancients; while through the centre of Germany, from the Rhine to the Viſtula, extended the vaſt Hercynian foreſt, by Heſſia, Thuringia, and the north of the Sudetic and Carpathian mountains. The mountain Melebocus of Ptolemy ſeems to be the ſame with the Bructerus of other writers, repreſenting the moſt northern mountains of Germany; thoſe of the Hartz, and the Semana Sylva, may alſo be ſought near the courſe of the Roman army towards Magdeburg. The interior of the country certainly remained in a great meaſure unexplored, till the age of Charlemagne; and the northern parts for ſeveral centuries after that period.

The ſupreme authority in Germany has been long that of an elective monarch; but its future deſtination in this reſpect can only be unboſomed by time. The manners, cuſtoms, and dialects, vary according to the different ſtates. The Saxon is accounted the pureſt and moſt claſſical idiom of the German tongue; and the ſouthern dialects of Swabia, Bavaria, and Auſtria, are the moſt uncouth.

The Auſtrian and Pruſſian dominions include moſt of the eaſtern provinces of Germany. The weſtern part is naturally divided into two portions by the river Maine. To the north of the Maine, Germany chiefly preſents wide ſandy plains, which ſeem as if they had been, in the firſt ages of the world, overwhelmed by the ſea. A few hills firſt begin to appear in the neighbourhood of Minden; and in the ſouth of the Hanoverian dominions ariſe the moſt northern mountains of Germany, thoſe of Blockſberg, and others in the Hartz. To the ſouth-weſt are the mountains of Heſſia, extending towards the Rhine; while on the eaſt the rich and variegated country of Saxony, one of the moſt beautiful and fertile in the empire, extends to the ſouthern limits of the mountains of Erzgeberg, abundant in mines and rich foſſils.

The regions to the ſouth of the Maine are for the moſt part mountainous. Both portions are watered by numerous and important rivers. In the north the Elbe is the moſt diſtinguiſhed, riſing in the Sudetic mountains of Sileſia; and, after running ſouth for about fifty miles, it ſuddenly aſſumes its deſtination of north-weſt, receives the Bohemian Mulda and Eger, the Mulda and Sala of Saxony, and the large river Havel from the eaſt, and enters the ſea near Cuxhaven, after a comparative courſe of more than five hundred Britiſh miles. The chief cities on the banks of the Elbe are Dreſden, Meiſſen, Wittenberg, Magdeburg, from which it runs almoſt a ſolitary ſtream to Hamburgh. The tide is viſible to the height of twenty-two miles; and, when raiſed by the north wind, middle-ſized veſſels may work up to Hamburgh; but they are in general obliged to anchor a mile below the city.

Not far to the weſt is the mouth of the Weſer, which firſt receives that name when its two ſources, the Werra and the Fulda, join near Munden in the principality of Calenburg, about ſixteen Britiſh miles ſouth-weſt of Gottingen. The Werra ſprings in the principality of Hildburghauſen; and the Fulda in the territories of the biſhopric ſo called; the former having the longeſt courſe, and being juſtly conſidered as the chief ſource of the Weſer, which thus flows about 270 Britiſh miles. The principal towns on this river are Bevern, Minden, and Bremen; the Rhine alone boaſting of numerous cities on its banks. The chief tributary ſtream is the Aller, from the duchy of Brunſwic. The inundations of the Weſer are often terrible, the adjacent towns and villages ſeeming to form iſlands in the ſea; hence the ſhores are eſteemed unhealthy.

The Ems is an unimportant river, which riſes in the biſhopric of Munſter. The ſources and mouths of the Rhine have in all ages been celebrious. This noble river forms the grand ancient barrier between France and Germany; and its courſe may be computed at about ſix hundred Britiſh miles. On the German ſide it is diverſified with mountains and rocks; but from Baſel to Spire the ſhores are flat and unintereſting. Near Mentz they become rich, variegated, and grand; and on the confluence with the Maine the waters are diſtinguiſhable for many leagues. The Rhinegaw is not only celebrated for its wines, but for the romantic appearance of the country, the river running through ſpiral rocks, crowned with majeſtic caſtles. Hence as far as Bonn the ſhores abound with beautiful and ſtriking objects, the Rhine not ſeeming to aſſume its rugged grandeur till after its junction with the Maine.

In the ſouthern part of Germany the moſt important river is the Danube, which according to ſome geographers riſes near the little town of Doneſchingen in Swabia; but others place the ſources a little further to the north. This noble ſtream becomes navigable a little above Ulm, where it receives the Iller. The next tributary ſtream is the Lech, which comes from the Tyrol, diſtinguiſhed in the annals of the revolutionary war; as is the Iſer, proceeding from Upper Bavaria. The Danube runs about 250 miles through this part of Germany, paſſing by Ulm, Ratiſbon, and Paſſau. To Or-

ſova it may be conſidered as an Auſtrian river for about 550 miles; thence it is Turkiſh for 480 to the Euxine.

The Necker is a tributary ſtream of the Rhine, riſing in the Black Foreſt, not far from the Danube, and running a picturesque courſe of about 150 Britiſh miles, through a country enriched with vineyards. Another and grander tributary ſtream of the Rhine ſprings from the lake of Fichtel See, on the mountain of Fichtelberg, eſteemed among the moſt elevated parts of Germany, as it gives ſource to four rivers running in various directions, the Maine to the weſt, the Eger to the eaſt, the Sala to the north, and the Nab to the ſouth. This ſource is called the White Maine; while another ſource, the Red Maine, ſo called from the red clay through which it flows, riſes near Hærnleinſreuth, in the principality of Bareuth. The Maine, after receiving the Rednitz and other conſiderable ſtreams, joins the Rhine to the ſouth of Mentz. The Maine is a muddy ſtream, but abounds with trout, carp, and other fiſh. After pervading the rich biſhoprics of Bamberg and Wurtzburg, and ſome territories of the ſee of Mentz, it waſhes the walls of Frankfort.

To the north of the Maine, Germany preſents but few lakes; the largeſt being in the duchy of Mecklenburg, where the lake of Plau extends under various names about twenty-five Britiſh miles in length, by ſix in breadth: that of Schwerin is about eighteen miles in length, while that of Ratzburg is only fifteen. There is alſo one in the county of Diepholtz, and another in the county of Mansfeldt, in Upper Saxony. In the more ſouthern and Alpine regions the Boden See, or lake of Conſtance, is the moſt diſtinguiſhed expanſe of water in that diſtrict. Next is the Chiem See, in Upper Bavaria, about fourteen Britiſh miles in length by five in breadth, ſometimes ſtyled the ſea of Bavaria. That circle, like moſt mountainous countries, alſo contains many other lakes of ſmaller note.

Of the mountains of Germany, the moſt northern are thoſe of the Hartz, called the Brocken or Blockſberg. Theſe riſe in the form of an amphitheatre, the higheſt being what is called the Great Blockſberg; which, (while the others are covered with pines and birch, thus uniting the primeval confuſion of foreſt and mountain,) only preſents white ſtinted bruſhwood: and the ſnow ſometimes remains till midſummer, and even longer in the northern cavities. On the ſummit is a ſmall hovel, a retreat for thoſe who aſcend. The river Ilſe riſes from the bottom; and other ſtreams ſpring from the hills to the north-weſt and to the eaſt. The height of the Great Brocken is by the barometer 3021 feet; and the Little Brocken 2713.

In Weſtphalia there are ſome lofty hills near Minden; and in the duchy of the ſame name, bordering on Heſſia, are the mountains of Winterberg, Aſtenberg, Schloſsberg, and others. The Heſſian territories may be regarded as generally mountainous, eſpecially towards the north. The range of Meiſner contains a coal mine, under which is a bed of petrified wood. To the north of Caſſel are many high mountains, as the Stauffenberg, the ſummit of which is called Bartelſpopf; and the Gameberg towards Munden. In the Heſſian territories are alſo the *bergs* of Doern, Behren, Schrecklen, Guden, Valken, all in the diſtrict of Zieremberg, with many in the ſouth-eaſt of Felſberg; not to mention the hilly foreſt of Habichtſwald. Thence ſouth-weſt towards the Rhine are ſeveral conſiderable hills, among which may be mentioned thoſe in the weſt of Wetterau, and the ſeven hills near the Rhine, almoſt oppoſite to Andernach; with the ridge of Heyrich, which protects the vines of Rhinegau. To the eaſt of Frankfort on the Maine are the hilly foreſts of Speſſart, with the metallic heights of Fulda and Henneberg; and that river ſprings from the remarkable mountain of Fichtelberg, or the mountain of pines, near twenty-two geographical miles in length, and ſixteen in breadth, diverſified with deſerts, precipices, high rocks, and marſhes. The ſummits have various names, the Ochſenkopf being reputed the higheſt. The lake called Fichtel See is in a cavity of this mountain, called the See Loh; but is of little extent, being only remarkable as the ſource of the White Maine. Other parts of this memorable mountain give riſe to the Eger, which runs to the eaſt; and the Sala and Nab flowing to the north and ſouth.

But the moſt celebrated mountains in that part of Germany which lies to the north of the Maine, are the Erzgeberg, or Metallic Mountains, which riſe to the north-eaſt of the Fichtelberg, running between Bohemia and Saxony, but ſupplying both countries with ſilver, tin, and other metals. The Erzgeberg are not of remarkable height, yet contain much granite, like thoſe of the Hartz and Heſſia; with gneiſs, in which moſt of the Saxon and Bohemian mines are found. Granular limeſtone alſo appears; and in Upper Luſatia an entire mountain is found of ſiliceous ſchiſtus, while Flinzberg conſiſts almoſt entirely of milk-white quartz. Miſnia contains mountains of pitchſtone; and that ſtrong primæval ſubſtance called hornblende, which approaches to the nature of iron, is found in immenſe ſtrata. In Voigtland, near Averbach, appears the famous topaz rock, conſiſting of pale topazes in hard lithomarga. Micaceous ſchiſtus and ſlate alſo form portions of the Saxon mountains, with large maſſes of trap and baſalt, often imbedded in the gneiſs, which likewiſe contains ſtrata of ſerpentine. Hornblende, ſlate, and ſandſtone, both calcareous and ſiliceous, alſo contribute their ſhare to this noted chain. Thoſe of Heſſia preſent nearly the ſame kinds of primary and ſecondary ſubſtances; and a ſummit of the Meiſner, as already mentioned, conſiſts of baſalt reſting on coal. In the Hartz, granite alſo abounds; with porphyry, ſlate, and other primitive ſubſtances.

Among the German mountains to the ſouth of the Maine, may firſt be named the Bergſtraſs, a ridge paſſing from near Manheim to the vicinity of Frankfort, and accompanied by a high-way commanding proſpects of prodigious extent. On the eaſt are the high hills of Odenwald. Further to the ſouth are the mountains of Wirtemberg, riſing both on the eaſt and weſt of that new kingdom. On the weſt the mountains form a continuation of thoſe of the Black Foreſt, which hence proceeds ſouth to the Rhine, being the Mount Abnoba of Tacitus, whence he juſtly derives the ſource of the Danube; and the Helvetian foreſt of Ptolemy. The mountains of the Black Foreſt, in German Schwarzwald, extend from near Neuenburg, in the territories of Wirtemburg, ſouth to the four foreſt towns on the Rhine. The ſouthern part is called the High, and the northern the Lower, foreſt: the length being about eighty Britiſh miles. To the eaſt the Necker may be conſidered as a boundary; and the breadth may be computed at about twenty Britiſh miles. The eaſtern part, as uſual, preſents a gradual elevation; while the weſtern ſhows precipitous ſummits to the inhabitants of Baden and Alſace. Its appellation ſeems to ariſe from the thick dark foreſts with which the aſcents are clothed. Beſides paſturage, the inhabitants of the Black Foreſt derive advantage from the roſin of the pines, and the timber, of which they make all kinds of utenſils. Some parts are cultivated by ſpreading branches of pine, covered with ſod, which being burnt, an excellent manure prepares the ground for four abundant harveſts. A branch of the Black Mountains ſpreads eaſt from near Sulz on the Necker towards the county of Œtingen, being more than ſixty miles in length. This chain is called the Alb, and ſometimes the Swabian Alps. Buſching traces this ridge from the north-eaſt extremity, the ſource of the Brenz, to the weſt of the Nereſheim, by Wiſenſteig, where the mountains are higheſt. Thence they turn north-weſt to Guttenberg, and weſt

to Neiffen, whence they pafs by Hohenzollern to the Necker, then bend fouth and weft between that river and the Danube. Buſching adds, that as this chain riſes inſenſibly at Konigſbronn north-eaſt, ſo it gradually terminates at Ebingen ſouth-weſt. The principal ſummits are in the north and weſt of the ridge; and the foreſts are chiefly beech, while the open ſpaces ſupply abundant paſturage for numerous flocks of ſheep. Of theſe two extenſive ridges of mountains, the Black Foreſt and the Alb, a conſiderable portion pervades the country of Wirtemburg; and near Stutgard, the capital, are the mountains of Boyferſteig, Weinſteig, and Haſenſteig. The conſtituent parts of theſe extenſive ridges have not yet been much examined; but a great part is calcareous, as they ſupply excellent marbles. Near Frudenſtadt, in the Black Mountains, are mines of ſilver and copper.

The ſouth-eaſt of this portion of Germany is bounded by the high mountains of Bavaria and Salzia or Salzburg; being branches or continuations of the Swiſs or Tyroleſe Alps, but without general appellations. Ferber ſays that the high mountains of Bavaria, bordering on the Tyrol, are granite; thence, as uſual, argillaceous and calcareous in the lower parts. Large pieces of graſs-green quartz are found ſtudded with red tranſparent garnets, and at Munchen or Munich they are worked into elegant ſnuff-boxes. Some hills near Regenſburg, or Ratiſbon, are calcareous; but towards Bohemia they conſiſt of gneiſs and granite. Of the Alps of Salzburg an account has been publiſhed by Vierthaler, whence it would ſeem that they exceed in height the Carpathian chain, or the Pyrenees, and only yield to the Swiſs and Tyroleſe Alps. The higheſt ſummits are ſaid to be the Sonnenblic, the Ankogel, the Wiſbacher Horn, and the Loffler in the Stillupe. Even the next to theſe in height, the Hohe Nan, or the Hockhorn, is computed at 10633 feet above the ſea; and the Groſſe Kogel in Rauris, at 9100; while ſeveral others exceed 8000 feet. The mines of this country are highly celebrated; and in Zillarthal, or the vale of the river Ziller, on the weſt, is found the ſubſtance called *zillerthite* by the French mineralogiſts. The chief ridge of the Salzian Alps is on the ſouth and eaſt of the country, being an elongation of the grand chain, reaching from Mount Blanc and Mount Roſa along the north of Italy through Tyrol.

Conſiderable remains even yet exiſt of the ancient woods and foreſts which pervaded Germany. The German word *wald*, correſponding with the old Engliſh *weald*, denotes a foreſt; and ſuch are found in the ſouth of Mecklenburg, continued eaſterly in different parts of the Pruſſian dominions; but the timber of Dantzic is ſupplied by the navigation of the Viſtula. The chief foreſts appear always to have extended along the middle regions of Germany, from the north-weſt towards the ſouth-eaſt. The Dromling-wald is to the north of Magdeburg; but the Sollinger-wald, the woody mountains of Hartz, the Lutten-wald, the wide foreſt of Thuringia, may be ſaid to be connected with the ancient foreſts of Sileſia, hence extending far to the eaſt through the centre of Poland and Ruſſia. More to the ſouth, in this part of Germany, are the Speſſart foreſt, and others. In the portion ſouth of the Maine, the vaſt Black Foreſt, and the woods along the Alb, are continued by others in various parts of Bavaria. In general, the paſſion among the grandees for the chace of the wild boar, and other pleaſures of hunting, has contributed greatly to the preſervation of the foreſts.

As Spain is diſtinguiſhed by its groves of cork trees and ilex, and Scandinavia by its fir woods, ſo is Germany remarkable for its deep and almoſt impenetrable foreſts of oak; not indeed that this is the invariable characteriſtic of the country, for in an empire of ſuch great extent, and of ſo varied a ſurface, it muſt needs happen that the native vegetable productions on the ſhore of the German Ocean ſhould differ conſiderably from thoſe in the receſſes of the Black Foreſt, or on the frontiers of Tyrol. There is however on the whole more uniformity than might be expected, and though perhaps few plants are abſolutely peculiar to Germany, yet the abundance of ſome ſpecies, and the abſence of others, forms a ſtriking feature in the botanical hiſtory of the empire. The woods are not to be dreaded, as in Aſia and Africa, for venomous and ferocious animals; the wild boar is indeed of ſuperior ſize; and thoſe of Weſtphalia are in particular eſtimation as food. In the north of Germany the lynx and bear are ſometimes ſeen; and the wolf is not unfrequent in the ſouth.

PRIMITIVE HISTORY.

The warlike nations of Germany, who firſt reſiſted, then invaded, and at length overturned, the weſtern monarchy of Rome, occupy an important place in hiſtory, and claim particular attention and regard. The name *German*, or, as it was formerly written, *Gar man*, ſignifies, in the Celtic, a *warlike man*.

The moſt civilized nations of modern Europe, appear to have iſſued from the woods of Germany; and in the rude inſtitutions of thoſe barbarians, we may partly diſtinguiſh the original principles of our preſent laws and manners. In their primitive ſtate of ſimplicity and independence, the Germans are ſtrikingly delineated by the maſterly pencil of Tacitus, the firſt of hiſtorians who applied the ſcience of philoſophy to the ſtudy of facts. The expreſſive conciſeneſs of his deſcriptions has exerciſed the diligence of innumerable antiquarians, and excited the genius and penetration of the hiſtorians and geographers of our own times.

Ancient Germany, excluding from its independent limits the province weſtward of the Rhine, which had very early ſubmitted to the Roman yoke, extended itſelf over a third part of Europe. Almoſt the whole of modern Germany, Denmark, Norway, Sweden, Finland, Livonia, Pruſſia, and the greater part of Poland, were peopled by the various tribes of this great nation, whoſe complexion, manners, and language, denoted a common origin, and preſerved a ſtriking reſemblance. On the weſt, ancient Germany was divided by the Rhine from the Gaulic, and on the ſouth by the Danube from the Illyrian, provinces of the empire. A ridge of hills, riſing from the Danube, called the Carpathian mountains, covered Germany on the ſide of Dacia or Hungary. The eaſtern frontier was partially marked by the mutual fears of the Germans and the Sarmatians, and was often confounded by the mixture of warring and confederating tribes of the two nations. In the remote darkneſs of the north, the ancients faintly deſcried a frozen ocean that lay beyond the Baltic ſea, and beyond the peninſula, or iſlands, of Scandinavia.

Some writers have ſuſpected that Europe was much colder formerly than it is at preſent; and the moſt ancient deſcriptions of the climate of Germany tend exceedingly to confirm their theory. The general complaints of intenſe froſt, and eternal winter, are perhaps little to be regarded, ſince we have no method of reducing to the accurate ſtandard of the thermometer, the feelings or the expreſſions of an orator born in the happier regions of Greece or Aſia. But there are two remarkable circumſtances of a leſs equivocal nature. 1. The great rivers which covered the Roman provinces, the Rhine and the Danube, were frequently frozen over, and capable of ſupporting the moſt enormous weights. The barbarians, who often choſe that ſevere ſeaſon for their inroads, tranſported, without apprehenſion or danger, their numerous armies, their cavalry, and their heavy waggons, over a vaſt and ſolid bridge of ice. Modern ages have not preſented an inſtance of a like phenomenon. 2. The rein-deer, from whom the ſavage of the North derives the beſt comforts of his

dreary

dreary life, is of a conſtitution that ſupports, and even ſeems to require, the moſt intenſe cold. He is found on the rocks of Spitzbergen, within ten degrees of the pole; he ſeems to delight in the ſnows of Lapland and Siberia; but at preſent he cannot ſubſiſt, much leſs multiply, in any country to the ſouth of the Baltic. Yet in the time of Cæſar, the rein-deer, as well as the elk, and the wild bull, was a native of the Hercynian foreſt, which then overſhadowed a great part of Germany and Poland. Modern improvements, however, ſufficiently explain the cauſes of the diminution of the cold. Theſe immenſe woods have been gradually cleared, which intercepted from the earth the rays of the ſun. The moraſſes have been drained, and, in proportion as the ſoil has been cultivated, the climate has become more genial, and the air more temperate. Canada, at this day, is an exact picture of ancient Germany. Although ſituated in the ſame parallel with the fineſt provinces of France and England, that country ſtill experiences the moſt rigorous cold. The rein-deer are very numerous, the ground is covered with deep and laſting ſnow, and the great river of St. Lawrence is regularly frozen, in a ſeaſon when the waters of the Seine and the Thames are uſually free from ice.

It is difficult to aſcertain, though eaſy to exaggerate, the influence of the ſevere climate of ancient Germany over the minds and bodies of the natives. Many writers have ſuppoſed, and ſome have allowed, though, as it ſhould ſeem, without any adequate proof, that the rigorous cold of the north was favourable to long life and generative vigour; that the women were more fruitful, and the human ſpecies more prolific, than in warmer or more temperate climates. We may aſſert, with greater confidence, that the keen air of Germany formed the large and maſculine limbs of the natives, who were, in general, of a more lofty ſtature than the people of the ſouth, gave them a kind of ſtrength better adapted to violent exertions than to patient labour, and inſpired them with conſtitutional bravery, which is the reſult of nerves and ſpirits. The ſeverity of a winter campaign, that chilled the courage of the Roman troops, was ſcarcely felt by theſe hardy children of the north, who in their turn were unable to reſiſt the ſummer heats, and diſſolved away in languor and ſickneſs under the beams of an Italian ſun.

There is not any where upon the globe, a large tract of country, which has ever been diſcovered deſtitute of inhabitants, or whoſe firſt population can be fixed with any degree of hiſtorical certainty. And yet, as the moſt philoſophic minds can ſeldom refrain from inveſtigating the infancy of great nations, our curioſity conſumes itſelf in toilſome and diſappointed efforts. When Tacitus conſidered the purity of the German blood, and the forbidding aſpect of the country, he was diſpoſed to pronounce thoſe barbarians *indigenæ*, or natives of the ſoil. We may allow with ſafety, and perhaps with truth, that ancient Germany was not originally peopled by any foreign colonies already formed into a political ſociety; but that the name and nation received their exiſtence from the gradual union of ſome wandering ſavages of the Hercynian woods. To aſſert thoſe ſavages to have been the ſpontaneous production of the earth which they inhabited, would be an inference condemned by religion, and unwarranted by reaſon.

An immenſe ſuperſtructure of wild fable has however been erected upon this doubtful and precarious foundation. The ſeventeenth century abounded with antiquarians of eaſy faith, who, by the dim light of legends and traditions, of conjectures and etymologies, conducted the great grandchildren of Noah from the Tower of Babel to the extremities of the globe. Of theſe credulous writers, one of the moſt entertaining was Olaus Rudbeck, profeſſor in the univerſity of Upſal. Whatever is celebrated either in hiſtory or fable, this zealous critic aſcribes to his own country. From Sweden, which formed ſo conſiderable a part of ancient Germany, the Greeks were ſaid to derive their alphabetical characters, their aſtronomy, and their religion. Of that delightful region, (for ſuch it appeared to the eyes of a *native*,) the Atlantis of Plato, the country of the Hyperboreans, the gardens of the Heſperides, the Fortunate Iſlands, and even the Elyſian Fields, were but faint and imperfect tranſcripts. A clime ſo favoured by nature, could not long remain deſert after the flood. The learned Rudbeck therefore allows the family of Noah a few years to multiply from about eight to twenty thouſand perſons. He then diſperſes them into ſmall colonies to repleniſh the earth, and to propagate the human ſpecies. The Swediſh detachment, which, according to him, marched under the command of Aſkenaz the ſon of Gomer, the ſon of Japhet, diſtinguiſhed itſelf by a more than common diligence in the proſecution of this great work. This northern hive caſt its ſwarms over the greateſt part of Europe, Africa, and Aſia; and, (to uſe Rudbeck's own metaphor,) "the blood circulated from the extremities to the heart."

But, unfortunately, all this laboured genealogy of the Germans is annihilated by a ſingle fact, too well atteſted to admit of doubt, and of too deciſive a nature to leave room for reply. The Germans, in the age of Tacitus, were unacquainted with the uſe of letters; and the uſe of letters is the principal circumſtance that diſtinguiſhes a civilized people from a race of ſavages, incapable of knowledge or reflection. Without that artificial help, the human memory ſoon diſſipates or corrupts the ideas intruſted to her charge; and thus the nobler faculties of the human mind, no longer ſupplied with models or with materials, gradually forget their powers; the judgment becomes feeble and lethargic, the imagination languid and irregular. Fully to comprehend this important truth, let us but attempt, in an improved ſociety, to calculate the immenſe diſtance between the man of learning, and the *illiterate* peaſant. The former, by reading and reflection, multiplies his own experience, and lives even in diſtant ages and remote countries; whilſt the latter, rooted to a ſingle ſpot, and confined to a few years of mere exiſtence, ſurpaſſes but very little his fellow-labourer, the ox, in the exerciſe of his mental faculties. The ſame, and even a greater, difference will be found between nations than between individuals; and we may ſafely pronounce, that without ſome form of writing, no people has ever preſerved the faithful annals of their hiſtory, ever made any progreſs in the abſtract ſciences, or ever poſſeſſed, in any ſenſible degree, the uſeful and elegant arts of human life.

Of theſe arts, the ancient Germans were certainly deſtitute. They paſſed their lives in a ſtate of ignorance and poverty, which it has pleaſed ſome declaimers to dignify with the appellation of virtuous ſimplicity. Modern Germany is ſaid to contain about two thouſand three hundred walled towns. In a much wider extent of country, the great Ptolemy could diſcover no more than ninety places, which he called by the name of cities; though, according to modern ideas, they would but ill deſerve that ſplendid title. We can only ſuppoſe them to have been rude fortifications, conſtructed, like thoſe of the ancient Britons, in the faſtneſſes of the woods, and deſigned to ſecure the women, children, and cattle, whilſt the warriors of the tribe marched out to repel a ſudden invaſion.

Tacitus however aſſerts, as a well-known fact, that the Germans, in his time, had *no* cities; and that they affected to deſpiſe the works of Roman induſtry, as places of confinement rather than of ſecurity. Their edifices were not even contiguous, or formed into regular villas; each barbarian fixed his independent dwelling on the ſpot to which a plain, a wood, or a ſtream of freſh water, had induced him to give the preference. Neither ſtone, nor brick, nor tiles, were employed in

theſe ſlight habitations. They were indeed no more than low huts of a circular figure, built of rough timber, thatched with boughs or ſtraw, and pierced at the top to leave a free paſſage for the ſmoke. In the moſt inclement winter, the children went naked, and the men hung the ſkin of ſome wild beaſt upon their ſhoulders, faſtening it with a thong; and perſons of the beſt quality wore only a coarſe woollen mantle, or a ſort of coat without ſleeves. Their uſual bed was the ground, covered with a little ſtraw, or the ſkins of bears and wolves. Their meals were taken in the ſame apartment, with the maſter of the family in the middle, and the reſt on the right and left, ſitting on the ground in a ſemicircle. The game of various ſorts, with which the foreſts of Germany were plentifully ſtocked, ſupplied them with food and exerciſe. Their numerous herds of cattle, leſs remarkable indeed for their beauty than for their utility, formed the principal object of their wealth. A ſmall quantity of corn was the only produce exacted from the earth: the uſe of orchards or artificial meadows was unknown to the Germans; nor ought we to expect any improvements in agriculture from a people, whoſe property every year experienced a general change by a new diviſion of the arable lands, and who, in that ſtrange operation, avoided diſputes, by ſuffering a great part of their territory to lie waſte and without tillage.

Gold, ſilver, and iron, were extremely ſcarce in ancient Germany. Its barbarous inhabitants wanted both ſkill and patience to inveſtigate thoſe rich veins of ſilver, which have ſo liberally rewarded the attention of the princes of Brunſwick and Saxony. Sweden, which now ſupplies Europe with iron, was equally ignorant of its own riches; and the appearance of the arms of the Germans furniſhed a ſufficient proof how little iron they were able to beſtow on what they muſt have deemed the nobleſt uſe of that metal. The various tranſactions of peace and war had introduced ſome Roman coins (chiefly ſilver) among the borderers of the Rhine and Danube; but the more diſtant tribes were abſolutely unacquainted with the uſe of money, inſomuch that they carried on their confined traffic by the exchange of commodities, and prized their rude earthen veſſels as of equal value with the ſilver vaſes, the preſents of Rome to their princes and ambaſſadors. To a mind capable of reflection, ſuch leading facts convey more inſtruction than a long detail of ſubordinate circumſtances. The value of money has been ſettled by general conſent to expreſs our wants and our property; as letters were invented to expreſs our ideas; and both theſe inſtitutions, by giving a more active energy to the powers and paſſions of human nature, have contributed to multiply the objects they were deſigned to repreſent. The uſe of gold and ſilver is in a great meaſure factitious; but it would be impoſſible to enumerate the important and various ſervices which agriculture, and all the arts, have received from iron, when tempered and faſhioned by the operation of fire, and the dextrous hand of man. Money, in a word, is the moſt univerſal incitement, iron the moſt powerful inſtrument, of human induſtry; and it is very difficult to conceive by what means a people, neither actuated by the one, nor ſeconded by the other, could emerge from the groſſeſt barbariſm.

If we contemplate a ſavage nation in any part of the globe, a ſupine indolence, and a careleſſneſs of futurity, will be found to conſtitute their general character. In a civilized ſtate, every faculty of man is expanded and exerciſed; and the great chain of mutual dependence connects and embraces the ſeveral members of ſociety. The moſt numerous portion of it is employed in conſtant and uſeful labour. The ſelect few, placed by fortune above that neceſſity, can, however, fill up their time by the purſuits of intereſt or glory, by the improvement of their eſtate, or of their underſtanding; by the duties, the pleaſures, and even the follies, of ſocial life. The Germans were not poſſeſſed of theſe reſources. The care of the houſe and family, the management of the land and cattle, were delegated to the old and the infirm, to women and ſlaves. The unemployed warrior, deſtitute of every art that might fill up his leiſure hours, conſumed his days and nights in the animal gratifications of ſleep and food. And yet, by a wonderful diverſity of nature, according to the remark of Tacitus, the ſame barbarians are by turns the moſt indolent, and the moſt active, of mankind. They delight in ſloth, they deteſt tranquillity. The languid ſoul, oppreſſed with its own weight, anxiouſly required ſome new and powerful ſenſation; and war and danger were the only amuſements adapted to its fierce temper. The ſound that ſummoned the German to arms, was grateful to his ear. It rouſed him from his lethargy, gave him a dauntleſs courage, and, by ſtrong exerciſe of the body, and violent emotions of the mind, reſtored him to a more lively ſenſe of his nature and exiſtence. In the dull intervals of peace, theſe barbarians were immoderately addicted to gaming and drinking; both of which, by different means, the one by inflaming their paſſions, the other by extinguiſhing their reaſon, alike relieved them from the pain of thinking. They gloried in paſſing whole days and nights in feaſting; and the blood of friends and relations too often ſtained theſe inebriating aſſemblies. Their debts of honour, (for in that light they have tranſmitted to us thoſe of play,) they diſcharged with the moſt ſcrupulous fidelity. The deſperate gameſter, who had ſtaked his perſon and liberty on a laſt throw of the dice, patiently ſubmitted to the deciſion of fortune, and ſuffered himſelf to be bound, chaſtiſed, and ſold into remote ſlavery, by his weaker but more fortunate antagoniſt.

Strong beer, a liquor which they extracted with very little art from wheat or barley, and *corrupted* (as it is expreſſed by Tacitus) into a certain ſemblance of wine, was ſufficient for the groſs purpoſes of German debauchery. Yet thoſe who had taſted the rich wines of Italy, and afterwards of Gaul, ſighed for the more delicious ſpecies of intoxication. They attempted not, however, (as has ſince been executed with ſo much ſucceſs,) to naturalize the vine on the banks of the Rhine and Danube; nor did they endeavour to procure by induſtry and labour, the materials of an advantageous commerce. To procure by labour what might be gained by arms, was eſteemed unworthy of the German ſpirit. The intemperate thirſt of ſtrong liquors often urged them to invade the provinces on which art or nature had beſtowed thoſe much envied, yet dangerous, preſents. The Tuſcan who betrayed his country to the Celtic nations, attracted them into Italy, according to Plutarch, by the proſpect of the rich fruits and delicious wines, the productions of a happier climate. And in the ſame manner the German auxiliaries, invited into France during the civil wars of the ſixteenth century, were allured by the promiſe of plenteous quarters in the wine-drinking provinces of Champaigne and Burgundy. Drunkenneſs, the moſt illiberal, though perhaps not the moſt dangerous, of *our* vices, was ſometimes capable, in a leſs civilized ſtate of mankind, of occaſioning a battle, a war, or a revolution.

The climate of ancient Germany has been mollified, and the ſoil fertilized, by the labour of ten centuries from the time of Charlemagne. The ſame extent of ground which at preſent maintains, in eaſe and plenty, a million of huſbandmen and artificers, was unable to ſupply an hundred thouſand warriors, or fighting men, with the ſimple neceſſaries of life. The Germans abandoned their immenſe foreſts to the exerciſe of hunting, employed in paſturage the moſt conſiderable part of their lands, beſtowed on the ſmall remainder a careleſs cultivation, and then accuſed with ſcantineſs and ſterility, the face of a country that refuſed, for want of labour only, to maintain the multitude of its inhabitants. When famine ſeverely admoniſhed them of the import-

ance

ance of the arts, the national diſtreſs was ſometimes alleviated by the emigration of a third, perhaps, or a fourth, part, of their youth. The poſſeſſion and the enjoyment of property are the pledges which bind a civilized people to an improved country. But the Germans, who carried with them what they moſt valued, their arms, their cattle, and their women, cheerfully abandoned the gloom of their woods, for the unbounded hopes of plunder and conqueſt in cultivated and populous countries. The innumerable ſwarms that iſſued, or ſeemed to iſſue, from the great ſtorehouſe of nations, were however multiplied by the fears of the vanquiſhed, and by the credulity of ſucceeding ages. And from facts thus exaggerated, an opinion was gradually eſtabliſhed, and has been ſupported by writers of diſtinguiſhed reputation, that, in the age of Cæſar and Tacitus, the inhabitants of the north were far more numerous than they are in our preſent days. But a more ſerious inquiry into the cauſes of population, ſeems to have convinced modern philoſophers of the falſehood, and indeed the impoſſibility, of the ſuppoſition. To the names of Mariana and of Machiavel, we can oppoſe the equal names of Robertſon and Hume.

A warlike nation like the Germans, without either cities, letters, arts, or money, thought they found a compenſation for this ſavage ſtate in the enjoyment of liberty. Their poverty certainly ſecured their freedom, ſince our deſires and our poſſeſſions are the ſtrongeſt fetters of deſpotiſm. "Among the Suiones, (ſays Tacitus,) riches are held in honour. They are therefore ſubject to an abſolute monarch, who, inſtead of intruſting his people with the free uſe of arms, as is practiſed in the reſt of Germany, commits them to the cuſtody, not of a citizen, or even of a freedman, but of a ſlave. The neighbours of the Suiones, the Sitones, are ſunk even below ſervitude; they obey a woman." In the mention of theſe exceptions, the great hiſtorian ſufficiently acknowledges the general theory of government. We are only at a loſs to conceive by what means riches and deſpotiſm could penetrate into a remote corner of the north, and extinguiſh the generous flame that blazed with ſuch fierceneſs on the frontier of the Roman provinces: or how the anceſtors of thoſe Danes and Norwegians, ſo diſtinguiſhed in latter ages by their unconquerable ſpirit, could thus tamely reſign the great character of German liberty. Some tribes, however, on the coaſt of the Baltic, acknowledged the authority of kings, though without relinquiſhing the rights of men; but in the far greater part of Germany, the form of government was a democracy, tempered indeed, and controlled, not ſo much by general and poſitive laws, as by the occaſional aſcendant of birth or valour, of eloquence or ſuperſtition.

Civil governments, in their firſt inſtitution, are voluntary aſſociations of the people for mutual defence. To obtain the deſired end, it is abſolutely neceſſary that each individual ſhould conceive himſelf obliged to ſubmit his private opinion and actions to the judgment of the greater number of his aſſociates. The German tribes were contented with this rude but liberal outline of political ſociety. As ſoon as a youth, born of free parents, had attained the age of manhood, he was introduced into the general council of his countrymen, ſolemnly inveſted with a ſhield and ſpear, and adopted as a new and equal member of the military commonwealth. The aſſembly of the warriors of each tribe was convened at ſtated ſeaſons, or on ſudden emergencies. The trial of public offences, the election of magiſtrates, and the great buſineſs of peace and war, were determined by its independent voice. Sometimes, indeed, theſe queſtions were previouſly conſidered, and prepared in a more ſelect council of the principal chieftains. The magiſtrates might deliberate and perſuade, but the people only could reſolve and execute; and the reſolutions of the Germans were for the moſt part haſty and violent. Barbarians accuſtomed to place their freedom in gratifying the preſent paſſion, and their courage in overlooking all future conſequences, turned away with indignant contempt from the remonſtrances of juſtice and policy; and it was the practice to ſignify by a hollow murmur, their diſapprobation of ſuch timid counſels. But whenever a more popular orator propoſed to vindicate the meaneſt citizen from either foreign or domeſtic injury, whenever he called upon his fellow-countrymen to aſſert the national honour, or to purſue ſome enterpriſe full of danger and peril, a loud claſhing of ſhields and ſpears expreſſed the eager applauſe of the aſſembly. For the Germans always met in arms; and it was ever to be dreaded, leſt an irregular multitude, inflamed with faction and ſtrong liquors, ſhould uſe thoſe arms to enforce, as well as to declare, their furious reſolves.

A general or chief of the tribe was elected on occaſions of danger; and, if the danger was preſſing and extenſive, ſeveral tribes concurred in the choice of the ſame chief. The braveſt warrior was named to lead his countrymen into the field, by his example rather than by his commands. But this power, however limited, was ſtill invidious. It expired with the war, and in time of peace the German tribes acknowledged not any ſupreme lord. *Princes* were, however, appointed in the general aſſembly, to adminiſter juſtice, or rather to compoſe differences, in their reſpective diſtricts. In the choice of theſe magiſtrates, as much regard was ſhewn to birth as to merit; and to each was aſſigned a guard, and a council of an hundred perſons, by the ſovereign voice of the people.

The comparative view of the powers of the magiſtrates, in two remarkable inſtances, is alone ſufficient to repreſent the early ſyſtem of German manners. The diſpoſal of the landed property within their diſtrict, was abſolutely veſted in their hands, and they diſtributed it every year according to a new diviſion. At the ſame time they were not authoriſed to puniſh with death, to impriſon, or even to ſtrike, a private citizen. A people thus jealous of their perſons, and careleſs of their poſſeſſions, muſt have been totally deſtitute of induſtry and the arts, but animated with a high ſenſe of honour and of independence.

The Germans reſpected only thoſe duties which they impoſed on themſelves. The moſt obſcure ſoldier reſiſted with diſdain the authority of the magiſtrates. "The nobleſt youths bluſhed not (ſays Tacitus,) to be numbered among the faithful companions of ſome renowned chief, to whom they devoted their arms and their ſervice. A noble emulation prevailed among the companions to obtain the firſt place in the eſteem of their chief; amongſt the chiefs to acquire the greateſt number of valiant companions. To be ever ſurrounded by a band of ſelect youths, was the pride and ſtrength of the chiefs, their ornament in peace, their defence in war. The glory of ſuch diſtinguiſhed heroes diffuſed itſelf beyond the narrow limits of their own tribe. Preſents and embaſſies ſolicited their friendſhip, and the fame of their arms often enſured victory to the party which they eſpouſed. In the hour of danger it was ſhameful for the chief to be ſurpaſſed in valour by his companions; ſhameful for the companions not to equal the valour of their chief. To ſurvive his fall in battle was indelible infamy. To protect his perſon, and to adorn his glory with the trophies of their own exploits, were the moſt ſacred of their duties. The chiefs combated for victory; the companions for the chief. The nobleſt warriors, whenever their native country was ſunk in the indolence of peace, maintained their numerous bands in ſome diſtant ſcene of action, to exerciſe their proweſs, and to acquire renown by voluntary dangers. Gifts worthy of ſoldiers, the warlike ſteed, the bloody and ever-victorious lance, were the rewards which the companions claimed from the liberality of their chief.

The rude plenty of his hoſpitable board was the only pay that he could beſtow, or they would accept. "War, rapine, and the free-will offerings of his friends, ſupplied the materials of his conſtant munificence." This inſtitution, however it might accidentally weaken the ſeveral republics, invigorated the general character of the Germans, and even ripened amongſt them all the virtues of which barbarians are ſuſceptible; the faith and valour, the hoſpitality and the courteſy, ſo conſpicuous long afterwards in the ages of knighthood and chivalry. The honourable gifts beſtowed by the chief on his brave companions, have been ſuppoſed, by an ingenious writer, to contain the firſt rudiments of the fiefs, or feodal tenures, diſtributed, after the conqueſt of the Roman provinces, by the barbarian lords among their vaſſals, with a ſimilar duty of homage and military ſervice. Theſe conditions are, however, very repugnant to the maxims of the ancient Germans, who delighted in mutual preſents; but without either impoſing, or accepting, the weight of obligations.

"In thoſe days of knighthood or chivalry, the men were brave, and the women chaſte;"—and notwithſtanding the latter of theſe virtues is acquired and preſerved with much more difficulty than the former, it is aſcribed, almoſt without exception, to the wines of the ancient Germans. See the article CHIVALRY, vol. iv. p. 505.—Polygamy was not in uſe, except among the princes, and among them only for the ſake of multiplying their alliances. Divorces were prohibited by manners, rather than by laws. Adulteries were puniſhed as rare and inexpiable crimes; nor was ſeduction juſtified by high example and faſhion. We can eaſily diſcover, that Tacitus indulges an honeſt pleaſure in the contraſt of barbarian virtue, with the diſſolute conduct of the Roman ladies; yet there are ſome ſtriking circumſtances that give an air of truth, or at leaſt of probability, to the conjugal faith and chaſtity of the German people.

Although the progreſs of civilization has undoubtedly contributed to aſſuage the fiercer paſſions of human nature, it ſeems to have been leſs favourable to the virtue of chaſtity, whoſe moſt dangerous enemy is the ſoftneſs of the mind. The refinements of life corrupt, even while they poliſh, the intercourſe of the ſexes. The groſs appetite of love becomes moſt dangerous when it is elevated, or rather indeed diſguiſed, by ſentimental paſſion. The elegance of dreſs, of motion, and of manners, gives a luſtre to beauty, and inflames the ſenſes through the eye of imagination. Luxurious entertainments, midnight dances, and licentious ſpectacles, preſent at once temptation and opportunity to female frailty. From ſuch dangers the unpoliſhed wives of the barbarians were ſecured by poverty, ſolitude, and the painful cares of a domeſtic life. The German huts, open on every ſide to the detection of indiſcretions, were a better ſafeguard of conjugal fidelity, than the walls, the bolts, and the eunuchs, of a Perſian harem. To this reaſon, another may be added of a more honourable nature. The Germans treated their women with eſteem and confidence, conſulted them on all occaſions of importance, and fondly believed, that in their breaſts reſided a ſanctity and wiſdom more than human. Some of theſe interpreters of fate, ſuch as Velleda, in the Batavian war, governed in the name of the deity the fierceſt nations of Germany. The reſt of the ſex, without being adored as goddeſſes, were reſpected as the free and equal companions of ſoldiers; aſſociated even by the marriage ceremony to a life of toil, of danger, and of glory. In their great invaſions, the camps of the Germans were filled with a multitude of women, who remained firm and undaunted amidſt the claſh of arms, the horrors of deſtruction, and the bleeding wounds of their ſons and huſbands. Fainting armies of German warriors have more than once been driven back upon the enemy, by the generous deſpair of the women, who dreaded death much leſs than ſervitude. If the day was irrecoverably loſt, they well knew how to deliver themſelves and their children, with their own hands, from an implacable victor. Heroines of ſuch a caſt may claim our admiration; but they were moſt aſſuredly neither lovely, nor very ſuſceptible of tender love. Whilſt they affected to emulate the ſtern valour of *man*, they muſt have reſigned that attractive ſoftneſs in which principally conſiſts the charms and weakneſs of *woman*. Conſcious pride taught the German females to ſuppreſs every tender emotion that ſtood in competition with honour, and the firſt honour of the ſex has ever been that of chaſtity. The ſentiments and conduct of theſe high-ſpirited matrons may, at once, be conſidered as a cauſe, as an effect, and as a proof, of the ſingular character of the nation. Female courage, however it may be raiſed by fanaticiſm, or confirmed by habit, can be only a faint and imperfect imitation of the manly valour that diſtinguiſhes the age or country in which it may be found.

The religious ſyſtem of the ancient Germans (if the wild opinions of ſavages can deſerve that name) was dictated by their wants, their fears, and their ignorance. Like the aboriginal Britons, they adored the great viſible objects and agents of nature, the ſun and the moon, the fire and the earth; together with thoſe imaginary deities, who were ſuppoſed to preſide over the moſt intereſting occupations of human life. They were perſuaded, that, by arts of divination, they could diſcover the will of the ſuperior beings, and that human ſacrifices were the moſt precious and acceptable offering to their altars. Some applauſe has been thoughtleſsly beſtowed on the ſublime notion entertained by that people of the Deity, whom they neither confined within the walls of a temple, nor repreſented by any human figure; but when we recollect, that the Germans were unſkilled in architecture, and totally unacquainted with the art of ſculpture, we ſhall readily aſſign the true reaſon of a ſcruple which aroſe not ſo much from a ſuperiority of reaſon as from a want of ingenuity. The only temples in Germany were dark and ſolitary groves, conſecrated by the reverence of ſucceeding generations. Their ſecret gloom, the imagined reſidence of an inviſible power, by preſenting no diſtinct object of fear or worſhip, impreſſed the mind with a ſtill deeper ſenſe of religious awe; and the prieſts, rude and illiterate as they were, had been taught by experience the uſe of every artifice that could preſerve and fortify impreſſions ſo well ſuited to their intereſt and authority.

The ſame ignorance which renders barbarians incapable of conceiving or embracing the uſeful reſtraints of laws, expoſes them naked and unarmed to the blind terrors of ſuperſtition. The German prieſts, improving this favourable temper of their countrymen, had aſſumed a juriſdiction, even in temporal concerns, which the magiſtrate could not venture to exerciſe; and the haughty warrior patiently ſubmitted to the laſh of correction, when it was inflicted, not by any human power, but by the immediate order of the god of war. The defects of civil policy were ſometimes ſupplied by the interpoſition of eccleſiaſtical authority. The latter was conſtantly exerted to maintain ſilence and decency in the popular aſſemblies; and was ſometimes extended to a more enlarged concern for the national welfare. A ſolemn proceſſion was occaſionally celebrated in the preſent countries of Mecklenburgh and Pomerania. The unknown ſymbol of the Earth, covered with a thick veil, was placed on a carriage drawn by cows; and in this manner the goddeſs, whoſe common reſidence was in the iſle of Rugen, viſited ſeveral adjacent tribes of her worſhippers. During her progreſs, the ſound of war was huſhed, quarrels were ſuſpended, arms laid aſide, and the reſtleſs Germans had an opportunity of taſting the bleſſings of peace and harmony. The *truce of God*, ſo often and ſo ineffectually proclaimed by the clergy

clergy of the eleventh century, was probably an imitation of this ancient cuſtom.

But the influence of religion was far more powerful to inflame, than to moderate, the fierce paſſions of the Germans. Intereſt and fanaticiſm often prompted its miniſters to ſanctify the moſt daring and the moſt unjuſt enterpriſes, by the approbation of Heaven, and full aſſurances of ſucceſs. The conſecrated ſtandards, long revered in the groves of ſuperſtition, were placed in the front of the battle; and the hoſtile army was devoted with dire execrations to the gods of war and of thunder. In the faith of ſoldiers, (and ſuch as were the Germans,) cowardice is the moſt unpardonable of ſins. A brave man was the worthy favourite of their martial deities; the wretch, who had loſt his ſhield, was alike baniſhed from the religious and the civil aſſemblies of his countrymen. Some tribes of the north ſeem to have embraced the doctrine of tranſmigration, others imagined a groſs paradiſe of immortal drunkenneſs. All agreed, that a life ſpent in arms, and a glorious death in battle, were the beſt preparations for a happy futurity, either in this or in another world.

The immortality ſo ſplendidly promiſed by the prieſts, was in ſome degree conferred by the bards. That remarkable order of men has deſervedly attracted the notice of all who have attempted to inveſtigate the antiquities of the Celts, the Scandinavians, and the Germans. Their genius and character, as well as the reverence paid to their office, have been ſufficiently illuſtrated. See the article BARD, vol. ii. p. 716.—But we cannot ſo eaſily expreſs, or even conceive, the enthuſiaſm of arms and glory, which they kindled in the breaſt of their audience. Among a poliſhed people, a taſte for poetry is rather an amuſement of the fancy, than a paſſion of the ſoul. And yet, when in calm retirement we peruſe the combats deſcribed by Homer or Taſſo, we are inſenſibly ſeduced by the fiction, and feel a momentary glow of martial ardour. But how faint, how cold, is the ſenſation which a peaceful mind can receive from ſolitary ſtudy! It was in the hour of battle, or in the feaſt of victory, that the bards celebrated the glory of heroes of ancient days, the anceſtors of thoſe warlike chieftains, who liſtened with tranſport to their artleſs but animated ſtrains. The view of arms and of danger heightened the effect of the military ſong; and the paſſions which it tended to excite, the deſire of fame, and the contempt of death, were the habitual ſentiments of a German mind.

Such was the character, ſuch the manners, of the ancient Germans, when attacked by Cæſar. Their climate, their want of learning, of arts, and of laws, their notions of honour, of gallantry, and of religion, their ſenſe of freedom, impatience of peace, and thirſt of enterpriſe, all contributed to form a nation of military heroes. And yet we ſhall find, that, during more than two hundred and fifty years that elapſed from the defeat of Varus to the reign of Decius, theſe formidable barbarians made but few conſiderable attempts, and not any material impreſſion, on the luxurious and enſlaved provinces of the Roman empire. Their progreſs was checked by their want of arms and diſcipline, and their fury was diverted by the inteſtine diviſions of their own country.

It has been obſerved, and not without truth, that the command of iron ſoon gives a nation the command of gold. But the rude tribes of Germany, alike deſtitute of both thoſe valuable metals, were reduced ſlowly to acquire, by their unaſſiſted ſtrength, the poſſeſſion of the one as well as of the other. The face of a German army diſplayed their paucity of iron. Swords, and the longer kind of lances, they could ſeldom uſe. Their *frameæ* (as they called them in their own language) were long ſpears headed with a ſharp but narrow iron point, and which, as occaſion required, they either darted from a diſtance, or thruſted in cloſe onſet. With this ſpear, and with a ſhield, their cavalry was contented. A multitude of darts, thrown with incredible force, were an additional reſource of the infantry. Their military dreſs, when they wore any, was nothing more than a looſe mantle. A variety of colours was the only ornament of their wooden or oſier ſhields. Few of the chiefs were diſtinguiſhed by cuiraſſes, ſcarcely any by helmets. Though the horſes of Germany were neither beautiful, ſwift, nor practiſed in the ſkilful evolutions of the manege, yet ſeveral of the nations obtained renown by their cavalry; but, in general, the principal ſtrength of the Germans conſiſted in their infantry, which was drawn up in ſeveral wedge-formed columns, according to the diſtinction of tribes and families. Impatient of fatigue or delay, theſe half-armed warriors ruſhed on to battle with diſſonant ſhouts and diſordered ranks; and ſometimes, by the effort of native valour, prevailed over the conſtrained and more artificial bravery of diſciplined mercenaries. But as the barbarians poured forth their whole ſouls on the firſt onſet, they knew not how to rally or to retire. A repulſe was a ſure defeat; and a defeat was moſt commonly attended with total deſtruction.

About the year 55 before Chriſt, Cæſar having ſubdued Belgic Gaul, haſtened to oppoſe the Uſipetes and Tenctheri, who had been driven out of Germany by the Suevi, and croſſed the Rhine, with a deſign to ſettle in Gaul. As ſoon as Cæſar appeared, theſe Germans ſent him a deputation, offering to join him, provided he would aſſign them lands. Cæſar replied, that there was no room for them in Gaul; upon which they fell upon ſome Roman ſquadrons, and cut them in pieces. This ſo provoked Cæſar, that he immediately marched againſt them, and purſuing them to the conflux of the Rhine and the Maeſe, the battle raged with ſuch fury, that almoſt forty thouſand of the Germans are ſaid to have periſhed. After this, Cæſar being reſolved to ſpread the terror of the Roman name through Germany, built a bridge over the Rhine, and entered their country. In this expedition, however, he performed no remarkable exploit. A little before his death, he had projected the conqueſt of Germany; but his aſſaſſination prevented the execution of his deſign.

Soon after this event, the Rhæti of Germany invaded the Roman territory, and committed the greateſt devaſtations. Againſt them was ſent Druſus, who found means to bring them to a battle; in which the Romans proved victorious, and cut in pieces great numbers of the enemy. Thoſe who eſcaped the general ſlaughter, being joined by the Vindelici, took their route towards Gaul, with a deſign to invade that province. But Auguſtus, upon the firſt notice of their march, diſpatched againſt them Tiberius, who was no leſs ſucceſsful than Druſus, in having given them a total overthrow. Thus were the Vindelici, the Rhæti, and Norici, three of the nations in ancient Germany, ſubdued. Tiberius, to keep the conquered countries in awe, planted two colonies in Vindelicia, and opened from thence a road into Rhætia and Noricum. One of the cities which he built for the defence of his colonies, he called, from his father Druſus, *Druſomagus*; the other by the name of Auguſtus, *Auguſta Vindelicorum*; which are now known by the names of *Mimminghen* and *Augsburg*.

In the mean time Druſus prepared to attack the Germans who dwelt beyond the Rhine. They had previouſly collected a moſt formidable army, with which they were advancing towards the Rhine, in order to invade Gaul. But Druſus defeated them as they attempted to croſs that river; and, purſuing his advantage, he overthrew them in a great battle, and following the courſe of the Rhine, approached the German ocean, reducing the Friſii and the Chauci between the Ems and the Elbe. After this ſucceſs, Druſus built two forts to keep the conquered countries in awe; the one at the confluence of the Lippe and the Alme, the other in the country of the

the Catti on the Rhine. On this occaſion alſo he made a canal, called after his name, *Foſſa Druſiana*, to convey the waters of the Rhine into the Sala or Sale. It extended eight miles; and was very convenient for conveying the Roman troops by water to the countries of the Friſii and Chauci, which was the object of the undertaking.

After the death of Druſus, Tiberius over-ran all thoſe countries which Druſus had conquered the preceding ſummer; and carried on, in a languid manner, a predatory war for upwards of eighteen years. During this period, ſome of the German nations had quitted their foreſts, and begun to live in a civilized manner under the protection of the Roman laws; but Quintilius Varus being now ſent to command the Roman forces, he ſo provoked the inhabitants by his extortions, that not only thoſe who ſtill held out refuſed to ſubmit, but even the nations that had ſubmitted were ſeized with an anxious deſire of throwing off the yoke. Among them was a young German named *Arminius*. He was the ſon of Sigimer, one of the moſt powerful lords among the Catti, had ſerved with reputation in the Roman armies, and been honoured by Auguſtus with the privileges of a Roman citizen; but the love of his country prevailing over his gratitude, he reſolved to improve the general diſcontent, to deliver his country from the bondage of a foreign dominion. In order to put Varus off his guard, he adviſed him to ſhow himſelf amicably to the inhabitants of the diſtant provinces, which, he ſaid, would more effectually ſubdue them than the perils of the Roman ſword. As Varus was a man of a peaceable temper, he readily conſented to this propoſal; and, leaving the neighbourhood of the Rhine, marched into the country of the Cheruſci. Upon which Arminius and the Germans roſe up in arms, and prepared to drive the invaders from the utmoſt boundaries of their country. On the firſt news of this revolt, Varus turned againſt the enemy with three legions and ſix cohorts; but being attacked by the Germans as he defiled through a wood, his army was totally cut off, while he himſelf and moſt of his officers fell by their own hands.

About the year 15 of the Chriſtian era, Germanicus the ſon of Druſus, ſo named on account of his exploits in Germany, entered that country with a powerful army, and commenced an arduous and bloody war with Arminius. Having built with great diſpatch, during the winter, one thouſand veſſels of different ſorts, he ordered them, early in the ſpring of the year 16, to fall down the Rhine, and appointed the iſland of the Batavians for the general rendezvous of his forces. Here the fleet arrived, and the proviſions and warlike engines were put on-board, and the whole army being embarked, the fleet entered the canal formerly cut by Druſus. Hence he ſailed to the mouth of the Ems; where, having landed his troops, he marched directly to the Weſer, where he found Arminius encamped on the oppoſite bank, ready to diſpute his paſſage. The next day Arminius drew out his troops in order of battle: but Germanicus, not thinking it adviſable to attack them, ordered the horſe to ford over under the command of Stertinius and Emilius; who, to divide the enemy's forces, croſſed the river in two different places. At the ſame time Cariovalda, the leader of the Batavian auxiliaries, croſſed the river where it was moſt rapid: but, being drawn into an ambuſcade, he was killed, together with moſt of the Batavian nobility; and the reſt would have been totally cut off, had not Stertinius and Emilius haſtened to their aſſiſtance. Germanicus in the mean time paſſed his main army over the river without moleſtation. A battle enſued, in which the Germans were defeated with ſo great a ſlaughter, that the ground was covered with arms and dead bodies for more than ten miles round. In memory of this ſignal victory Germanicus raiſed a mount, upon which he placed as trophies the arms of the enemy, and inſcribed underneath the names of the conquered nations. After this victory he returned to Rome, was honoured with a triumph, and took the ſurname of *Germanicus* Cæſar.

From this time partial invaſions, and predatory wars, were frequently carried on, in which the Germans loſt an incredible number of their troops, and the Romans gained nothing but hard blows, and very little glory. At length the gallant Probus, purſuing his Gaulic victories, paſſed the Rhine into Germany, A. D. 277, and diſplayed his invincible eagles on the banks of the Elbe and the Necker. He was fully convinced, that nothing could reconcile the minds of the Germans to peace, unleſs they experienced in their own country the calamities of war. Germany, having been exhauſted by repeated emigration, was as much unprepared for his attack, as aſtoniſhed by his preſence. Nine of the moſt conſiderable princes repaired to his camp, and fell proſtrate at his feet; and ſuch a treaty was gladly received by the Germans, as it pleaſed the conqueror to dictate. He exacted a ſtrict reſtitution of the effects and captives which in their predatory wars they had carried away from the provinces; and obliged their own magiſtrates to puniſh the more obſtinate ſoldiers, who preſumed to detain any part of the ſpoil. A conſiderable tribute of corn, cattle, and horſes, was at the ſame time reſerved for the uſe of the garriſons which Probus eſtabliſhed on the limits of their territory. He even entertained ſome thoughts of compelling the Germans to relinquiſh the exerciſe of arms, and to truſt entirely to the juſtice and power of Rome. To accompliſh theſe ends, the conſtant reſidence of an imperial governor, ſupported by a numerous army, would have been requiſite. Probus therefore judged it more expedient to defer the execution of ſo great a deſign; which was indeed rather of ſpecious than ſolid utility. Inſtead, therefore, of reducing the warlike natives of Germany to the condition of ſubjects, Probus contented himſelf with the humble expedient of raiſing a bulwark againſt their inroads. The country, which afterwards formed the circle of Swabia, had been left deſert in the age of Auguſtus, by the emigration of its ancient inhabitants. The fertility of the ſoil ſoon attracted a new colony from the adjacent provinces of Gaul. Crowds of adventurers, of a roving temper and of deſperate fortunes, occupied the doubtful poſſeſſion, and acknowledged, by the payment of tythes, the majeſty of the Roman empire. To protect theſe new ſubjects, a line of frontier garriſons was gradually extended from the Rhine to the Danube. About the reign of Adrian, when that mode of defence began to be practiſed, theſe garriſons were connected and covered by a ſtrong intrenchment of trees and paliſades. In the place of ſo rude a bulwark, the emperor Probus conſtructed a ſtone-wall of a conſiderable height, and ſtrengthened it by towers at convenient diſtances. From the neighbourhood of Newſtadt and Ratiſbon on the Danube, it ſtretched acroſs hills, valleys, rivers, and moraſſes, as far as Wimpfen on the Necker, and at length terminated on the banks of the Rhine, after a winding courſe of near two hundred miles. This important barrier, uniting the two grand ſtreams that protected the provinces of Europe, ſeemed to fill up the vacant ſpace through which the barbarians, and particularly the Alemanni, could penetrate with the greateſt facility into the heart of the empire. But the experience of the world, from China to Britain, has expoſed the vain attempt of fortifying any extenſive tract of country. An active enemy, who can ſelect and vary his points of attack, muſt, in the end, diſcover ſome feeble ſpot, or ſome unguarded moment. The ſtrength, as well as the attention, of the defenders is divided; and ſuch are the blind effects of terror on the firmeſt troops, that a line once broken in a ſingle place, is almoſt inſtantly deſerted. The fate of the wall which Probus erected, may confirm the general obſervation. Within a few years after his death, it was overthrown by the Alemanni. Its

ſcattered

ſcattered ruins, aſcribed by the natives to the power of the *dæmon*, now ſerve only to excite the wonder of the Swabian peaſants.

Marcus Aurelius was the next among the Roman emperors who meditated the conqueſt of Germany, and whoſe numerous legions menaced its armies with approaching deſtruction. His great deſigns were cut ſhort by his death; after which the Germanic nations became every day more and more formidable to the Romans. Far from being able to invade and attempt the further conqueſt of theſe northern countries, the Romans had now the greateſt difficulty to repreſs the incurſions of their armies, which threatened Rome itſelf. The immediate deſtroyers of the Roman empire were the Heruli; who, under their leader Odoacer, dethroned Auguſtulus the laſt Roman emperor, and proclaimed Odoacer king of Italy, A. D. 476. The Heruli were ſoon expelled by the Oſtrogoths; and theſe in their turn were ſubdued by Juſtinian, who re-annexed Italy to the eaſtern empire. But the popes found means to obtain the temporal as well as ſpiritual juriſdiction over a conſiderable part of the country, while the Lombards ſubdued the reſt. Theſe laſt proved very troubleſome to the popes, and at length beſieged Adrian I. in his capital. In this diſtreſs he applied to *Charles the Great*, king of France; who conquered both Italy and Germany, and was crowned emperor of the weſt in the year 800.—See the articles FRANCE and ROME.

Charlemagne, or Charles the Great, was the firſt who united the warlike ſtates of Germany under the ſame ſceptre. The Alemanni, ſo formidable to the Romans, became the faithful vaſſals of Charlemagne; and their country was inſcribed within the modern limits of Alſace, Swabia, and Swiſſerland. The Bavarians, with a liberal indulgence of their laws and manners, were leſs patient of a maſter: but the north of Germany, from the Rhine and beyond the Elbe, ſtill remained hoſtile and pagan; nor was it till after a war of thirty-three years, that the Saxons bowed under the yoke of Charlemagne. The idols and their worſhip were extirpated: the foundation of eight biſhoprics, of Munſter, Oſnaburgh, Paderborn, and Minden, of Bremen, Verden, Hildeſheim, and Halberſtadt, define, on either ſide of the Weſer, the bounds of ancient Saxony; theſe epiſcopal ſeats conſtituted the firſt ſchools and cities of that ſavage land. Beyond the Elbe, the *Slavi*, or Sclavonians, overſpread the modern dominions of Pruſſia, Poland, and Bohemia. The conqueſt or converſion of the two former countries, is of a more recent age; but the firſt union of Bohemia with the Germanic body may be juſtly aſcribed to the arms of Charlemagne, the firſt conqueror of the invincible nations of Germany; which, with his reſtoration of the weſtern empire, forms a grand epocha in the chronology of the world.

Charlemagne, and his poſterity, continued to reign over the Germanic empire until the extinction of the Carlovingian race. Louis *le Debonaire*, king of France and emperor of Germany, the ſon and ſucceſſor of Charlemagne, dividing at his death his immenſe territories among his children, Germany was made the portion of his ſon Louis, who thence received the name of "Louis the German," and was crowned *king* of that country, by the title of Louis II. his father, *le Debonaire*, having been conſidered as Louis I. In 870, this prince reduced half of the Lotharingian kingdom under his ſubjection; and his ſon, Louis III. ſurnamed the Younger, nine years after, reduced the other half. Louis the Younger ſharing his paternal kingdom with his two other brothers, Carlman was made king of Bavaria, Louis of Eaſt Franconia, and Charles the Fat of Alemannia; but the latter, ſurviving both his brothers, not only inherited their kingdoms, but obtained all Italy and France; yet governed in ſo injudicious a manner, that in 887 he was depoſed by the German ſtates, who conſtituted Arnulph, Carlman's natural ſon, king of Germany. This prince defeated the Normans, who had made great devaſtations in Germany; and, by the aſſiſtance of the Huns, ſubdued the Bohemians. To him ſucceeded his ſon Louis IV. ſurnamed the Child; at whoſe death, in 911, the race of Charlemagne became extinct. The affairs of Germany under the government of theſe kings, are already recorded under the article FRANCE, vol. vii. p. 654–661, to which the reader is referred. When the empire raiſed by Charlemagne had thus fallen away, the different princes of the ſtates of Germany aſſumed the right of election, and gave a new and ſingular turn to their own importance, as well as to the pretenſions of their ſovereign, totally unwarranted by any precedent or example in the annals of other countries. Thus, while in the other kingdoms of Europe, the dignity of the great lords, who were all originally allodial or independent barons, was diminiſhed by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raiſed upon the ruins of the emperor's ſupremacy, and of the people's juriſdiction; from which remote period, the right of the *electors* has been recognized and employed without interruption, until the recent ſubjugation of Germany by Napoleon emperor of France.

FROM THE EXTINCTION OF THE POSTERITY OF CHARLEMAGNE, TO THE ELECTION OF RODOLPHUS I. FOUNDER OF THE AUSTRIAN DYNASTY.

After the death of Louis IV. the laſt *king* of Germany, the princes of the empire aſſembled at the place now called Worms, and offered the imperial diadem to Otho duke of Saxony; but being unwilling to accept a dignity for which his advanced age rendered him unfit, he requeſted that they would apply their invitation to Conrad duke of Franconia, whom he knew to be a prince of merit and capacity, and who was deſcended from Louis I. Conrad therefore was unanimouſly elected to fill the German throne, by the title of *emperor*, A. D. 912; and he immediately took the neceſſary precautions to eſtabliſh and ſupport his authority. Underſtanding that his preſence was neceſſary to quell ſome diſcontents in Lorrain, he marched thither with great expedition; and, by ſeveral popular acts, conciliated the eſteem and affection of the natives. He then perſuaded the duke of Saxony, who had aſſembled a powerful army, to ſuſpend his intended hoſtilities; and cruſhed three alarming rebellions, which were ſucceſſively raiſed againſt him. The Hungarians, however, made a ſanguinary irruption into his dominions, and, after marking their progreſs with fire and ſword, compelled Conrad to purchaſe a peace upon very diſadvantageous terms: but, notwithſtanding all the exertions of his enemies, he retained the ſceptre, and conducted the affairs of the empire with proſperity and prudence till the time of his death. Perceiving at length his approaching diſſolution, he convened the princes and ſtates of the empire, and ſeriouſly exhorted them to raiſe Henry duke of Saxony, and ſon of Otho, to the imperial throne; although that nobleman had inſulted him by open rebellion, and had made an attempt upon his life by means of a poiſoned bracelet. Thus he nobly ſacrificed his reſentment to the public intereſt, and ſent the crown, ſceptre, and imperial regalia, to his intended ſucceſſor. Conrad I. then expired, after a virtuous and patriotic reign of ſeven years.

Early in the enſuing year, 919, the dukes of Bavaria, Franconia, and Swabia, with the heads of other ſtates of Germany, aſſembled at the place now called Fritzlar, and beſtowed the imperial dignity upon Henry duke of Saxony, whom hiſtorians have diſtinguiſhed by the epithet of the *Fowler*, on account of his predilection for that amuſement. This prince had no ſooner aſſumed the reins of government, than he prudently laboured to promote

promote a general reconciliation among the princes of the empire. His exertions for this purpoſe were crowned with ſucceſs: they unanimouſly reſolved to ſupport his intereſts, and acted with ſuch extraordinary gallantry in his defence, that a numerous army of Hungarian invaders were repulſed with prodigious ſlaughter; the Vandals alſo, who had made an inroad into the empire, were almoſt exterminated on the coaſts of the Baltic; and the Dalmatians, Bohemians, Abotrites, and Sclavonians, were compelled to lay down their arms. His greateſt ſtruggle was with the Thuringians, with whom he at length concluded a truce. Charles the Simple he drove from the banks of the Rhine; and, after ſome conferences, the two princes concluded the treaty called *Pactum Bonneſe*, which conſtitutes a famous epoch in hiſtory. An aſſembly, compoſed of ſeveral French and German prelates, was held ſoon afterwards at the place now called Coblentz, where this treaty was confirmed; and, among other regulations, it was enacted that no layman ſhould receive tythes, which were entirely eccleſiaſtic, and that no marriage ſhould be ſolemnized between relations within the ſixth degree of conſanguinity.

Henry now turned his attention to the regulation and improvement of his dominions. Accordingly he publiſhed a general amneſty in favour of the robbers and banditti, with which deſcription of men every part of Germany at that time abounded, and he actually perſuaded them to engage in the ſervice of their country. He alſo took excellent precautions for the eſtabliſhment and regular ſupply of magazines of corn, that the inhabitants might never be diſtreſſed by a ſcarcity of proviſions. Nor were the exertions of this prince confined to the diſcharge of his imperial duties; but his zeal induced him to undertake the propagation of the Chriſtian religion; and, after appointing the firſt biſhop in Holſtein to declare the glad tidings of the goſpel to the recently ſubdued Vandals, he had the ſatisfaction to witneſs, in the year 927, the converſion of the king of the Abotrites, whoſe territories bordered upon Bulgaria, in that part of Dacia contiguous to the Danube. Henry now received a preſſing invitation into Italy, to receive the holy unction from the hands of the pope. This induced him to undertake that journey; but, being ſeized with an apoplexy on the road, he was compelled to return to the place now called Manſleben, where, with the conſent of the ſtates, he ſettled the ſucceſſion on his ſon Otho, and expired in the ſixtieth year of his age, and the ſeventeenth of his reign.

It was reſerved for the emperor Henry I. to re-eſtabliſh the authority of the imperial crown, which had ſuffered a great decline. To preſerve the connection of Bavaria with the empire, after the introduction of Chriſtianity, he made a ſacrifice, in granting to the dukes of that country the authority over the biſhops of it, which was conſidered as a part of the royal power. Whether this was deſigned merely as a perſonal prerogative conferred on the then duke, or intended for all the ſucceeding dukes of Bavaria, is a queſtion which is ſtill diſputed, particularly by the Bavarian and Salzburg writers. The union which had been formed between Lorrain and Germany, in the years 923 and 935, was now reſtored, by more than one treaty with the king of France, to its former ſtate.

"We are principally indebted (ſays the learned Pütter) to this reign for the change which took place in the interior parts of Germany, by drawing the inhabitants from the woods, and laying the foundation of the German towns. Before this period, excepting the caſtles on the mountains, the ſeats of the nobility, and convents which happened to be ſurrounded with walls, there were only lonely farms and villages. A few people might poſſibly have erected ſome houſes in the neighbourhood of a caſtle or church; but all theſe places were open and defenceleſs.

"The mournful experience, that ſo few were able, in ſuch ſituations, to make effectual proviſion againſt the increaſing diſtreſs occaſioned by the incurſions of foreign nations, firſt ſuggeſted the idea to Henry, that it would be more conducive to the public ſecurity if there were towns ſurrounded with walls, with towers and gates; and not only large enough to contain a greater number of inhabitants, but capable of affording protection to their effects, and thoſe of their neighbours who might take refuge there in times of neceſſity. Any other motives than thoſe of neceſſity would have availed but little to diveſt the people of their averſion to live in towns; but the experience of other advantages which this inſtitution produced, ſoon taught them to change their opinion; and of courſe therefore the number of towns continually increaſed.

"But how was it poſſible to accompliſh this innovation at firſt? The method which Henry adopted was, that every ninth man ſhould remove from the country, and ſettle in the towns, and that all public meetings ſhould be held there; a plan which certainly merits the higheſt approbation. We have no particular account of any other regulation which might have been made, to encourage the population of the towns, and promote their trade; much leſs are we acquainted with the number and ſituation of the particular towns then founded. It is probable that many of them owed their origin to buildings which happened to be already in the neighbourhood of epiſcopal churches and cloiſters, or elſe adjoining caſtles which were ſurrounded by extenſive walls. The diviſion of the ſtreets muſt naturally have depended upon accident, by one houſe by degrees being added to another. Even where the towns were built entirely from the ground, one cannot be ſurprized that there was ſo little regularity obſerved, and ſo little application of that refined policy which we imagine to be requiſite in a town at preſent; partly as this event relates to an age of the groſſeſt ignorance, and partly becauſe there was only the ſhort period of nine years, during which Henry had made a truce with the Thuringians, allotted for the purpoſe. In ſuch circumſtances it is rather a wonder that ſo much was performed, and that a nation which was before ſo exceedingly averſe to this mode of living, could ſo ſoon be prevailed upon to reſide in towns. But the greateſt proof of this having really been the caſe was, that, after the dangers which they were expoſed to from the Thuringians were over, their number continually increaſed in the towns.

"With reſpect to the manner of life of the inhabitants of theſe new towns, and amongſt other things the particular diſtinction of rank which prevailed, we muſt not form our ideas of them from the ſtate of our modern towns. Every one of the original inhabitants knew what rank he was of, and whether he was free or not. In the firſt generation, it is probable that the people ſeldom married perſons of any other rank than their own. At that time, the mere abode in a town was not a ſufficient reaſon for conſtituting a particular rank or order of men; and this is the cauſe that even in the preſent day there are noble families in many ancient cities, who have preſerved their rank from time immemorial. It was not till ſeveral generations afterwards that the inhabitants of cities, whoſe anceſtors were freemen, no longer ſcrupled to intermarry with perſons whoſe wealth and perſonal accompliſhments made them willingly forget that their anceſtors perhaps were originally ſlaves, or came firſt into the town in the capacity of menial ſervants.

"In the ſame manner, likewiſe, the averſion which the people in general had to merchandiſe and mechanical employments, was by degrees deſtroyed. Thoſe indeed who continued to keep up their houſes in the old ſtyle in the country, ſoon laid claim to precedency, becauſe they ſtill complied with the cuſtoms of their anceſtors, by principally occupying themſelves in the chaſe and

and the war, and trading only in the produce of their lands and cattle. Theſe likewiſe were the only perſons who were appointed to the offices of the court, and performed the feudal duties, which the inhabitants of the towns were wholly excluded from. At laſt people were required to produce proof of the noble deſcent both of their paternal and maternal anceſtors, in religious foundations, and at tournaments. Hence we may conceive how the few people of the country, whoſe liberty and birth otherwiſe entitled them to no ſuperiority over the inhabitants of towns, who were originally equally free, in a few centuries conſidered themſelves of a diſtinct rank from the burghers, and endeavoured to emulate the rank of thoſe independent families which had hitherto conſtituted the real nobility of Germany; though an eſſential difference has been always preſerved between this order of high nobility, and thoſe free families which conſtitute at preſent what is called the inferior nobility. On the other ſide, the burghers, by virtue of the freedom which they originally inherited from their anceſtors, or elſe by obtaining their burgherſhip, or freedom of the town, remained as eſſentially diſtinct from the order of peaſants, who were ſtill either in a ſtate of ſlavery, or elſe groaned under the grievous hardſhips of villanage, and impoſts on their property. This was the origin of the four diſtinct ranks of people ſtill exiſting in Germany. The high nobility, conſiſting of princes, counts, and barons; the inferior nobility, who had anciently no other pretenſion to ſuperiority than their mere enjoyment of freedom; the order of burghers, or freemen of towns; and, laſtly, the peaſants.

"The cotemporary writer, to whom we are indebted for the account of the towns founded by the emperor Henry I. ſpeaking of the manner adopted to people them, by means of taking every ninth man from the country, makes uſe of an expreſſion, which ſome interpret as if the firſt inhabitants of the German towns had been only peaſants: but he expreſsly ſays, *milites agrarios*, which, according to the language of the ſucceeding times, muſt be tranſlated "country knights," or warriors who lived on their eſtates. The addition of the word *agrarius* was probably intended to diſtinguiſh ſuch knights or freeholders from thoſe who were obliged to perform military ſervice as vaſſals in the field, or elſe garriſon duty in the caſtles, or the offices of the court as miniſters, juſt as at preſent the country gentlemen, *landjunkers*, are diſtinguiſhed from thoſe noblemen who are in offices at court, or in the army."—See Dornford's Tranſlation of Pütter's German Empire.

Purſuant to the dying requeſt of Henry I. his ſon Otho, ſurnamed the Great, was elected emperor at Aix-la-Chapelle, A.D. 936. The ceremonial of his election is thus recorded: The eccleſiaſtical and ſecular princes, having taken the oath of allegiance, conducted him to the great church, where he was met by the archbiſhop of Mentz and the diocefan, in their pontificals, aſſiſted by other biſhops and clergymen. On his advancing into the church, the prelate addreſſed the congregation to this effect:—"I preſent the imperial crown unto Otho, choſen of God, formerly nominated to the empire by his reverend father, and now elected into that ſupreme ſtation by the princes here aſſembled. If this election be agreeable to you, hold up your hands in token of approbation." This addreſs was received with unbounded applauſe; and Otho was conducted to the high altar. The archbiſhop then girded on the emperor's ſword, ſaying: "Receive this ſword, and uſe it againſt the enemies of Jeſus Chriſt; and employ the power of the empire, which God hath put into your hands, to preſerve and confirm the welfare of the church." Then, putting on the imperial mantle, "Remember, (continued he,) with what fidelity and fortitude you are obliged to maintain peace and tranquillity to the end of your life." Laſtly, preſenting the mace and ſceptre, he added, "Warned by theſe emblems, inflict no other than paternal chaſtiſement upon your ſubjects; extend your mercy to the miniſters of God, to the widow and the orphan; and let the balm of your pity never ceaſe to flow, that with your diadem in this life you may acquire an unfading one in that which is to come." After this ſolemn exhortation, Otho received the imperial crown from the hands of the archbiſhop; and on his return to the palace a magnificent feaſt was ſerved up, which terminated the ceremony.

The commencement of Otho's reign was marked by profound tranquillity; but an irruption of the Hungarians, ſome ſucceſſes of the Bohemians under their duke Boleſlaus, and a revolt in the province of Bavaria, ſoon alarmed the emperor, and called his army into action. After ſome time, however, the invaders were defeated; Boleſlaus was compelled to ſubmit to his powerful opponents; and Bavaria was reduced to obedience. The emperor now marched into France, in order to ſupport Louis againſt his formidable enemy Hugh the Great. Upon this occaſion he made ſome noble exertions, and acquired much military renown.

Having, in 950, made a ſucceſsful expedition againſt the Danes, and employed his mediation in terminating the troubles of France, Otho eſpouſed Alix, widow of Lotharius king of Italy; and gained a deciſive conqueſt over Beranger, who had recently perſecuted and ſtripped her of her dominions. Shortly after the marriage, Otho's ſon, Ludolphus, engaged in a treaſonable confederacy with Conrad duke of Franconia, and ſeveral other German noblemen. This unnatural revolt produced ſome ſerious hoſtilities, and occaſioned the deſtruction of the city of Ratiſbon: but, after ſome time, the prince was made ſenſible of his error, and took an opportunity, while his father was hunting, to throw himſelf at his feet, and implore his clemency: "Have pity (ſaid he) upon your miſguided child, who returns like the prodigal ſon to his father. If you permit him to live after he has deſerved death, he will aſſuredly repent of his ingratitude, and the reſidue of his life ſhall be marked by exemplary obedience." To this affecting appeal Otho could only reply by a paternal embrace; but when his agitations ſubſided, he aſſured the penitent of his warmeſt favour, and generouſly pardoned all his adherents. The bitter reproaches, however, which Ludolphus received from the Italians, in his ſubſequent expedition againſt Beranger, overwhelmed him with inſupportable diſtreſs, and brought him to an untimely grave.

At the earneſt ſolicitation of the Italians, Otho repaired in perſon to Rome, where he was ſolemnly crowned emperor of the Romans, dignified with the appellation of Auguſtus, and honoured with the homage of the ſenate and people, who unanimouſly ſwore obedience to him as their lawful ſovereign. Yet, notwithſtanding the exterior marks of reſpect which he received upon this occaſion, Otho had ſcarcely withdrawn his army, before pope John introduced Albert the ſon of Beranger into the city, and endeavoured to excite the fears of the populace, by aſſerting that the lands of the church were in danger. The emperor, however, returned with ſuch ſpeed to Rome, that the treacherous pontiff and his new patron conſulted their ſafety by flight; and a council was convened, which, after a mature examination of John's licentious conduct, ſolemnly depoſed him, and elected Leo VIII. to fill the papal chair. This pontiff executed a decree by which Otho was recogniſed emperor of the Romans and king of Italy, with all the rights and prerogatives to him and his ſucceſſors which pope Adrian I. had granted to Charlemagne; ſo that from this period, Otho may be juſtly ſtyled Emperor of the Romans.

Having judiciouſly regulated the affairs of the ſtate, the emperor cauſed his ſon Otho to be crowned as his aſſociate in the empire. He then made a tour through

the cities of Italy, and acquired a conſiderable degree of popularity by confirming the donations of Pepin and Charlemagne. During Otho's reſidence at Capua, he received an embaſſy from Nicephorus Phocas, emperor of Conſtantinople, who profeſſed a deſire of renewing the alliance which formerly ſubſiſted between the eaſtern and weſtern empires. Otho returned a polite anſwer to the Greek emperor, and ſignified his aſſent to a match which had been propoſed between his own ſon Otho and the princeſs Theophania. But Nicephorus was ſo highly incenſed at the refuſal of ſome other demands, that he reſolved to take a cruel revenge; and, accordingly, when the German ambaſſadors were ſent to fetch his daughter, he cauſed both them and their attendants to be maſſacred. This enormity, however, was ſoon puniſhed by an imperial army, under counts Gonther and Sigifrid; and, on the ſubſequent aſſaſſination of Nicephorus, the princeſs Theophania was ſent, with a magnificent train, into Italy, where her marriage with the emperor's ſon was immediately ſolemnized.

In 972, about two years after this event, the emperor died, at the city of Minleben in Saxony, after an active reign of thirty years, during which he gave ſome extraordinary proofs of piety, courage, and generoſity, and juſtly acquired the epithet of *Great*. His conſort Alix retired into a convent immediately after his deceaſe; and his remains were interred with due ſolemnity in the cathedral church of Magdebourg, where his tomb may ſtill be diſtinguiſhed by a Latin inſcription.

Otho II. ſurnamed the Sanguinary, ſucceeded his father on the imperial throne: but his authority was warmly diſputed by Henry duke of Bavaria; and the commencement of his reign was diſturbed by ſome hoſtile incurſions of the Danes and Bohemians. After ſome time, however, the rebellious duke was ſubdued, and baniſhed to Utrecht; and the invaders were compelled to agree to a very diſadvantageous peace. But no ſooner were theſe commotions appeaſed, than Otho found himſelf involved in a troubleſome war with Lothaire king of France. That monarch had revived his pretenſions to the ſovereignty of Lorrain, and granted his protection to the two ſons of Ranier, count of Hainault, who had been deprived of his dominions during the reign of the late emperor. Otho attempted to appeaſe the French king by ſome important conceſſions; but this proving unſucceſsful, he aſſembled an army of ſixty thouſand men, made an irruption into the enemy's country, and committed ſuch dreadful ravages, that he ſoon obtained peace upon his own terms. In this expedition, however, he was expoſed to imminent danger by an inundation of the river Aiſne, which deſtroyed a conſiderable part of his army.

After devoting ſome time to the arrangement of his affairs in Germany, he led a numerous body of forces into Italy, A. D. 979, in order to puniſh a revolt of the Romans, and to recover Apulia and Calabria, which had been taken by the Greeks and Saracens. He accordingly entered Rome without oppoſition, and ſoon afterward hazarded a battle with the enemy; when his army was utterly defeated, and he was reduced to the neceſſity of committing himſelf to the mercy of the waves in a ſolitary veſſel. This ſhip being taken by corſairs, who were totally ignorant of his quality, he was carried into Sicily; but on the payment of a large ſum of money, he obtained his freedom. Soon after this event he renewed the war with increaſed vigour, and his exertions were attended with ſuch ſignal ſucceſs, that the Saracens in Italy were utterly exterminated, in 980. He then chaſtiſed the puſillanimous troops who had deſerted him in his former engagement; gave up the town of Beneventum to military execution, for having furniſhed his enemies with proviſions; and revenged himſelf for the defection of the Romans, by cauſing many of the principal citizens to be maſſacred at a banquet. This action, ſo totally unworthy of a Chriſtian prince, was the occaſion of his being branded with the epithet of Sanguinary. In 983, the emperor died at Rome, of a bloody flux, ſaid to be occaſioned by the wound of a poiſoned javelin, received in his war with the Greeks. Some hiſtorians however have aſſerted, that his death was haſtened by the imprudent behaviour of his empreſs Theophania, who publicly exulted in the victory of her countrymen, though it was obtained over her own huſband.

Otho III. was but twelve years of age when he ſucceeded his father in the empire, for which reaſon he was ſurnamed the Infant; but this appellation was ſoon laid aſide, and he acquired the epithet of Rufus. The commencement of his reign was diſturbed by ſome hoſtile incurſions of the Danes and Sclavonians; but they were repulſed in ſeveral inſtances, and the imperial arms were decidedly victorious. The emperor, having attained the age of diſcretion, made a progreſs, A. D. 988, through the different provinces of the empire, enacted ſome excellent regulations for the welfare and civilization of his ſubjects, and confirmed the eccleſiaſtics in the enjoyment of many valuable privileges. At the ſame time the Saxons repulſed a freſh irruption of the Danes; and Eric king of Sweden ſoon afterward annexed Denmark to his hereditary dominions. Otho, being apprifed of this circumſtance, thought it adviſable to court the friendſhip of his powerful neighbour; and a treaty was concluded by the two princes, which authoriſed the German miſſionaries to preach the goſpel in the dominions of Eric, and promiſed future ſecurity to the inhabitants of the empire.

A revolt being now excited by Creſcentius, the emperor marched with a numerous army into Italy, and took poſſeſſion of Milan, where he was crowned king of Lombardy. He then repaired to Ravenna, and raiſed his relation Bruno to the papal chair, which had become vacant by the demiſe of John XV. The new pontiff aſſumed the name of Gregory V. and, on the firſt convenient opportunity, expreſſed his gratitude to his powerful patron, by crowning him king of the Romans.

Having reſtored the public tranquillity in Capua and Beneventum, and extended his pardon to the turbulent Creſcentius, Otho ſet out on his return to Germany, taking his route through the principal towns of Lombardy. On his arrival at Modena, he gave a ſtriking proof of his love of juſtice, by his conduct towards the empreſs Mary, daughter of the king of Arragon. That princeſs, exaſperated at the coldneſs of an Italian count to whom ſhe had made ſome amorous advances, accuſed him of having inſulted her by an attempt upon her honour. In conſequence of this charge, the unfortunate nobleman was tried, and ſentenced to loſe his head; but, as his innocence was clearly proved after his execution, the vile calumniatreſs was ordered to be burnt alive, and the emperor devoted a large ſum of money to the benefit of the nobleman's widow.

Otho next made a tour through the towns of Upper Saxony; and thence proceeded to Poland, which he created into a kingdom, at the requeſt of duke Boleſlaus, who conſented to hold his dominions as a fief of the empire. Shortly after this event, Otho was called into Italy to repel an invaſion of the Saracens, and to cruſh a freſh revolt of the turbulent Romans. His exertions againſt the Saracens were attended with complete ſucceſs; but the Romans openly refuſed to ſubmit to his authority; and while he was aſſembling an army to revenge this inſult, he was poiſoned by a widow, whom he is ſaid to have ſeduced under a promiſe of marriage. The Germanic empire ſuſtained a heavy loſs by the death of this prince; for he was equally famed on account of his munificence to the church, his valour in defending his dominions, and his equity in redreſſing the wrongs of his ſubjects. He died at Paterno, in the

OTHO I. EMPEROR OF GERMANY.

London, Published as the Act directs Sep.r 27 th 1806, by J Wilkes

thirtieth year of his age and the nineteenth of his reign, A. D. 1002. He fixed upon Aix-la-Chapelle, in his laſt moments, as the place of his ſepulture.

As Otho III. left no iſſue, three competitors immediately claimed the imperial dignity; Henry duke of Bavaria, Herman duke of Swabia, and Ekkard marquis of Saxony. The pretenſions of theſe noblemen ſeem to have been nearly equal; but, by means of his ſuperior power, the duke of Bavaria triumphed over his rivals, and was ſolemnly elected and conſecrated, at Mentz, by the name of Henry II. It appears, however, that he did not obtain this ſucceſs till Ekkard was removed by aſſaſſination. Henry had no ſooner aſſumed the imperial enſigns, than he cauſed his ſurviving competitor, Herman, to be declared an enemy to the empire; and even employed the forces of Germany in ravaging his territories. Herman, on the other hand, reſolved to ſupport his pretenſions by force of arms, and boldly challenged the emperor to decide their claim by ſingle combat: but, when Henry intimated his acceptance of the challenge, Herman's courage forſook him; and he was eventually compelled to bow before the ſuperior fortune of his enemy.

In compliance with the earneſt ſolicitations of his nobles, Henry eſpouſed Cunegunda, daughter of the count of Luxembourg; and Paderborn was honoured with the celebration of the royal nuptials. He then made a tour through his provinces, deciding vexatious cauſes, re-eſtabliſhing the peace of the empire, and promoting a ſpirit of harmony among the grandees; and on his arrival at Aix-la-Chapelle, he was crowned a ſecond time, for the ſatisfaction of ſeveral of the nobles, who had objected to the informality of his firſt coronation.

At the urgent requeſt of the archbiſhop of Milan, the emperor put himſelf at the head of his troops, and marched to Pavia, where he was ſolemnly crowned king of Lombardy; but the partiſans of Hardouin, who had recently aſſumed the ſovereignty, inflamed the unthinking populace to ſuch a degree, that the whole city was thrown into commotion, the ſtreets were ſprinkled with the blood of Henry's adherents, and the emperor himſelf was obliged to retire to the fortreſs of St. Peter. The tumult, however, gradually ſubſided; and an apology of the principal inhabitants was generouſly accepted. For ſeven years after this occurrence, Henry was fully employed in chaſtiſing the inſolence of the Poles, and appeaſing the frequent troubles of Lorrain. But his mind was fatigued by his perpetual exertions, and he ardently deſired to abdicate the imperial throne, that he might devote the remainder of his life to religious retirement. Theſe ſentiments, however, were ſtrongly combated by the princes of Germany; and he was perſuaded to retain the government of a country which now required extraordinary care and attention.

Upon the concluſion of peace with Boleſlaus king of Poland, A. D. 1014, Henry led a freſh army acroſs the Alps, in order to chaſtiſe the inſolence of Hardouin, who had reaſſumed the ſupreme authority in Italy. He met and defeated his enemy on the frontiers of the Veroneſe; and was ſoon afterward crowned by pope Benedict VIII. in the city of Rome. Having at length, A. D. 1024, appeaſed the troubles which had long diſtracted his dominions, Henry reſolved to devote the remainder of his life to that repoſe which ſeems to have been the conſtant object of his heart; and in order to preſerve a good underſtanding with his neighbours, he had an interview with Robert king of France; upon which occaſion the two princes conceived a particular friendſhip for each other, and mutually concerted meaſures for the reformation and aggrandiſement of their ſubjects. This conference ſeems to have been the laſt remarkable tranſaction of Henry's life; for he died in the month of July following, after a proſperous reign of twenty-two years. He was ſurnamed the Lame, from an impediment in walking; and he received the appellation of the Hungarian Apoſtle, from his great munificence to the church. In him the male race of the Saxon emperors became extinct.

Violent diſputes now aroſe reſpecting the nomination of a ſucceſſor to the empire. At length, however, the Germanic princes and ſtates aſſembled in the open fields, between Mentz and Worms; and Conrad duke of Franconia, ſurnamed the Salic, was unanimouſly inveſted with the ſupreme authority. Conrad II. received this appellation from the circumſtance of his having been born on the banks of the river Sala. During the two firſt years of his reign, Conrad was chiefly employed in regulating the police, and other affairs of adminiſtration; but in the third, A. D. 1027, he received intelligence that the Lombards had ſhaken off their allegiance, and he was conſequently obliged to march into Italy. The rebels, however, were ſoon reduced to obedience; and the conqueror was ſolemnly crowned at Rome, by pope John XX. in preſence of Rodolph III. king of Burgundy, and Canute king of England. Soon after this event, Conrad's ſon Henry was declared his ſucceſſor, and crowned at Aix-la-Chapelle; and the dukes of Swabia, Worms, and Carinthia, who had endeavoured to excite a revolt, were, by a ſolemn decree, ſtripped of their dominions. The ſeven ſucceeding years were occupied by wars between the emperor, Poland, Bohemia, and Hungary; but as theſe offer nothing worthy of particular notice here, it is only neceſſary to obſerve, that the imperial arms were generally ſucceſsful; and that, on the demiſe of Rodolph, Conrad acquired the ſovereignty of all Transjurane Burgundy.

After chaſtiſing a revolt of the Milaneſe, and receiving the benediction of pope Benedict IX. Conrad II. died ſuddenly, at Utrecht, in the fifteenth year of his reign. He was univerſally revered as a juſt and magnanimous prince; and all thoſe who diſtinguiſhed themſelves in his ſervice had ample cauſe to applaud his munificence. Among many other inſtances of his generoſity, we are told, that a gentleman who had loſt his leg in battle, received as many peices of gold as one of his boots would contain; which the emperor remarked might defray the expence of his cure.

Henry III. ſurnamed the Black, aſcended the imperial throne on his father's deceaſe, A. D. 1040; and he immediately led a numerous army againſt Brztiſlaus duke of Bohemia, who had refuſed to pay the accuſtomed tribute. This expedition was crowned with ſucceſs; and in a ſubſequent one againſt Hungary, Henry acquired great reputation, by wreſting the ſceptre from an uſurper, and reſtoring it to the lawful prince. Henry's young ſon was now declared king of the Romans, and heir to the empire. Some freſh commotions, however, called the emperor into Italy; and an unexpected irruption of the Sclavonians took place in Saxony; which, with the public calamities of earthquakes, plague, and famine, overwhelmed his ſpirits, and finally occaſioned his death, in the thirty-ninth year of his age, and the ſixteenth of his reign. He entered twice into the conjugal ſtate; and by his ſecond empreſs, Agnes, daughter of William duke of Poitou, he had two ſons and three daughters. It muſt not be forgotten that Henry III. depoſed three popes, who had ſet up againſt each other; and he ſupported a fourth againſt them: ſince which time the vacancy of the papal chair was always intimated to the emperor, and it became an eſtabliſhed form for the emperor to ſend a deputation to Rome, requeſting that a new pope may be elected.

Henry IV. ſurnamed the Great, was acknowledged emperor on the death of his father, A. D. 1056. But as he was at this time only five years of age, he was placed under the tutelage of his mother Agnes, who acquitted herſelf of that truſt with prudence and affection. When Henry had attained the age of twenty-two, he took the reins of government into his own hands,

A. D.

A. D. 1072; and commenced his adminiſtration by reſtraining the robberies and extortions which the inhabitants of Saxony had long exerciſed upon ſtrangers, and among themſelves, to the great prejudice of the public tranquillity. In order to cruſh theſe practices, he took up his reſidence among them at Goſlar, and ordered ſeveral caſtles to be erected as a check upon the country, and a protection to the innocent ſufferers. This meaſure, however, excited a general diſcontent in the duchy, and both laymen and eccleſiaſtics accuſed him of intending the ſubverſion of their liberties.

It muſt indeed be acknowledged that the violence of Henry's paſſions often hurried him into indiſcretions, which fixed an indelible ſtain upon his character, and induced his moſt powerful adherents to abandon his intereſts. His incontinence, in particular, was ſo great, that he endeavoured to ſacrifice every beautiful female to his unlawful deſires; and he was ſo highly exaſperated at his empreſs for attempting to obſtruct theſe licentious amours, that he earneſtly ſolicited the pope to diſſolve his marriage, and even authoriſed one of his courtiers to attempt her honour, that he might obtain a divorce. But the injured princeſs conducted herſelf with exemplary prudence, and Henry's baſe deſigns were happily fruſtrated.

Soon after the concluſion of the treaty with his Saxon ſubjects, Henry was accuſed, by one of his own domeſtics, of having laid a plan for the deſtruction of the dukes of Swabia and Carinthia; and this calumny, though entirely groundleſs, proved of ſuch prejudice to his affairs, that he was compelled to take refuge in the city of Worms; while the princes of the empire aſſembled at Mentz for the expreſs purpoſe of depoſing him, and of electing another emperor. After ſome time, however, a conference was held at Oppenheim, in which Henry, by a ſolemn acknowledgment of his faults, appeaſed the princes who claimed to be electors, and was by them permitted to reſume his authority.

No ſooner had the emperor's fears ſubſided, in conſequence of this accommodation, than the Saxons broke out in a freſh revolt, which occaſioned a prodigious effuſion of blood; and, though they were eventually compelled to ſubmit, they were encouraged by the partiſans of Hildebrand, who had aſſumed the papacy under the name of Gregory VII. to ſend ambaſſadors to Rome, complaining of the injuries they had received from the emperor, and requeſting that the pope would depoſe him, on account of his miſconduct and immorality. Gregory, in conſequence, exerted himſelf ſo ſucceſsfully in embroiling the affairs of Germany, that the princes of the empire actually renounced their allegiance, and placed Rodolph duke of Swabia on the imperial throne. Henry, being appriſed of this rebellion, marched with all poſſible diſpatch againſt the inſurgents, and gained three ſucceſſive victories over them: but his affairs ſtill continued in a perilous ſituation; a ſentence of excommunication was fulminated againſt him, and the Roman pontiff effectually revived the ſpirits of the malcontents, by confirming the election of Rodolph.

Henry convened an aſſembly of the German biſhops at Mentz, to inveſtigate this pretended right of the pope to dethrone an emperor, or whether he might legally depoſe Hildebrand, and nominate another prelate to the apoſtolic chair. After mature deliberation, the nineteen biſhops propoſed that Henry ſhould call in all the other prelates, and hold a national council at Brixen. This the emperor agreed to; and, on the revival of the buſineſs at Brixen, the depoſition of Gregory was ſolemnly confirmed; and cardinal Wiberti, archbiſhop of Ravenna, was choſen pope, under the name of Clement III. In the mean time, Rodolph aſſembled ſome forces in Saxony, and began to make formidable preparations againſt his competitor. Henry, receiving intelligence of his motions, marched againſt him with great expedition, and the two armies engaged near Merſberg, with equal fury. For ſome time victory ſeemed to hover over the rebel troops; but their leader's hand being cut off by the duke of Lorrain, they were ſeized with a panic, and ſoon gave up the advantage they had gained. Rodolph, perceiving himſelf at the point of death, ordered the hand which he had loſt to be brought to him, and, addreſſing himſelf to his officers, "Behold, (ſaid he,) the hand with which I took my oath of allegiance to Henry, which I have violated at the inſtigation of the court of Rome, in perfidiouſly aſpiring to an honour that was not my due!" Having uttered theſe words, he expired with great penitence, and was buried at Merſberg in Saxony.

The diſturbances of Germany being thus compoſed, Henry, in 1081, led a numerous army into Italy, for the purpoſe of ſetting Clement in the papal chair; but Gregory had ordered the gates of Rome to be ſhut againſt him, and the garriſon withſtood a ſiege of two years and a half. At the expiration of that time the city was taken by aſſault; Gregory retired firſt to the caſtle of St. Angelo, and afterward to Salerno; and the new pope, being conſecrated in the church of St. Peter, expreſſed his gratitude by crowning Henry, on Eaſter-day, emperor of the Romans.

Henry now hoped to enjoy ſome tranquillity, ſince the chiefs of the German rebels were dead, and an accommodation had been entered into with the Saxons and Bavarians, A. D. 1099. But his ſubſequent attempts to preſerve the rights of the empire relative to the nomination of a pope, ſerved to foment the enmity of the Romans, and induced Paſcal III. the ſucceeding pontiff, to fulminate a new excommunication againſt him for introducing ſchiſms into the church.

Whilſt the emperor laboured under theſe preſſing calamities, his unnatural ſon Henry took up arms againſt him, and avowed the intention of wreſting the ſceptre from his hands; alleging that, as the ſubjects were diſcharged from their allegiance, he was obliged to fulfil the duties of the imperial ſtation; and that, as the laws of the church were ſuperior to thoſe of nature, he could not acknowledge Henry for his father, until he ſhould be abſolved from the ſentence of excommunication. The emperor uſed many remonſtrances to diſſuade his ſon from proceeding to ſuch extremities: but theſe produced no effect; and the uſurper brought an army into the field which put him in poſſeſſion of Spire, and the imperial treaſures. He then fixed a day for the princes to aſſemble at Mentz; but as he underſtood that the emperor deſigned to be preſent, with a very numerous army, he had recourſe to treachery, and, throwing himſelf at his father's feet, implored forgiveneſs for his undutiful behaviour, which he imputed to the advice of evil counſellors. The ill-fated emperor heard this declaration with unſpeakable joy, and, at the requeſt of his ſon, diſbanded the imperial army; but he was next day confined to his chamber by the ſuppoſed penitent, and the archbiſhop of Mentz and Cologne, together with the biſhops of Worms, were ſent to inform him of his depoſition, and to demand the crown and other regalia.

The emperor received this deputation, A. D. 1106, with concern and aſtoniſhment, and earneſtly demanded the cauſe of ſuch indignant treatment. The archbiſhop of Mentz replied, that he had rendered himſelf unworthy of wearing the imperial diadem, by the numerous ſchiſms he had introduced into the church, and the ſcandalous manner in which he expoſed benefices to ſale. "If then, (exclaimed the agitated prince,) we have proſtituted the benefices of the church for hire, you are the moſt proper perſons to convict us of that charge. Say then, I adjure you, what have we either exacted or received for *your* promotion to the dignities which you now enjoy?—You acknowledge our innocence with reſpect to your preferment; and yet, the arch-

archbiſhoprics of Mentz and Cologne being two of the beſt in our diſpoſal, we might have filled our coffers by expoſing them to ſale, inſtead of beſtowing them gratuitouſly upon perſons who have made ſo unworthy a return for our benevolence. Alas! we begin to ſink under the accumulated weight of age and ſorrow, and but little of our mortal pilgrimage is left unperformed: ſuffer that little to be concluded in peace, and ſeek not to terminate our reign with miſery, by becoming partiſans of thoſe who, in defiance of gratitude and allegiance, have lifted up their hands againſt their lawful ſovereign."

As this pathetic addreſs produced no effect on the minds of the unfeeling prelates, Henry put on his royal ornaments, and, ſeating himſelf in a chair of ſtate, renewed his remonſtrance to this effect: "Here are the enſigns of that royalty with which we were inveſted by God and the princes of the empire: if you diſregard the wrath of heaven, and the eternal reproach of mankind, ſo much as to lay violent hands upon your ſovereign, and ſtrip us of them by force, we are not in a condition to defend ourſelves from ſuch an outrage." This expoſtulation had no more effect than the former upon the eccleſiaſtic deputies, who immediately ſnatched the crown from Henry's head, and, dragging him from his ſeat, pulled off the imperial robes by force; whilſt he lifted his hands to heaven, acknowledging the ſins of his youth, and imploring God to puniſh the perjury and inſolence of his enemies. Soon after this heart-rending occurrence, an aſſembly of the princes obliged the old emperor to make a voluntary reſignation of his authority in favour of his unworthy ſon. With this ſad neceſſity he complied; and his ſpirit was ſo effectually broken, that he threw himſelf at the feet of the pope's legate, and earneſtly beſought him to abſolve him from the ſentence of excommunication; but his requeſt was refuſed, on pretence that he could receive abſolution from no other than the ſovereign pontiff himſelf.

In contemplating the hard fate of this prince, who was hurled from the pinnacle of greatneſs to the loweſt abyſs of miſery, diveſted of his honours, deprived of ſupport, abandoned by his friends, and eventually thrown into priſon by command of his ſon, we are naturally led to ſuppoſe that his courage muſt have been utterly extinguiſhed, and his mind overwhelmed with deſpair. This ſurmiſe, however, is unfounded; for, after the firſt exceſs of his grief had ſubſided, he found means to elude the vigilance of his keepers, and repaired to the Low-countries, where he raiſed a conſiderable body of forces to attempt his reſtoration, and wrote circular letters to all the princes in Chriſtendom, to intereſt them in his misfortunes. He even wrote to the pope, offering terms of accommodation; and he had the ſatisfaction of ſeeing many of his ſubjects return to their allegiance: but before any thing of importance could take place, he died at Liege, in the fifty-ſixth year of his age, and the forty-ninth of his reign. His remains were interred in the cathedral with becoming ſolemnity: but his unfeeling ſon ordered them to be dug up and depoſited in the chapel of Afron, where they remained five years unburied, on account of his dying under the ſentence of excommunication.

Upon an impartial review of the chequered life of Henry IV. it appears that he was endowed with great courage, and many other excellent qualities; and, if he had not excited the indignation of his ſubjects by his youthful exceſſes, and inflamed the hatred of the Romans by an obſtinate adherence to the rights of his prerogative, he might have eclipſed the glory of all his anceſtors. A peculiar air of dignity was ſtamped upon his countenance; his converſation was lively and intereſting; he poſſeſſed a mild and merciful temper; and he was ſo extremely charitable, that he is ſaid to have entertained the ſick, the lame, and the blind, at his own table, and even to have lodged ſome of them in his own apartments, that he might be at hand to miniſter to their neceſſities. From the twelfth year of his age, he had been conſtantly engaged in the toils of war; he had commanded in ſixty pitched battles, and ſurvived many ſecret attempts that were made upon his life. He frequently expreſſed a lively contrition for the enormities which had diſgraced the commencement of his reign; and he met his death, A. D. 1197, with equal fortitude and reſignation.

Henry V. ſurnamed the Young, endeavoured to eſtabliſh himſelf in the authority which he had ſo baſely uſurped, by conciliating the eſteem of the eccleſiaſtics: but the natural haughtineſs of his temper ſoon induced him to change his conduct, and a quarrel broke out between him and pope Paſcal II. about the long-diſputed queſtion of the inveſtitures of biſhoprics, which threatened very ſerious conſequences. After an unſucceſsful invaſion of Hungary, and a troubleſome war with the Poles, the emperor croſſed the Alps with an army of eighty thouſand men, and a great number of noblemen, in order to aſſert the rights of his crown in Italy, and to do himſelf juſtice either by negociation or force of arms. Having reduced ſome cities which attempted to diſpute his paſſage, he ſent a ſplendid embaſſy to Paſchal, and ſoon afterwards concluded a treaty of peace at Sutri, to his entire ſatisfaction.

It appears, however, that the Roman pontiff was inſincere in all his conceſſions: for on the very day of the emperor's entry into Rome, A. D. 1111, ſeveral perſons belonging to his train were groſsly inſulted by the populace; the new treaty of peace was formally oppoſed by the Italian prelates; and a ſpirit of diſaffection was predominant in the breaſts of the citizens. Exaſperated at theſe indignities, Henry ordered his ſoldiers to ſeize the perſon of the pope, and permitted them to inſult the cardinals and biſhops without diſtinction. The conſul now put all the Romans under arms, and a battle was fought with equal fury and reſolution. The citizens, however, were defeated with ſuch ſlaughter, that the Tiber was ſtained with their blood; the walls of the city were raſed in ſeveral places; and the pope, after enduring an impriſonment, and witneſſing the execution of his friends, was obliged to comply with all the demands of the conqueror, and to ratify the former accommodation. Upon the concluſion of this treaty, Henry was ſolemnly crowned at Rome; and the pope, in token of perfect reconciliation, divided the hoſt between the emperor and himſelf. But, though Paſchal preſerved the exterior marks of friendſhip, the court of Rome ſtill acted with its accuſtomed treachery; and Henry had afterwards the mortification to hear that the new bull, relative to inveſtitures, was publicly burnt, and himſelf excommunicated by the council of Lateran, for having preſumed to revive the prerogative of his anceſtors. Great diſturbances were now fomented between the courts of Rome and Germany, and an alarming confederacy was formed againſt the emperor: but, after ſeveral embaſſies and negociations, a general council was convened at Rome, A. D. 1124, in which the long-conteſted affair of inveſtitures was ſettled to the mutual ſatisfaction of all parties; and, in a ſubſequent diet held at Worms, the pope's legate adminiſtered the ſacrament to Henry, as a token of perfect reconciliation.

Soon after this accommodation with the Roman pontiff, Henry found himſelf engaged in a civil war, by the revolt of Holland; and, notwithſtanding the general ſucceſs of his arms, a ſpirit of ſedition continued to ſpread from town to town, and his own life was expoſed to the moſt imminent danger. Theſe misfortunes made a deep impreſſion on his ſpirits, and are ſuppoſed to have haſtened his death, which happened at Utrecht, in the forty-fifth year of his age, and the nineteenth of his reign, A. D. 1125. In him became extinct the male line of the Franconian emperors. Henry V. poſ-

feſſed a good ſhare of wiſdom, policy, and courage; but he has been generally branded with the vices of cruelty, pride, and avarice, and his unnatural behaviour to his father has fixed an indelible ſtain upon his memory.

It was generally ſuppoſed that the ſupreme dignity would be conferred upon one of the nephews of the deceaſed emperor. But Albert archbiſhop of Mentz prevailed on the princes of the empire to give their ſuffrages in favour of Lotharius duke of Saxe-Supplembourg, who was accordingly crowned at Aix-la-Chapelle, in preſence of the pope's nuncio. His competitors made ſome vigorous exertions for the ſupport of their pretenſions; but, after a ſanguinary and unavailing conteſt, they took the oath of allegiance, and were honoured with particular marks of their ſovereign's friendſhip. After a ſucceſsful expedition againſt the Bohemians, Lotharius, in 1133, undertook to re-eſtabliſh pope Innocent II. who had been forced from the apoſtolic chair by Anacletus. This attempt anſwered his expectation, and Innocent remunerated his ſervices by performing the ceremony of his coronation with great magnificence. Some time after theſe tranſactions, his holineſs was expoſed to imminent danger by an hoſtile incurſion of Roger king of Sicily: but Lotharius again advanced to his aſſiſtance, and Roger's inſult was puniſhed by the loſs of all his Italian poſſeſſions. On his return to Germany, Lotharius was ſeized with a dangerous diſtemper, which terminated his life, in the twelfth year of his reign. By command of this prince, the Juſtinian code of laws, which had been diſuſed for upwards of five-hundred years, was revived in the empire. This reign was alſo rendered remarkable by ſome exceſſive heats in Germany, which withered the corn and fruits of the earth, dried up the moſt conſiderable rivers, and occaſioned a dreadful mortality among the cattle.

Having paid the laſt duties to the deceaſed emperor, the princes and ſtates aſſembled at Coblentz, A.D. 1139, and unanimouſly elected Conrad III. duke of Franconia, to fill the vacant throne. This meaſure was warmly reſented by Henry of Bavaria, ſurnamed the Haughty, and he poſitively refuſed to ſurrender the regalia, which had been depoſited in his hands by Lotharius: but after ſome time he was compelled to ſubmit, and his grief on the ſubſequent alienation of his territories brought him to his grave. Upon the demiſe of this nobleman, his brother Guelphe, with the aſſiſtance of the king of Sicily, raiſed the ſtandard of rebellion, and made ſome vigorous exertions for the recovery of the confiſcated duchies. After ſeveral indecifive engagements, however, he was cloſely beſieged by the emperor in the caſtle of Weinſberg, and compelled to ſurrender at diſcretion. Upon this occaſion, the ducheſs petitioned that herſelf and all the women belonging to the caſtle might come out with as much as each could carry, and be conducted to a place of ſafety. Conrad granted her requeſt, ſuppoſing that the ladies were anxious for the preſervation of their treaſures; but when he ſaw them ſtaggering under the weight of their huſbands, who had incurred his reſentment, he was overcome with admiration at the affecting ſpectacle, and freely pardoned the objects of their conjugal affection.

In 1147, Conrad was prevailed on by the admonitions of St. Bernard, to join the cruſade againſt the Saracens, for the defence of the Holy Land; and he accordingly ſet out for Paleſtine, at the head of no leſs than ſixty thouſand cavalry. But moſt of his forces were ſacrificed to the treachery of the Greek emperor, and the irreſiſtible fury of the Turks; and he was ſoon compelled to return with diſgrace into his own dominions. The death of the emperor's eldeſt ſon, who had been elected king of the Romans, added to the above misfortune, ſeems to have made a very deep impreſſion on his ſpirits, and conſiderably affected his health. However, being anxious to provide for the ſucceſſion, he convened a diet at Bamberg, and recommended his nephew, Frederic Barbaroſſa, to the ſtates of the empire, as a prince of known courage and capacity. This recommendation was univerſally approved; and Conrad III. died ſoon afterward at Bamberg, in the fourteenth year of his reign. He left one ſon by his empreſs Gertrude, but his tender age precluded him from aſcending the throne.

Frederic I. ſurnamed Barbaroſſa, was ſolemnly crowned at Aix-la-Chapelle, A.D. 1152, in the twenty-ninth year of his age; and he had the ſatisfaction of receiving congratulatory addreſſes from almoſt all the princes of Europe. Having compromiſed ſome differences between the princes of the empire, and compelled Sueno to do homage for the kingdom of Denmark, Frederic put himſelf at the head of a numerous army, and marched into Italy, where ſeveral cities had thrown off their allegiance, and the Romans had made an inſurrection againſt the pope's ſovereignty. This expedition was attended with complete ſucceſs: for the revolted towns were quickly reduced; the Romans were obliged to acknowledge their pontiff's ſupremacy; and the victorious emperor was ſolemnly crowned with the Lombard and imperial diadems. Some time after theſe tranſactions, a quarrel broke out between Frederic and his holineſs, reſpecting the imperial authority; and a letter of Adrian IV. which audaciouſly intimated his power of tranferring the empire from the Germans to the Greeks, occaſioned an univerſal conſternation. Frederic, however, acted with ſuch ſpirit and reſolution, that his adverſary thought proper to elude chaſtiſement, by writing a ſecond letter, in which he explained away the meaning of his former expreſſions.

Notwithſtanding this ſubmiſſion on the part of Adrian, the emperor reſolved to march into Italy, and aſſert the rights of his imperial crown. Accordingly, after reducing Boliſlaus duke of Poland, confirming the ſovereignty of Waldemar, and ſecuring the fidelity of the king of Hungary, he croſſed the Alps with a numerous army, and reduced Breſcia, which had the preſumption to oppoſe his paſſage. He then compelled all the revolted cities of Lombardy to return to their allegiance; and held an aſſembly on the plain of Roncalie, where he enacted ſeveral laws for the maintenance of tranquillity, aſcertained the prerogatives of royalty, and exacted homage of all who held of the empire, without making any diſtinction between laymen and eccleſiaſtics. The latter part of theſe proceedings gave great umbrage to his holineſs, and a grand embaſſy of legates was ſent to complain of the diſrepect which had been thus offered to the church: but Frederic effectually ſilenced them by obſerving, that Jeſus Chriſt himſelf, though lord of the univerſe, had deigned to pay, for himſelf and St. Peter, the tribute which was demanded in the name of Cæſar.

Whilſt Frederic was employed in chaſtiſing ths Milaneſe for a freſh inſurrection, pope Adrian died; and a ſchiſm aroſe in the election of a ſucceſſor to the papacy. The greateſt part of the cardinals, who were on the ſpot at the time of his death, gave their ſuffrages on behalf of Roland, chancellor of the church, who aſſumed the name of Alexander III. and the reſt choſe Octavian of St. Cecilia, who tore the papal robe, by force, from his competitor, and cauſed himſelf to be proclaimed by the name of Victor IV. The emperor, being appriſed of this circumſtance, convened a council at Pavia, in which Victor was recogniſed as lawful pope, and declared with the uſual ſolemnities; but Alexander thundered out a ſentence of excommunication againſt the emperor, and all his adherents.

The ſeverity which Barbaroſſa had exerciſed upon the Milaneſe excited moſt of the other Italian ſtates againſt him, and induced them, in 1164, again to ſhake off the imperial yoke. The Romans and Venetians accordingly

FREDERICK BARBAROSSA, EMPEROR OF GERMANY

London, Published as the Act directs, Dec.r 19th 1807, by J. Wilkes.

cordingly entered into a confederacy with the inhabitants of Padua, Vicenza, and Verona; the citizens of Milan rebuilt their walls, and pillaged the caſtle of Trea of immenſe treaſures; and the imperial army was ſo dreadfully afflicted by diſeaſe, as to render a return into Germany indiſpenſably neceſſary. Meanwhile, Alexander continued to receive the homage of his numerous adherents; and all Italy was tired of a ſchiſm which had continued under theſe anti-popes. At length fortune ſeemed to deſert the imperial arms; and the loſs of a battle near Signano, together with a naval defeat by the Venetians in which his eldeſt ſon was taken priſoner, induced the emperor to conclude a peace with his formidable enemy. Alexander readily embraced his propoſals; and an accommodation was ſoon entered into with the revolted cities.

During theſe tranſactions in Italy, Henry duke of Saxony, ſurnamed the Lion, raiſed freſh troubles in Germany, by oppreſſing his own ſubjects, and committing many outrages againſt his neighbours. Upon the emperor's return, therefore, Henry was ſummoned to a diet, in order to anſwer for his miſconduct; and on his refuſing to appear, he was put to the ban of the empire, and ſtripped of all his dominions. After ſome time, however, he excited the compaſſion of the emperor, and prevailed on him to promiſe that the territories of Brunſwic and Lunenburg ſhould be protected on behalf of his children. Having obtained this aſſurance, he retired to England, where he was hoſpitably entertained by his father-in-law, Henry II. and where his wife bore him a fourth ſon, from whom the preſent illuſtrious houſe of Brunſwic is deſcended.

After this event, Frederic made a tour through the Italian cities, cauſed his ſon Henry to be crowned king of Lombardy, and negociated a match between that prince and Conſtance, ſiſter of William king of Sicily. But no remarkable political occurrence claims our attention till the year 1188, when the emperor engaged in a cruſade againſt the famous ſultan Saladin, and marched at the head of a prodigious army into the dominions of the Greek emperor, whom he chaſtiſed for his perfidious conduct. Having croſſed the Helleſpont, and refreſhed his troops for a few days at Laodicea, he fell upon the Turks, and defeated them in ſeveral engagements. He alſo pillaged the city of Iconium, led his victorious followers acroſs Mount Taurus, and filled Aſia Minor with the terror of his name: but whilſt the Chriſtians of that country expected to derive the moſt important advantages from his aſſiſtance, he was unfortunately drowned in the river Cydnus, in the ſixty-ninth year of his age, and thirty-eighth of his reign. His ſon Frederic duke of Swabia, having performed the rites of ſepulture to the emperor at Tyre, haſtened to join the army of the eaſtern Chriſtians, who were engaged in the ſiege of Ptolemais; but he ſoon fell a victim to an infectious diſorder; and moſt of his troops returned, with the duke of Guelderland and the landgrave of Thuringia, into Germany, in 1190.

Henry VI. ſurnamed the Severe, had been already elected king of the Romans, and was acknowledged the lawful ſucceſſor of the empire: but the commencement of his reign was diſturbed by ſome freſh outrages of Henry the Lion, who had returned from England; and ſeveral bloody engagements took place before the malcontents were reduced to ſubmiſſion. At length, however, an accommodation was negociated, and the emperor marched into Italy, in order to receive the imperial diadem from the hands of the pope, and to recover the ſucceſſion of William king of Sicily, who had died without legitimate iſſue. On his arrival at Rome, in 1191, Henry and his empreſs Conſtance were ſolemnly crowned by pope Celeſtine III.

Henry now reſolved to make ſome vigorous exertions againſt Tancred count of Leccio, who had been lately placed on the throne of Sicily; and his forces ſoon reduced the towns of Campania, Apulia, and Calabria: but whilſt he was engaged in the ſubſequent blockade of Naples, a dreadful diſtemper broke out in the camp, and he was ſoon compelled to return to Germany. Having prevailed on the princes of the empire to enact a law for rendering the ſupreme dignity hereditary in his houſe, Henry applied himſelf very attentively to the adminiſtration of juſtice, ſitting in perſon to hear and redreſs the grievances of his ſubjects. One of his favourites obſerving that he fatigued himſelf too much with giving audience, which frequently interfered with his neceſſary meals, Henry replied, that although a private man was at liberty to eat when he pleaſed, a prince ought not to ſit down to table till he had diſcuſſed the affairs of his people.

Soon after the termination of a quarrel between Henry the Lion and Rodolphus count of Holſtein, Richard I. king of England, returned from Paleſtine; and, being ſhipwrecked on the coaſt of the Adriatic, aſſumed the habit of a pilgrim, that he might ſafely paſs through the territories of Leopold duke of Auſtria, whom he had offended at the ſiege of Ptolemais. Leopold, however, obtained intelligence of this event, and cauſed the unfortunate monarch to be ſeized, and loaded with chains. After ſome time, the emperor demanded that the royal priſoner ſhould be put into his hands, and compelled him to appear before a diet at Haguenau, where he was formally accuſed of maintaining an uſurper on the throne of Sicily, preventing the conqueſt of Jeruſalem by his diſagreement with the king of France, unlawfully invading the kingdom of Cyprus, inſulting the duke of Auſtria during the ſiege of Ptolemais, conſenting to the aſſaſſination of the marquis of Montſerrat, and finally concluding a truce with Saladin, contrary to the general intereſts of Chriſtendom.

The king of England replied, that, although he was accountable to no perſon for his actions, yet, as his honour was concerned, he would wave his royal prerogative, and vindicate his character from theſe aſperſions. He affirmed that he had not made any attempts either for the elevation of Tancred, or the confirmation of his authority, but had merely treated with him as a prince in actual poſſeſſion of the Sicilian crown; that the ill ſucceſs of the cruſade in Paleſtine reſulted entirely from the jealouſy of the French monarch, who was the firſt to retire from the ſcene of action; that he had, indeed, wreſted the kingdom of Cyprus from a tyrannical uſurper, who had incurred his reſentment, but had afterward ceded it in favour of Guy de Luſignan, to indemnify him for the loſs of Jeruſalem; that the duke of Auſtria had effectually revenged his ſuppoſed inſult, by loading a ſovereign prince with chains; that the marquis of Montſerrat had acquitted him of all ſuſpicion of being concerned in his murder, by requeſting, with his lateſt breath, that the city of Tyre might be delivered into his hands; and laſtly, that the truce he concluded with Saladin could not be the effect of any intereſted view, ſince of all the booty he had taken from the caravan of Babylon, he had reſerved nothing to himſelf but the ring upon his finger.

This explanation made a deep impreſſion on the German princes, who not only admitted the defence, but pitied the misfortunes, of the invincible Richard; and with one conſent ſolicited their emperor to ſet him at liberty. By the intrigues of the French monarch, however, Richard was detained for a conſiderable time, and was at length compelled to purchaſe his freedom upon the hard conditions of paying one hundred and fifty thouſand marks of ſilver, liberating the king of Cyprus and his daughter, and beſtowing his niece Eleanor of Bretagne upon the eldeſt ſon of the duke of Auſtria. However, Leopold died ſoon afterwards, confeſſing his injuſtice toward the king of England; his ſucceſſor ſent back the princeſs Eleanor, who did not happen to captivate his affections; and the emperor diſpatched an ambaſſador

ambaſſador to ſolicit the future friendſhip of Richard, and to promiſe reſtitution of the ſum which had been exacted for his ranſom.—See the article ENGLAND, vol. iv. p. 572.

Shortly after theſe tranſactions, Henry ſent a conſiderable body of forces againſt Naples, under the command of his lieutenant Berthold, who, in 1194, obtained ſome conſiderable advantages during his march, and gave up the towns of Recca, Sexti, and Venafro, to be pillaged by his followers. Tancred immediately made preparations for checking the progreſs of the imperial general; but the death of his ſon Roger made ſo deep an impreſſion on his ſpirits, that he ſoon fell a victim to grief; and his ſurviving ſon William, though in his cradle, was declared king of Sicily. Upon the firſt intelligence of Tancred's death, the emperor repaired to Genoa, and thence to Naples, which, by the vigorous exertions of himſelf and his allies, was ſoon reduced, together with Apulia and Calabria. Palermo alſo was taken by aſſault, and the citizens were treated with ſuch ſeverity for an inſult which they had formerly offered to the empreſs, that all the other towns were terrified into ſubmiſſion, and Henry found himſelf in peaceable poſſeſſion of the two Sicilies. He then prevailed on Tancred's widow, with her infant ſon and two daughters, to ſurrender themſelves upon certain terms of accommodation: but they were no ſooner in his power, than, in direct violation of his word of honour, he ſtripped them of all their treaſures, cauſed the harmleſs infant to be emaſculated and deprived of ſight, and confined the widow and her unfortunate daughters in a monaſtery.—Such were the infamous practices even of kings, in the twelfth century!

Having ſettled the affairs of his new kingdom, and ſeized the immenſe treaſures which had been amaſſed by Tancred, the emperor returned into Germany; where he cauſed his infant ſon Frederic to be elected king of the Romans; and, in a general diet at Worms, declared his reſolution of taking the croſs to ſuccour the Chriſtians in the Holy Land. This declaration was received with general applauſe; a multitude of ſoldiers from all the imperial provinces expreſſed a deſire to engage in the purpoſed expedition; and even Margaret, queen-dowager of Hungary, reſolved to enliſt among the cruſaders.

But whilſt two powerful armies were ſent toward Paleſtine, Henry was obliged to employ a third againſt the Sicilians, who had raiſed a rebellion, and taken vigorous meaſures for ſhaking off the imperial yoke. On his arrival at Naples, he diveſted all the Neapolitans, Calabrians, and Sicilians, of their lucrative offices and employments, and even extended his ſeverity to the clergy, by annulling their exemptions from military ſervice. This rigour, however, only ſerved to inſpire the Sicilians with a kind of deſperate reſentment; and even the empreſs Conſtance was ſo highly provoked at the unworthy treatment of her countrymen, that a general inſurrection was fomented under her immediate encouragement; and Henry, having permitted moſt of his troops to embark for Paleſtine, was compelled to conclude a peace with the malcontents on very degrading terms. A few days after this accommodation the emperor died, as was generally ſuppoſed, of a fever, occaſioned by too violent exerciſe in hunting; but other hiſtorians have hinted that he received a deleterious potion from the hands of Conſtance, who dreaded the effects of his vindictive diſpoſition. Henry VI. appears to have poſſeſſed ſome good qualities, and was generally renowned for his prudence, eloquence, courage, and reputation: but he was juſtly charged with bloodſhed and cruelty; and his perfidious behaviour towards the king of England, and the family of Tancred, were equally unworthy of his character as a ſovereign or a Chriſtian. The troops whom he had ſent into Aſia abandoned their deſign upon the firſt intelligence of his death, and returned into Europe, leaving Paleſtine in the hands of the Saracens.

Philip duke of Swabia aſſumed the adminiſtration, A. D. 1197, in compliance with the requeſt of his dying brother, who ſent him the regalia, and committed to his tuition the young king of the Romans. But pope Innocent III. immediately declared againſt theſe meaſures, and not only exhorted the German princes to ſet aſide the houſe of Swabia and proceed to the election of another king of the Romans, but was even heard to affirm that Philip ſhould loſe the empire, or he himſelf forfeit the papacy. This behaviour on the part of the ſovereign pontiff ſoon occaſioned violent diſſenſions in Germany; and Otho duke of Saxony was ſolemnly crowned by one party, while Frederic's election was confirmed by another, and Philip was choſen king of the Romans, that he might exerciſe the office of guardian with more authority. Theſe elections ſoon ſpread ſlaughter and conſternation over the empire. Otho was ſtrongly ſupported by the pope, and by his uncle Richard of England; and Philip found a powerful patron in the king of France. Every nobleman was now at variance with his neighbour; the ties of friendſhip and conſanguinity were diſregarded; and the moſt flagrant outrages were committed by a licentious ſoldiery.

After many deſperate conflicts, Otho was obliged to ſeek refuge in England, and Philip, in 1208, remained the undiſputed maſter of the empire: but whilſt he was labouring to conciliate the affections of his ſubjects, and endeavouring to procure an accommodation with the pope, he was baſely aſſaſſinated by the count-palatine Otho of Wittleſbach, whom he had incenſed by refuſing to give him one of his daughters in marriage. Such was the untimely end of Philip:—a prince endowed with many amiable qualities, and ſincerely regretted by all who knew him. His countenance was comely and intereſting, his behaviour remarkably affable, and his eloquence perſuaſive. He acted with great prudence during his ſhort adminiſtration, and he poſſeſſed in an eminent degree the virtues of clemency and liberality.

Otho IV. appriſed of his competitor's death, haſtened to Halberſtadt, where his election was renewed by the princes of Saxony, Miſnia, and Thuringia; and he ſoon afterwards conciliated the eſteem of the oppoſite faction by eſpouſing Beatrice, daughter of the deceaſed regent. After ſettling the affairs of the empire, and ſecuring the loyalty of his clergy by many conſiderable promiſes, he ſet out for Italy, and was ſolemnly crowned at Rome by the pope. But, notwithſtanding the apparent friendſhip of Innocent, and ſome important conceſſions on the part of the emperor, the Romans took up arms, on ſome trifling occaſion, and killed upwards of a thouſand Imperialiſts on the ſpot; Otho's remonſtrances were but little regarded; and the pope took an early opportunity of ſeizing Apulia, together with the marquiſate of Ancona, and the county of Spoleto. Otho judged it adviſable to diſſemble his reſentment for the preſent, and accordingly quitted Rome in apparent friendſhip with his holineſs: but in the enſuing ſpring he put himſelf at the head of a numerous army, and avowed his intention of re-eſtabliſhing his authority in thoſe countries which had been unjuſtly withdrawn from the empire. This declaration was followed by ſeveral victories; the dominions of Frederic king of the Two Sicilies were ravaged by the conquering army; and Innocent learned, with equal grief and indignation, that the protection of the holy ſee was too weak to repel the arms of his exaſperated Otho. Recourſe was now had to the eccleſiaſtical fulminations; and an aſſembly was held at Bamberg, in compliance with the pope's deſire, in which Otho was ſolemnly depoſed, and Frederic duke of Swabia and king of Sicily, who in his infancy had been proclaimed king of the Romans, was nominated to the imperial throne. Alarmed at theſe meaſures,

fures, Otho haſtened into Germany, and proſecuted the war with ſucceſs againſt the rebels: but in attempting to weaken the power of France, he was defeated with prodigious ſlaughter; and his young competitor ſucceeded ſo effectually in conciliating the eſteem of the Germans, that he was eventually compelled to reſign all pretenſions to the crown, and to ſeek a retreat in Brunſwic, where he died after a ſhort and unfortunate reign.

Frederic II. at about eighteen years of age, A.D. 1215, aſcended the throne in full poſſeſſion of thoſe accompliſhments which are expected to give luſtre to a diadem, and to render a nation happy. He had been carefully educated, and had ſtudied, above all things, to imitate the conduct of his illuſtrious grandfather Frederic I. He was crowned at Aix-la-Chapelle with great magnificence; and, as an acknowledgement of the favours which Divine Providence had hitherto beſtowed upon him, he made a vow to go in perſon to the Holy Land.

The firſt four years of Frederic's reign having been ſpent in arranging the affairs of the empire, and curbing the rebellious ſpirit of Otho's adherents, he made a progreſs into Italy in the ſummer of 1220, and received the imperial crown from Honorius III. He alſo cauſed his ſon Henry to be declared king of the Romans; and promiſed, upon oath, that he would lead an army into Aſia, at any time his holineſs ſhould appoint. However he delayed ſo long to perform his vow, that Honorius threatened him with excommunication; and a rupture enſued which preſaged very ſerious conſequences: for the emperor not only ſent a ſevere remonſtrance to the pope, but publiſhed a manifeſto for the juſtification of his own conduct, and ordered his troops to march to the frontiers of the eccleſiaſtical ſtate. Honorius perceived the neceſſity of apologizing for his raſhneſs; and a reconciliation took place, in which Frederic agreed to marry Yolanda, daughter of the king of Jeruſalem; and promiſed to ſet out with an army in two years, for the recovery of Paleſtine. But notwithſtanding theſe freſh engagements, Frederic ſtill heſitated to take the croſs; and a revolt of the Lombards excuſed his delay; but on the termination of thoſe troubles, Honorius renewed his remonſtrances, and a literary correſpondence commenced, in which he accuſed the emperor of ingratitude and cruelty towards his father-in-law, who had ceded his title to the kingdom of Jeruſalem; and Frederic recriminated by charging his adverſary with having diſturbed the peace of Italy, and granted an aſylum to perſons who had dared to raiſe the ſtandard of rebellion againſt their lawful ſovereign.

On the demiſe of Honorius, and the elevation of Gregory IX. to the apoſtolic chair, in 1228, Frederic avowed his intention of performing his engagement, and actually ſet ſail from Brundiſi, with a very powerful armament: but, about three days after he had put to ſea, a ſlight indiſpoſition ſerved him as an excuſe for returning. Hereupon the pope excommunicated him; and ſuch commotions enſued, that Frederic thought proper to ſet out again for the Holy Land. As he did not wait, however, for an abſolution from the papal anathema, he met with a very cold reception at Jeruſalem; the cruſaders peremptorily refuſed to acknowledge him as their chief; and the conſequent improbability of acquiring any military reputation, induced him to conclude a treaty with the Saracens. He then cauſed himſelf to be crowned at Jeruſalem, and returned to Naples with an empty title, which however, from that time, has been preſerved by the Sicilian monarchs.

The emperor ſtill laboured under the ſentence of excommunication; and the Roman pontiff was ſo highly exaſperated at his treaty with the ſultan of Egypt, that the breach ſeemed to be conſiderably widened. But Frederic reſolved to ſupport his authority by force of arms; and his ſoldiers committed ſuch dreadful ravages in the eccleſiaſtical ſtate, that Gregory thought proper to liſten to terms of accommodation, and the papal fulmination was withdrawn. This reconciliation, however, was followed by freſh troubles. The Lombards peremptorily refuſed to bear the imperial yoke; and after Frederic had been employed nearly five years in reducing them to obedience, Germany was ſuddenly involved in commotion, and Henry king of the Romans, forgetting or totally diſregarding the duties of a ſon, put himſelf at the head of the rebels. This prince, however, acted with ſuch extreme caution, that many of the nobles approved without underſtanding his conduct; and although, on Frederic's return, he was fully convicted of rebellion, his crime was imputed entirely to evil counſellors, and he was permitted to retire into Sicily. Thus diſmiſſed with impunity, Henry engaged in freſh ſchemes againſt his father's authority, and even promiſed to ſuccour thoſe towns in Lombardy which ſtill refuſed to return to their allegiance. Frederic now perceived his danger; and his ungrateful ſon was cloſely confined in the caſtle of Apulia.

Some time after this event, the emperor, in 1237, cauſed his ſecond ſon, Conrad, to be elected king of the Romans; and then repaired into Lombardy, where ſeveral cities remained in arms under pretence of defending certain liberties which had been granted them during the reign of Frederic Barbaroſſa. This expedition proved ſucceſsful to the Imperialiſts; and upon the elevation of Innocent IV. to the papacy, the German princes congratulated themſelves on the proſpect of returning tranquillity; but Frederic poſſeſſed more penetration, and obſerved that the cauſe of their rejoicing had deprived him of a cardinal's friendſhip, and entailed on him the hatred of a pope. The event ſoon juſtified this aſſertion; for, notwithſtanding the zeal which Innocent had hitherto expreſſed for the emperor's intereſt, he now avowed himſelf his enemy; cauſed the election of Conrad to be annulled in the council of Lyons; adviſed the nomination of Henry, landgrave of Thuringia, to ſuperſede Conrad; and even procured a ſentence of depoſition againſt the emperor himſelf. On hearing of theſe tranſactions, Frederic placed the imperial diadem on his head, ſaying, "Before this depoſition I was obedient to the pope and to the laws of the church: but, now that he has releaſed me from my duty in that particular, I no longer owe him any reſpect, and will continue to be emperor in ſpite of all his exertions."

Henry of Thuringia being ſlain by an arrow at the ſiege of Ulm, in 1247, the pope cauſed an aſſembly of the ſtates to be held at Nuitz, where the title of "king of the Romans" was ſolemnly conferred upon William count of Holland. But ſeveral cities ſtill retained their allegiance to the emperor and his ſon Conrad, notwithſtanding all the exhortations and menaces of the Roman pontiff. Meanwhile Frederic, who was buſily employed at the ſiege of Parma, narrowly eſcaped the treachery of his enemies, who had bribed both his phyſician and his favourite chancellor to take him off by poiſon. He was, however, fortunately appriſed of their deſign, and his infamous ſervants received the juſt reward of their villainous purpoſe. Soon after this event, Frederic was totally defeated by the Parmeſans, and was obliged to retire to his kingdom of Naples, where he died of a fever, in the fifty-fifth year of his age and the thirty-fourth of his reign. Frederic II. was five times excommunicated by three popes; yet he prevailed ſo far againſt Gregory IX. as to depoſe him from the papal chair. Theſe reiterated conteſts between him and the popes, gave riſe to the two famous factions of the Guelphs and Gibellines; the former adhering to the popes, and the latter to the emperors.

Conrad IV. was no ſooner appriſed of his father's death, in 1254, than he aſſumed the imperial title, and ſet out to take poſſeſſion of his Italian dominions. He

was, however, engaged in ſeveral quarrels with the court of Rome; and his life was ſoon terminated, either by ſickneſs or the treachery of his enemies. He left one ſon, named Conradin; but as he was only three years of age, the Sicilian ſceptre was uſurped by Mainfroy prince of Tarentum; and the government of the empire was veſted in William count of Holland, who had been elected king of the Romans during the reign of Frederic II.

William's acceſſion was marked by two ſingular occurrences, which expoſed him to the moſt imminent peril; for, ſoon after his marriage with the daughter of the duke of Brunſwic, his palace was conſumed by fire; and, during a temporary reſidence at Utrecht, he was ſo dangerouſly wounded with a ſtone from an unknown hand, that he narrowly eſcaped inſtant death. The coronation of this prince was performed at Aix-la-Chapelle, with the expreſs conſent of the pope: but he found himſelf involved in a troubleſome war with Margaret counteſs of Hainault, and his partiſans were, for ſome time, unable to make any conſiderable progreſs againſt the noblemen who refuſed to acknowledge his authority. At length, however, he concluded a treaty with Margaret; conciliated the affection of the German princes; and acquired great popularity by patroniſing an aſſociation of towns for the defence of their commerce, which, in thoſe times of confuſion, had ſuffered very ſeverely from the depredations and oppreſſions of ſeveral petty noblemen, who reſided in ſtrong caſtles, and ſubſiſted chiefly by rapine and plunder. This ſeems to have been the true epoch of the general union among the Hans Towns; though a ſimilar treaty had long ſubſiſted between Hamburg, Bremen, and Lubec.

After a cruſade againſt the Ruſſians, and the founding of Konigſberg by the Teutonic knights, William, in 1256, undertook an expedition againſt the Friezelanders, who had renounced their allegiance. But in attempting to reconnoitre the burg of Hochwend, without any attendants, his horſe unfortunately ſunk into a moraſs, and he became an eaſy prey to the enemy, who killed him without knowing his rank, and afterwards buried his remains in a burgher's houſe. Such was the ſad cataſtrophe of a prince whoſe courage and accompliſhments deſerved a better fate.

Several aſſemblies were now convened for the purpoſe of electing a new emperor; but none of the princes were willing to undertake ſo weighty a charge. At length, however, Richard duke of Cornwall conſented to accept the proffered dignity, and was ſolemnly crowned at Aix-la-Chapelle, notwithſtanding the ſpirited oppoſition of a party who declared for Alphonſo king of Caſtile. The new emperor had laviſhed ſuch immenſe ſums previouſly to his election, that he found his treaſures totally exhauſted whilſt making a tour through the cities of the empire; and the princes, after avowing that they had choſen him merely on account of his riches, ſent him a formal renunciation of their allegiance. He was therefore compelled, in 1258, to abandon the government, and retire into England, where he ended his life.

For fifteen years after the abdication of this prince, Germany groaned beneath the accumulated evils which uſually attend an interregnum. No laws were obſerved, no order was maintained; but murder, theft, and rapine, were committed with impunity, and the conſtitutions of the empire were totally neglected. Sanguinary wars reſulted from the feuds of private noblemen; biſhops and clergymen, forgetful of their ſacred character, embrued their hands in blood, for the augmentation of their benefices; commerce was almoſt annihilated; travelling was unſafe; and anarchy was completely and univerſally prevalent. The princes, indeed, convoked ſeveral aſſemblies: and Conradin, ſon of Conrad IV. made ſome gallant exertions to retrieve his inheritance; but the meaſures of the former were rendered abortive by the obſtinacy of the Roman pontiff; and the latter, being taken priſoner by Charles count of Anjou, was doomed to periſh on a ſcaffold. The ſubſequent execution of Conrad prince of Antioch, terminated the illuſtrious race of Swabia; and Germany continued without a maſter till pope Gregory X. enforced the neceſſity of a ſpeedy renewal of the ſovereign authority, by the nomination and election of a new emperor.

From the ELECTION of RODOLPHUS I. Founder of the AUSTRIAN DYNASTY, to the ABDICATION of CHARLES V.

In compliance with the injunctions of the pope, the princes of the empire aſſembled, in diet, at Frankfort, A. D. 1273; and, notwithſtanding the remonſtrance of Alphonſo's ambaſſador, and the pretenſions of ſome other candidates to the imperial crown, they elected Rodolphus count Hapſburg, on account of his known prudence, and the brilliant reputation which he had acquired by his bravery on ſeveral important occaſions. On receiving information of this event, Rodolphus haſtened to Frankfort, whence he was conducted to Aix-la-Chapelle, in order to be inveſted with the imperial crown: but when all things were prepared for the ceremony, it was diſcovered that the ſceptre was wanting, without which the princes could not receive the inveſtiture of their reſpective fiefs. This circumſtance occaſioned much confuſion, and the princes ſcrupled to take the accuſtomed oaths in an irregular manner: but the emperor immediately took a crucifix from the altar, ſaying, "This is the repreſentation of Him by whom we were ſaved; let us uſe it inſtead of a ſceptre." They agreed to this expedient, and the ſolemnity was performed accordingly.

The firſt care of Rodolphus was to put a ſtop to thoſe acts of cruelty and depredation which had ſo long diſgraced the police of Germany, and he exerted himſelf with ſuch vigilance upon this occaſion, that ſixty caſtles which had ſerved as retreats to banditti, were demoliſhed; ninety-nine marauders were executed, at one time, in the city of Erfurt; and peace and ſecurity were ſeaſonably re-eſtabliſhed. He then obtained a confirmation of his dignity from the pope, after promiſing to defend the holy ſee againſt all its enemies; and Alphonſo of Caſtile was perſuaded to renounce his pretenſions to the empire.

Rodolphus maintained his intereſts with the popes, by a truly dextrous policy. At an interview with Gregory X. he promiſed to lead an army into Paleſtine; and, at the deſire of Nicholas III. his ambaſſadors renewed his promiſe, in full conſiſtory, at Rome; but he wiſely contrived to diſpenſe with theſe engagements; and his chancellor was empowered to treat with ſeveral of the Italian cities reſpecting their enfranchiſements, as he preferred the receipt of their money to the alternative of making war upon them. He had been frequently requeſted to viſit Rome, and to receive the imperial crown from the hands of his holineſs; but he always declined the journey, and (alluding to the fable of the ſick lion) replied, that many of his predeceſſors had gone to Italy, but that he had obſerved few of them to return without the loſs either of their rights or authority.

After Rodolphus had ſwayed the imperial ſceptre about eighteen years, he convoked a diet at Frankfort, and requeſted that the empire might be ſecured to his ſon Albert duke of Auſtria, by creating him king of the Romans: but the princes excuſed themſelves from complying with this propoſal; and Rodolphus retired in diſguſt to Gemerſheim, where he died, after a ſhort illneſs, in the ſeventy-third year of his age. This prince was juſtly renowned for his valour, ſagacity, and love of juſtice; and by his ſole conduct and courage, the empire was extricated from rapine and miſery, and reſtored to the enjoyment of peace and opulence.

Rodolphus

Rodolphus had ſeven beautiful daughters, by means of whom he contracted alliances which proved highly advantageous to his poſterity. He had alſo ſeven ſons; but none of theſe ſurvived him except his ſon the duke of Auſtria. In him began the ſovereign elevation of the houſe of Auſtria, of which dynaſty of emperors he was the founder.—Their hiſtory is briefly this: The houſe of Auſtria ſprung from the counts of Hapſburg, a ſmall territory of Swiſſerland on the river Aar, in the canton of Bern; where, on a lofty eminence, ſtand the remains of an ancient caſtle, the firſt ſeat of the houſe of Auſtria. When Rodolphus I. count of Hapſburg, was called to fill the imperial throne, he was liege lord of the greater part of Swiſſerland, after the extinction of the powerful houſe of Zaeringen, and that of the counts of Kyburg; whoſe joint inheritance devolving on Rodolphus, became, in 1273, the grand baſis of his power, and that of his ſucceſſors of the ancient and illuſtrious houſe of Auſtria.

After an interregnum of about nine months, a diet was held at Frankfort for the election of a new ſovereign, A. D. 1292; and the princes were ſtrongly ſolicited to give their ſuffrages in favour of the late emperor's ſon; but by the intrigues of Gerhard elector of Mentz, the majority declared for Adolphus of Naſſau, who, although one of the pooreſt princes of the empire, was renowned for his military ſkill and bravery. He proved himſelf, however, unworthy of his new dignity; for, having injudiciouſly attacked the count-palatine of Burgundy and the princes of Thuringia, his ill ſucceſs diminiſhed his reputation: he alſo rendered himſelf odious to the people by violating his promiſes, and ſetting up his own will as a ſupreme law; and was publicly accuſed of having ſacrificed helpleſs maidens, wives, widows, and even nuns, to his luſt and cruelty. Accordingly the ſtates declared him incapable of wearing the diadem; and, by a ſolemn act, transferred their allegiance to the duke of Auſtria. Upon the firſt intelligence of this tranſaction, Adolphus advanced againſt his competitor, and ſingled him out in the heat of engagement; but victory reſted on the ſword of Albert, and the remains of the fallen emperor were depoſited in the cloiſter of Frauenfelt, whence they were afterward removed to the imperial ſepulchre by Henry of Luxemburg.

Albert I. furnamed the Triumphant, on account of the numerous victories he obtained over his enemies, was inveſted with the royal diadem at Aix-la-Chapelle, in 1298. Upon the demiſe of Winceſlaus the Younger, Albert raiſed a ſtrong party in order to put the crown of Bohemia upon the head of his ſon Rodolphus, and even perſuaded the widow of the late king to beſtow her hand upon him in marriage. Rodolphus, however, was ſoon taken off by a ſudden death; and Henry count of Carinthia eſtabliſhed himſelf ſo firmly on the throne, that Albert found it impoſſible to depoſe him. Some time after theſe tranſactions, the emperor eſpouſed the cauſe of Philip Naſſau againſt Frederic and Dictmann, who had been diſinherited by an unnatural father; but this flagrant injuſtice was generally execrated; Frederic raiſed a numerous body of troops; and Albert was eventually compelled to retire from the ſword of his young adverſary. His chagrin on this occaſion, however, was ſoon diſſipated by the elevation of his nephew Charobert to the throne of Hungary.

Albert's conduct toward the Swiſs was exactly the reverſe of his father's; for, though the latter had conciliated their affection by kindneſs and indulgence, and had uniformly defended their privileges againſt the nobles who attempted to infringe them, yet Albert wiſhed to govern them as an abſolute ſovereign, and appointed governors who oppreſſed them in the moſt unfeeling manner. The three cantons of Ury, Switz, and Underwald, in 1307, preferred ſeveral complaints and remonſtrances to the emperor on the ſubject of their grievances: but as they found it impoſſible to obtain any redreſs, they took an early opportunity of ſhaking off the imperial yoke; and the other cantons ſoon engaged in a confederacy, which laid the firſt foundation of the Helvetic republic.

The emperor had ſix ſons and three daughters; and the eagerneſs which he manifeſted to aggrandiſe his family, caſt a ſtain upon his reputation, and finally coſt him his life. Being entruſted with the guardianſhip of his nephew John, ſon of Rodolphus duke of Swabia, he took upon himſelf the adminiſtration of his dominions, and even heſitated to reſtore to him ſome caſtles which the young duke demanded. This conduct induced many of the German princes to ſuppoſe that Albert meant to appropriate his ward's patrimony to the benefit of his own children; and John was ſo exaſperated at the idea of ſuch an injury, that he engaged three confederates to aid him in his purpoſed revenge. They accordingly fixed a time for the execution of their deſign, and aſſaſſinated the emperor on the bank of the Rhus, near Schaffhauſen. One of the murderers, being apprehended, was broken alive upon the wheel; John, and another of his accomplices, lingered out a miſerable life of penitentiary humiliation in a monaſtery; and the fourth aſſaſſin lived thirty-five years as a cowherd in an obſcure village, and did not diſcover his guilty ſecret till the hour of his diſſolution.

Upon the firſt news of Albert's aſſaſſination, A. D. 1308, Philip the Fair, king of France, avowed his intention of becoming a candidate for the vacant throne; and even ſet out for Avignon, in order to ſolicit pope Clement V. to determine the ſuffrages in his favour: but the ſovereign pontiff had ſufficient cauſe to dread the elevation of a prince who might probably enforce the claims of his predeceſſors to Italy; and therefore wrote privately to the electors, urging them to nominate a chief, and aſſuring them that, unleſs they proceeded to the election immediately, the imperial dignity would revert from Germany to France. An aſſembly of the princes was accordingly held at Frankfort, and Henry of Luxemburg was unanimouſly choſen to fill the vacant throne.

Having been crowned, with the uſual ſolemnities, at Aix-la-Chapelle, in 1309, Henry made a progreſs along the Rhine, to receive the cuſtomary oaths of fidelity from the princes; and ſoon afterward convened an imperial diet at Spire, where ſentence of death was pronounced againſt the murderers of the late emperor, and Albert's four ſons were inveſted with the duchy of Auſtria. Upon this occaſion, alſo, a marriage was ſolemniſed between the emperor's ſon John, and the princeſs Elizabeth of Bohemia, by which means the crown of Bohemia became hereditary in the houſe of Luxemburg. After chaſtiſing one of his refractory counts, and promulgating a famous decree for the expulſion of the Jews from all the provinces of Germany, the emperor ſet out on an expedition to Italy; where he received the ſubmiſſions of ſeveral cities, and was ſolemnly crowned at Milan. The pope, however, took ſuch offence at the arrival of a German army, that he formed a confederacy againſt his illuſtrious viſitor, and urged the inhabitants of Cremona, Breſcia, Florence, and ſome other cities, to defend themſelves with vigour; but againſt whom the emperor immediately led the imperial forces.

After reducing Cremona, and compelling Parma, Vicenza, and Placentia, to make peace upon his own terms, Henry laid ſiege to Breſcia, which reſiſted all his efforts for a conſiderable time, with aſtoniſhing firmneſs; but the inhabitants were at laſt reduced to ſuch extremity, that they were compelled to appeal to his clemency, and preſented themſelves before him, barefoot, with halters about their necks. This ſpectacle effectually appeaſed the reſentment which had been excited in Henry's breaſt by the death of his brother Waleran,

and the execution of fifty German priſoners upon the walls; and he readily granted the ſupplicants their lives, on condition they ſhould pay ſixty thouſand crowns, and deliver one hundred hoſtages. However, he ordered their walls and fortifications to be demoliſhed, and entered in triumph through the breach which his troops had made.

Though Henry was, for ſome time, amuſed by the diſſimulation of Robert king of Naples, who had formed a ſtrict alliance with the pope, he reſolved to march toward Rome, in 1312, in order to receive the imperial crown. Accordingly, he led his army thither with all poſſible expedition, and was crowned by ſome cardinals (who had received a commiſſion for that purpoſe) in the church of St. John of Lateran, becauſe the church of St. Peter was occupied by his enemies. As the city of Rome was at this period diſtracted by two contending factions, the majority of the inhabitants rejoiced at Henry's arrival, as the only means of delivering them from the horrors of civil war; but when the emperor, inſtead of gratifying them with inſtances of his bounty, demanded money for the ſupport of his army, they broke out into open rebellion, and upwards of two thouſand Imperialiſts were ſacrificed to their tumultuary vengeance.

Finding it impoſſible to reduce his enemies at Rome, the emperor marched through the territory of Perugia, which he ravaged with fire and ſword, and laid ſiege to Florence; but the inhabitants defended themſelves with ſuch gallantry, that he was unable to obtain any advantage over them, and retired into winter quarters. In the enſuing ſpring, notwithſtanding his ill ſtate of health, he engaged in an expedition againſt Robert king of Naples; but on his arrival at Buonconvento he died ſuddenly, and it was generally aſſerted that a Florentine dominican had poiſoned him in adminiſtering the ſacrament. Henry VII. was, at the time of his death, in the fifty-firſt year of his age, and the fifth of his reign. In his perſon he poſſeſſed an appearance of majeſty mingled with great complaiſance; and he was generally beloved by his ſubjects, on account of his juſtice, piety, and valour.

The imperial diadem now excited the wiſhes and the efforts of Frederic of Auſtria, and Louis of Bavaria, who came forward, in 1315, as candidates for the ſupreme dignity; and each formed a party ſufficiently ſtrong to inveſt them with the inſignia of royalty. Accordingly, a double coronation took place, and the two emperors made the moſt vigorous efforts againſt each other for about ſeven years; but at the expiration of that time, Frederic was defeated and taken priſoner, and Louis was ſolemnly recogniſed as the lawful poſſeſſor of the throne.

Louis had no ſooner ſettled the affairs of Germany, than he exerted himſelf to appeaſe pope John XXII. who had availed himſelf of the recent quarrels to gain poſſeſſion of ſeveral domains, and to make various encroachments upon the imperial crown. But the haughty pontiff, inſtead of liſtening to propoſals of an accommodation, publiſhed a bull, in which he aſſerted that the empire was a fief of the holy ſee, and that Louis was an uſurper of the ſupreme dignity. He even commanded the emperor to deſiſt immediately from the adminiſtration of government; and enjoined all patriarchs, biſhops, prieſts, nobles, and commoners, to withdraw or renounce their allegiance. Louis proteſted againſt this bull, and requeſted that his holineſs would ſuſpend his cenſures until he could conſult the ſtates of the empire; but, at the expiration of three months, the pontiff had recourſe to the eccleſiaſtical thunder, and actually negociated with ſome of the German princes for electing Charles the Fair, king of France, to the imperial dignity.

Notwithſtanding this violent conduct, the pope found himſelf unable to effect his purpoſe; and perceived, with the utmoſt mortification, that a great majority of the Germans were reſolved to defend the dignity of their ſovereign, and the liberties of their conſtitution. Some diſorders which had recently broke out in the empire were happily huſhed to ſilence; the populace were overjoyed at the liberation of the duke of Auſtria, who now renounced his pretenſions to the throne; and Louis contrived to render himſelf peculiarly agreeable to his nobles, by the faſhion of the times, in entertaining them with ſeveral magnificent tournaments.

Having convened a diet at Spire, A. D. 1327, and obtained ſome neceſſary ſupplies of troops and money, Louis reſolved to make an expedition into Italy, whither he had been ſtrongly invited by the Gibellines, and took a ſolemn oath that he would never return until he ſhould have received the imperial crown at Rome. Upon this occaſion, alſo, he ordered the pope to be excommunicated, as an heretic unworthy of filling the apoſtolic chair. On his arrival at Milan, he was crowned king of Italy by the biſhop of Arezzo, as the archbiſhop of Milan refuſed to perform the ceremony. He then advanced into Tuſcany; and, after reducing the city of Piſa, marched towards Rome, where he was received with all poſſible reſpect. The governor and ſenators came out to welcome his arrival; and, after the ceremony of his coronation, which was performed by the biſhops of Venice and Aleria, the affection of the Romans was effectually conciliated by his liberality and courteous behaviour.

The pope, in the mean time, renewed his bulls of excommunication againſt the emperor, and treated him with ſuch indignity, that Louis loſt all patience, and ſwore to be revenged. Accordingly, he convoked an aſſembly at Rome, where pope John was degraded and condemned to death, as a perſon guilty of hereſy and treaſon; and Pietro de Rainauci, a Cordelier, was ſolemnly inveſted with the papacy, by the name of Nicholas V. Sentences of excommunication were now mutually fulminated by John and the antipope, and the former was actually burnt in effigy: but, after ſome time, the Romans became diſcontented; the Piſans reconciled themſelves to the holy ſee; ſeveral other Italian cities renounced the emperor's party; and Nicholas, being compelled to ſubmit to the ſuperior power of his enemy, was ſtripped of his ſacerdotal dignities, and doomed to perpetual impriſonment. His holineſs then engaged in ſeveral new intrigues with the German princes, and with the king of Bohemia; but his meaſures were cut ſhort by death, in the ninetieth year of his age, and the papal chair was filled by James Duſour, in 1336, who aſſumed the name of Benedict XII.

Louis, having quelled other diſturbances in the empire, ſent a ſubmiſſive embaſſy to the new pope, who received them very graciouſly, and expreſſed an earneſt deſire of terminating the differences which had ſo long ſubſiſted between Germany and the ſee of Rome. But the pontiff's favourable intentions were defeated by the intrigues of the French, Bohemian, and Neapolitan, courts; and he was ſoon afterwards perſuaded to renounce the intereſts of Louis, as thoſe of an excommunicated heretic. Hereupon the German princes nobly aſſembled at Spire, declared the empire independent of the pope, and acknowledged Louis of Bavaria as their only lawful emperor; and in a ſubſequent diet at Frankfort, they enacted that famous Conſtitution by which the independence of the empire was for ever eſtabliſhed. On this occaſion, all the electors, except the king of Bohemia, declared by a ſolemn proteſtation, "that whoever was elected king of the Romans by a majority of the princes, needed not the conſent or confirmation of the holy ſee to aſſume the regal title, adminiſter the laws, or govern the eſtates of the empire."

After this triumph, Louis applied himſelf with great diligence to the regulation of the police, and the eſtabliſhment of wholeſome regulations for the preſervation

of

of public tranquillity. The mildneſs of his adminiſtration, united with his ſtrict adherence to juſtice, effectually conciliated the eſteem of his ſubjects; his court became numerous, ſplendid, and polite; and almoſt all the princes who had formerly thwarted his meaſures now began to ſolicit his friendſhip and protection. In this proſperous ſtate of his affairs he was unfortunately killed by a fall from his horſe, A.D. 1343, in the thirty-ſecond year of his reign.

Charles IV. of Luxemburg, was grandſon of Henry VIII. and king of Bohemia in his mother's right. He received an excellent education at the court of Charles the Fair, king of France; and gave ſo many proofs of his valour upon ſubſequent occaſions, that he was univerſally beloved by the Bohemians; who, upon his father's deceaſe, declared him their lawful ſovereign. After Charles had ſpent about ſeven years in arranging the affairs of the empire, he took a journey to Milan, in 1355, where he was crowned king of Lombardy. On his return to Germany, he convoked a diet at Nuremburg, in order to regulate the future election of the emperors, and the number of electors. It was accordingly reſolved, that the form and ceremonies to be obſerved on thoſe occaſions, together with the number, rights, and privileges, of the electors, ſhould be written and publiſhed in the form of an edict. This edict received the name of the *Golden Bull*, from a golden ſeal called *bulla*; which decreed, that the territories by which the great offices of the ſtate were held, ſhould deſcend to their heirs male for ever, in perpetual entail, entire and indiviſible: and the emperor prepared a magnificent entertainment on the occaſion. The city of Mentz was honoured with the firſt exhibition of this new ceremonial. Charles and his empreſs repaired, in their royal robes, to a magnificent platform which roſe from the centre of the market place, and was covered with a ſumptuous banquet. The archbiſhops of Mentz, Triers, and Cologne, as high-chancellors of Germany, Gaul, and Italy, preſented themſelves on horſeback, each having a ſeal depending from his neck, and a letter in his hand. From the fartheſt part of the market-place came up, at full gallop, the duke of Saxony, as chief marſhal, bearing a ſilver meaſure of oats in his hand; and, as it was his province to regulate the precedency of his colleagues, he alighted, and aſſigned to each his proper ſtation. The marquis of Brandenburg, grand-maſter of the palace, then poured out water for the emperor and empreſs to waſh; the count palatine ſerved up the repaſt in a ſervice of gold; and the duke of Luxemburg, repreſentative of the king of Bohemia in the office of chief butler, poured out wine for their majeſties to drink. The marquis of Miſnia and the count of Schwartzenburg, as chief huntſmen, exhibited the ſpectacle of the death of a ſtag and a bear; and the entertainment was concluded with a liberal diſtribution of preſents.

After this ſolemnity, Charles applied himſelf ſedulouſly to the encouragement of the liberal arts, the reformation of his clergy, and the impartial adminiſtration of juſtice; but he gradually ſunk into a ſtate of deſpondency, and paid little attention to the affairs of his dominions. Yet, notwithſtanding his ſupine conduct, he ſucceeded in procuring the election of his ſon Winceſlaus as king of the Romans. He then undertook a journey to France, for the ſole pleaſure of reviſiting a country for which he had ever entertained an affection; and, ſoon after his return to Prague, he was ſeized with a fever, which terminated his life, in the thirty-ſecond year of his reign, A.D. 1378. Beſides the Golden Bull, Charles enacted ſeveral ſalutary laws and conſtitutions; and ordered the feaſt of Charlemagne to be annually celebrated in the church of Aix-la-Chapelle.

Winceſlaus ſucceeded his father in the empire, when ſcarcely ſeventeen years of age; and his firſt public act was deſigned to heal a ſchiſm of the church, which had been occaſioned by the competition of the two pontiffs who had aſſumed the names of Urban VI. and Clement VII. But, notwithſtanding his ſeeming attention to the intereſts of religion, he ſoon exhibited the moſt vicious inclinations, and abandoned himſelf to all kinds of licentiouſneſs; while the provinces became an eaſy prey to banditti, and many cities were obliged to engage in aſſociations for their mutual defence. Two attempts were made to take him off by poiſon, but both failed in their effect. Winceſlaus, as ſome ſay from the deleterious effect of the poiſon, acquired an habit of drunkenneſs, which augmented his natural tyranny, and enflamed him to ſuch a degree of fury, that it was dangerous to be near him. Among other acts of cruelty, he is ſaid to have ordered his confort's confeſſor to be drowned, becauſe he would not reveal the particulars of her confeſſion; cauſed his cook to be roaſted alive, for having ill prepared a diſh of meat; ſtruck off the head of a common executioner, with whom he had contracted a diſgraceful intimacy; and ſentenced all the magiſtrates of the chief tribunal at Prague to be decapitated in a ſingle day, without the formality of a trial. This was afterwards imputed to inſanity; and the princes of the empire ſolemnly depoſed him, and elected Frederic duke of Brunſwic to the ſupreme dignity. The violence of his temper, however, remained unabated, and finally occaſioned his death: for being ſuddenly alarmed by a tumult in the city of Prague, and one of his domeſtics imprudently ſaying that he had been appriſed of this diſturbance, Winceſlaus flew upon him, pulled him to the ground by the hair of his head, and abandoned himſelf to ſuch ungovernable fury, that he fell down in an apoplectic fit, and expired, in the fifty-ſeventh year of his age.

Frederic of Brunſwic being aſſaſſinated, A.D. 1400, the electors conferred the ſovereignty upon Robert count palatine, and cauſed him to be ſolemnly conſecrated in the church of Cologne. At the earneſt ſolicitation of the electors, he undertook an expedition into Italy, in order to reſtore the affairs of that country to their former ſituation: but John Galeazzo, duke of Milan, haraſſed him in ſuch a manner, that, notwithſtanding ſome conſiderable reinforcements which he received from Auſtria, he found it impoſſible to achieve any advantage, and was compelled to return into Germany. The ſubſequent death of Galeazzo offered a more favourable opportunity of retrieving the imperial authority; but the electors of Mentz, Triers, and Cologne, refuſed to grant any ſubſidies for a ſecond expedition, and Robert was conſequently obliged to remain at home.

After chaſtiſing Bernard marquis of Baden, for having eſtabliſhed tolls in his dominions, contrary to the regulations of the public peace, and witneſſing the happy termination of a war between the city of Baſil and the houſe of Auſtria, Robert ſolaced himſelf with the idea of having extinguiſhed all the factions in Germany. But the elector of Mentz ſtill contrived to vex and alarm him, by forming aſſociations againſt the imperial authority, and erecting a ſtrong fortreſs at Horhſt in open defiance of his orders. The emperor was highly incenſed at theſe proceedings; and, after ſome time, determined to curb his enemy's inſolence by force of arms: but this deſign was fruſtrated by a fever, which put a period to his life, in the ninth year of his reign, A.D. 1411.

This prince acquired the ſurname of Short, on account of his ſtature; but he was remarkably active and vigorous, poſſeſſed great penetration, and had made ſome progreſs in the ſtudy of literature. His reign was more diſtinguiſhed by juſtice and clemency, than conſpicuous for martial exploits; and the only blemiſh in his character was avarice. He left three daughters

by his empreſs Elizabeth; and his remains were ſolemnly interred at Heidelberg, where he had founded an academy.

After the death of Robert, Joſſe marquis of Moravia was regularly elected at Frankfort: but his promotion was vigorouſly oppoſed by Sigiſmund, brother to Winceſlaus; many of the imperial cities refuſed to take the cuſtomary oaths of allegiance; and death put a period to his authority, after he had worn the diadem about three months.

Sigiſmund aſcended the imperial throne in 1411, and employed his firſt attention in remedying the grievances which had long prevailed in the provinces, and the ſchiſm which had, for thirty years, diſtracted the church. Accordingly, after effecting an accommodation between ſome hoſtile noblemen, and concluding a treaty with the king of Poland againſt the Teutonic Order, he concurred with pope John XXII. for convoking a council at Conſtance, and deliberating upon meaſures for terminating the ſchiſm and hereſy of the Huſſites.

The reign of this prince was very little diſturbed by the devaſtations of war; and without difficulty he got the ſucceſſion ſettled in favour of his ſon-in-law, Albert duke of Auſtria. This was one of his laſt actions; and he died in the ſeventieth year of his age, having reigned fifty years in Hungary; twenty-ſeven in quality of emperor of Germany, and ſeventeen as king of Bohemia. Sigiſmund was equally remarkable for his comelineſs and majeſtic deportment: he was a liberal rewarder of literary merit; and his own learning was ſo extenſive as to have gained him the epithet of "Light of the World."

Albert II. ſurnamed the Grave and the Magnanimous, was honoured with the crowns of Hungary, Bohemia, and Germany, A. D. 1438. Caſimir of Poland, who had oppoſed his election, was compelled to bow before his reſiſtleſs arms; and his general conduct, both in the field and the cabinet, was, in all reſpects, worthy of applauſe. But while his numerous ſubjects rejoiced in the contemplation of his accompliſhments, and while his vigorous conſtitution promiſed many years of felicity, he died of an indigeſtion, cauſed by an over quantity of fruit, and his remains were ſolemnly interred at Weiſſenberg. Albert was of a tall ſtature, and extraordinary ſtrength; he poſſeſſed the virtues of juſtice and munificence in a very eminent degree; and his memory is revered on account of his zeal for religion and the true intereſts of his people.

After the demiſe of Albert, in 1440, the electors placed Frederic of Auſtria upon the imperial throne; and he made ſome laudable exertions, in the commencement of his reign, for the regulation of the police, and an impartial adminiſtration of juſtice. He alſo ſtrove to extinguiſh the ſchiſm which ſtill continued to diſtract the church, and, at the council of Baſil, he propoſed terms of conciliation between the popes Felix and Eugenius; but as his propoſitions were totally diſregarded, he left them to accommodate their differences themſelves. A rupture between the Swiſs and Auſtrians involved the emperor in greater difficulties, and induced him to ſolicit the aid of Charles VII. of France, after he had unſucceſsfully applied to all the princes of the empire. Charles readily granted his requeſt, and ſent the dauphin with forty thouſand men into Germany, where he defeated the Swiſs with prodigious ſlaughter: but the victorious troops committed ſuch outrages in Alſace, that the ſtates began to be ſeriouſly alarmed, and even threatened to take up arms againſt France. However, this meaſure was prevented by negociation, and the dauphin retired to his father's dominions.

Frederic now returned to Auſtria, where he found himſelf involved in very ſerious difficulties, by a diſpute with the Hungarians, whom he had irritated by detaining their young king, Ladiſlaus, at his court, and delaying to reſtore their crown and regalia, which were in his poſſeſſion. The princes of the empire expreſſed their diſapprobation of his conduct in ſtrong terms, and a number of Bohemians expoſtulated with him upon the ſame ſubject: but he continued to amuſe them with evaſions, till he was, in 1453, compelled by hoſtilities to ſign an accommodation.

Frederic now received intelligence that Charles duke of Burgundy had augmented his paternal inheritance by the addition of Zutphen and Guelderland; and that his ambition had prompted him to tamper with ſome of the electors, in hopes of being choſen king of the Romans. But, ſhortly after this diſcovery, Charles altered his ſcheme, and reſolved to cultivate the friendſhip of the emperor, who, he ſuppoſed, might be eaſily perſuaded to erect his duchy into a kingdom, and confer upon him the title of vicar of the empire in thoſe parts. Having made this determination, he invited Frederic to an interview at Triers, in 1471, and even prepared a throne, canopy, and regalia, for the expected ceremony; but when the emperor had received the homage which was to be the price of his conſent, he departed, under pretence of urgent buſineſs, on the very day appointed for the coronation. Having thus converted the duke's foible to his own advantage, Frederic contented himſelf with keeping an obſervant eye upon his motions: he ſaw him exhauſt his ſtrength in a war againſt his ſubjects, come to an open rupture with France, and periſh in a combat with the Swiſs, leaving an only daughter, Mary of Burgundy, who was reputed the richeſt heireſs in Europe. This conjuncture was exactly ſuited to the wiſhes of the emperor, who gained over the Flemings, and perſuaded them to beſtow the hand of their ducheſs on his ſon Maximilian, whom he had procured to be elected king of the Romans. From this period he repoſed upon Maximilian the chief weight of the government, though, from a review of his conduct, it does not appear to have been a very heavy burthen upon his own ſhoulders. At the age of ſeventy-nine years he ſubmitted to the amputation of an ulcerated leg; but the fever which followed that operation conducted him to the grave.

Frederic III. was a prince of an agreeable air and majeſtic countenance. He was plain in his apparel, moderate in his paſſions, and ſo remarkably abſtemious that his life is ſaid to have reſembled a continual faſt. From his natural averſion to war he was ſurnamed the Pacific, yet the inconſtancy of his temper often prompted him to embark in a quarrel. He was endowed with a fund of low cunning, and a tenacious memory, but he appears to have been equally deſtitute of courage, reſolution, and generoſity. It muſt, however, be remarked, that he greatly aggrandiſed the wealth and power of the houſe of Auſtria.

His ſon Maximilian I. was inveſted with the ſupreme authority, by the unanimous conſent of the electors, A. D. 1493. Shortly after his coronation, he entered a ſecond time into the conjugal ſtate, and eſpouſed Blanche Maria, ſiſter to the duke of Milan, famed for her perſonal charms and amiable qualities. He then appointed his ſon Philip governor of the Low-countries; and convoked a diet at Worms, where he cauſed a conſtitution to be enacted for the preſervation of the public tranquillity, and decreed that the imperial chamber, which had hitherto travelled about with the court, ſhould be ſtationary.

Upon the reduction of Naples by Charles VIII. the emperor and the princes of Italy engaged in a league againſt that monarch, and their confederacy was joined by Ferdinand and Iſabella of Spain. Maximilian embraced this favourable opportunity to propoſe a match, which afterwards took place, between his ſon Philip and the infanta Joanna, and which proved no leſs advantageous to the Auſtrian family than that of the em-

MAXIMILIAN I.

London. Published as the Act directs. Dec.r 26. 1807. by J. Wilkes.

peror with the princeſs of Burgundy. Meanwhile the king of France, hearing of the powerful league that was formed againſt him, ſet out from Naples to return to his own dominions; but on his arrival at the plain of Fornova, he found the allies drawn up to diſpute his paſſage, and he was conſequently obliged to give them battle. Fortune, however, favoured his arms upon this occaſion, and he purſued his route without further interruption.

Soon after theſe tranſactions, Ferdinand recovered the kingdom of Naples; and the emperor was earneſtly ſolicited to march into Italy in order to fruſtrate the new deſigns of aggrandiſement of the French monarch. Maximilian readily acceded to this requeſt, and croſſed the Alps with a ſmall body of troops; but his expedition proved altogether fruitleſs. Louis XII. having now aſcended the throne of France, avowed his intention of ſeizing Milan; ſo that the emperor found it indiſpenſably neceſſary to turn his arms againſt the Swiſs, who had begun to make hoſtile irruptions into the Auſtrian territories, and had renewed their alliance with France. Maximilian therefore ordered a numerous army to rendezvous near Conſtance, whence they ſallied out, in ſeveral ſmall detachments, to pillage the caſtles and villages in the neighbourhood of Schaffhauſen: but whilſt they were thus employed, the enemy ruſhed upon them with irreſiſtable fury, and put them nearly all to the ſword. A ſimilar misfortune happened to a body of Swabians, who had plundered the cantons of St. Gall and Appenzel; for, whilſt they were triumphing in their ſucceſs, they fell into an ambuſcade, and were cut to pieces. The emperor then repaired in perſon to Conſtance, and collected a body of forces conſiſting of about fifteen thouſand men: but theſe, together with ſome powerful reinforcements, were defeated, and Maximilian was compelled to negociate a peace.

In the mean time, Louis XII. having ſubdued the Milaneſe, and compelled the king of Naples to reſign his ſovereignty, A. D. 1501, reſolved to cultivate Maximilian's friendſhip, and actually demanded of that prince the inveſtiture of Milan. The emperor was, at firſt, greatly averſe to this propoſal: but a pecuniary preſent effectually conquered his reluctance; and a peace was concluded between the courts of France and Germany, by which the emperor granted the inveſtiture of the Milaneſe, and Louis engaged to aſſiſt his ally againſt the Turks, maintain the rights of his ſucceſſors to the kingdoms of Hungary and Bohemia, and facilitate his coronation at Rome.

Soon after this occurrence, Maximilian undertook an expedition to receive the crown of Italy; but, being refuſed a paſſage through the valley of Trent, he was obliged to deſiſt from his enterpriſe, after having ſuſtained conſiderable loſs in an engagement with Bartolomeo d'Alviano, general of the Venetian republic. And, as he was alſo diſappointed of his coronation at Rome, he laid injunctions upon all the ſtates of the empire, to give him the appellation of "Roman emperor elected,"—a title which has ſince been aſſumed by all his ſucceſſors. The conduct of the Venetians gave ſuch umbrage to the French monarch, that, in 1509, he formed the project of a league, in order to diveſt the Venetians of all the dominions they had uſurped from the empire in Lombardy, from France and Spain in the Milaneſe and Apulia, and from the eccleſiaſtical ſtate in Romagna. The emperor was ſo far from oppoſing this ſcheme, that he entered into it with the greateſt cheerfulneſs; and the combined armies proved ſo ſucceſsful, that the Venetians ſoon abandoned all their territories upon the continent, and were eventually reduced to ſuch extremity, that they ſent a *charte blanche* to the emperor, and implored his clemency in the moſt ſubmiſſive terms; but their application was rendered fruitleſs by the remonſtrances of cardinal d'Amboiſe, who, about this time, received the inveſtiture of Milan in the name of his royal maſter.

Louis had no ſooner repaſſed the Alps, than the Venetians felt their courage revive; and they retook ſeveral places which were garriſoned by the imperial troops. Maximilian marched to check their progreſs, at the head of eighty thouſand men: but they defended themſelves with uncommon reſolution, and, by a capital ſtroke of policy, prevailed on the Roman pontiff to eſpouſe their cauſe. At this time alſo the Florentines obtained an advantageous peace of the emperor, and, in conſideration of forty thouſand crowns of gold, he granted an amneſty for all their revolts, and confirmed their privileges in the moſt ample manner.

The attempt of pope Julius to negociate an accommodation, proved entirely fruitleſs; and Julius, finding it impoſſible to effect his deſigns by mediation, declared war againſt the French monarch, on pretence of his having refuſed to reſtore ſome towns which belonged to the holy ſee. Louis immediately convoked an aſſembly of his clergy, to enquire how far he ought to reſpect the power of the church, which the pope exerciſed ſo unjuſtly; and the aſſembly unanimouſly declared that he might repel an unjuſt attack by force of arms, and inſiſt upon the common rights of mankind, according to the decrees of the council of Baſil. This declaration was not more agreeable to Louis than the emperor, who, it is ſaid, entertained the ſingular idea of procuring himſelf to be elected pope, and had actually reſolved to borrow a large ſum of money to purchaſe the votes of the cardinals.

Whilſt the pope was employed againſt the duke of Ferrara, Louis and Maximilian ſent ambaſſadors to the king of Arragon, complaining of his conduct, and exhorting him to ſecond their endeavours for the convocation of a council; but he anſwered very coldly upon both theſe ſubjects, and endeavoured, by private negociation, to detach Maximilian from the intereſt of France. His attempts, in that reſpect, were not altogether unſucceſsful; for the emperor ſoon began to treat his ally with indifference, and eventually declared for his enemies. Louis, thus forſaken, was ſoon ſtript of his conqueſts in Italy, and found himſelf reduced to great extremities by an invaſion of the Swiſs and the Engliſh; the latter of whom had denounced war againſt him at the inſtigation of Ferdinand, and joined the imperial forces in Picardy, where they obtained the deciſive victory which is generally called the battle of the ſpurs. Hoſtilities were carried on with various ſucceſs till the demiſe of Louis, A. D. 1515; when his ſucceſſor Francis I. negociated an accommodation with the emperor, and concluded a treaty of peace with Venice and England. The ſubſequent ſucceſs of that prince in Italy alarmed Maximilian, and induced him to have recourſe to arms; but he ſoon conſented to make peace; and Francis remained in tranquil poſſeſſion of his important conqueſts.—See the article FRANCE.

Maximilian now exerted all his abilities to procure the election of his grandſon Charles, who had recently taken poſſeſſion of the Spaniſh diadem: but, as there was no precedent for nominating a king of the Romans previouſly to the emperor's coronation at Rome, he could not obtain the gratification of his deſire. This diſappointment ſeems to have preyed upon his ſpirits; for he was, ſoon afterwards, attacked with a fever, which brought him to the grave, in the ſixtieth year of his age, and the twenty-ſixth of his reign, A. D. 1520. Maximilian was a prince of a very majeſtic appearance, and a friend to literature: and he poſſeſſed ſo tenacious a memory, that he never forgot the names of perſons whom he had once ſeen, or heard mentioned. During his reign, the empire was divided into ten circles.

Charles V. ſon of Philip king of Caſtile, upon the firſt intelligence of his grandfather's death, preſented himſelf

himſelf as a candidate for the imperial throne, and (as his partiſans obſerved) his hereditary claim to the extenſive territories of the houſe of Auſtria, the rich ſovereignty of Franche Compté and the Netherlands, and the entire poſſeſſion of Spain and Sicily, all united to hold him up to the firſt dignity among Chriſtian princes. But Francis I. of France declared himſelf a competitor, and with no leſs confidence of ſucceſs than Charles. He truſted to his ſuperior years and experience; and, urged, as a peculiar recommendation, that the French cavalry when united to the German infantry would not only form an irreſiſtible barrier againſt invaſion, but might alſo prove ſufficient to cruſh the augmenting power of the Turks.

Both theſe claims were certainly plauſible, yet both were rejected; and the electors made a tender of the imperial diadem to Frederic, ſurnamed the Wiſe, duke of Saxony. But he was ſo far from being dazzled by its ſplendour, that he rejected it with noble firmneſs, and inſiſted on the expediency of raiſing Charles to the ſupreme dignity. "In times of tranquillity, (ſaid the magnanimous duke,) we wiſh for an emperor who has no power to curtail our liberties; times of danger demand one who is able to maintain our ſafety. The Ottoman forces, led by a martial and victorious prince, are now aſſembling, and are ready to pour in upon our empire with a violence unknown in former ages. New conjunctures call for freſh expedients. The imperial ſceptre muſt be placed in ſome hand more powerful than mine, or that of any other German prince. We poſſeſs neither dominions, revenues, nor authority, ſufficient to encounter ſo formidable an enemy. Recourſe muſt, therefore, be had to one of the royal competitors. Each of them can certainly raiſe forces for our defence: but as the king of Spain is of German extraction, as he is a prince of the empire by the territories which deſcend to him from his grandfather, and as his dominions ſtretch along that frontier which lies moſt expoſed to the enemy, his claim, in my opinion, is preferable to that of Francis, who, notwithſtanding his extenſive power, is a ſtranger to our language, our cuſtoms, and our country." This well-timed ſpeech made a deep impreſſion on the minds of the electors, and Charles was inveſted with the imperial crown at Aix-la-Chapelle, in the year 1521.

The firſt act of Charles's adminiſtration was to appoint an imperial diet to be held at Worms, in order to concert meaſures for checking the progreſs of Luther's opinions, and the reformation, which were repreſented as inimical to the peace of Germany, and ſubverſive of the catholic religion. Luther appeared at that aſſembly; and, being aſked whether he would retract or defend the doctrines he had recently promulgated, he inſiſted upon the truth of what he had advanced, and reſiſted, with equal firmneſs, the perſuaſions and remonſtrances of thoſe who had tampered with him in private. Some of the members of the diet were highly incenſed at his perſeverance, and urged the emperor to violate the ſafe conduct which he had granted; but Charles rejected this advice with noble diſdain, and reminded them, "that if good faith were baniſhed from all the reſt of the world, it ought to find an aſylum in the palaces of princes." Luther was, therefore, permitted to retire in ſafety, though he was, at the ſame time, condemned and proſcribed, by public edict, as an impious heretic, who had broached the moſt pernicious doctrines.

Previouſly to the deciſion of the electors reſpecting an emperor, Charles and Francis had conducted their rivalſhip without enmity, and had even mingled in their competition many expreſſions of fraternal regard. But a ſpirit of jealouſy was afterwards kindled between thoſe two great princes, which involved them in frequent hoſtilities, and kept their whole lives in diſquietude. The Spaniards alſo, chagrined at the departure of their ſovereign, and exaſperated by the avarice of the Flemings, who had lately preſided at the helm of government, entered into an aſſociation, which they called the *Sancta Juncta*; and the ſword was appealed to as a means of redreſs. Francis conſidered this as a favourable conjuncture for reinſtating the family of John d'Albert in the ſovereignty of Navarre; and a French army was immediately ſent out under the command of Andrew de Foix, whoſe exertions were, at firſt, crowned with victory; but on his raſhly penetrating into Caſtile, he was defeated and taken priſoner; and Navarre was recovered in a ſhorter time than he had ſpent in reducing it.

Soon after this event, Francis encouraged the duke of Bouillon to make war upon the emperor, and to invade Luxemberg; but this inſult was ſoon chaſtiſed by the imperial forces: and the French king, who had broken into the Low-countries, loſt an opportunity of gaining a complete victory. During theſe operations a congreſs was held at Calais, under the mediation of Henry VIII. king of England; but this proved entirely unſucceſsful: and a league was ſoon afterward concluded between the pope, the emperor, and the Engliſh monarch, againſt France. In the mean time, the Milaneſe, weary of the exactions of mareſchal de Lautrec, reſolved to expel the French troops, and put themſelves under the protection of Francis Sforza, brother to Maximilian their late duke. This deſign was approved by his holineſs the pope, who fulminated an excommunication againſt Lautrec, and took into his pay a numerous body of Swiſs. The papal army, commanded by Proſper Colonna, received a powerful reinforcement from Germany; the city of Milan was betrayed to the confederates; Parma and Placentia were united to the eccleſiaſtical ſtate; and of all their conqueſts in Lombardy, only the caſtle of Milan, the town of Cremona, and ſome inconſiderable forts, remained in the hands of the French.

Pope Leo X. received the news of this brilliant ſucceſs with ſuch immoderate tranſport, as brought on a fever and occaſioned his death. By this accident the ſpirit of the confederacy was broken, and its operations ſuſpended. The Swiſs were immediately recalled; ſome other mercenaries diſbanded for want of pay; and only the Spaniards and a few Germans remained to defend the Milaneſe. Lautrec, who had taken refuge in the territories of Venice, was anxious to improve ſo favourable an opportunity; but all his efforts were fruſtrated by the vigilance and ability of Colonna. During theſe tranſactions, much diſcord prevailed at Rome reſpecting the election of a ſucceſſor to Leo X. Cardinal Wolſey had long relied on the emperor's intereſt; and Julio de Medici, Leo's nephew, thought himſelf ſure of the tiara; but both theſe candidates were ſet aſide, and cardinal Adrian, who at that time governed in the emperor's name, was unanimouſly raiſed to the papal chair, to the great diſguſt of the Italians, and the aſtoniſhment of all Europe.

Rouſed by the augmented power of his rival, Francis now determined to make a vigorous exertion for the recovery of Lombardy; and, accordingly, ſent a reinforcement of ten thouſand Swiſs to Lautrec. The French commander was alſo in a condition to act offenſively, and actually advanced within a few miles of the city of Milan: but his new auxiliaries growing mutinous, he was obliged to attack the Imperialiſts at Biocca, where he was defeated with prodigious ſlaughter. He was conſequently obliged to retire into France; while Colonna effected the reduction of Genoa, and effectually re-eſtabliſhed the imperial authority.

Whilſt an Engliſh army, under the earl of Surrey, made an unſucceſsful deſcent on the coaſt of France, and the emperor was fully employed in tranquillizing the

the Spaniſh dominions, Solyman the Magnificent made an irruption into Hungary, and reduced Belgrade. He then turned his arms againſt the iſland of Rhodes, and, after an obſtinate ſiege of ſix months, added that important place to his former conqueſts. Charles and Francis were equally aſhamed of having neglected the relief of an iſland which was generally conſidered as the great bulwark of Chriſtendom in the eaſt; and the emperor, by way of reparation, granted to the knights of St. John the iſland of Malta, where they fixed their reſidence, and continued long to retain their ancient ſpirit, though diminiſhed in ſtrength and ſplendour.

Pope Adrian IV. though devoted to the intereſts of the emperor, endeavoured to aſſume the impartiality which beeame his pontifical character, and laboured to effect a reconciliation between the contending princes. The Italian ſtates were alſo diſpoſed to peace; and ſo much regard was paid to the pope's propoſal of a truce for three years, that the Imperial, French, and Engliſh, ambaſſadors, at Rome, were empowered to treat upon that ſubject; but whilſt they were employed in fruitleſs negociations, their ſovereigns were continuing hoſtile preparations, and the confederacy againſt Francis became more powerful than ever. The Venetians, who had hitherto eſpouſed the French intereſt, formed engagements with the emperor for ſecuring the Milaneſe to Francis Sforza; the Florentines, the dukes of Ferrara and Mantua, and all the Italian powers, acceded to the ſame alliance; while the emperor undertook the invaſion of Guienne, the forces of England and the Netherlands hovered about Picardy, and a numerous body of Germans was appointed to ravage Burgundy.

Although the enemies of France had thus carried the war into the very bowels of that kingdom, Francis ſtill retained his natural courage, and determined, even at this perilous criſis, to make a freſh attempt for the recovery of the Milaneſe. Accordingly, in 1524, he ſent an army of thirty thouſand men acroſs the Alps, under the command of general Bonnivet. Colonna was in no condition to reſiſt this force; and the duchy of Milan might have been eaſily reduced, had not Bonnivet waſted his time in unimportant enterpriſes. By his imprudent conduct, in this reſpect, his own army was greatly diminiſhed, while that of the confederates received powerful ſuccours, and he was compelled to make an ignominious retreat, after loſing his braveſt troops in an engagement at Biagraſſa. Francis, having defended his native kingdom with aſtoniſhing ſucceſs, reſolved to march in perſon againſt the Milaneſe, in order to wipe off the diſgrace of Bonnivet's expedition; but, although he obtained ſeveral important advantages, he was at laſt defeated, and taken priſoner at the ſiege of Pavia; Milan was inſtantly abandoned; and after a few weeks there was ſcarcely a Frenchman left in Italy.

Whatever joy the emperor might have felt on this occaſion, he concealed his real ſenſations, and forbade any public rejoicing to be made in his dominions; obſerving, that all victories gained over fellow-chriſtians were rather objects of mourning than of mirth. His confeſſor, believing that he ſpoke the language of his heart, exhorted him to releaſe his illuſtrious captive without ranſom, as ſuch an act of generoſity would tranſmit his name with glory to poſterity, and the French monarch would be neceſſarily attached to his intereſts in future, by the ſtrongeſt ties of gratitude. But, inſtead of following this advice, Charles ſuffered his unfortunate rival to remain in cloſe confinement, and propoſed ſuch ſevere terms as the price of his liberty, that he was with difficulty reſtrained from putting a period to his own exiſtence. At length, however, the emperor thought proper to abate a part of his exorbitant demands, and Francis was removed to Madrid, where he obtained his liberty on condition of ceding Burgundy, and ſome other territories, to his conqueror, and delivering up his two ſons, the dauphin of France, and the duke of Orleans, as hoſtages for the performance of the treaty. He had, however, no ſooner returned to his own dominions, than he proteſted againſt this agreement as a compulſory act, and announced his intention of renewing the war. Francis was ſupported in theſe meaſures by the courts of Rome and England; and a formidable confederacy, called the "Holy League," was formed, to curb the dangerous power of the emperor, to enforce the liberation of Francis's ſons on the payment of a reaſonable ranſom, and to re-eſtabliſh Sforza in the duchy of Milan.

In conſequence of this league, Italy once more became the ſeat of war, and the confederate army entertained the moſt brilliant hopes of ſucceſs: but Francis, who it was expected would have infuſed vigour into the whole body, had paſſed through ſuch a ſcene of diſtreſs, that he was become diffident of his abilities, and diſtruſtful of his fortune. He flattered himſelf that the mere name of ſuch a confederacy would induce Charles to liſten to terms of accommodation; and under this miſtaken idea, neglected to ſend reinforcements to his allies in Italy. Meanwhile the duke of Bourbon, who commanded the imperialiſts, reduced the whole of the Milaneſe, and led his victorious forces to the gates of Rome. His attempt upon that city coſt him his life; but his followers ſoon ſcaled the walls, ſacrificed many of the unfortunate inhabitants to their reſentment, and confined the ſovereign pontiff in the caſtle of St. Angelo. Charles received the news of theſe tranſactions with his accuſtomed diſſimulation, and even ordered his clergy to offer up prayers in their churches for the pope's liberation; though he determined to prolong his captivity till he ſhould pay an enormous ranſom, and ſurrender to him all the places of ſtrength in the eccleſiaſtical dominions.

The kings of France and England had, previouſly to the ſacking of Rome, agreed to invade the Low-countries with a powerful army; but on the firſt intimation of the pope's misfortune, they transferred the theatre of the projected war to Italy, and Clement obtained his liberty. But though the confederates were ſucceſsful at the opening of the campaign, their fortune was ſuddenly changed by ſome untoward accidents; and Francis was ſo effectually diſcouraged, that he began to turn his thoughts toward a pacification. Charles, on the other hand, was anxious to return into Germany, where his preſence was abſolutely neceſſary; and after ſome time, an accommodation was negociated at Cambray, by which Francis conſented to reſign all his claims to Lombardy, Flanders, and Artois, and pay two millions of crowns as the ranſom of his ſons, and the emperor ceaſed to demand the reſtitution of Burgundy. Charles alſo, about the ſame time, concluded a peace with the pope; and having been crowned by his holineſs at Bologna, he returned triumphant to the German empire.

Charles now made ſome vigorous exertions for ſecuring the imperial dignity to his brother Ferdinand, who had aſcended the throne of Hungary; and, notwithſtanding the ſpirited remonſtrances of ſeveral princes, he procured him to be elected king of the Romans. This meaſure gave great offence to the elector of Saxony and his confederates, and Germany appeared to be threatened with the horrors of a civil war, but the dread of an invaſion from the Turks, induced both parties to unite in defence of their country. Charles had received intelligence that the armies of that nation were advancing in prodigious numbers toward Stiria; that fifteen thouſand cavalry had already penetrated as far as Lintz, and that Solyman had croſſed the Danube in perſon at Belgrade. But a timely treaty of accommodation with the proteſtants had produced ſuch general unanimity, that the emperor ſoon found himſelf at the head of 120,000 men. With theſe he marched againſt the invaders; and had either he or Solyman dared to hazard a general engagement, it would probably have been deciſive of the fate of two great empires: but both the chieftains ſeemed to have entertained fears of each other's power, and they

took the earlieſt opportunity of retreating mutually to their reſpective dominions.

After making ſome unſucceſsful exertions againſt the proteſtant reformers, A. D. 1536, Charles fitted out a powerful armament, and undertook an expedition into Barbary, in order to reinſtate Muley Haſſein, the exiled king of Tunis, upon his throne; and to chaſtiſe the inſolence of the grand pirate Barbaroſſa, who continually infeſted the coaſts of Spain and Sicily. He accordingly ſet ſail with a numerous fleet, and his deſign was ſo well conducted, that in a ſhort time he reduced the city of Tunis, and the fortreſs of Goletta; liberated a great number of Chriſtian ſlaves; defeated the corſair both by ſea and land; and reſtored Muley Haſſein to the ſovereignty, after that prince had acknowledged himſelf his vaſſal, and engaged to ſupport a Spaniſh garriſon in the Goletta.

The king of France now took advantage of the emperor's abſence, to revive his pretenſions to Italy; and though unſupported by any ally, he raiſed a formidable army, under the pretence of chaſtiſing the duke of Milan for a breach of the law of nations, in putting to death his ambaſſador. Inſtead, however, of marching directly into the Milaneſe, he commenced hoſtilities againſt the duke of Savoy, with whom he had ſome cauſe of diſſatisfaction; and in the courſe of a ſingle campaign ſtripped him of all his dominions, except the province of Piedmont. In this exigence the unfortunate duke applied to Charles for protection; and, as his calamities were chiefly occaſioned by his attachment to the imperial intereſt, he naturally expected immediate aſſiſtance; but the emperor, who had juſt returned from his African expedition, was unable either to march to his relief, or to ſend him the neceſſary ſuccours. In the mean time, the death of Sforza duke of Milan totally changed the nature of the war, and afforded Charles full leiſure to prepare for taking an active part in the conteſt. The pretext of the king of France for taking up arms was now removed; but, as Sforza had died without iſſue, all the rights which had been added to him and his deſcendants reverted now to his enemy. Had Francis, at this juncture, enforced his claim at the head of his army, Milan muſt have immediately ſubmitted to his authority; but, by an accountable fatality, he waſted his time in fruitleſs negociations, while his more politic rival took poſſeſſion of the duchy, as a vacant fief of the empire, and even formed a project for the ſubverſion of the French monarchy.

Upon this occaſion Charles appears to have been too ſanguine. Having chaced the forces of his enemy out of Savoy, he led an army of fifty thouſand men to invade the ſouthern provinces of France, while two formidable detachments were ordered to make an irruption into Champagne and Picardy. Francis was greatly alarmed at this invaſion; but he prudently reſolved to remain entirely upon the defenſive, and to deprive the enemy of ſubſiſtence, by laying waſte the country before them. The mareſchal Montmorency, who was entruſted with the execution of this plan, aſſembled a conſiderable body of forces at the confluence of the Rhone and Durance; while Francis, with another army, encamped at Valence, higher up the Rhone. Arles and Marſeilles were furniſhed with ſtrong garriſons, but the other frontier towns were evacuated; ſuch fortifications as might have afforded ſhelter to the enemy were demoliſhed; corn, forage, and proviſions of every kind, were carried off; and the country was literally changed into a vaſt deſert, from the Alps to Marſeilles, and from the ſea to the confines of Dauphiny.

Charles was much chagrined at the unexpected difficulties which preſented themſelves to his view; but he ſtill perſiſted in his reſolution, and endeavoured to revive the ſinking hopes of his officers, by liberal promiſes of lands and honours in France. He accordingly undertook the ſiege of Marſeilles, and uſed his utmoſt exertions to draw Montmorency from his camp at Avignon; but, at the expiration of two months, he found it impoſſible to obtain any advantage, and was, conſequently, obliged to retreat. The invaſion of Picardy was equally unſucceſsful. After theſe events a ſuſpenſion of arms was effected by the interpoſition of the queens of France and Hungary, and a truce was concluded at Nice, through the mediation of pope Paul III. a man of a venerable character, and pacific diſpoſition. A few days after ſigning the truce, Charles was driven, by contrary winds, on the coaſt of Provence, and was received by Francis with the warmeſt demonſtrations of eſteem and affection. Mutual viſits were paid with an equal degree of confidence; and theſe two powerful rivals, who had accuſed each other of every kind of baſeneſs, converſed together with the cordiality of brothers.

Whilſt the emperor was employed in regulating the affairs of Spain, the citizens of Ghent, in 1540, broke out into rebellion, on account of a tax which they judged contrary to their ancient privileges. Senſible, however, of their inability to reſiſt the force which would inevitably be ſent againſt them, they implored the protection of the French monarch, offering to put him in immediate poſſeſſion of their city, and to aſſiſt him in recovering ſuch provinces of the Netherlands as had formerly belonged to his crown. But Francis, forgetful of his paſt injuries, rejected theſe propoſitions, and communicated the whole negociation to the emperor. By this generous proceeding, Francis hoped to obtain the inveſtiture of Milan, and the emperor flattered him in that apprehenſion for his own intereſted purpoſes. His preſence being neceſſary in the Netherlands, Charles demanded a paſſage through France; and was received in that kingdom with every mark of reſpect. The dauphin and the duke of Orleans offered to go into Spain, as hoſtages for his ſecurity; the king entertained him at Paris with the utmoſt magnificence; and the young princes, whoſe generous offer had been refuſed with due acknowledgment, accompanied him to the frontiers of the Low-countries; yet he ſtill found means to evade his promiſe relative to the inveſtiture of the Milaneſe.

The rebellious citizens of Ghent were no ſooner appriſed of the emperor's arrival, than they ſent a ſolemn embaſſy to deprecate his wrath; but he was deaf to their entreaties, and entered the place of his nativity at the head of a formidable army, as if it had been a hoſtile city taken by aſſault. Twenty-ſix of the principal burghers were executed, as ringleaders of the ſedition, a greater number were baniſhed, the town was deprived of its artillery, arms, and privileges, and the unfortunate inhabitants were compelled to pay a fine of one million two hundred thouſand crowns for the erection of a citadel and the ſupport of a garriſon, which might operate as a future check upon them.

Having thus re-eſtabliſhed his authority in the Low-countries, Charles was obliged to turn his attention toward the affairs of Germany. The proteſtants, having made ſeveral fruitleſs applications for a general council, entreated him to appoint a conference between a ſelect number of divines of each party, in order to examine thoſe points which had been ſo long and vigorouſly conteſted. After mature deliberation, the emperor acceded to this requeſt, and a conference was held, with great ſolemnity, at Ratiſbon: but the eccleſiaſtics choſen to manage the controverſy, were only able to ſettle a few ſpeculative opinions, and the diet was adjourned to a future period.

In 1541, Charles received the vexatious intelligence of a great revolution which had happened in Hungary, to the detriment of his brother's power, and the aggrandiſement of the infidels. However, his well-timed conceſſions to the proteſtants were productive of ſuch ample ſupplies, both of men and money, as left him under little anxiety about the ſafety of Germany. He therefore haſtened

THE EMPEROR CHARLES V.

London, Published as the Act directs June 20th 1809, by J. Wilkes

haſtened to execute a favourite project which he had concerted againſt Algiers, and ſet ſail, with a formidable fleet, for the coaſt of Barbary; but the weather proved ſo extremely tempeſtuous, and the Algerines defended themſelves with ſuch gallantry, that he was compelled to abandon his deſign. The loſs which Charles ſuſtained in this affair encouraged the king of France to begin hoſtilities, on which he had for ſome time reſolved, in order to chaſtiſe the emperor for his duplicity relative to the inveſtiture of Milan, and for the treacherous aſſaſſination of two ambaſſadors, by the marquis del Guaſto, governor of the Milaneſe.

After explaining to all the courts of Europe the heinouſneſs of this injury, the baſe conduct of the emperor, and the abſolute neceſſity of vengeance, Francis, in 1545, made formidable preparations for war; and his orders were executed with ſuch diſpatch, that five armies were ſoon ready to take the field, under different deſtinations. Charles, on the other hand, levied a prodigious number of forces, and even threatened to divide the kingdom of France between himſelf and Henry VIII. of England. But the ſubſequent hoſtilities proved altogether indeciſive; and after ſome time a peace was concluded at Creſpy, by which it was agreed, that all recent conqueſts ſhould be mutually reſtored; that Charles ſhould reſign his claim to the duchy of Burgundy, and Francis renounce all pretenſions to the ſovereignty of Flanders and Artois; that the emperor ſhould give in marriage to the duke of Orleans, either his eldeſt daughter with the Low-countries, or the ſecond daughter of his brother Ferdinand, with the inveſtiture of Milan; and that both parties ſhould turn their arms againſt the infidels; but the premature death of the duke of Orleans ſoon diſentangled Charles from this ſtipulation.

The emperor was chiefly induced to grant this peace by a deſire of humbling the proteſtant princes in Germany, who with the papal juriſdiction might probably throw off the imperial authority. He accordingly concluded a diſhonourable peace with the Porte; and, at the ſame time entered into a league with pope Paul III. for the extirpation of hereſy. His ambition, however, met with a very ſevere check; for, although his arms were for ſome time crowned with ſucceſs, he was obliged, in 1552, to conclude a peace with the proteſtants on their own terms.

Charles had no ſooner made peace with the proteſtants, than he began to regret the loſs of Metz, Toul, and Verdun; and reſolved to attempt the recovery of thoſe biſhoprics, by force of arms. Accordingly, he levied an army of ſixty thouſand men, and prevailed on Albert of Brandenburg to join him, with a ſtrong reinforcement; but after ſpending almoſt ſixty days before the walls of Metz, and loſing upwards of thirty thouſand men, he was compelled to abandon the enterpriſe. To add to his misfortunes, he now loſt the footing which he had hitherto maintained in Tuſcany; and the mal-adminiſtration of his viceroy in Naples threatened that kingdom with the moſt dreadful calamities. Exaſperated by theſe diſaſters, and impatient to obliterate the ſtain which his military reputation had received before Metz, Charles retired into the Low-countries, and carried Terouane and Heſdin by aſſault. In Italy, however, the imperial arms were leſs ſucceſsful, and the Turks continued to augment their conqueſts in Hungary. After the war had been carried on for ſome time, with various ſucceſs, a truce for five years was concluded between the emperor and Henry II. king of France, on condition that both parties ſhould retain the territories which they then had in poſſeſſion.

Shortly after the ceſſation of hoſtilities, the emperor, finding his health rapidly decline, determined to relinquiſh the burthen of government; and accordingly recalled his ſon, on whom, at his recent marriage with Mary queen of England, he had beſtowed the kingdoms of Naples and Sicily, together with the duchy of Milan. Having aſſembled the ſtates of the Low-countries at Bruſſels, he explained the reaſons of his reſignation, recapitulated the moſt important actions of his life, and transferred the ſovereign authority to Philip with ſuch unaffected magnanimity and paternal affection, that the whole audience melted into tears. A few weeks after this ſolemnity, Charles conferred all his royalties and ſignories, both in Europe and America, upon his ſon; reſerving nothing to himſelf but a penſion of one hundred thouſand crowns, to be deducted from the revenue of Spain. After making ſome ineffectual attempts to ſecure the German princes in the intereſts of Philip, Charles made a formal reſignation of the empire to his brother Ferdinand, and immediately ſet out for Spain with a choſen retinue, A. D. 1555. On his landing at Laredo, his joy was ſo exceſſive, that he proſtrated himſelf upon his knees, and with an exclamation of rapture kiſſed the ground. Previouſly to his arrival in Spain, a ſmall building had been annexed to the monaſtery of St. Juſt, conſiſting of ſix rooms; four of them in the form of friars' cells, with naked walls; and the other two hung with brown cloth, and furniſhed in the moſt ſimple manner. Thither Charles retired with only twelve domeſtics; and there, after a peaceful ſolitude of about two years, he reſigned his breath, in the fifty-ninth year of his age. His body was interred at Granada, near thoſe of his grandfather and grandmother; but it was afterwards removed to the Eſcurial, by order of Philip IV. —See the article SPAIN.

FROM THE ABDICATION OF CHARLES V. TO THE TREATY OF RASTADT.

Ferdinand I. brother of Charles V. having been unanimouſly approved of by the electors, they transferred to him, on the late emperor's act of abdication, the imperial dignity, and took the accuſtomed oaths of allegiance. The Roman pontiff, however, refuſed to admit the abdication of Charles, or the election of his brother, becauſe both theſe events had taken place without his concurrence. He even refuſed audience to don Martin de Guzman, whom Ferdinand had ſent to take the uſual oath in his name; and appointed certain cardinals to examine into the merits of the affair. Theſe commiſſaries declared that the ambaſſador could not be admitted to any audience, until he ſhould have demonſtrated in what manner the imperial throne became vacant, and by what right Ferdinand pretended to the ſucceſſion; as all the recent proceedings at Frankfort were null and void, becauſe carried on by heretic electors, without the conſent of his holineſs. Ferdinand, however, paid little regard to this declaration; for he conſidered the ancient cuſtom of ſoliciting the papal confirmation, and going to receive the imperial diadem at Rome, as ſuperfluous ceremonies. His indifference was not productive of any ſerious conſequence; for, on the death of Paul IV. which happened ſhortly after the election, he received the confirmation of his new dignity from Pius IV.

Ferdinand, being deſirous of ſettling the affairs of the empire, convoked a diet at Augſburg, in 1560, to which was given the name of the *aulic council*; and he earneſtly exhorted the princes and ſtates to ſubmit to it, as the only means of re-eſtabliſhing the union of Germany; and he pledged his word that they ſhould be more favourably heard in that aſſembly than they had been in the council of Trent. The proteſtants refuſed to accede to this propoſal: upon which Ferdinand ſolicited the pope to convoke a national council; and after ſome time his holineſs publiſhed a bull for renewing the council of Trent, whither all princes, prelates, and ambaſſadors, were invited. On the publication of this bull, the proteſtants aſſembled at Naumberg in Saxony, where they were viſited by two nuncios, whom the pope had ſent to invite them to the council. But, though they received the papal ambaſſadors with great politeneſs, and liſtened to their harangue with profound attention, they firmly

firmly refuſed to attend a council which the pope had no power to convoke, and declared their intention of adhering to the Confeſſion of Augſburg in ſpite of all oppoſition.

In the mean time, Ferdinand managed his intereſts ſo ſucceſsfully in a diet at Frankfort, that his ſon Maximilian, who had already received the crown of Bohemia, was unanimouſly elected king of the Romans. He likewiſe took this opportunity of attempting to perſuade the proteſtants to ſubmit to a general council; but finding them inflexible, he reſolved to take another method to terminate thoſe diſſenſions which had ſo long diſtracted the empire. Accordingly, with the aſſiſtance of Charles IX. of France, he concerted a remonſtrance to the fathers of the council, exhorting them to undertake a reformation among the eccleſiaſtics, whoſe depravity afforded a ſubject of univerſal complaint; but the pope would not allow the council to take cognizance of an an affair which he affirmed to belong to his own peculiar province. This was the laſt public act in which Ferdinand was concerned; for he was ſoon afterward attacked by a diſorder, which put a period to his life, in the ſixty-firſt year of his age, and the eighth of his reign, A. D. 1564.

Maximilian II. aſcended the imperial throne immediately after the death of his father. Like him, he preferred pacific expedients in all diſputes, eſpecially thoſe of religion: obſerving that ſpiritual affairs ought not to be determined by the ſword; and affirming that thoſe who held a contrary opinion were enemies to union and tranquillity.

Having obtained a ſubſidy for the maintenance of a numerous army, Maximilian marched, at the head of eighty thouſand foot and twenty thouſand horſe, into Hungary, where Solyman had inveſted Zighet. But, being perſuaded to remain on the defenſive, he had the mortification to witneſs the reduction of that town; and imprudently retreated to Auſtria, while the infidels were thrown into conſternation by the ſudden death of their ſovereign, which was occaſioned by an apoplexy. The emperor however placed ſuch ſtrong garriſons in moſt of the principal towns of Hungary, that Selim, the ſon of Solyman, thought proper to conclude a truce for twelve years. On his return from this expedition, Maximilian condemned John-Frederic, duke of Saxony, to perpetual impriſonment, for having granted a protection to criminals, and levied troops with a deſign of ſeizing the imperial throne. About this time alſo the proteſtants of Auſtria were indulged in liberty of conſcience; and the emperor made ſome vigorous, though ineffectual, exertions on behalf of thoſe inhabitants of the Netherlands whoſe religion ſubjected them to the vengeance of the court of Spain.

After procuring his eldeſt ſon Rodolphus to be elected king of the Romans, and acknowledged as his ſucceſſor to the crowns of Hungary and Bohemia, Maximilian hoped to have obtained the kingdom of Poland for his ſecond ſon; and he actually made preparations for aſſerting his claim by force of arms. But his project was ſoon interrupted by a diſtemper, which induced him to relinquiſh all worldly affairs, and devote his thoughts entirely to the contemplation of a future ſtate. He had for ſome time been accuſtomed to diſcourſe, in his familiar parties, upon the immortality of the ſoul; and he encountered the terrors of death with perfect reſignation, in the fiftieth year of his age. Maximilian II. appears to have been one of the moſt amiable princes that ever ſwayed the imperial ſceptre. No individual ever complained of having heard a harſh expreſſion from his lips; none ever departed diſſatisfied from his audience. So regular were his economical arrangements, that to every act of his life its appropriate hour was allotted; and every day, after dinner, the meaneſt of his ſubjects was at liberty to approach him. A faithful huſband, an affectionate parent, and a paſſionate lover of truth, his example had conſiderable influence on the manners of his people, and the empire flouriſhed in a peculiar manner under his adminiſtration.

On the demiſe of this illuſtrious prince, A. D. 1576, his eldeſt ſon ſucceeded to the empire by the title of Rodolphus II. and the firſt acts of his government were calculated ſtill to preſerve the peace of Germany, and to provide a powerful reſiſtance againſt the Turks. Their emperor, Amurath III. in violation of a truce which he had concluded, made an hoſtile incurſion into Croatia, and ravaged the country with fire and ſword. Hereupon Rodolphus ſent out an army of forty thouſand men, which attacked the infidels, near the abbey of Siffeg, and defeated them with prodigious ſlaughter. Amurath made ſome vigorous attempts to retrieve this misfortune; but victory continued to hover over the imperial ſtandard, and the Turks were again diſcomfited, with the loſs of twelve thouſand men. The emperor's lieutenant-general alſo recovered twelve ſtrong caſtles, and emancipated a prodigious number of Chriſtians from ſlavery.

After obtaining ſome freſh ſupplies from a diet at Ratiſbon, the emperor returned to Prague, in order to prepare for the defence of Hungary, as the grand-vizir Sinan, general of the Turks, had compelled the archduke Matthias to raiſe the ſiege of Graan; made himſelf maſter of the fortreſſes of Thata and St. Martin; and prevailed on the governor of Javerin to betray his truſt for a conſiderable ſum of money. In 1526, Sinan's progreſs was checked by a reinforcement which the emperor ſent to his brother Matthias, and the infidels were defeated in ſeveral engagements; but the enſuing year was not ſo fortunate to the imperialiſts. Mohammed III. who had ſucceeded Amurath in the Ottoman empire, reſolved to ſignaliſe the commencement of his reign by ſome great exploit; and accordingly marched with an army of a hundred and fifty thouſand men againſt Agria, one of the moſt important places in Hungary. At firſt the garriſon made a reſolute defence; but, growing impatient at the delay of an expected reinforcement, they compelled the governor to ſurrender upon diſhonourable conditions. This baſeneſs, however, was amply revenged; for the Turks had no ſooner entered the place than they violated the capitulation, and put the whole garriſon to the ſword.

The war was carried on with various ſucceſs for about nine years; but as no advantages were gained by either party which could juſtify ſuch a prodigious effuſion of blood, both ſides began to think of peace, and an accommodation was concluded, in 1606, between the emperor and ſultan Achmet, the ſucceſſor of Mohammed, by which it was agreed that the Turks ſhould forbear from making incurſions on the Chriſtians; that both parties ſhould mutually ſend preſents to each other every three years; that they ſhould retain their reſpective conqueſts; and that they ſhould not attack each other on any pretence during the term of twenty years.

Shortly after the ratification of this treaty, the ſtates of Hungary aſſembled at Preſburg, and elected the archduke Matthias for their king, on condition that he ſhould confirm all their privileges, and indulge them with the liberty of profeſſing the reformed religion. Many of the Bohemians alſo determined on a ſimilar meaſure, and actually perſuaded Matthias to march into their country at the head of a numerous army. Theſe proceedings were extremely diſagreeable to the emperor, who had conceived a ſlight jealouſy of his brother; and it was expected that ſome ſerious conſequences would take place. But theſe were happily prevented by the interpoſition of the princes; and, after ſome time, a treaty was concluded, by which Rodolphus yielded Hungary and Auſtria to the archduke, and even promiſed to ſecure him in the ſucceſſion to Bohemia, provided he himſelf ſhould die without male iſſue. After this tranſaction the emperor became melancholy and diſtruſtful, and ſe-

cluded himſelf in the retirement of his palace, till he was ſeized with a diſorder which put a period to his life, in the fifty-ninth year of his age, and the thirty-ſixth of his reign, A. D. 1612.

Matthias, having received his brother's diadem from the electors, fixed his reſidence at Vienna, and exerted himſelf to re-eſtabliſh the tranquillity of the empire. This he in a great meaſure effected; and he had alſo the good fortune to perſuade the Perſians and Ruſſians to participate the burthen of a war againſt the Turks. But, by his procuring the crowns of Hungary and Bohemia for his couſin Ferdinand, he occaſioned much diſturbance and effuſion of blood. Ferdinand had no ſooner received the ſceptre of Bohemia, than he declared himſelf inimical to the ſectaries, who were very numerous in that kingdom; and both the proteſtants and catholics ſoon perceived that his grand object was to weaken their parties, for the purpoſe of obtaining abſolute authority. A general revolt was the conſequence of this diſcovery; and, though the emperor aſſiſted his couſin with the braveſt troops of Germany, the Bohemians defended themſelves with extraordinary reſolution, and often cauſed the victory to be doubtful. After this conflict had continued ſome time, the ſtates of Sileſia entered into an alliance with the Bohemians; which meaſure proved the ſource of a war that ravaged Germany during the ſpace of thirty years. This misfortune, together with the loſs of his empreſs, and the obvious diſcontent of the Auſtrians, had ſuch an effect upon Matthias, that he ſunk into a languiſhing diſtemper, which terminated his life in the ſixty-third year of his age and the eighth of his reign, A. D. 1619.

Upon the demiſe of Matthias, the imperial crown was offered to Maximilian duke of Bavaria; but he prudently refuſed a preſent which muſt inevitably have ſubjected him to the vengeance of the houſe of Auſtria; and, after ſome time, Ferdinand II. was proclaimed king of the Romans with the accuſtomed ceremonies. The Bohemians were ſo highly exaſperated at this election, that they renounced all allegiance to Ferdinand, and beſtowed his diadem upon Frederic, the elector palatine. That prince prevailed on the kings of Sweden and Denmark to eſpouſe his cauſe; but, while he remained in expectation of their aſſiſtance, he was totally defeated by the imperialiſts, put under the ban of the empire, and deprived of all his ſtates. Gabor alſo, whom the emperor had, in a moment of difficulty, acknowledged as king of Hungary, was now compelled to reſign his regal dignity; the king of Denmark was deſpoiled of his Germanic poſſeſſions, and confined within his priſtine boundaries; and Mansfeld, the gallant general who had long nouriſhed the martial ardour of the Bohemians, fell a victim to unconquerable grief.

Theſe ſucceſſive advantages ſeemed to promiſe Ferdinand a happy triumph; but his hopes proved illuſive, and a tremendous ſtorm ſoon followed the ſun-ſhine of ſecurity; for now commenced the thirty years war, which aimed at the total extirpation of the proteſtants. The court of Vienna, emboldened by ſucceſs, was the firſt to avow their deſign of ſuppreſſing the proteſtant religion, extinguiſhing the liberties of the empire, and rendering the imperial diadem hereditary in the houſe of Auſtria. Germany conſequently began to tremble with the apprehenſion of a ſlaviſh ſubjection; the proteſtants more eſpecially took the alarm; and cardinal Richelieu, anxious to humble the Auſtrian greatneſs, excited the public inquietude, and fomented the diſcontent of Guſtavus Adolphus king of Sweden, who had been inſulted by the emperor. Richelieu's plans were attended with complete ſucceſs. The proteſtants and catholics, laying aſide their theological diſputes, conſpired together for the diminution of Ferdinand's power; the courts of France and England cheerfully embarked in the ſame cauſe; and Guſtavus ruſhed, with the impetuoſity of a torrent, into Germany.

Having made himſelf maſter of ſeveral places of importance, and engaged in a treaty with the landgrave of Heſſe and the electors of Saxony and Brandenburg, Guſtavus made preparations for engaging count Tilly, general of the imperial forces, who was then encamped in the fields of Leipſic. Accordingly the two armies (each conſiſting of about forty thouſand men) were drawn up in order of battle, and a moſt obſtinate conflict enſued; but victory declared in favour of the Swedes and their allies, and the imperialiſts were defeated, with the loſs of ſeven thouſand ſix hundred men, beſides five thouſand who were taken priſoners. One hundred pair of colours and many ſtandards, together with all the baggage and artillery, fell into the hands of the conquerors. The immediate conſequence of this victory was the reduction of Leipſic, which had been long wreſted from the elector of Saxony: and Guſtavus extended his conqueſts with ſuch ſurpriſing rapidity, that he ſoon made himſelf maſter of the whole country from the Elbe to the Rhine, comprehending a ſpace of near one hundred leagues, full of fortified towns. Erfort in Thuringia, Wirtzburg, and all the ſtrong places of Franconia, eluded his reſentment, by timely ſubmiſſions; Mentz ſurrendered, after a ſhort reſiſtance; and the victorious prince erected a pyramid upon the banks of the Rhine, that poſterity might know how far he had conducted his heroic followers.

Theſe ſucceſſes were followed, in 1632, by a general revolution in favour of the conqueror; and Ferdinand ſaw himſelf in danger of being beſieged in his own capital, or chaſed for ever from his dominions. In this extremity his miniſters repreſented, that the moſt prudent expedient for re-eſtabliſhing his affairs would be to deprive Tilly of his command, and beſtow it upon a general of ſuperior ability. This advice was accepted; and Walſtein duke of Fridland, who had been unjuſtly diſgraced, was now recalled to defend his country. But notwithſtanding this regulation, and the ſubſequent exertions of the emperor, Guſtavus continued to enlarge his conqueſts; and the wreath of laurel which adorned his brow ſeemed to acquire freſh verdure in every engagement. Having reduced a conſiderable part of Franconia, and expreſſed his intention of penetrating into Bavaria, he received intelligence that Tilly had prepared to diſpute the paſſage of the Leck; but he perſiſted in his deſign, and opened ſuch a prodigious fire upon the imperial regiments, that they were ſoon diſperſed with dreadful ſlaughter, and Tilly himſelf was mortally wounded.

While Guſtavus was employed in the reduction of Munich, Walſtein reduced all Bohemia under the dominion of the emperor; but the recollection of his private wrongs predominated in his mind, and he obſtinately refuſed to adopt ſuch meaſures as might have facilitated the reſtoration of a general peace. He even permitted his troops to ravage the Upper Palatinate, as if it had been an enemy's country; and inſtead of attacking the Swedes while they were greatly inferior to him in numbers, he contented himſelf with cutting off their convoys, and interrupting their foraging parties. Meanwhile Guſtavus received ſuch numerous reinforcements, that he ſoon found himſelf at the head of ſixty thouſand men, and made immediate preparations for attacking the imperialiſts in their camp. An engagement accordingly enſued, in which both parties diſtinguiſhed themſelves by extraordinary exertions for the ſpace of ten hours: but, though every regiment in the Swediſh army marched up to the attack in its turn, Guſtavus found it utterly impoſſible to force the intrenchments; and he therefore reſolved to effectuate a retreat.

After this rencontre, Guſtavus marched to Naumburg, where he received intelligence that Papenheim had been detached from the imperial army to conduct ſix regiments to Cologne; and that Walſtein had retired to Lutzen, at the diſtance of two leagues from Leipſic. The

king was elated by this news, and immediately ſet out to attack his enemies, who had thus imprudently weakened their forces. On his arrival at Lutzen, in 1633, he arranged his troops in order of battle, and next morning commenced the aſſault with ſuch irreſiſtible fury, that the imperialiſts were driven from the place where their cannon was mounted: but this poſt was retaken in half an hour, and the Swedes were compelled to give way in their turn. Alarmed at this circumſtance, Guſtavus alighted from his charger, and, putting himſelf at the head of his regiments, "If," ſaid he, "after having forded ſo many rivers, ſcaled ſo many walls, and reduced ſo many fortified towns, you have not courage to defend me, at leaſt make one effort to ſtand and witneſs my death." This ſpeech produced an inſtantaneous effect upon his troops, who now faced about, and renewed the battle with ſuch reſolution as to gain the artillery and force the intrenchments of Walſtein's camp: but while they were thus employed, their gallant ſovereign was ſlain by a party of cuiraſſiers. This fatal accident, together with the arrival of count Papenheim, ſeemed to threaten the Swedes with the moſt fatal conſequences: but they ſtood their ground with undaunted firmneſs; and continued the combat with unremitting fury, till the imperialiſts were defeated, with the loſs of ſix thouſand men and all their cannon. Next morning the king's body was found, ſtripped and mangled, on the field of battle; whence it was conveyed to Stockholm with great ſolemnity.

Upon the death of Guſtavus, the emperor was adviſed to publiſh a general amneſty, in order to facilitate an accommodation: but he perſiſted in his deſign of acquiring abſolute power, and made new preparations for continuing the war. Germany was, therefore, doomed to remain under her diſtracting calamities; towns were reduced and retaken; battles were fought with various ſucceſs till the country was purpled with blood. During theſe tranſactions, Walſtein alarmed the emperor by his ambitious conduct; and, in conſequence of his threatening a revolt, the cabinet of Vienna determined that he ſhould either be killed or apprehended. The former alternative took place, and the gallant duke of Fridland periſhed by the hand of an aſſaſſin. His moſt intimate friends, who had engaged to follow his fortune, met a ſimilar fate.

Notwithſtanding the general calamities which had reſulted from his own pride and ambition, Ferdinand poſſeſſed ſufficient intereſt with the ſtates to procure the election of his ſon as king of the Romans. This, however, was one of his laſt gratifications; for he died ſoon afterwards, in the fifty-ninth year of his age, and the eighteenth of his reign. By the performance of ſeveral vows which he made againſt the proteſtants, he acquired the appellation of the "Apoſtolic Emperor," and many popiſh hiſtorians have held him up as the object of admiration: but, from an impartial review of his conduct, we muſt pronounce him an unfeeling bigot, and a ſcourge of the empire.

Ferdinand III. ſon of the late emperor, aſcended the imperial throne at a diſtreſſing juncture; for though he ſucceeded in tranquilliſing the interior of Germany, he had the mortification to perceive that the flames of war continued to rage with unabated fury on the frontiers, and that the calamities of the people were unneceſſarily prolonged by the generals employed, Bannier, Torſtenſon, Weimar, Wrangel, Merci, and many others, who were anxious to diſtinguiſh themſelves by their gallant conduct. Shortly after the new emperor's acceſſion, Bernard duke of Weimar penetrated into Alſace, and croſſed the Rhine by a bridge of boats about ſix leagues above Straſburg: he alſo erected ſeveral forts in the iſland of Wittenweyer. But his forces were defeated by general de Wert; and he himſelf was ſeriouſly embarraſſed by the death of his friend William landgrave of Heſſe-Caſſel, who had deſigned to re-eſtabliſh the Palatine family, by means of a league between France, Sweden, and the United Provinces.

The duke's courage, however, was not damped by theſe misfortunes. Having croſſed the Rhine with ſome choſen troops, he reduced the foreſt-towns of Seckingen, Lauffemberg, and Waldſhut, and defeated the imperialiſts in a pitched battle before Rhinfield. Hunningen, Neuberg, and Rottelin, were ſoon added to his conqueſts; and Briſac was obliged to ſurrender, after having been reduced to ſuch extremity of famine, that the inhabitants were with difficulty reſtrained from digging up and devouring the bodies of their deceaſed friends. Louis XIII. being appriſed of theſe tranſactions, diſpatched a meſſenger on pretence of congratulating the duke, but in reality to perſuade him to cede Briſac to the crown of France. This attempt proved unſucceſsful; but Weimar returned ſuch an evaſive anſwer, that the French monarch promiſed him a reinforcement of eight thouſand men.

Whilſt the duke of Weimar was thus triumphing over the Auſtrians in Alſace, and the Swediſh general Bannier was employed in the reduction of Pomerania, an engagement took place in Weſtphalia, between Charles Louis, prince palatine, and count de Hasfeld, one of the emperor's lieutenant-generals; and, after a very ſanguinary conflict, victory declared in favour of the imperialiſts. Prince Rupert and count de Ferents were made priſoners; all the palatine's artillery fell into the hands of the conqueror; and Charles Louis eſcaped with great difficulty to Minden.

Upon the demiſe of the duke de Weimar, which happened ſhortly after his reduction of Thau, in 1639, a treaty was concluded between the king of France and the Weimarian forces; by which the duke de Longueville was acknowledged general, and a reſolution was taken to march toward the Lower Palatinate, while the count de Guebriant put the foreſt-towns in a ſtate of defence; John Louis d'Erlach was continued in the government of Briſac; and Philip Bernold, a gentleman of Alſace, was inveſted with the command of Rhinfeld. In the mean time conferences were held at Hamburg, to promote the reſtoration of peace; but the powers who ſent their miniſters ſeemed to be inſpired with mutual diſtruſt. Louis XIII. quarrelled with the count palatine about the omiſſion of ſome ceremonial; an ancient grudge which ſubſiſted between the French and Engliſh rendered them averſe to the concluſion of a treaty; and the Dutch, who were ill-affected to both, refuſed to renounce the neutrality which they had promiſed to the emperor.

While all the true patriots of Germany regretted the failure of theſe negociations, Bannier was making a rapid progreſs in Saxony; where he took ſeveral places of importance, and defeated the Saxon general Maracini in two engagements. Bohemia was alſo filled with diſmay by the terror of his arms; and Mecklenburg, Brandenburg, and Franconia, were ravaged by generals Koningſmark and Axel-Cili. The emperor endeavoured to check Bannier's career by ſome ſplendid offers, and the Swediſh hero actually began to think of putting an end to his fatigues: but this was a mere ſtratagem to amuſe the mareſchal, till the archduke Leopold and general Picolomini ſhould be in readineſs to march againſt him. Upon the arrival of theſe imperial forces, Bannier formed a junction with the troops of de Longueville, and perſuaded George duke of Brunſwic to aſſiſt him with three thouſand foot and five hundred horſe: but Picolomini's advantageous encampment precluded the hope of a ſucceſsful attack; and, after the two armies had remained in ſight of each other for ſix weeks, the confederates removed to Neuſtadt. Picolomini followed them with the utmoſt expedition; but he ſtill remained on the defenſive, and carefully ſhunned an engagement. By ſteadily purſuing this conduct, the imperial general compelled Bannier to quit the hereditary territories of the houſe

houſe of Auſtria, and eventually chaſed the confederates out of Franconia.

The hoſtile powers again expreſſed a wiſh for a pacification; and Lutzoro, one of Ferdinand's aulic counſellors, was employed to negociate the preliminaries at Hamburg, with the plenipotentiaries of France and Sweden, A. D. 1641. But the emperor conſidered the articles as derogatory to his honour; and a diet which he had convoked at Ratiſbon granted him ſupplies for carrying on the war. Bannier, being appriſed of this circumſtance, formed the deſign of diſperſing the aſſembly, and even of ſurpriſing the town: accordingly he led the confederates to Schwendorf, whence he detached ſix regiments of cavalry acroſs the Danube, to Ratiſbon. The approach of this army occaſioned an univerſal conſternation; fifteen hundred imperial troops were made priſoners, and the emperor himſelf eſcaped with difficulty; for whilſt he was preparing to take the diverſion of hunting, his advanced guard, litter, hawks, and equipage, were all carried off by the enemy. It ſeems that the confederates had deſigned to take the advantage of the froſt, to block up the town; but the weather becoming more mild, they were obliged to repaſs the river, and rejoin their main army. Soon after this expedition, Bannier retired to Halberſtadt, where he died, in the forty-firſt year of his age, to the inexpreſſible regret of his partiſans.

Notwithſtanding the death of Bannier, war continued to deſolate the empire; and the imperial forces were extremely unſucceſsful. Picolomini and the archduke Leopold flattered themſelves with the hope of compelling the proteſtant princes of Brunſwic and the landgrave of Heſſe to ſue for an accommodation; but this project was ſoon fruſtrated by the Swedes and French, who met and defeated them near Wolfembuttle, with great ſlaughter. In the enſuing campaign, count de Guebriant gained a deciſive victory over a body of Auſtrian troops near Ordinguen; the duke of Saxe-Lawemburg was defeated by the Swediſh general Torſtenſon, and obliged to ſurrender himſelf priſoner of war; and a more numerous army under Picolomini was utterly diſperſed in the plain of Breitenfield, with the loſs of eight thouſand men, forty-ſix pieces of cannon, one hundred and ſixteen pair of colours, and ſeventy-five ſtandards. After this battle, and the ſubſequent reduction of Leipſic, in 1643, the confederates expected that the houſe of Auſtria would be ſincerely diſpoſed to an accommodation; but as the courts of Vienna and Madrid were ſenſible that an exorbitant price would be ſet upon the peace at that juncture, they appeared very indifferent about renewing the negociations. However, after mature deliberation, they agreed to open conferences for a general peace in the month of July; and the preliminaries being publiſhed, all the nations which had been ſo long expoſed to a calamitous war, congratulated themſelves upon the near approach of returning tranquillity.

But this pleaſing proſpect was for a time overcaſt by the death of Louis XIII. and the hoſtile deſigns of the new government. A victory obtained over the Spaniards, by the duke d'Enguien, convinced the confederates that they might ſtill expect the aſſiſtance of the French miniſtry; and Torſtenſon was ordered by his court to march againſt the king of Denmark, whom they accuſed of harbouring all the ſentiments of an enemy, under the maſk of a mediator. About the ſame time the duke of Lorrain renounced his treaty with France; Guebriant was mortally wounded at the ſiege of Rotweil; and de Rantzau, who ſucceeded him in command, was defeated and taken priſoner by count de Merci, general of the Bavarians. On the re-eſtabliſhment of peace between the crowns of Sweden and Denmark, Torſtenſon returned into Germany, and purſued the imperial army from place to place, till at length an engagement took place in the neighbourhood of Thabor. This action continued for the ſpace of four hours with equal obſtinacy and ſucceſs, but the Auſtrians were defeated; general Gocutz, and about three thouſand men, were killed on the ſpot; general Hasfield, and ſeveral officers of diſtinction, were numbered among the priſoners, and twelve hundred fugitives were overtaken and ſlaughtered upon the banks of the Danube.

Alarmed by theſe repeated misfortunes, Ferdinand preſſed the elector of Bavaria to furniſh him with more troops; and the duke accordingly ſent four thouſand men toward Vienna, while Galas collected the remains of the imperial army in Bohemia, and encamped under the cannon of Pilſen to obſerve the motions of the enemy. Torſtenſon, in the mean time, made himſelf maſter of almoſt all the towns in Moravia, and laid cloſe ſiege to Brinn, as the reduction of that place would enable him to penetrate into Hungary and Auſtria. Upon the firſt intelligence of Torſtenſon's deſign, the city of Vienna was overwhelmed with ſuch conſternation, that the emperor immediately retired to Ratiſbon; and the empreſs, with many of the courtiers, took refuge at Gratz, in Stiria. All the valuable furniture was removed; the fortifications were repaired; the magazines were filled; and all the neceſſary preparations made for ſuſtaining a vigorous ſiege. However it was ſoon diſcovered that Torſtenſon had no intention of attacking the capital, and the gallant reſiſtance of Brinn gave Ferdinand time to put his affairs in better order. During theſe tranſactions, general Merci obtained a ſignal victory over the viſcount de Turenne, in the neighbourhood of Mariendal; but, on the arrival of a reinforcement under the duke d'Enguien, a ſecond battle was fought, which terminated in the death of Merci, and the defeat of the imperialiſts. Nordlingen, and ſome adjacent towns, immediately opened their gates to the conquerors; but they were, ſoon afterward, retaken by the archduke Leopold.

Torſtenſon having reſigned the command of the Swediſh army, in 1646, general Wrangel was nominated as his ſucceſſor; and his arms were attended with conſiderable ſucceſs. In concert with the viſcount Turenne, he ravaged part of Bavaria, pillaged all the country toward the Lake of Conſtance, and ſurpriſed ſeveral important fortreſſes in the vicinity of Bruckheim. Meanwhile the emperor cauſed his ſon Ferdinand to be proclaimed king of Bohemia, and afterwards carried him to Preſburg, where he was ſolemnly inveſted with the crown of Hungary. Early in the enſuing ſpring, Wrangel and Turenne attacked an imperial army, under general Melander, in the neighbourhood of Augſburg. The engagement commenced with great fury, and both ſides fought with incredible reſolution; but, on the death of Melander, the imperialiſts were thrown into confuſion, and were diſperſed with great ſlaughter. About the ſame time baron Lamboy, who commanded the troops of Weſtphalia and Cologne, was utterly defeated in the duchy of Juliers; and Charles Guſtavus, prince palatine, undertook the ſiege of Prague with ſo numerous an army, that the place muſt inevitably have been taken, had not the emperor now reſolved to conclude a peace.

Hitherto the negociations at Munſter and Oſnaburg had varied according to the viciſſitudes of the war: the ceſſion of Alſace to the crown of France, and the ſeveral demands of the treating powers, met with ſuch difficulties as appeared almoſt inſurmountable. But after many debates and altercations, theſe obſtructions were removed; the conferences were tranſlated firſt to Oſnaburg and then to Munſter; and at each place a treaty was concluded, ſince known by the appellation of the "Peace of Weſtphalia," which terminated the thirty years war. By this treaty, France acquired the biſhoprics of Metz, Toul, and Verdun; together with Briſac, the landgraviate of Upper and Lower Alſace, the Suntgaw, and the prefecture of the ten towns ſituated in Alſace: Sweden obtained the archbiſhopric of Bremen, and ſome other territories: the houſe of Auſtria recovered the foreſt-towns, with all their territories and appurtenances:

purtenances: the electors and princes of both parties were re-eſtabliſhed in all their poſſeſſions: and the proteſtants obtained the right of exerciſing their religion, both in private and public. Yet notwithſtanding all the precautions that could be taken, many difficulties intervened before this important buſineſs could be concluded. The pope publiſhed a bull, annulling all the articles which he conceived prejudicial to the Romiſh religion; and the king of Spain formally proteſted againſt the reſtoration of the Lower Palatinate to Charles Louis, count palatine of the Rhine. But theſe meaſures were totally diſregarded; and, after mature deliberation, the plenipotentiaries of the different powers mutually delivered their ratifications, A. D. 1649.

Soon after the reſtoration of peace, the emperor exerted himſelf to procure the ſucceſſion for his ſon Ferdinand; and that prince was accordingly elected king of the Romans, in 1652, after ſigning a ſolemn engagement, by which he obliged himſelf to maintain inviolably the Golden Bull; to obſerve religiouſly the treaties of Munſter and Oſnaburg; and to form no alliance concerning the affairs of the empire without the conſent of the Germanic body. After this, the emperor returned to Ratiſbon; where a diet was held to deliberate upon complaints that had been made by ſeveral ſtates againſt the king of France, who, they affirmed, had invaded their privileges, in conſequence of the ceſſion of Alſace. The inhabitants of Bremen alſo complained that Charles Guſtavus, king of Sweden, paid no attention to the preſervation of their rights, but had even ſurpriſed a borough in their neighbourhood by force of arms; and that, when the towns of Lubec and Hamburg remonſtrated on theſe proceedings, Koningſmark had replied, that neither the diet nor the emperor had the leaſt right to intermeddle with the concerns of Sweden and its ſubjects. Upon this repreſentation, the circles of Weſtphalia and Lower Saxony were ordered to defend the privileges of Bremen, and hoſtilities were immediately threatened on both ſides; but, by the mediation of the Hollanders, this difference was accommodated; and the grievances of Bremen were redreſſed in a congreſs at Staden. At the ſame time, the proteſtants choſe the elector of Saxony to direct their conferences and execute their reſolutions; and the catholics declared the elector of Bavaria chief of their union. Theſe affairs being ſettled, the diet broke up; and the emperor, with his empreſs and eldeſt ſon, returned to Vienna amidſt univerſal acclamations. The joy of the populace, however, was ſoon converted into mourning, by the loſs of the king of the Romans, who died in the twentieth year of his age; and the imperial court removed to Eberſdorf, overwhelmed with grief.

Having procured his ſon Leopold to be acknowledged king of Hungary, and amuſed the proteſtants of that kingdom with great promiſes of indulgence, Ferdinand engaged in a treaty with the kings of Denmark and Poland againſt the Swedes. This league was approved by the cham of the Crim Tartars, and the king of Denmark declared war by a manifeſto: but the emperor did not ſee the effect of theſe meaſures; for, previouſly to the commencement of hoſtilities, he died at Vienna, in the forty-ninth year of his age, and the twentieth of his reign, A. D. 1657. Ferdinand III. was zealouſly attached to the Romiſh religion; and on ſome occaſions he expreſſed a tender regard for the intereſts of his ſubjects: but he was peculiarly unfortunate in the diſtribution of his favours, and admitted ſeveral perſons into his councils who involved him in many difficulties. It is but juſtice, however, to obſerve, that no emperor was ever attacked by ſo many potent enemies at once, or ſuſtained ſuch accumulated defeats, without ſinking under his misfortunes.

Immediately after the demiſe of this prince, an electoral diet was held at Frankfort, in order to ſupply the vacancy on the imperial throne; and, after much oppoſition on the part of France, Leopold Ignatius, king of Hungary and Bohemia, was declared duly elected. The new emperor, having compelled the king of Sweden to make an accommodation with Poland, determined alſo to check his progreſs in Denmark, and accordingly ordered a numerous army of Auſtrians and Brandenburgers to invade Pomerania: but the Swediſh generals took ſuch precautions for the defence of the principal towns, that this expedition was rendered abortive. Meanwhile, the French and Engliſh preſſed the States-general to withhold all further aſſiſtance from the king of Denmark; and, having concluded a treaty, called the Convention of the Hague, they engaged to reduce by force that party which ſhould refuſe to come to an accommodation. This meaſure was extremely diſpleaſing to his Swediſh majeſty; but, having ſuſtained a ſevere defeat, he declared his reſolution of acceding to it; and his death, which happened ſoon afterwards, facilitated the reſtoration of peace.

Scarcely were the troubles of the North compoſed, before Leopold I. was threatened with an invaſion from the Turks, who had made an irruption into Tranſylvania, ſlain the vaivode Ragotſki in battle, and threatened to ravage the country of Zathmar with fire and ſword, unleſs the inhabitants would acknowledge the ſultan for their ſovereign. Hereupon Leopold ſent Montecuculi with twenty thouſand men into Hungary, garriſoned Zekelheid with five thouſand Germans, and repaired all the fortifications of the frontier towns. Theſe preparations, however, were by no means agreeable to the Hungarian nobles: they imagined that Leopold intended rather to conquer their country than to oppoſe the invaders; and that, by taking poſſeſſion of all the fortreſſes, he hoped to drive the proteſtants out of Hungary, as he formerly had expelled them from Bohemia. Theſe ſuſpicions being communicated to the commonalty, a general diſcontent prevailed over all parts of the kingdom, and the imperialiſts were obliged to make uſe of violence to obtain quarters and proviſions.

In the enſuing ſpring, the Turks took the field, and advanced by rapid marches towards Friuli; but they were attacked by count Serina at the paſſage of the Sluin, and defeated with prodigious ſlaughter. The conqueror improved this advantage by burning the bridge of Eſſek, taking the city of Five Churches, and ſecuring ſeveral important places between the Drave and the Danube; while the count de Souches, who commanded a ſeparate detachment, defeated four thouſand of the infidels near Newhauſel, and attacked the town of Lewentz with ſuch irreſiſtible fury, that the garriſon ſurrendered at diſcretion.

Meanwhile the grand-vizir, having made himſelf maſter of Serinſwar, in 1664, paſſed the Meur, and avowed his intention of marching to Vienna. Montecuculi, however, reſolved to ſtop his progreſs; and a battle enſued, near St. Godard, which terminated in the total defeat of the Ottoman forces. This memorable engagement laſted from nine o'clock in the morning till four in the afternoon, and the Turks obſtinately refuſed to yield the victory till they had loſt the greateſt part of their troops. Upon the firſt intelligence of this defeat, the emperor expected ſome conceſſions on the part of the Turks, and his expectations were verified; the grand-vizir immediately offered negociations of peace, and a treaty was in conſequence concluded at Temeſwaer.

The Hungarians were ſo highly exaſperated at the concluſion of this treaty, that they openly threatened a revolt, and even aſſaulted the meſſenger who was employed to carry diſpatches from the grand-vizir to their ſovereign. Hereupon the emperor ſummoned ſome of the refractory noblemen to Vienna; and authoriſed prince Lobkowitz, preſident of the imperial council, to tell them, that the Turks had of themſelves propoſed a peace, in which it was agreed that Tranſylvania ſhould enjoy its liberty; that Zathmar and Zambolick ſhould

be ceded to the empire; and that his imperial majeſty ſhould have the power of erecting forts to reſtrain the garriſons of Waradin and Newhauſel. This declaration, together with an aſſurance of exemption from the lodging and ſubſiſtence of foreign troops, appeaſed the minds of the Hungarian lords, who immediately ratified the treaty, and returned peaceably to their reſpective eſtates. But the ſubſequent conduct of the emperor proved ſo inimical to the liberty of Hungary, that the people unanimouſly reſolved to ſhake off their allegiance, and actually took up arms to deliver themſelves from the unjuſt oppreſſions of the houſe of Auſtria.

No ſooner had Leopold ſent a body of forces to check this dangerous revolt, than he received intelligence that Louis XIV. of France had made an irruption into the Low-countries, and threatened to carry the war into Franche Comté. The emperor now ſaw himſelf placed as it were between two fires—being attacked on the one hand by Louis, and on the other by the revolted Hungarians: the princes of the empire offered but little aſſiſtance in this diſtreſſing exigence; and the French monarch purſued his conqueſts with ſuch ſurpriſing rapidity, that in the ſpace of one month the Netherlands were threatened with entire reduction; and the Spaniards were obliged to purchaſe the recovery of Franche Compté by a ceſſion of Borgues, Fernes, Courtray, and the whole country afterwards called French Flanders. In the mean time, the Hungarians perſiſted in their reſolution of either ſhaking off the imperial yoke or leſſening their dependence. Leopold conſented to ſilence ſome of their complaints, by filling up the vacant office of palatine, and reſtoring the proteſtants all their churches and revenues; but the reſidence of a German garriſon at Tokai ſtill afforded ample cauſe of diſcontent, and Hungary ſtill reſounded with murmurs and diſaffection.

While the emperor was taking meaſures to appeaſe the troubles of Hungary, the malcontents of that kingdom, in 1671, conceived the deſign of expelling all the German forces; and counts Tattembach and Serini ſent a private deputation to ſolicit the aſſiſtance of the Turks. The ſultan, however, honourably refuſed this overture; and the conſpirators, being betrayed to his imperial majeſty, periſhed by the hands of the executioner. All the nobles and deputies of Upper and Lower Hungary were then ſummoned to a diet at Preſburg; and inſtead of obtaining their former demands, they were compelled to maintain a German army of thirty thouſand men, to pay their uſual taxes, and to inflict exemplary puniſhments on their ſeditious countrymen.

Meanwhile Louis XIV. having diſſolved the triple alliance of the Dutch, Swedes, and Engliſh, made formidable preparations for an invaſion of Holland, and prevailed on the emperor to obſerve a neutrality. Leopold, however, was ſoon alarmed by the progreſs of the French arms, and determined on ſending a powerful reinforcement to the States-general. Accordingly, he ordered thirty thouſand men to march to their aſſiſtance; and at the ſame time declared by a manifeſto, that, as guarantee of the treaty of Weſtphalia, which the French had violated, he propoſed to exert himſelf for the ſafety of the Germanic body, and to check the progreſs of an inſatiate enemy, who was dreaded by all Europe.

The prince of Orange, being unable to oppoſe the French army, employed himſelf in retaking ſome towns which had been recently ſeized; and, by a ſubſequent junction of his forces with thoſe of Montecuculi and the governor of Spaniſh Flanders, he compelled the enemy to evacuate the provinces of Holland, after they had exacted ſome heavy contributions, and ſecured the artillery at Graves and Maeſtricht.

Louis XIV. opened the next campaign with the ſiege of Beſançon, the garriſon of which made a vigorous defence; but were at length obliged to ſurrender themſelves priſoners of war. Dole, Salins, and Gemerſheim, were alſo reduced; and the viſcount Turenne, having defeated an army of the allies near Sintzheim, ravaged the whole palatinate with fire and ſword. The complaints of the elector palatine upon this occaſion inſpired the other princes of Germany with indignation againſt the invaders; and in leſs than a month they ſent out ſuch powerful reinforcements, that Turenne deemed it adviſable to retire to Landau, while the imperialiſts waited upon the banks of the Ill for the elector of Brandenburg, who had promiſed to join them with twenty thouſand men. Previouſly to that junction, however, they were attacked by Turenne, who obliged them to take refuge under the cannon of Straſburg. He afterwards made a ſucceſsful attempt upon their quarters at Remiremont, and reduced them to great extremities: but in attempting the reduction of Salſbach, he was killed by a cannon-ball, and his troops were obliged to retire with precipitation to Altenheim. Immediately after this event, the elector of Brandenburg made an irruption into Swediſh Pomerania, and the cities of Bremen and Verden were taken by the imperialiſts.

Montecuculi having, in 1677, obtained permiſſion to retire upon account of his infirmities, the command of the imperial army was given to the duke of Lorraine, one of the greateſt generals that ever ſerved the houſe of Auſtria. This prince immediately marched into Upper Alſace againſt the duke of Luxemburg, and attacked the French forces with ſuch impetuoſity, that they were quickly thrown into diſorder, and would have been totally routed, had not their Engliſh allies ſupported the charge, while they retreated under the counterſcarp of Saverne. The ſubſequent ſiege of Philipſburg proved extremely troubleſome to the imperialiſts; for their tents were waſhed away by the overflowing of the Rhine, and the duke of Luxemburg ſeized every opportunity of traverſing their meaſures: but theſe difficulties were ultimately ſurmounted, and the town ſurrendered on capitulation. Meanwhile the elector of Brandenburg, having reduced Stettin, and many other places of importance in Swediſh Pomerania, paſſed over to Stralſund, where general Koningſmark commanded, with one thouſand ſix hundred horſe, and ſix hundred foot. Three thouſand of the citizens immediately took up arms, and avowed their intention of defending themſelves to the laſt extremity; but, after ſuſtaining a furious bombardment, they hoiſted a flag of truce, and obliged the governor to capitulate. Gripſwald was ſoon afterward attacked in a ſimilar manner, and the garriſon were obliged to ſurrender at diſcretion.

Whilſt the duke of Lorraine was employed in Alſace, Leopold gave freſh cauſe of diſcontent to the Hungarians, by ſuppreſſing the office of palatine, and appointing a viceroy for their kingdom. This change of government was ſo extremely odious, that the malcontents immediately threatened to throw off the Auſtrian yoke, and chooſe a king of their own nation; and they received ſuch powerful ſuccours from the vaivode of Tranſylvania, that they were ſoon in a condition to reſiſt the troops of the emperor. Tekeli, prime miniſter to the vaivode, aſſerted the rights of Hungary at the head of twenty thouſand men; and a zealous proteſtant, called Father Joſeph, led a numerous army into the hereditary countries of the houſe of Auſtria, and compelled moſt of the inhabitants to flee for ſafety to Vienna.

The imperialiſts made every poſſible exertion to cruſh this dangerous revolt; but their attempts were generally unſucceſsful, and they were defeated in ſeveral ſucceſſive engagements. This circumſtance, together with the expectation of more ſerious conſequences from the interference of the Turks, induced Leopold, in 1679, to hearken to terms of accommodation, and a truce was accordingly concluded between Tekeli and the imperial general. About the ſame time, Louis XIV. and the allies concluded a peace at Nimeguen, which was ſoon after ratified by the emperor. The elector of Brandenburg, and the king of Denmark, conceiving themſelves

to be injured by this treaty, prepared to aſſert their rights by force of arms, and actually commenced hoſtilities againſt the troops of France and Sweden: but after ſome time they conſented to ſheath their ſwords, and all differences were happily terminated. The bleſſings of tranquillity, however, proved of ſhort duration. Count Tekeli violated the truce in Hungary, and a numerous army of Turks, having joined the malcontents, marched up to the walls of Vienna: whilſt the emperor and his courtiers took refuge in Lintz, and the citizens were overwhelmed with conſternation. On the 16th of July, 1683, the trenches were opened, and the ſiege was carried on with ſuch extraordinary vigour, that a conſiderable breach was made in the body of the place, notwithſtanding the intrepid gallantry of its defendants. But juſt at the moment when all reſiſtance appeared fruitleſs, and the Ottoman forces exulted in the anticipation of their important conqueſt, John Sobieſki king of Poland, with the duke of Lorraine and the elector of Bavaria, deſcended from the mountains of Calemburg, at the head of ſixty thouſand men, and defeated the infidels with prodigious ſlaughter. This victory was ſo complete, that the Turks who eſcaped deſtruction fled on every ſide with precipitation, leaving behind them the great ſtandard of Mahomet, with their baggage, ſtores, and artillery.

Leopold, being now informed of the great preparations which the grand-ſignior had been making to repair his loſſes, obtained a ſupply of thirty-five thouſand men from the ſtates of the empire, and prevailed on the Roman pontiff to contribute to the expences of the war. The operations of the campaign were left to the duke of Lorraine, only it was reſolved that count Schultz ſhould cover Moravia with ten thouſand men, and that count Leſlie with a body of Croatians ſhould act upon the Drave. After gaining ſome advantages in the neighbourhood of Buda, the duke of Lorraine reſolved to beſiege Newhauſel; but on hearing that the Turks had inveſted Strigonia, he immediately marched thither at the head of thirty thouſand men. The infidels were no ſooner informed of his approach, than they retired to an advantageous poſt, having a marſh before them and the Danube on the right: but the duke contrived to draw them into an engagement, and they were defeated with great ſlaughter. This victory was followed by the reduction of Newhauſel, Novigrade, and Wiſſegrade; and the Turks were ſo effectually diſcouraged, that they croſſed the Danube, and retired with the utmoſt precipitation.

The duke of Lorraine having now ſtrongly repreſented that the reduction of Buda was eſſentially neceſſary to the ſecurity of his former conqueſts, it was reſolved, in 1686, to undertake the ſiege of that city. Accordingly, the allies marched thither with all poſſible expedition; and, after a month ſpent in advancing their approaches, the duke of Lorraine and the elector of Bavaria agreed upon a general aſſault. At the firſt ſignal, the grenadiers removed the gabions from a breach which had been recently made, and being ſupported by a body of fuſileers, advanced to take poſſeſſion of the paliſadoes: but the Turks, after diſcharging a volley of ſtones, bombs, and grenades, attacked them ſword in hand, and compelled them to retire. Impatient to revenge this diſgrace, the imperialiſts ruſhed again towards the breach with irreſiſtible fury, and actually made themſelves maſters of the paliſadoes; but, the enemy ſpringing a mine, they were all killed or dreadfully wounded. Freſh troops, however, preſſed forward with unabated ardour, and notwithſtanding the prodigious fire to which they were expoſed, they took poſſeſſion, and made a lodgement upon the ruins.

Upon intelligence that the grand-vizir was advancing at the head of forty thouſand men, the duke of Lorraine reſolved to increaſe the fire of his batteries; and the imperialiſts renewed the attack with ſuch irreſiſtible fury, that the Turks were driven from their poſts. A dreadful ſcene of confuſion enſued, and the wretched inhabitants were maſſacred without diſtinction of age, ſex, or quality. The Ottoman army carefully avoided an engagement, and the imperial ſtandard was, in 1687, planted on the walls of Segedin and Five-Churches. About this time, alſo, Leopold procured for his ſon Joſeph the crown of Hungary, and prevailed on an aſſembly of the ſtates to declare that kingdom hereditary in the houſe of Auſtria.

The duke of Lorraine being ſeized with a dangerous illneſs, the elector of Bavaria undertook to open the enſuing campaign; and he accordingly reſolved to lay ſiege to Belgrade. Having thrown a bridge acroſs the Save, he marched in order of battle to force the Turks, who had intrenched themſelves in that neighbourhood; but he was agreeably ſurpriſed to find their camp abandoned, though abounding in proviſions and forage. He then reconnoitred the city, and made ſuch prudent arrangements for the proſecution of the ſiege, that on the fifth of the enſuing month the place was taken by aſſault.

During theſe tranſactions, the king of France commenced hoſtilities againſt the empire, under colour of ſupporting the pretenſions of the ducheſs of Orleans to the ſucceſſion of the late elector palatine, and of aſſerting the right of the cardinal of Furſtemberg to the electorate of Cologne. Accordingly the marquis de Boufflers, having paſſed the Rhine, reduced Keiſer-Lauter, Oppenheim, and Philipſburg; and, on the emperor's refuſing to conclude a peace, the conquering army proceeded to beſiege Mentz, Frankerdal, Triers, Spire, and Worms. Alarmed at theſe rapid movements, the ſtates of the empire reſolved to declare war againſt the aggreſſors; and they were ſupported in this reſolution by the courts of England, Sweden, Spain, and Denmark. The elector of Saxony, the landgrave of Heſſe, and the duke of Hanover, immediately marched ſome forces toward Frankfort; the biſhop of Munſter and the marquis of Brandenburg engaged to ſend two thouſand eight hundred men into Cologne; the elector of Brandenburg aſſembled his beſt troops at Weſel; and the ſtates of Holland ſent upwards of eight thouſand men into the country of Juliers and the electorate of Mentz; while Leopold ordered ſix regiments of cavalry and five of infantry to advance towards the Rhine. The command of the troops in Hungary being given to prince Louis of Baden, it was deemed adviſable to aſſemble three armies on the Rhine; namely, thirty thouſand men on the Upper Rhine, to aſſemble at Heilbron, under the elector of Bavaria; an equal number to aſſemble on the Lower Rhine, under the command of the elector of Brandenburg; and the third body, conſiſting of forty thouſand men, to aſſemble near Frankfort, and be commanded by the duke of Lorraine.

The electors of Saxony and Bavaria, and the landgrave of Heſſe, arriving at the camp, it was reſolved to undertake the ſiege of Mentz, as the allied armies by their ſituation might be eaſily united. The town was accordingly inveſted on the ſixteenth of July, 1689, and the garriſon was compelled to capitulate, after a ſiege of ſeven weeks. The conqueſt of this place was ſoon followed by the reduction of Bonn; and the duke of Lorraine propoſed to beſiege Terderbach, but the allies declining any new action during that campaign, the troops retired into winter quarters. In the mean time, the prince of Baden gained three ſucceſſive victories over the infidels in Hungary, forced their camp, and ſeized all their baggage, military ſtores, and proviſions. He likewiſe took poſſeſſion of Niſſa and Vidin, and ſtationed ſix regiments in Walachia, in order to protect the hoſpodar from the incurſions of the Tartars.

Leopold having convoked a diet at Augſburg, in 1690, he earneſtly exhorted the electors to nominate a king of the Romans; obſerving, that ſuch a meaſure was indiſpenſably neceſſary for diſappointing the ambitious hopes

of Louis XIV. and ſecuring the tranquillity of the empire: accordingly Joſeph was crowned on the twenty-ſixth of January, 1691, with the accuſtomed ceremonies. About three months after this event, the duke of Lorraine died in the forty-eighth year of his age, and the command of the imperial army devolved upon the elector of Bavaria.

Meanwhile the grand-ſignior, having declared Tekeli vaivode of Tranſylvania, and choſen a new vizir, made great preparations for the enſuing campaign; and his arms were, for ſome time, attended with conſiderable ſucceſs. General Heiſler undertook, with a body of four thouſand men, to check the progreſs of Tekeli, who appeared upon the frontiers of Tranſylvania; but the vaivode poſſeſſed ſuch a ſuperior force, that the imperialiſts were ſoon cut in pieces, and Heiſler himſelf was taken priſoner. This defeat obliged the prince of Baden to paſs the Danube at Semendria, and during his abſence Niſſa and Vidin fell into the hands of the enemy. The grand-vizir, alſo, took that opportunity of laying ſiege to Belgrade; and the confuſion occaſioned by an accidental exploſion of a powder magazine, enabled him to carry the place by aſſault.

While Catinat, one of the French generals, was employed in ravaging the territories of the duke of Savoy, Leopold had ordered the prince of Baden to watch the motions of the grand-vizir, who, at the head of ſixty thouſand Turks, deſigned to paſs the Save and beſiege Eſſeck. The prince earneſtly wiſhed for an engagement, but the vizir contented himſelf with haraſſing his enemies by ſlight ſkirmiſhes, and intercepting their convoys. This he executed ſo effectually, that two hundred waggons loaded with proviſions fell into his hands, and the imperialiſts were conſequently reduced to great extremities. On the nineteenth of Auguſt, however, the prince reſolved to force the Turkiſh camp; and his ſoldiers acquitted themſelves with ſuch extraordinary gallantry, that the enemy was compelled to retire, and the grand-vizir himſelf was ſlain in the action.

Early in the enſuing ſpring of 1692, the French army paſſed the Rhine near Philipſburg, and the marquis de Chamilly encamped before Heidelberg; while the duke de Lorges, at the head of thirty thouſand men, croſſed the mountains in order to oppoſe the prince of Baden. The marquis having gained the ſuburbs of Heidelberg, and killed about five hundred of the garriſon, entered the town, and compelled the governor to ſurrender on capitulation. The articles being ſigned, and the garriſon conducted to Wimpfen, the French reduced the caſtle to aſhes, not ſparing even the tombs of the electors and palatine princes. About this time, the duke of Savoy was defeated by Catinat, at Marſaglia; and the approach of the new grand-vizir with a numerous army, obliged the duke de Croy to raiſe the ſiege of Belgrade.

Purſuant to the advice of the prince of Baden, Leopold, in 1694, reſolved to have a fleet this year upon the Danube; but his finances being exhauſted, he was obliged to grant commiſſions to private adventurers, which proved very injurious to commerce. It was alſo found neceſſary to levy a new tax upon Hungary, in order to ſupport the expences of the war; and the court of Vienna was ſo completely embarraſſed for want of money, that very ſerious conſequences might have been expected, had not ſome loyal noblemen borrowed conſiderable ſums upon their own credit, to pay the garriſons of Peterwaradin and the adjacent cities. Meanwhile the grand-vizir paſſed the Save, and inveſted Peterwaradin with an army of ninety thouſand men, while his fleet of one hundred and ten veſſels advanced within cannon-ſhot of the imperialiſts; but he was ſeverely haraſſed by perpetual ſkirmiſhes with the German forces, and the heavy rains which came on about the end of September, compelled him to abandon his enterpriſe.

Whilſt the prince of Orange was employed in the reduction of Dixmude, and ſome other places in the biſhopric of Liege, the mareſchal de Lorges, having paſſed the Neckar, burnt the town of Laudenburg, and ravaged the adjacent country. He then formed a deſign of ſurrounding the imperial army, and ordered the marquis d'Uxelles to fall upon their rear, whilſt he himſelf attacked them in front; but the prince of Baden, ſuſpecting his intention, immediately repaſſed the Rhine, and a ſudden ſwell of that river precluded the poſſibility of a purſuit.

In Montferrat, the duke of Savoy and prince Eugene undertook the reduction of Caſal, with an army of twelve thouſand men, and twenty-four pieces of cannon; but after the ſiege was conſiderably advanced, they were compelled, by a heavy fall of ſnow, to return into winter quarters. In the month of June, however, they again took the field, and the town ſurrendered on capitulation. Meanwhile the imperialiſts in Hungary were obliged to remain upon the defenſive: for the Turkiſh army amounted to upwards of a hundred thouſand men; the fleet upon the Danube was unſerviceable for want of ſailors; the court of Vienna was ſtill perplexed for money; and many officers refuſed to join their regiments till they had aſſurances of receiving their arrears.

In the beginning of Auguſt, 1695, the elector of Saxony marched to Peterwaradin, and from thence to the aſſiſtance of Veterani, who guarded the frontiers of Tranſylvania; but the Turks having made themſelves maſters of Titoul and Lippa, came up with Veterani before the elector's arrival, and defeated him with conſiderable loſs. And now the intrigues of the French court, ſeconded by the pope's nuncio and the Venetian envoy, proved ſucceſsful in detaching the duke of Savoy from the grand alliance. Accordingly, a treaty was publiſhed under the title of the neutrality of Italy; the allies began to retire out of a country where they were regarded as enemies; and the duke, after requeiting Leopold to accede to the neutrality, joined his forces with thoſe of France. Thus, by an adventure ſcarcely paralleled in hiſtory, the ſame general commanded two contending armies in one campaign. The ſubſequent ſiege of Valentia obliged the allies to evacuate Italy, and haſtened the general pacification of the following year.

In the mean time, the elector of Saxony, who commanded in Hungary, reſolved to attack the grand-vizir's army, which was encamped in the plain of Temeſwaer. He accordingly ordered ſix battalions, ſupported by two regiments of dragoons, to force the intrenchments; but a body of Turkiſh cavalry ſoon compelled them to retire, and the janiſſaries having penetrated to their ſecond line, threw the whole army into confuſion. The imperialiſts prepared to repaſs the Beghe, but many of their braveſt troops were cut off in the attempt; and they were ſo perpetually haraſſed in their march, that it was with difficulty they effected a retreat to Ollaſch. Shortly after this occurrence, the elector of Saxony was choſen to ſucceed John Sobieſki on the throne of Poland.

The French, having withdrawn their troops from Italy, ordered Catinat to undertake the ſiege of Aeth, in Flanders, with forty thouſand men, while Boufflers and Villeroy, with two other armies, oppoſed the progreſs of the allies. Aeth was ſoon reduced, and the victors propoſed to take poſſeſſion of the poſt of Anderlach, which might have facilitated the reduction of Bruſſels and Vilvorde; but finding the allies advantageouſly ſituated, they thought proper to alter their deſign.

In 1697, the plenipotentiaries of the allies being arrived at the Hague, while thoſe of France reſided at Delft, it was deemed expedient to hold the conferences at Ryſwick; and baron Lillieroot, who acted as mediator, appointed the firſt conference to be held on the ninth of May. The imperial miniſters made a tedious anſwer to the plan propoſed by France, as Leopold was deſirous of continuing the grand alliance, to aſſiſt him in placing his youngeſt ſon upon the throne of Spain; but Louis, having formed a ſimilar deſign in favour of the duke of Anjou,

Anjou, reſolved to haſten a pacification, and the emperor was compelled to ratify a treaty which had already received the approbation of his allies. By the treaty of Ryſwick, Louis XIV. agreed, that the fort of Keil, with Philipſburg, Friburg, and all his other conqueſts beyond Alſace, ſhould be reſtored to the empire; Leopold ceded Straſburg, and all its territories on the left ſide of the Rhine, to the crown of France; and the duke of Neuburg was re-eſtabliſhed in the palatinate.

During theſe negociations, the grand-ſignior marched from Belgrade with an intention of beſieging Peterwaradin, while his fleet of one hundred and ſix veſſels ſailed up the Danube, and paſſed the Save; but on the approach of prince Eugene he changed his deſign, and made an irruption into Tranſylvania. Eugene continued his march to watch the enemy's motions, and on their forming an encampment near Zenta he reſolved to draw them to an engagement. The Turks, being defended by three intrenchments and ſeventy pieces of cannon, reſiſted the attack of the imperialiſts with extraordinary vigour, and returned their fire with unſhaken reſolution for upwards of two hours; but their intrenchments being at length forced, they were totally routed, with the loſs of thirty thouſand men. The ſpoil taken from the infidels, on this occaſion, conſiſted of fifteen thouſand tents, the military cheſt, the archives of the ſultan's chancery, nine hundred waggons, ſix thouſand camels laden with proviſions, ſeven thouſand horſes, and ſeventy-two heavy cannon. After this brilliant exploit, prince Eugene took the capital of Boſnia by ſurpriſe, deſtroyed the fortreſſes of Dobay, Magloy, and Brandack; and led his victorious army into winter quarters. The enſuing campaign paſſed over without any action; and a peace was, ſoon afterward, concluded between the emperor and the ſultan at Carlowitz.

Louis XIV. having, in 1701, accompliſhed his deſign of placing Philip of Anjou on the throne of Spain, ordered French garriſons into the Spaniſh Netherlands and the duchy of Milan; and at the ſame time ſent a ſquadron of veſſels to the Weſt Indies. Leopold was highly exaſperated at the ſeizure of the Milaneſe, which devolved to him by the death of the king of Spain, and he reſolved to aſſert his right to that territory by force of arms. Accordingly he ordered a body of twenty-nine thouſand men to march into Italy, under the command of prince Eugene, and ſecured the elector of Brandenburg to his intereſt, by conſenting to acknowledge him as king of Pruſſia. He alſo endeavoured to negociate alliances with the other powers of Europe; but the kings of Denmark, Sweden, and Poland, refuſed to engage in a league againſt France, and the Swiſs and Venetians declared that they would obſerve a ſtrict neutrality. After ſome time, however, William king of England concluded a treaty with the emperor, and the ſtates of Holland; by which it was agreed, that if, in the ſpace of two months, Louis did not make ſatisfaction, the parties concerned ſhould mutually aſſiſt each other with their whole ſtrength.

Meanwhile prince Eugene, hearing that the mareſchal Villeroy had repaired to Milan, in order to be preſent at ſome public diverſions, formed the deſign of ſurpriſing Cremona. Accordingly he ordered a body of eight thouſand men to be ready at a certain time to take poſſeſſion of the bridge upon the Po, whilſt he ſent a ſmall detachment through the ruins of an old aqueduct, and by that means obtained admiſſion into the city before the garriſon had any apprehenſion of his approach. The ſubſequent conflict between the garriſon and imperialiſts was extremely obſtinate; and Villeroy, who had juſt returned from Milan, was taken priſoner. But, as the German troops who had been appointed to ſeize the bridge arrived too late, Eugene was compelled to retreat with all poſſible expedition. Queen Anne at this time ſucceeding to the throne of England, ſupported the engagements of her illuſtrious predeceſſor, and, on the fourth of May, declared war againſt France and Spain; and the Dutch, who had hitherto contented themſelves with furniſhing ſome auxiliaries, now became principals in the war.

Whilſt the French army was encamped at Cleves, the duke of Marlborough took upon him the command of the confederates, and endeavoured to bring the enemy to an engagement; but the deputies of the States-general having repreſented to him that it would be more for the advantage of Holland to recover ſome towns in Spaniſh Guelderland, he detached ſeveral parties, who ſoon made themſelves maſters of Venloo, Stevenſwert, Maſeick, and Ruremond. Marechal Boufflers, fearing that the allies had a deſign upon Leige, poſted himſelf at Tongres, in order to ſecure that place; but, in ſpite of all his exertions, the town was compelled to capitulate, and the citadel was ſoon afterward taken by aſſault. About this time, the king of the Romans effected the reduction of Landau, and left the imperial army at Biſchweiller, under the command of the prince of Baden.

As the hoſtilities between Leopold and Louis XIV. did not directly regard the empire, but only the ſucceſſion to the crown of Spain, ſeveral of the German princes had hitherto ſtood neutral; but on the elector of Bavaria declaring publicly for France, the diet at Ratiſbon reſolved to eſpouſe the cauſe of their ſovereign, and requeſted him to proceed againſt the elector according to the conſtitution of the empire. Meanwhile the French army took poſſeſſion of Neuberg on the Rhine, and, after an obſtinate conflict with the prince of Baden, made themſelves maſters of Triers and Traerbach; while on the other ſide, the prince of Heſſe Caſſel marched from Liege at the head of ten thouſand men, and retook Zinch, Briſac, and Andernach. About the ſame time, the duke of Savoy abandoned the intereſts of France, and concluded a treaty of alliance with the emperor.

Whilſt the elector of Bavaria was employed in defending his territories from the imperialiſts, mareſchal Villars had croſſed the Rhine, and taken the fortreſs of Keil, together with ſeveral redoubts. Afterwards attacking the lines of the prince of Baden at Stolhoffen, he was repulſed with conſiderable loſs, but he contrived to join the elector by the paſſes of the Black Foreſt, and obtained a deciſive victory over count Stirum, while another army, commanded by the duke of Burgundy, laid ſiege to Briſac. Upon the Lower Rhine, and in Flanders, the affairs of the confederates were more ſucceſsful. Count Lotum, general of the Pruſſians, made himſelf maſter of Rhenberg, and blocked up Guelders; the duke of Marlborough obliged Bonn to ſurrender after a vigorous ſiege; and the French were compelled to evacuate Maeſtricht, after having blown up the walls and tower. A deſperate engagement took place, about the ſame time, between the forces of general Opdam and thoſe of the mareſchal Boufflers; but as the loſs was nearly equal on both ſides, each party claimed the victory.

Shortly after the re-taking of Landau by the French, in 1704, Leopold ceded his pretenſions to the Spaniſh monarchy in favour of the archduke Charles, who was received at the court of England with great magnificence, and ſailed from thence to Portugal with about nine thouſand men. Upon his arrival at Liſbon, he publiſhed a manifeſto, promiſing a pardon to all who ſhould abandon the intereſts of Anjou, while Philip V. took ſtill more vigorous meaſures, and reduced ſeveral towns on the frontiers of Portugal. At the ſame time the prince of Darmſtadt, having made an unſucceſsful attempt on Barcelona, ſailed with the combined fleet to Gibraltar, which he reduced, and ſurrendered into the hands of the Engliſh.

While the duke of Vendome was rapidly extending his conqueſts in Italy, freſh diſturbances broke out among the Hungarians; and the malcontents, after ravaging the duchy of Auſtria, puſhed their incurſions to the very gates

gates of Vienna. Ragotſki, who had recently eſcaped from priſon, commanded an army of twenty thouſand men; general Forgarts appeared at the head of eight thouſand; and count Caroli, with Eſterhagi and Berecenni, were employed in aſſembling an army of thirty-eight thouſand men. So formidable an armament elevated the courage, and raiſed the demands, of the Hungarians; inſomuch that they grew indifferent to an accommodation, and ſeemed diſpoſed to drive matters to the laſt extremity.

In the mean time, the elector of Bavaria occupied the chief poſts on the Neckar and Danube; mareſchal Tallard penetrated, by forced marches, through the Black Foreſt; and the empire would, in all probability, have ſunk under the arms of France, had not the duke of Marlborough haſtened to join the prince of Baden, and turned the balance of victory by his extraordinary exertions. Several advantageous propoſitions were now made to the elector of Bavaria, in order to detach him from the intereſts of Louis XIV. but, although the battle of Blenheim was loſt after prodigious ſlaughter, the electreſs was obliged to implore the protection of the imperial court at the price of half her dominions, and the electorate was reduced to the utmoſt diſtreſs, he remained firm and unmoved in his reſolution.

After mature deliberation, the confederates reſolved to undertake the ſiege of Landau, and here the brave defence of Laubanis excited the aſtoniſhment of all Europe. This intrepid officer, though labouring under bodily infirmity and the misfortune of blindneſs, behaved with all the ardour and impetuoſity of youth. He replied to a menacing ſummons ſent by the king of the Romans, "that he could not loſe the glorious opportunity of periſhing in the ſervice of his country, and erecting the moſt honourable monument to his own memory on the ruins of Landau." His ſubſequent conduct was perfectly conſiſtent with this aſſertion; for he obſtinately defended the laſt remaining work, cauſing himſelf to be led to the trenches in order to feel the progreſs of the enemy, and giving directions for ſallies, which his ſoldiers obeyed without murmuring, and executed with irreſiſtible fury. At length, however, Laubanis was wounded: every inch of ground was diſputed before it was loſt; the garriſon began to ſink beneath their fatigue; and the enemy made vigorous preparations for a general aſſault. Theſe circumſtances induced the governor to prevent an unneceſſary effuſion of blood by an honourable capitulation; and his propoſals were accepted, after the allies had loſt nearly ten thouſand men in the proſecution of the ſiege.

This campaign terminated with the battle of Caſſano, in which prince Eugene was defeated, after having made the moſt arduous exertions for the reſtoration of the emperor's affairs in Italy. Greatly inferior in force, diſtreſſed for neceſſaries, and ſupported only by his own genius, he encountered Vendome, the beſt general of France, at the head of an army flushed with conqueſt; but his prodigies of valour now proved unavailing, and his gallant followers were overpowered by numbers. The princes of Germany now began to reprobate the war, as productive of nothing but uſeleſs victories, ſlaughter, and deſolation; the republic of Holland ſtarted ſeveral difficulties reſpecting her quota of troops and money; the prince of Heſſe inſiſted that his men ſhould never be commanded by Dutch officers; and the prince of Baden refuſed to acknowledge that ſuperiority which the other inferior officers of the empire conſidered as due to the States General. Such was the diſtracted ſtate of the court of Vienna when the emperor Leopold died, in the forty-ſeventh year of his reign. This prince is ſaid to have maintained the affection of his ſubjects, and conciliated the eſteem of his neighbours, by his affable behaviour; and it is certain that his prudence often preſerved the diadem which tottered on his head.

Upon the acceſſion of Joſeph to the imperial throne in 1705, it was generally expected that a termination would be put to the war, which had already deſolated Germany, and impoveriſhed a conſiderable part of Europe: but the Engliſh peremptorily refuſed to liſten to an accommodation; and Louis was not ſufficiently humbled to propoſe ſuch conditions to the emperor as he could with honour accept. To compromiſe the differences with the Hungarians, Joſeph diſmiſſed thoſe miniſters that were attached to the intereſts of the Jeſuits, and offered to convoke a general diet, where the pretenſions of the diſcontented chiefs might be examined, and all grievances taken into conſideration. But the malcontents declared, that they would hearken to no propoſals till the emperor ſhould engage to baniſh all the Jeſuits, to reſtore to the people their ancient right of electing their own ſovereigns, and to give ample ſecurity that no foreign troops ſhould ever be quartered in the kingdom, or employments beſtowed but upon Hungarians, except in caſes where the diet ſhould think proper to gratify extraordinary ſervices by preferment. The conſequence of this declaration being dreaded by the confederates, they undertook to mediate an accommodation, and conferences were actually opened at Tyrnaw; but ſome inconſiderable advantages encouraged the emperor to riſe in his demands, and the negociation was ſuddenly broken off.

General Heberville, having raiſed the blockade of Waradin, advanced within ſight of the malcontents, in the neighbourhood of Scibo, and determined to draw them to an engagement. The enemy ſuſtained his firſt attack with extraordinary firmneſs, and twice repulſed his troops with great ſlaughter; but being at length overpowered by the imperial cavalry, they were obliged to abandon their camp with precipitation. This victory was ſoon followed by the total reduction of Tranſylvania. But whilſt Vienna rung with rejoicings for this brilliant ſucceſs, Lower Hungary, Moravia, and the hereditary dominions of the houſe of Auſtria, were literally deſolated by the rebels; and ſuch crowds of Auſtrian peaſants flocked to their ſtandard, that they bade defiance to oppoſition, and poſitively refuſed an armiſtice which was propoſed by the mediators.

In the mean time, mareſchal Villars was at the head of a formidable army on the Moſelle; the banks of the Rhine were covered by the numerous troops of Marſin; the elector of Bavaria had taken Huy; and Liege muſt probably have ſurrendered, had not the reſiſtleſs arm of Marlborough interpoſed for its preſervation. That general, with his accuſtomed intrepidity, forced the elector's lines near Meſſeling on the Maine, and obliged him to retire in diſorder towards Louvain. His glorious ardour, however, was checked by the unſeaſonable caution of the Hollanders, and he juſtly complained that they wreſted victory out of his hands. Violent altercations enſued between Marlborough and the prince of Baden, and a ſeparation of the allied army enabled Villars to reinforce the elector of Bavaria with thirty battalions and fifty ſquadrons.

During theſe tranſactions, Joſeph found himſelf involved in a diſpute with the Roman pontiff. Cavaletti, one of the imperial ambaſſador's domeſtics at Rome, had been thrown into priſon for ſtriking ſome officers of juſtice; and the affair was repreſented at Vienna in ſo ſerious a manner, that the count de Lamberg was immediately recalled, and the pope's nuncio was deſired to quit the imperial court. This trivial circumſtance was ſufficient to revive an ancient controverſy; and the emperor now demanded that Palavicini, governor of Rome, ſhould be baniſhed; that a proceſs formed againſt the marquis del Vaſto, who had been veſted with the character of ambaſſador from the archduke Charles, ſhould be burnt by the common executioner; that his holineſs ſhould immediately ſend a cardinal to apologiſe for his conduct; and that Ferrara ſhould admit an imperial garriſon. Had Joſeph perſiſted in theſe demands,

the pope would, in all probability, have been effectually humbled; but, after ſome time, the affair ſunk into oblivion.

Meanwhile Bavaria groaned under the moſt cruel and tyrannical oppreſſions. A treaty had been concluded between the electreſs and the imperialiſts, by which all acts of hoſtility on both ſides were to ceaſe; the elector was to be regarded merely as a general of Louis XIV. at the head of a French army; the Bavarians were to be confirmed in all their privileges; and the revenues of Munich and its dependencies were to remain unfouched, as conſtituting the ſupport of the princeſs and the electoral family. But the Auſtrian forces had no ſooner taken poſſeſſion of the country, than the electoral palace was ſtripped of all its rich furniture; the nobility and people were oppreſſed with exorbitant contributions; many individuals were impriſoned, upon ſuſpicion of concealing their property; and even the tombs were violated in queſt of hidden treaſure. Loud complaints were conſequently made to the imperial commiſſaries, and crowds of ſufferers poured out their grievances in the moſt pathetic manner: but they were treated with brutal neglect; and the aggreſſors endeavoured to juſtify their proceedings, by charging the Bavarians with a dangerous conſpiracy.

After theſe flagrant acts of injuſtice had for ſome time been committed with impunity, count de Lowenſtein, governor of the province, publiſhed an edict, enjoining all the young men, from the age of eighteen to thirty-five, to appear at certain places, in order to be draughted for recruits to the regiments in Hungary and Italy. The peaſants, alarmed at this ordinance, endeavoured to elude compliance by a temporary concealment; but this evaſion was conſtrued into an act of rebellion, and all the gaols in Bavaria were crowded with unfortunate wretches, who had been dragged out of churches, monaſteries, and other places of refuge; while their houſes were pillaged, and their homes deſtroyed. Diſtracted by theſe calamities, and rendered deſperate by the preſſure of extreme want, the ſufferers at length reſolved to unite for their own defence, and join the Bohemian malcontents againſt their common enemy. This plan being reduced to execution, an army of twenty thouſand men took the field, and made themſelves maſters of ſeveral important places; but, finding it impoſſible to make a long reſiſtance againſt regular troops, they laid down their arms, upon aſſurances of a general amneſty. The Auſtrian faith, however, was ſoon violated; and the unhappy leaders of the inſurrection were treated with the moſt ſavage barbarity. At this time the electreſs, who had been to viſit her mother the queen of Poland, demanded leave to return to her dominions; but juſt as ſhe arrived on the frontiers, ſhe was prohibited from purſuing her journey, and deprived of the poor ſatisfaction of mingling her tears with thoſe of her faithful ſubjects.

In the mean time Joſeph, in 1706, having conſtrained the aulic council to proſcribe the electors of Bavaria and Cologne, convened a numerous aſſembly to witneſs the ceremonial of their diſgrace. Being ſeated in his imperial throne, he cauſed the acts to be recited by which Leopold had inveſted the proſcribed princes with the electoral dignity: he then tore them in pieces, daſhed them on the ground, and directed the heralds at arms to throw them into the ſtreet. The decree of the aulic council was then publicly proclaimed in all the principal ſtreets of Vienna; a price was ſet upon the head of the elector of Bavaria; and the ſame meaſure would have been taken againſt the elector of Cologne, had not his eccleſiaſtical character exempted him from ſuch ſeverity. Theſe rigorous proceedings, however, were ſtrongly reprobated by ſeveral of the German princes, and many of them expreſſed great aſtoniſhment at the emperor's conduct.

M. Villars, being appriſed of theſe circumſtances, determined to uſe his utmoſt endeavours for reſtoring the affairs of the electors. Having advanced by rapid marches along the Sar, he compelled the prince of Baden to retire precipitately toward Druſenheim; and the imperialiſts were driven from place to place, without the credit of ſtriking a ſingle blow, or making the leaſt reſiſtance. The French commander availed himſelf of this general conſternation, to gain poſſeſſion of ſeveral fortreſſes between the rivers Moter and Spirebach, and to recover Haguenau from the enemy. About the ſame time, the Hungarian malcontents, having forced the intrenchments of Guy de Staremberg, made an irruption into Auſtria, and concerted a ſcheme for ſeizing the emperor as he was hunting in the foreſt of Eberdorf: but this project miſcarried.

The affairs of the imperialiſts in Italy, in 1707, were not more fortunate: the French, under M. Berwick, had gained ſuch a decided ſuperiority, that they actually meditated the conqueſt of all Piedmont, while prince Eugene found it equally impracticable to animate the councils or quicken the meaſures of the court of Vienna. At length, however, the ſum of twenty-five thouſand pounds ſterling was borrowed from the Engliſh; and Eugene repaired with a numerous army to Turin, at the very moment that the capital was on the verge of deſtruction. This was indeed a moſt extraordinary exertion; and the rapidity with which he recovered all the recent conqueſts, will tranſmit his memory with glory to the lateſt poſterity: but the duke of Marlborough rivalled his fame at the battle of Ramilies, in which Villeroy was utterly defeated, with the loſs of his cannon, baggage, and a prodigious number of men, who were either killed or taken priſoners.—See theſe intereſting events more copiouſly narrated, under the article ENGLAND, vol. vi. p. 702–707.

The long duration of a war in which all Europe had ſome concern entirely drained the provinces of money, and incapacitated them from furniſhing the uſual ſupplies. But the Imperial and Britiſh courts, and the States General, were not yet ſatiated with conqueſt. The circles of the Upper and Lower Rhine, with thoſe of Swabia and Franconia, complained of the impracticability of defending the frontiers, unleſs the ſtipulated forces were regularly levied; and it was therefore reſolved, that an army of forty thouſand men ſhould be raiſed for this purpoſe. Magazines were alſo ordered to be erected at Philipſburg; Landau was to be well fortified and garriſoned; and recruits were to be ſent off with the greateſt expedition, to complete all the imperial regiments in Savoy. At the ſame time, the emperor ceded Valencia and Alexandria, with their dependencies, to Victor Amadeus duke of Savoy, and inveſted the archduke with the duchy of Milan.

Upon the demiſe of Louis prince of Baden, the command of the imperial army on the Rhine was given to the margrave of Brandenburg Bareith; but as his troops did not exceed twenty thouſand men, and moſt of theſe were newly levied and indifferently armed, it appeared impoſſible to reſiſt the ſuperior force of M. Villars, and to defend the lines at Stolhoffen, which covered the territory of Baden Dourlach, and extended to the impaſſable mountains of the Black Foreſt. Villars was perfectly acquainted with the ſtate of the imperial army, and amuſed them with ſeveral feints and falſe attacks, while he was aſſembling twenty battalions and forty-five ſquadrons, under the count de Broglio, at Lauterberg. Filling ſixty boats with grenadiers, he haſtened to the iſle of Newberg, whence he chaſed the imperialiſts, after a ſhort reſiſtance; and, on his preparing to attack the lines, the margrave retired with the utmoſt precipitation, leaving the enemy in poſſeſſion of all the ſtrong works of Stolhoffen, together with the tents, artillery, baggage, and ammunition. Villars conſequently became maſter of the whole marquiſate of Baden, and ſoon afterward penetrated into the duchy of Wirtem-

Wirtemberg, which he taxed at the rate of two millions of livres.

Meanwhile the circles of Swabia and Franconia remonſtrated to the diet at Ratiſbon upon the dangers which threatened their territories, and intimated, that if ſpeedy meaſures were not taken for their defence they ſhould be obliged to accept a neutrality, which had been offered by the king of France. Theſe repreſentations, and the ſubſequent aſſurance that Baden and ſome other frontier towns had reſolved to conclude a ſeparate pacification, effectually alarmed the diet, and induced them to exert their utmoſt vigilance for preventing ſo dangerous a breach in the ſtates of the empire. After mature deliberation, it was reſolved that the margrave of Bareith ſhould haſten to join the troops of Weſtphalia and other circles aſſembling in the neighbourhood of Mentz; and that, after this junction, he ſhould proceed to the Rhine; as it was expected that M. Villars, who had now advanced into the interior of Germany, would follow the margrave's route. This project was put in execution; and the imperial general paſſed through Franconia with ſuch rapidity, as baffled all the endeavours of Villars to obſtruct his progreſs. The French commander, however, ſent a detachment of four thouſand men to defend the lines at Lauterberg, while the count de Broglio ſecured Lauffen on the Neckar, and the mareſchal in perſon haſtened to Dourlach. His approach fruſtrated the deſign which the imperialiſts had formed againſt Alſace, and enabled him to lay the whole palatinate under contribution. Shortly after theſe tranſactions, the margrave of Bareith reſigned his command, which was beſtowed, with the title of field-mareſchal, on the elector of Hanover.

Meanwhile the affairs of Spain bore a gloomy aſpect. The battle of Almanza was loſt; all the deſigns of the confederates were rendered abortive, by the ſuperior vigilance and genius of M. Berwick; and the kingdoms of Arragon and Valencia were obliged to ſubmit to the conqueror. Theſe misfortunes, however, were in ſome meaſure counterbalanced by the revolution in Naples, which raiſed the archduke Charles to the ſovereignty of that kingdom.

Whilſt the imperial diet was diſtracted by altercations reſpecting the proſecution of the war, the king of Portugal, the duke of Savoy, prince Eugene, the prince of Heſſe-Caſſel, and the duke of Wirtemberg, were clamorous for money, troops, and other neceſſaries. All were completely embarraſſed, and all their projects were equally at a ſtand; but nothing could quicken the proceedings of the Germanic body. Without the aid of England, the confederates muſt inevitably have been ruined, and the brilliant victories of Eugene and Marlborough rendered abortive. But the Britiſh parliament adhered ſtrictly to their engagements, and exerted themſelves with ſuch activity, that the combined armies were again put in motion. In Flanders, the battle of Oudenarde was gained under the auſpices of Marlborough and Eugene, though the enemy were headed by a prince of the blood, and aſſiſted by the duke of Vendome, who was generally conſidered as the prop of Louis's declining glory. Liſle, Ghent, and other cities, were alſo ſpeedily reduced; and the impetuoſity of the confederates ſeemed now irreſiſtible.

After an unſucceſsful negociation for peace between the courts of Verſailles and Vienna, in 1709, both ſides prepared, with augmented fury, for the proſecution of the war. The confederates, under Eugene and Marlborough, were again victorious in the Netherlands: Villars loſt the battle of Malplaquet; but it has been juſtly remarked, that he was formidable in his defeat, and ſtained deeply with blood the laurels gained by his enemies. On the Rhine, however, the imperialiſts were leſs ſucceſsful; and count Thaun, who commanded in Italy, found it impoſſible to acquire any important advantage. While the allies were, with ſucceſs, proſecuting the war in Flanders, Louis XIV. made freſh overtures for peace, by his ſecretary the marquis de Torcy; but although he offered to accept ſome of the conditions which he had rejected in the preceding year, Joſeph was ſtill inexorable; and the confederates gradually roſe in their demands, till at length they plainly declared, that no treaty of pacification could take effect, unleſs the moſt Chriſtian king would contribute his aſſiſtance to dethrone his own grandſon.

No ſooner were the conferences broken off at Gertrudenburg, than the allies renewed hoſtilities in the Netherlands, and made themſelves maſters of Aire, St. Venant, and Bethune; but theſe advantages were purchaſed by the loſs of twenty thouſand men. Towards the Rhine no conſiderable action was performed; for the ſtrength of the adverſe armies was nearly equal, and the reſpective commanders were unwilling to hazard an engagement. In Hungary the affairs of the empire were rather more proſperous than in the preceding campaign; but the old obſtructions to peace ſtill remained, and all attempts to ſoothe the malcontents proved entirely fruitleſs.

Meanwhile the ſuccours afforded by England enabled the archduke Charles to gain the victory of Saragoſſa, which would have eſtabliſhed him on the Spaniſh throne, had the advantages been properly purſued. But the arrival of De Vendome ſoon reſtored the affairs of Philip V. and raiſed him from a fugitive prince to a triumphant monarch.

The beginning of the year 1711, was marked by a revolution in the Engliſh miniſtry; and the intereſts of Europe were ſenſibly affected by the death of the emperor, who fell a martyr to the ſmall-pox in the prime of life. His character has been variouſly repreſented: but from a review of his actions we may pronounce him leſs gentle, mild, and affable, than his father; though his ſpirit and vivacity ſometimes procured him the tribute of admiration. Impatient of oppoſition, he was haughty, active, and enterpriſing, and frequently purſued from motives of reſentment what he had firſt undertaken from policy. His ſucceſs augmented the pride of his diſpoſition, and added fuel to a fire which had long burnt with extreme violence. In the ſpace of five years he ſaw Lombardy ſubdued, Piedmont evacuated, Naples reduced, and the Netherlands conquered by his own arms and thoſe of his allies. In his imperial capacity he certainly governed with more deſpotiſm than any of his predeceſſors, and the houſe of Bavaria was a monument of the inflexibility of his temper.

When the electoral college aſſembled, in order to ſupply the vacancy on the imperial throne, the archduke Charles was propoſed as a candidate, and the elector of Mentz gained for him all the votes by a deciſive argument. "The empire, (ſaid he) is a wife of high birth without a fortune. She requires a great expenditure for her maintenance; and the houſe of Auſtria alone poſſeſſes revenues adequate to that purpoſe." Upon the firſt intimation of his election, Charles ſet out from Barcelona, and on his arrival at Frankfort he ſwore to obſerve the imperial capitulation in the manner it was propoſed by the electors. The ceremony of his coronation was performed with great magnificence, in 1711, and ſeveral gold medals were diſtributed among the princes of the empire and the foreign ambaſſadors.

As the queen of England had acquainted her parliament with her pacific intentions, and Holland was upon the point of concluding a ſeparate treaty, the new emperor found himſelf under the neceſſity of ſuſtaining the entire weight of a war with France and Spain, or of accepting the terms offered by Louis. At this juncture a congreſs was held at Utrecht for the purpoſe of opening negociations between the hoſtile powers, and the allies reſolved to make ſome freſh exertions againſt

the

the crown of France; and it was generally expected that the queen of England, tired out with the clamours of her allies, would enter zealously into this measure: but Eugene entertained suspicions, and expressed his impatience at the mysterious conduct of the British officers. When the confederates had passed the Scheld, and encamped opposite to the enemy, Eugene proposed a junction between the English and Austrian forces; but this proposal was rejected; and, after some time, the duke of Ormond produced his orders not to act offensively. Exasperated at this discovery, the Imperial and Dutch generals declared, they would prosecute the war without the queen's concurrence; and demonstrate to her that England was of less consequence to the alliance than she imagined. Having made this declaration, they undertook the seige of Quesnoi, and pushed on their attacks with such vigour, that the garrison were compelled to surrender at discretion; while the duke of Ormond withdrew his army, and took possession of Dunkirk.

Elated by their success at Quesnoi, the allies resolved to attempt the reduction of Landreci, which was accordingly invested by the prince of Anhalt Dessau, with thirty-four battalions and thirty squadrons; while prince Eugene, with the remainder of the army, covered the siege, and took every precaution to ensure success. Mareschal Villars, however, soon obliged them to abandon their enterprise; and recovered all the conquests which they had made in three successive campaigns. About the same time, the emperor Charles was crowned king of Hungary, without the formality of an election, which he regarded as a mere ceremony; and with respect to Bohemia, he did not think even a coronation necessary to the complete investiture of the sovereignty.

Charles seems to have flattered himself that the French monarch, being advanced in years, and harassed by perpetual inquietudes, must soon finish his career, and that the subsequent minority would produce a revolution favourable to the empire. The Dutch also seemed rather desirous of extending the flames of war, than of cherishing the blessings of tranquillity; and the influence of prince Eugene seemed to throw insurmountable obstacles in the way of a general pacification. At this juncture, however, the duke of Savoy began to cool in his attachment toward the house of Austria. Tired with a war which only contributed to his ruin and the opposition to his own daughter's elevation, he resolved to commit his affairs into the hands of the queen of England, who immediately undertook to mediate his peace with Louis, and also to procure for him the crown of Sicily, and the reversion of the Spanish monarchy in default of male issue of the direct line. A treaty having been concluded to this effect, and the courts of Savoy and Portugal having acceded to the treaty of Utrecht, the queen drew off all her forces from Portugal and Catalonia; and, after mature deliberation, the States General also resolved on a peace with France.

The negociations at Utrecht now assumed a more promising aspect, and the clouds which had been raised by jealousy or resentment were mostly dissipated. The congress was opened by a number of ministers, equally famed for ability and elocution. All practised the utmost refinements of policy; each enforced his master's rights with energetic zeal; and their perseverance at length triumphed over all difficulties. Accordingly, after some violent altercations, it was agreed that the imperialists should evacuate Catalonia, and a neutrality take place in Italy; that an armistice should be published in Catalonia, and that, on the day of its publication, the imperialists should surrender Barcelona or Tarragona; that all prisoners on either side should be released; that an amnesty should be published in Spain; and that the utmost influence of her Britannic majesty, and the king of France, should be exerted to persuade Philip V. to leave the Catalans in full possession of their liberties.

The subsequent propositions respecting the cession of conquests were peremptorily refused by count Zinzendorf; and his conduct was approved at the court of Vienna, where the peace was violently contested; and her Britannic majesty was libelled in a most scandalous manner, for having withdrawn herself from the grand alliance. Sums of money were now borrowed for the prosecution of the war, and prince Eugene was again employed to check the arms of France; but these exertions proved totally unavailing; and the reduction of Keiserlauter, Linenga, Volstein, and Friburg, convinced the emperor of his own inferiority, and the impossibility of prosecuting a claim against two powerful monarchies, in which he must rely entirely upon the abilities of his generals, unsupported by men or money. Eugene was, therefore, in 1713, permitted to open a negociation with M. Villars, at the castle of Rastadt; and, after a few days, a definitive treaty was concluded, by which it was agreed that Philipsburg and Friburg should be restored to the emperor; that all the French conquests on this side the river Queifch should be confirmed to his most Christian majesty; and that the proscribed electors should be reinstated in all their former dignities and possessions. Such was the termination of a sanguinary war which had continued almost during three reigns, and involved all the powers of Europe in bloodshed and slaughter.

From the TREATY of RASTADT, to the PEACE of PRESBURG, in 1805.

Soon after the conclusion of the treaty of Rastadt, Charles was alarmed by the hostile proceedings of the Turks; but these were completely repulsed by the sword of Eugene; and two decisive victories obtained by that hero at Peterwaradin and Belgrade, in 1714, obliged the infidels to accede to a pacification. From this time the emperor was anxiously employed in forming projects for the preservation of his hereditary dominions in Italy; and the accession of the house of Hanover to the throne of England, gave him a very decisive importance in the affairs of Europe. His knowledge of this advantage rendered him assuming, and his haughty conduct occasioned a breach between him and George I. which threatened very serious consequences; but as the aggrandisement of Hanover was a favourite object with the British court, and Charles was equally desirous of establishing the pragmatic sanction in favour of his daughter, mutual concessions were made during the reign of George II. and the elector of Saxony was persuaded to relinquish his claims upon the Austrian succession.

Some time after this accommodation, Charles entered into a fresh war with the Turks, under the expectation of indemnifying himself for some great sacrifices which he had been compelled to make to the princes of Bourbon. But on this occasion his hopes were entirely groundless. Prince Eugene, who had formerly infused vigour and emulation into the imperial troops, was now dead; and the war was carried on with very ill success, till, at length, cardinal Fleury undertook to mediate a peace, and obtained better terms for Germany than she had any reason to expect. Having ratified this treaty, and given his eldest daughter in marriage to the duke of Lorraine, Charles paid the debt of nature in the twenty-ninth year of his reign, A. D. 1740.

The imperial throne, after having been long vacant, was filled, in 1742, by the elector of Bavaria, who assumed the title of Charles VII. while the French took possession of the capital of Bohemia; and the queen of Hungary was compelled to make a formal renunciation of

of the duchy of Silesia to the king of Prussia. Her youth and beauty, however, made a sensible impression on the hearts of the Hungarians, and induced them to declare unanimously in her favour. Accordingly, her generals acted with such extraordinary vigilance that the French were soon chased out of Bohemia; George II. at the head of an English and Hanoverian army, gained the famous battle of Dettingen; and Charles VII. was reduced to such extremities, that he would have concluded a peace with the queen of Hungary upon any terms that were not absolutely injurious to his honour. But that princess imprudently refused to listen to any accommodation, till the king of Prussia led a numerous army into Bohemia, and subdued the greatest part of that kingdom, under pretence of supporting the imperial dignity.

Upon the demise of Charles VII. in 1745, and the subsequent election of the duke of Lorraine, consort to her Hungarian majesty, the king of Prussia asserted, that the empress-queen, the empress of Russia, and the king of Poland as elector of Saxony, had entered into a secret convention to strip him of his dominions, and divide them among themselves. On this pretence he took up arms against the king of Poland, defeated his troops, chased him out of Saxony, and held the city of Dresden as a legal conquest, till his Britannic majesty interfered and negociated an accommodation. By the subsequent treaty of Aix-la-Chapelle, the duchy of Silesia was guaranteed to Prussia: but, as the empress of Russia happened to coincide in sentiment with the king of Poland and the empress-queen, and as France engaged to support their designs, a fresh war was kindled in the empire.

The king of Prussia, in 1756, encouraged by the promise of an annual subsidy from the British parliament, rushed like a resistless torrent into Saxony, defeated the imperial general at Lowositz, and again compelled the elector to retire into Poland. After this exploit he was put under the ban of the empire, and the armies of France and Russia hastened to support the imperial arms: but, instead of shrinking from the danger, or even lowering his pretensions, the Prussian monarch made such exertions as are scarcely to be paralleled in history. Having made a fresh irruption into Bohemia, he defeated an army consisting of a hundred thousand Austrians, and attacked the city of Prague with a most tremendous artillery; but just as he was congratulating himself on the irresistible valour of his troops, the Austrian general Daun obliged them to raise the siege, and to retreat to Eisnach. The arrival of the Russians gave a new turn to the aspect of the war; and the political manœuvres of count Daun involved his Prussian majesty in many embarrassments, notwithstanding all his splendid victories. A nocturnal attack upon his army at Hochkirchen threw his affairs into a most perilous situation; and, though he contrived to retrieve this misfortune, he was compelled to sacrifice Saxony for the preservation of Silesia. It has been justly observed, that few periods of history afford so much room for contemplation as this campaign did:—six sieges were raised almost at the same time:—that of Colberg by the Russians; that of Leipsic by the duke of Deux-Ponts; that of Dresden by count Daun; and those of Cosel, Neiss, and Torgau, by the Austrians.

The king of Prussia's misfortunes now poured in upon him from every quarter. The Russians, of whom he had formerly entertained too mean an opinion, advanced, under the command of count Soltikoff, to Silesia, and defeated his army with prodigious slaughter; succeeding defeats seemed to announce his ruin, and all avenues to a pacification were barred against him. Still, however, he remained firm and undaunted; and towards the end of the campaign, he defeated the imperialists in the battle of Torgau; but this victory was attended with no great consequences in his favour, though it cost him ten thousand of his bravest troops. The subsequent reduction of Colberg by the Russians, and of Schweidnitz by the Austrians, seemed to threaten his last hopes with annihilation; but at this critical juncture, his most formidable enemy was removed by death, and the new emperor of Russia recalled his armies. The empress-queen still desired to crush this enterprising prince, who had incurred her implacable resentment; but as the German princes disapproved that design, and her generals testified a strong repugnance to execute her orders, she at length consented to an armistice; and the subsequent treaty of Hubertsburg again secured to his Prussian majesty the possession of Silesia. About two years after the conclusion of this treaty, the emperor Francis died, in the twenty-first year of his reign. This prince never appeared to take any share in the concerns of Germany, but such as his gratitude to his consort, his dependance upon her for the support of his imperial dignity, and a natural regard for his children, seemed to dictate.

Joseph II. who had been crowned king of the Romans in 1764, succeeded his father in the empire in 1765; and soon gave some convincing proofs of his activity, by new-modelling the armies, introducing economy, and visiting all the camps which were formed, during the summer, in Bohemia, Moravia, and Hungary. And among many other excellent regulations, the emperor set apart one day in every week for receiving petitions and complaints from all his subjects, without any distinction of birth or fortune; and the officers of his court were expressly forbidden to repulse any, even the meanest object, who came to implore his protection. "It behoves me, (said he,) to do justice, and it is my invariable intention to render it to all the world, without respect of persons."

Notwithstanding these exertions on the part of the sovereign, and the blessings of profound tranquillity, Germany was, in 1771, doomed to suffer most poignant calamities. A series of unfavourable seasons had occasioned a general dearth of corn, which was more or less felt in all the countries of Europe: but in most parts of Germany the scarcity was so great, that vast numbers of people actually perished, and the peasants, in many places, were compelled to unthatch their cottages to supply the want of provender for their cattle. The approach of summer increased instead of alleviating the public distress; for the unusual quantities of snow which lay on the mountains, being suddenly melted, rushed in torrents on the level country; while the overflowing of the great rivers, and the continual rains which fell from the latter end of May till the middle of July, diffused on every side scenes of confusion, terror, and distress. Many parts of Lower Saxony, of the old march of Brandenburg, and of the adjacent countries, were totally ruined by an inundation of the Elbe; Hamburg was in a most critical situation; and the great suburb lying toward the Elbe was so completely covered with water, that only the tops of the trees were discernible.

The princes and states of Germany made every possible exertion to hush the complaints, and alleviate the miseries, of the people; but, as the famine was not confined to the empire, the supplies which they procured were very disproportionable to their benevolent design. A riot happening at Prague in consequence of this unfortunate scarcity, the governor told the people, that if they did not immediately disperse, he would order his soldiers to fire upon them; but this menace was so far from terrifying them, that they replied with perfect coolness, they should look upon the execution of it as a signal favour, a sudden death by shot being much preferable to a lingering one by famine. The empress-queen, being informed of this transaction, burst into tears, and sent the unhappy rioters immediate relief. About the same time a hundred barrels of flour

were diſcovered in a ſtorehouſe at Munich, where they had lain ever ſince the year 1631, when the famous Guſtavus Adolphus ravaged Bavaria. This flour, upon examination, was found to be grown into a hard ſubſtance that reſembled a kind of ſtone; but the preſſing exigence of the times induced the diſcoverers to mix it with freſh meal, and to diſtribute it in bread to the poor, who had for a long time ſubſiſted on the bark of beech and alder, mixed with a ſmall quantity of ſpice.

During theſe calamities, his imperial majeſty joined with Ruſſia and Pruſſia in the diſmemberment of Poland: but it ſeems that the court of Vienna was either aſhamed of the infamy, or ſhocked at the injuſtice, of this tranſaction; for count Kaunitz, being interrogated upon the ſubject by ſome foreign miniſters, denied it in the moſt ſolemn terms, and the conduct of the emperor was ſo equivocal, that none of the European powers could fathom his real intentions. At length, however, all diſguiſe was thrown aſide; a manifeſto, delivered at Warſaw by the Ruſſian and Pruſſian miniſters, was ſeconded by the empreſs-queen; and the three powers openly avowed their intentions. This, however, did not prevent hoſtilities from being commenced between Auſtria and Pruſſia, on account of the ſucceſſion to the electorate of Bavaria. Upon this occaſion the emperor diſcovered much military ſkill; but, although prodigious armies were raiſed on both ſides, all the actions proved unimportant, and the diſpute was finally ſettled by negociation.

The year 1780 was marked by the death of Maria Thereſa, empreſs of Germany, queen of Hungary and Bohemia, and archduchefs of Auſtria; a princeſs who appears to have inherited all the ſpirit, firmneſs, and magnanimity, of her moſt renowned anceſtors, together with a clear underſtanding, a happy temper, and a captivating condeſcenſion, which inſenſibly gained her the affections of all her ſubjects. In the courſe of her life ſhe experienced many viciſſitudes of fortune; and at the death of her father, her enemies ruſhed with ſuch fury upon her territories, that it was actually doubted whether ſhe could retain the poſſeſſion of any place capable of affording an aſylum during her lying-in: but her undaunted courage enabled her to ſurmount all theſe difficulties, and to elevate the houſe of Auſtria to a degree of power which it had not enjoyed ſince the reign of Charles the Fifth. Excluſive of her imprudent engagements againſt Poland, ſhe was entitled to univerſal reſpect for the juſtice of her adminiſtration; and in the characters of a wife and parent ſhe was certainly unrivalled.

Early in the enſuing year, his imperial majeſty promulgated a decree in favour of the liberty of the preſs, which had been hitherto much circumſcribed in the Auſtrian dominions. By one of the articles he allowed a free circulation, without particular licence, to all literary reviews; and by another, he permitted that all ſtrictures upon the throne itſelf might be publiſhed with full ſecurity, provided they did not deſcend to the character of libels or paſquinades. His remark upon this occaſion was equally worthy of his character and dignity. "If they be founded on juſtice, (ſaid he,) we ſhall profit by them; if not, we ſhall diſregard them."

This decree was ſoon followed by others which were admirably calculated to augment the reputation of the ſovereign, and render the moſt important ſervices to the ſubjects. The proteſtants, who had formerly experienced much perſecution on account of their religion, were now indulged with the imperial protection; the Jews, on whom innumerable cruelties had often been practiſed in preceding reigns, were permitted to exerciſe all kinds of arts or trades, to apply themſelves to agriculture, or to purſue their ſtudies in the univerſities, without any impediment on the ſcore of religion; and the authority of the court of Rome was prudently curtailed, by an ordinance which prohibited all the religious orders within the imperial dominions from holding any correſpondence, on ſpiritual or temporal ſubjects, with their reſpective chiefs who reſided in any foreign country.

In a journey to the Netherlands, the emperor excited the admiration, and acquired the warmeſt affection, of the populace. The free audience which he granted to all ranks of perſons, the complaiſance with which he received their petitions, and the unwearied patience which he exhibited in the inveſtigation of their grievances, were indeed calculated to produce the happieſt effects. The inhabitants of Oſtend were particularly honoured with his royal favour. He declared their port to be free; ordered their accommodations for ſhipping to be enlarged at his own expence; and gave ſuch encouragement to foreign ſettlers in the commercial line, that the town was immediately augmented by many new ſtreets, and crowds of people flocked in from every quarter. The emperor afterwards demanded of the Dutch the free navigation of the Scheldt, but in this he failed.

On his return to Vienna, he reaſſumed his important regulations, and granted an enlargement of perſonal liberty to his ſubjects, which muſt infallibly tranſmit his name with unfading glory to all poſterity. The peaſants of Bohemia, Moravia, and Sileſia, had long languiſhed in a ſtate of vaſſalage, and had been frequently driven, by extreme oppreſſion, to the madneſs of inſurrection, without any poſſibility of ſucceſs. Some attempts had been made in the late reign to curb the wanton tyranny of the nobles, and to meliorate the condition of theſe unfortunate people: but much remained to be done, and the honour of their complete emancipation was reſerved for Joſeph the Second. Accordingly, that magnanimous prince publiſhed an edict for the total abolition of vilainage and ſlavery in thoſe three countries; and ſimilar meaſures were taken, ſoon afterward, for the relief of the peaſants in Auſtrian Poland.

The ſubſequent ſuppreſſion of many religious orders, and the promulgation of an imperial reſcript, diſclaiming all ſubordination in ſecular affairs to the holy ſee, induced pope Pius VI. to take a journey to Vienna; but, notwithſtanding the very flattering attentions which he received at his arrival, and the uniform politeneſs of the emperor and all the courtiers, he found it impoſſible either to accompliſh his purpoſe, or to procure an intermiſſion of thoſe reforms which were now extended to the ſecular clergy and hierarchy, as well as to the religious orders, or regulars.

But the court of Rome, in 1786, was deſtined to receive a greater ſhock from another quarter than it had yet ſuſtained from the vigorous exertions of Joſeph. The German prelacy, taking advantage of their ſovereign's diſpoſition, reſolved to ſeize the preſent opportunity of calling in the great official powers lodged in his hands, to concur in emancipating them from the Italian yoke in the adminiſtration of eccleſiaſtical affairs; for the interference of the pope in their metropolitan government had been long conſidered as an intolerable grievance, and an ignominious badge of ſervitude. The reſidence of nuncios, and the eccleſiaſtical juriſdiction which they aſſumed, appeared to ſum up in themſelves the whole amount of this grievance, and were conſidered as ſtanding monuments of the papal oppreſſion. The abolition of theſe was conſequently made the firſt object of contemplation; and at the earneſt ſolicitation of the elector of Mentz and the archbiſhop of Saltzburg, his imperial majeſty publiſhed a memorial, in which he refuſed to admit any future interference on the part of Rome in eccleſiaſtical matters, and exhorted his prelates to reſiſt and ſternly to oppoſe all encroachments and uſurpations againſt their rights and government. The publication of this memorial was ſoon followed by a conference of the eccleſiaſtical princes held

at Ratiſbon, where it was unanimouſly reſolved to withdraw themſelves entirely from the juriſdiction of the pope; to revive the ancient complaints of the German nation againſt the oppreſſions of the holy ſee; to claim the emperor's protection for the reſtoration of all their privileges; and to eſtabliſh new regulations with reſpect to eccleſiaſtical diſcipline. Thus was an end put to the papal domination in Germany, which had been maintained for many ages, and had frequently occaſioned much effuſion of blood.

Early in the ſpring of 1788, a declaration of war was publiſhed at Vienna againſt the grand-ſignior; and about the middle of April the emperor joined the grand army on the Danube, where the attack of Schabatz had been deferred till his arrival. Having altered the diſpoſitions made by the beſiegers, and ordered an attack to be made on the oppoſite ſide of the town, he had the ſatisfaction of witneſſing its ſpeedy reduction. The garriſon, conſiſting of eight hundred men, ſurrendered themſelves priſoners of war, and the emperor permitted their wives and children to retire with their effects to the neareſt Turkiſh garriſon. The triumph of this ſucceſs, however, was ſoon damped by the ſevere repulſe which Lichtenſtein's army received at Dubieza. The prince, having carried on his approaches for ſome time againſt that fortreſs, and made a breach which was deemed practicable, determined to carry the place by aſſault: but neither the diſcipline nor the cool determined valour of the German veterans, were capable of withſtanding the deſperate fury with which they were encountered by the garriſon. The fall of the imperial commander, and the immediate wounding of his ſucceſſor, occaſioned a general conſternation; and the aſſailants were routed and purſued with prodigious ſlaughter.

The firſt conſiderable action which took place after this unſucceſsful attempt upon Dubieza, was an attack made by the Turks on the prince of Saxe-Cobourg, who occupied with a conſiderable body of forces the heights of Rohatin. The engagement commenced with extraordinary fury, and was ſupported with unremitting vigour for three hours, when the arrival of a reinforcement to the prince obliged the enemy to retire. But the Turks, having likewiſe received a reinforcement, renewed the attack again towards evening, and the ſhades of night were ſcarcely ſufficient to ſeparate the combatants. On the three following days the battle was renewed with unabated fury; and the ceſſations were ſo extremely ſhort, each ſide being frequently relieved by freſh detachments, that it ſeemed to be little leſs than a continued action. The ſucceſs was various, and the effuſion of blood prodigious: but the adverſe armies at length parted, without having gained any deciſive advantage.

The emperor now attempted the reduction of Belgrade, in order to appeaſe the diſcontents which began to be extremely prevalent at Vienna and in the army. Accordingly, three bridges were thrown over the Saave, about the beginning of June, and an enormous train of battering cannon and other engines of deſtruction were brought forward from the neighbouring garriſon. But the rapid approach of the grand-vizir, with eighty thouſand men, produced an immediate change in his imperial majeſty's plan of operation. The bridges over the Saave were haſtily demoliſhed, the imperial camp was every where covered by artillery, and the war on the part of the Auſtrians became merely defenſive.

Meanwhile the grand-vizir, inſtead of following the quieſcent example of his adverſary, adopted meaſures which ſpread danger and confuſion on every ſide. Having thrown bridges acroſs the Danube at Cladora, he ſent ſome powerful detachments to the other ſide, with a view of invading the Bannat of Tameſwar, and of reducing his imperial majeſty to the dilemma, either of ſeeing that fine province ravaged, or of quitting his ſtrong camp at Semlin, and expoſing his troops to the inceſſant attacks of the Ottomans. Strong detachments were accordingly ſent from Semlin to counteract the motions of the enemy; while the grand-vizir diſpatched ſeveral reinforcements to maintain the ſuperiority which his forces had already gained. Thus, by degrees, both armies were drawn from their reſpective camps, and involved with their commanders in the Bannat. General Wartenſleben, who had held the principal command in that province before the arrival of his ſovereign, continued for ſome time on the heights of Mehadia; but he was ſoon driven thence by the ſuperior force of the infidels, and obliged to take ſhelter under the wings of the imperial army.

Prince Lichtenſtein being obliged, by illneſs, to reſign the command of the army in Croatia, marſhal Laudohn was, with ſome difficulty, perſuaded to ſucceed him, and the great name and preſence of that veteran officer ſeemed to reanimate the troops with vigour and confidence. Under his auſpices, fortune began to favour the Auſtrian arms, which had been long attended with doubtful ſucceſs. Dubieza was reduced after a moſt obſtinate defence; Novi, a ſtill ſtronger fortreſs, was obliged to ſurrender at diſcretion; and Turkiſh Gradiſca would inevitably have ſhared a ſimilar fate, had not the violence of the autumnal rains, and a ſudden inundation of the Saave, precluded the poſſibility of carrying on the ſiege.

During theſe tranſactions, the war in the Bannat raged with unabated violence; torrents of blood were ſhed on both ſides; and both armies performed actions of extraordinary valour. Fortune, however, ſeemed now to favour the Ottoman forces, and the utter defeat of general Papilla, in the neighbourhood of Schuppaneck, obliged the emperor to quit his camp at Semlin, and to lead the remainder of his army, conſiſting of forty thouſand men, to Weiſkirchen. After devoting a few days to neceſſary repoſe, his imperial majeſty removed to the valley of Karanſebes, which ſeemed to offer an advantageous ſituation. But in leſs than a week he was obliged to quit this place, and to deſcend into the open plain, being vigorouſly purſued by the victorious enemy. Nothing could be more unfortunate than this retreat: two columns, croſſing each other in the dark, fired under a mutual miſtake, and fourteen hundred men were ſacrificed before the error was diſcovered. The general confuſion was now ſo great, that the bat-men throwing the loads from their horſes, and the waggoners taking theirs from the carriages, conſulted their ſafety by a precipitate flight, while the plain was completely covered with baggage, which fell into the hands of the enemy. This ſhocking affair cloſed the campaign in the Bannat. The imperialiſts encamped in tolerable ſecurity at Lugos; and the violence of the autumnal rains ruined many of the Turkiſh horſes, inſomuch that ſix thouſand of their cavalry were obliged to ſerve on foot. This circumſtance, together with the loſs of a prodigious number of men, induced the grand-vizir to retire to Belgrade; and the emperor ſoon afterward returned to Vienna.

Notwithſtanding the bad ſucceſs of this campaign, and the ruin of his own conſtitution, Joſeph reſolved to proſecute the war with redoubled vigour. Accordingly, having obtained ſome ſubſidies, and filled up the ranks of his armies, he appointed the old field-marſhal Haddick to ſupply his place in the chief command, while the prince de Ligne enjoyed the ſecond poſt of honour in the grand army; the prince of Saxe Cobourg was to act in concert with the Ruſſians on the ſide of Moldavia, and marſhal Laudohn to command in Croatia. Early in the ſpring of 1789, both armies took the field; but the affairs of the Turks were involved in confuſion, all the arrangements of the late grand-vizir were ſubverted, the troops had loſt their accuſtomed valour, and fortune now forſook the Ottoman ſtandard. Upon the

borders

borders of Tranſylvania, the war commenced with mutual ſpirit and animoſity, but nothing of importance was achieved by the enemy. Turkiſh Gradiſca, which had formerly made ſo brave a reſiſtance, was ſtrangely abandoned on the firſt attack; the prince of Saxe-Cobourg gained a deciſive victory over thirty thouſand infidels, who were encamped under the command of a ſeraſquier in Wallachia; the grand-vizir was totally defeated at Martineſti by the joint forces of Saxe-Cobourg and general Suwarrow; and the fortreſs of Belgrade was reduced by the irreſiſtible arms of marſhal Laudohn.

Notwithſtanding the extraordinary ſucceſs of this and the ſucceeding campaign, a ſpirit of diſcontent ſeemed to predominate in the Auſtrian dominions; and even the empreſs conſented that Joſeph ſhould conclude a ſeparate treaty with the Turks. An alliance was now concluded between the Ottoman Porte and the king of Pruſſia, by which it was ſtipulated, that in caſe an equitable peace ſhould not be granted in a given time, his Pruſſian majeſty ſhould uſe his utmoſt endeavours for extorting it by force of arms. The emperor, however, perſiſted in his reſolution, and vigorous preparations were therefore made, on both ſides, for renewing the war.

Meanwhile the Hungarians, who had long been in a ſtate of inſurrection, ſent a haughty memorial to Vienna, demanding the reſtoration of all their ancient privileges, the return of their crown and other regalia, which had been removed from Preſburg, and the liberty of exchanging the German for their old native dreſs. Upon theſe conditions they promiſed to defend the kingdom to the laſt drop of their blood, and to ſupply the emperor's armies with every neceſſary their country would afford; but while their grievances remained without redreſs, they declared they muſt regard the imperial authority as unjuſt and deſpotic. The emperor, ſoftened by public calamities and worn down with bodily diſeaſe, complied with moſt of theſe requiſitions, and ſolemnly declared, that if he ſhould be alive in the enſuing month of May, he would viſit the capital of Hungary for the purpoſe of being crowned. Whilſt the Hungarians were making public rejoicings on this occaſion, the emperor was conſtantly attended by his two favourite generals, the marſhals Lacy and Laudohn, and very frequently, notwithſtanding his great age, by marſhal Haddick. His illneſs had been long and painful; but he bore all his ſufferings with remarkable patience, and met the approaches of death with fortitude and reſignation. He had even the magnanimity to order a preſent of ten thouſand florins to the phyſician who acquainted him, not only with the impoſſibility of his recovery, but that his diſſolution was to be apprehended hourly, and ſo ſuddenly as to prevent all notice of the fatal ſtroke. After this melancholy ſentence, he lingered for ſeveral days, and expired on the 20th of February, 1790, in the twenty-fifth year of his reign.

Joſeph II. was conſpicuouſly noted for benevolence, condeſcenſion, and temperance. Patient of fatigue, and poſſeſſed of an ardent mind, he applied himſelf with unremitting diligence to the ſuppreſſion of intolerance and ſuperſtition, and the promotion of induſtry, throughout his dominions. He has been violently accuſed of encroaching on the liberties of his Flemiſh ſubjects, and of exhibiting a conſiderable degree of rapacity in his attempts on Bavaria; but theſe faults may in ſome meaſure be overlooked among the truly glorious actions which contributed to the aggrandiſement of his own name, and the more permanent felicity of his people.

Leopold II. who was grand-duke of Tuſcany, ſucceeded his brother on the imperial throne; and, notwithſtanding the embarraſſed ſtate of public affairs, he ſoon acquired popularity by his moderation and conciliatory meaſures. Diſcontents in Hungary, an inſurrection in the Netherlands, and the formation of a ſextuple alliance againſt the confederation between Auſtria and Ruſſia, marked the commencement of his reign, and expoſed him to the moſt ſerious difficulties; but all theſe were gradually obviated by his prudent conduct, and a treaty was at length concluded between the Porte and Vienna, which happily terminated an expenſive, protracted, and deſtructive, war. A ſhort time before the concluſion of this treaty, marſhal Laudohn died, in the ſeventy-fifth year of his age; and his death was greatly lamented, not only on account of his military talents, but for his amiable virtues, which ſhone forth equally in his intercourſes with ſociety, and in his domeſtic retirement.

The French revolution now began to attract the attention of all the European powers; and, in 1791, a conference was held at Pilnitz between the emperor, the king of Pruſſia, and the elector of Saxony. Upon this occaſion, however, Leopold acted with his accuſtomed moderation; and, inſtead of adviſing hoſtilities with France, he merely wiſhed to oppoſe an effectual ſecurity againſt the tremendous hurricane which ſeemed to threaten all Europe. He was afterwards, however, perſuaded to commence hoſtilities, but his deſigns were ſoon terminated by a pleuritic fever, which brought him to the grave in the ſecond year of his reign. This prince had governed Tuſcany for nearly twenty-five years, with equal prudence and reputation; having directed his principal exertions to the amelioration of the laws, and the general improvement of his people. While only a diſtant ſpectator of the great ſcenes paſſing in the empire, he attentively ſtudied the affairs of government; and upon his elevation to the imperial throne, he retained all the ſentiments of his former life. In the courſe of his ſhort reign he remedied many calamities which had reſulted from his brother's precipitation; conducted his own affairs to a proſperous iſſue; and entered upon a career which ſeemed to promiſe the moſt ſolid advantages to Europe. Yet was this prince doomed to feel the thorns which ſo frequently encompaſs a diadem; although a lover of peace, he beheld the glowing embers of a ſanguinary war menacing his country from the French republic; whilſt he ſaw his unfortunate ſiſter Antoinette, the late queen of France, degraded from her high dignity, kept a cloſe priſoner, and in hourly expectation of an untimely end: but death kindly cloſed his eyes upon theſe afflicting ſcenes in March 1792, in the forty-fourth year of his age.

Francis II. ſucceeded his father, in 1792, in the kingdoms of Hungary and Bohemia, and, after a ſhort time, he was raiſed to the imperial throne. At the inſtigation of the king of Pruſſia, he reſolved to contribute his utmoſt endeavours to the reſtoration of monarchy in France; and the haughty language in which he demanded that Avignon ſhould be reſtored to the pope, and that the internal government of France ſhould be inveſted with ſuch efficiency as might obviate the apprehenſions of the other powers of Europe, produced a declaration of war on the part of the national aſſembly. On the 3d of July, the duke of Brunſwic arrived, with the firſt diviſion of an army of Pruſſians, at Coblentz, on the right bank of the Rhine; and on the 27th of the ſame month he publiſhed a manifeſto, which was intended to ſerve the cauſe of royalty, but which unhappily produced a very oppoſite effect. The indignation which it excited in France induced upwards of ten thouſand young men to enrol their names, without bounty, for the defence of their country; and the liberal rewards which were offered to all who ſhould reſort to the French ſtandard, occaſioned a great defection among the Auſtrian ſoldiers. On the 20th of September, the Auſtrians and Pruſſians made an attack upon the advanced guard of Kellerman, near Dampierre; but after a vigorous cannonade on both ſides, they were compelled to retire. Sickneſs and want of proviſions now began to pervade the combined armies; the ſoldiers, from eating large quantities of unripe grapes, had brought on a dyſentery; the horſes

were

were alſo ſeized with diſtempers, owing to the new wheat on which they had been fed; while the extreme badneſs of the weather increaſed theſe calamities, and rendered the roads almoſt impaſſable.

In the mean time, Cuſtine took poſſeſſion of Spires, where he found abundance of arms and ammunition; Worms, Mayence, and Frankfort, were, ſoon after, compelled to ſurrender; and the victorious general appeared eager to proceed to Coblentz, the noted ſeat of counter-revolutioniſts: but the Auſtrians and Pruſſians for a time ſtopped his career, by garriſoning that town, and forming an encampment in the adjacent country. On the 4th of November, general Dumouriez entered the Auſtrian Netherlands, with an army of forty thouſand men, and a prodigious train of artillery. Next morning he reconnoitred the poſition of the Auſtrian army, which conſiſted of about twenty thouſand men, under the command of the duke of Saxe-Teſchen. Their right wing extended to the village of Jemappe, and their left towards mount Paliſel; and they were defended by three tiers of redoubts, furniſhed with a hundred pieces of cannon. Several ſkirmiſhes took place before they came to a general engagement; but at length a battle was fought at Jemappe, which decided the fate of the Netherlands. The aſſault was dreadful, and the obſtinacy of the conflict truly memorable. All the flanks and lines of the imperialiſts were attacked at once; all the diviſions of the French were in action, and almoſt every individual fought perſonally. See the article FRANCE, vol. vii. p. 783.
